

Scriptcase Overview

What is Scriptcase?

Scriptcase is a complete development tool, with a friendly web interface. A low-code environment that creates PHP applications high-speed and with quality was built to save time, reduce costs, gain productivity, and to integrate the development teams. Using Scriptcase, you can create many types of applications like **Grids, Charts, Forms, Calendars, and many other applications**. It also offers an IDE integrated for you to customize applications or even to create using only codes.

You can divide Scriptcase environment into 3 parts: **RAD (Rapid Application Development)**, **Scriptcase environment tools** and **Code editors**.

- **RAD (Rapid Application Development)**: Within Scriptcase, you can find some ready-to-use applications as well as complete system templates. You can see a sample of all applications accessing our website [here](#).
- **Scriptcase environment tools**: You have available plenty of tools to assist your development within Scriptcase, such as Database Manager, SQL Builder, Data dictionary, CSV, XLS and Access converters, Documentation Creator, Themes Manager, Images Manager, Libraries Manager, Tasks Manager, and Key Shortcuts.
- **Code editors**: Besides the ready-to-use applications, templates, and tools, you can also customize or create your application using the editors, they work like an IDE integrate into Scriptcase. Within the editors, you can add your system rules integrating with web services, third-party libraries and components, APIs, and Scriptcase internal functions (macros). The editors are compatible with PHP, JavaScript, CSS, and HTML, and you can also use Emmet Shortcuts.

How does Scriptcase work?

Scriptcase works generating web applications in PHP and always relating the content with the most used databases on the market. Installing on a web server, Scriptcase can be accessed simultaneously by many developers through the browser, allowing remote and collaborative development. The source code is in PHP, and it works independently of the tool. Once you finish your project on Scriptcase, you can deploy it anywhere with a WEB server that allows you work with PHP. You do not need a license to run the generated applications. Scriptcase provides a "Production environment" where you can manage the libraries, connections, and deployed applications. Learn more about the deployment [here](#).

Which source code is generated?

Scriptcase generates (PHP, JavaScript, and HTML) source code. The generated code is independent of the tool, and you can deploy it on a web server with PHP enabled. The PHP language is free (GNU), and you can use on any operating system (Windows, Linux, or Mac). PHP processes work on the Server.

What are the supported databases?

Scriptcase connects to the leading relational databases: Oracle, MS-SQL Server, DB2, MySQL, Informix, PostgreSQL, Access, InterBase, FireBird, Progress, and others ODBC or OLEDB patterns.

What are the requirements to run ScriptCase?

A webserver (Apache, IIS, Sambar, Abyss, PWS, Xitami) that is enabled to run PHP 8.1 Scripts and IonCube Loader.

Accessing Scriptcase

Access to Scriptcase must be done through a browser of your choice. The tool is compatible with the most used browsers.

To access, we must inform in the address bar of the browser: **Server IP:+port+Scriptcase folder name**

Example of access when performing local installation

- 127.0.0.1:8092/scriptcase
- localhost:8092/scriptcase

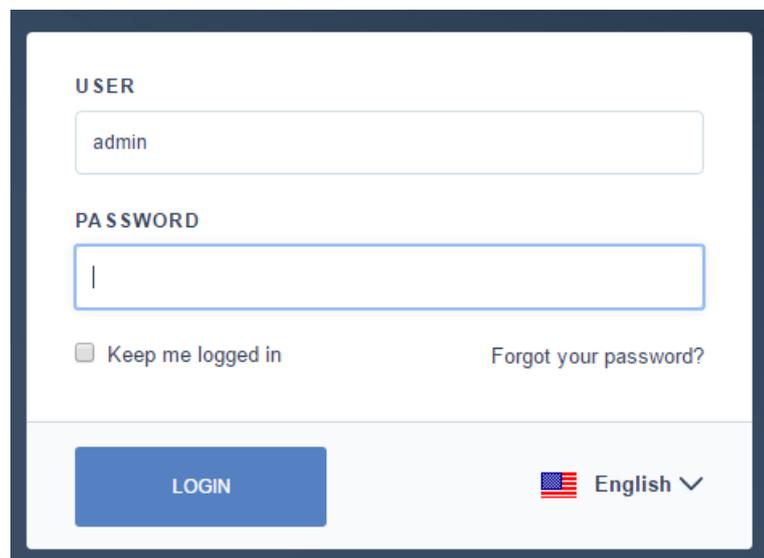

Example of access when performing installation on a server

- 180.204.163.144:8092/scriptcase/
- mysc.domain.net/scriptcase/

Compatible browsers

 Chrome	Any version
 Firefox	Version 4 or higher
 Edge	Any version
 Opera	Version 9 or higher
 Safari	Version 5.2 or higher

Login screen

The login screen contains the following elements:

- USER** field: A text input containing the text "admin".
- PASSWORD** field: A text input with a vertical cursor.
- Keep me logged in**: A checkbox with the label "Keep me logged in".
- [Forgot your password?](#): A link for password recovery.
- LOGIN** button: A blue button with the text "LOGIN".
- Language selection: A dropdown menu showing "English" with a flag icon and a downward arrow.

In addition to the **User** and **Password** fields, the login screen has some resources. **Keep me signed in**, **Forgot your password?** and the **Interface language selection**.

Keep me logged in

This option allows the browser to store the cookie and remain connected to your account when you close the browser tab where Scriptcase is open, and come back later without the need to log in again.

The cookie storage time is defined by accessing the menu [Settings > Administration](#) in the option **Time to expire the login**

cookie (days)

Forgot your password?

Allows recovery of the Scriptcase access password. For this option to work correctly, it is necessary to configure the SMTP in the tool settings.

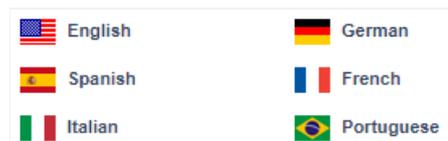

It is recommended that this configuration be performed on the first accesses.

[Check here](#) how to perform this configuration. [Check here](#) some SMTP options.

Interface Language Selection

Allows you to set the Scriptcase interface language.

Below are the available options.

The Portuguese language is only available in pt_br installers

Scriptcase Installing Overview

- ScriptCase installer includes PHP 8.1, Apache 2.4.53, and SourceGuardian.
- The installation process is described according to the Operating System.

Installing ScriptCase is not complicated, select your operating system below, follow the tutorial, and in a few steps, you get to install and start using ScriptCase. If you need any assistance, please contact our technical support [here](#).

Installer for Windows

The automatic installer quickly and simply configures the entire environment necessary to use Scriptcase. In addition to the tool itself, Apache and PHP will be configured, enabling essential libraries for the tool to function.

What will be installed

Scriptcase's automatic installer does not install any database.

- Apache Web Server **v2.4.53**.
- PHP **8.1.6** with extensions **MBSTRING**, **ZIP**, **BCMATH** and **GD** enabled.
- SourceGuardian **13.0.3**.
- Scriptcase

Installing Scriptcase with PHP 8.1 will not conflict with an existing installation of Scriptcase with PHP 7.0 or 7.3. The installer configures a different Apache service (**ApacheScriptcase9php81**) and port (**8092**) than the installer with PHP 7.0 or 7.3.

The installer is [available on our website](#) in x86 and x64 bit versions, download the installer according to your Windows architecture.

Compatibility Table

Scriptcase Automatic Installer is compatible with the following Windows versions

Windows	Windows Server
Windows 11	Windows Server 2022
Windows 10	Windows Server 2019
Windows 8.1	Windows Server 2016
Windows 8	Windows Server 2012 R2
Windows Vista SP2	Windows Server 2012
Windows 7 SP1	Windows server 2008 R2 SP1
	Windows server 2008 SP2

Installing Scriptcase with PHP 8.1 will not conflict with an existing Scriptcase installation using PHP 7.0 or PHP 7.3. The new Installer configures an Apache service (**ApacheScriptcase9php81**) with a different port (**8092**) than the installers with the PHP 7.0 or PHP 7.3.

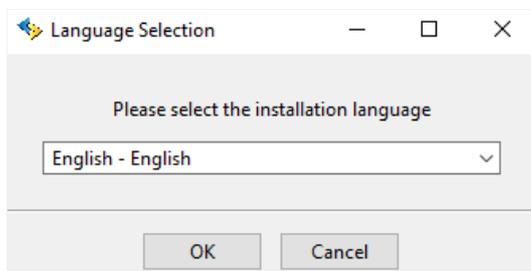

Check out the installation step-by-step below.

Scriptcase installation

1 - Language Selection

You can select the language that will be displayed in the installation process. This step does not select the Scriptcase interface language, only the installer language.

Click **Ok** to continue.

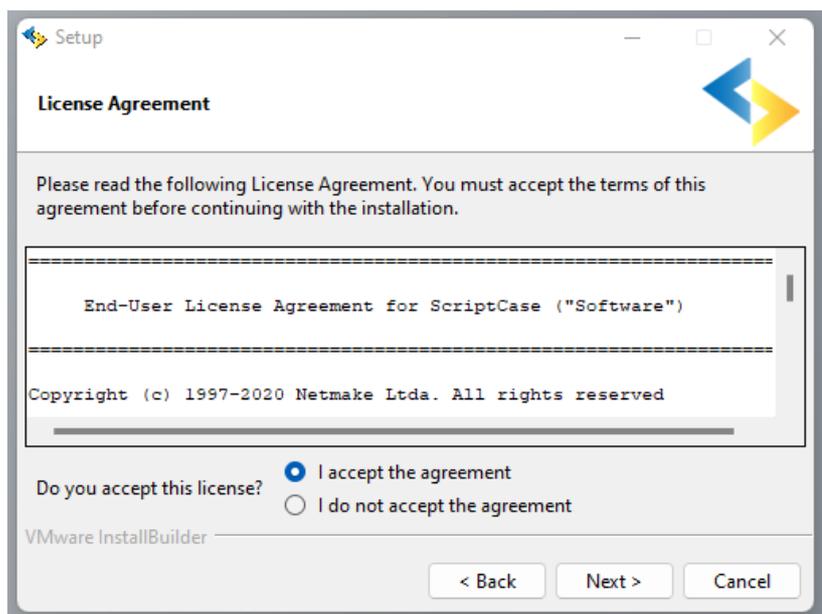

2 - Click "Next" to continue.

3 - License Agreement

Read and accept the terms of the license agreement

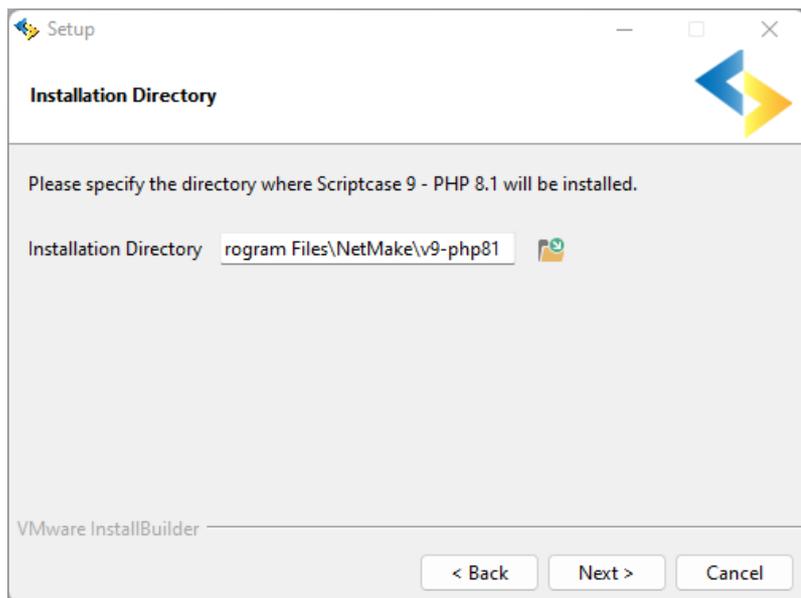

Click **Next** to continue.

4 - Installation Directory

The default installation path is "C:\Program Files\NetMake\v9-php81". It is not recommended to make any changes to this path

unless it is necessary.

Installation directory

In this option, you can set the installation path.

 : This button lets you select the installation folder or create a new one.

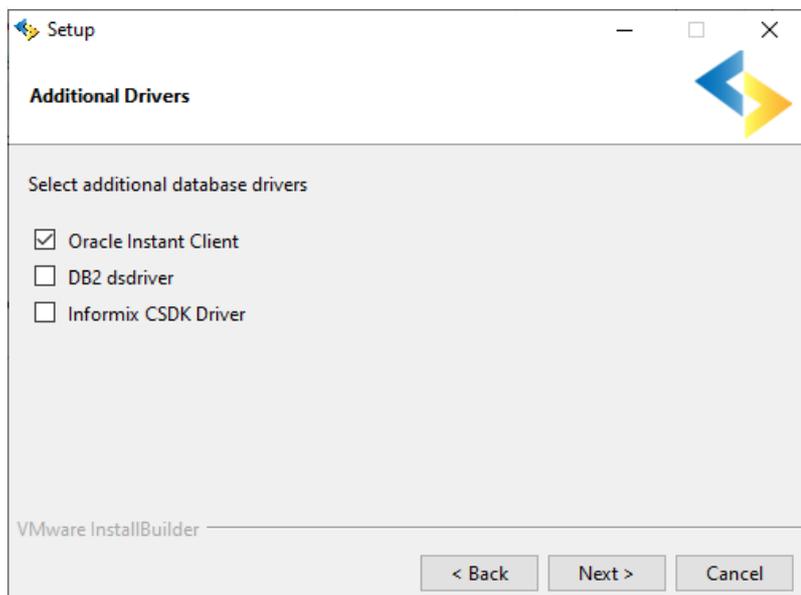

Click **Next** to continue.

5 - Drivers Adicionais

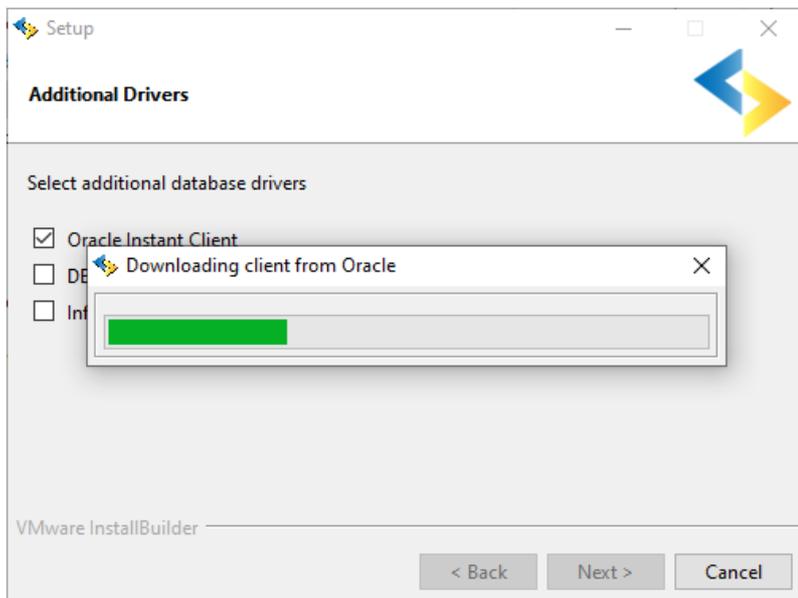

In this step, you can enable the drivers for the **Oracle**, **DB2** and/or **Informix** connections according to your needs. The other connections are automatically enabled when using our installer.

Choosing one of the drivers is optional, if you are not interested in enabling those drivers, just click **Next**.

This step is only available when using the x64 installer due to x86 architecture restrictions.

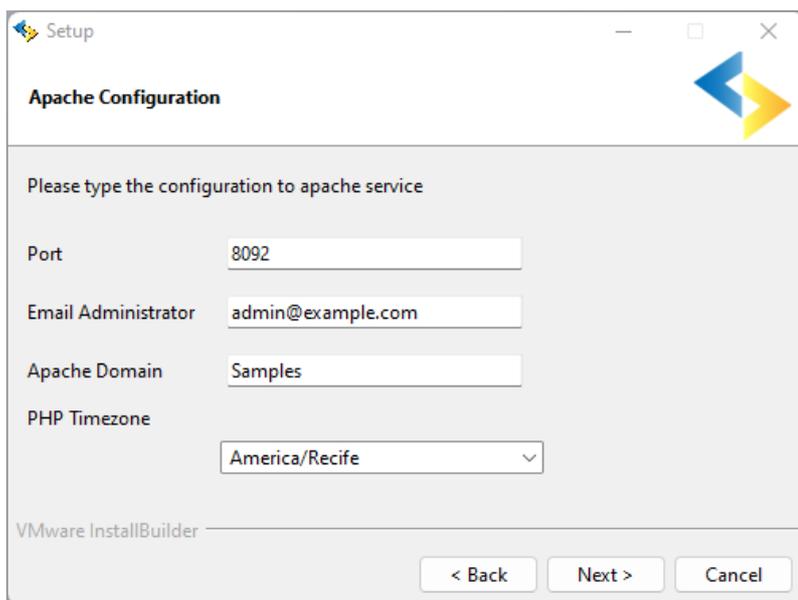

If you choose to configure any of the additional drivers, simply select the desired driver and click **Next**.

If you are using the x86 installer or have installed Scriptcase without selecting some of the drivers, check out our documentation on how to enable the [Oracle](#), [DB2](#) or [Informix](#).

6 - Configure Apache.

Port

Here will define in which port the Scriptcase Apache service will run on. We recommend using the value set in this installation. **(8092)**.

Email Administrator

You can configure Apache administrator email for better control of your environment. This setting serves as information when a server error occurs. A message will appear along with the administrator email to be contacted.

Internal Server Error

The server encountered an internal error or misconfiguration and was unable to complete your request.

Please contact the server administrator at root@localhost to inform them of the time this error occurred, and the actions you performed just before this error.

More information about this error may be available in the server error log.

Apache Domain

The Apache domain must be set here. We do not recommend making any changes to the default value.

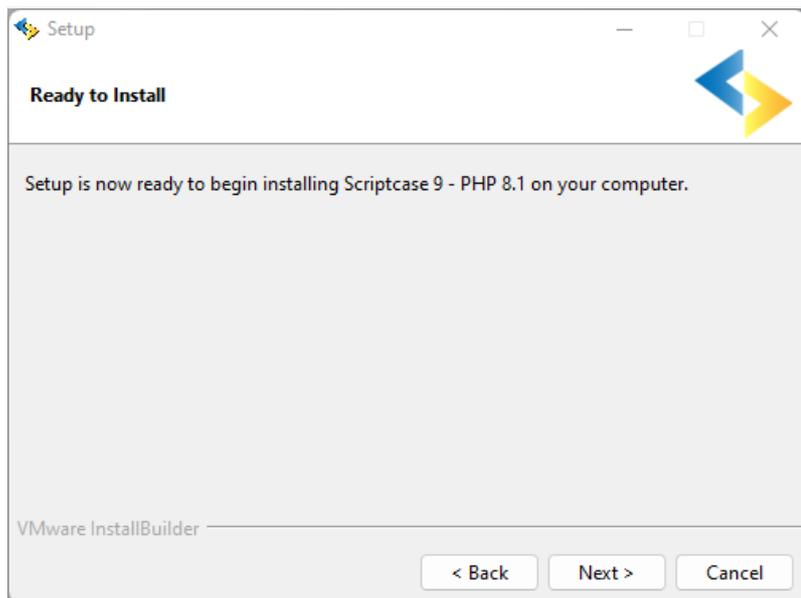

PHP TimeZone

In this option, you can set your PHP TimeZone. It is recommended to select the option corresponding to your time zone. You can check the list of available TimeZones [here](#).

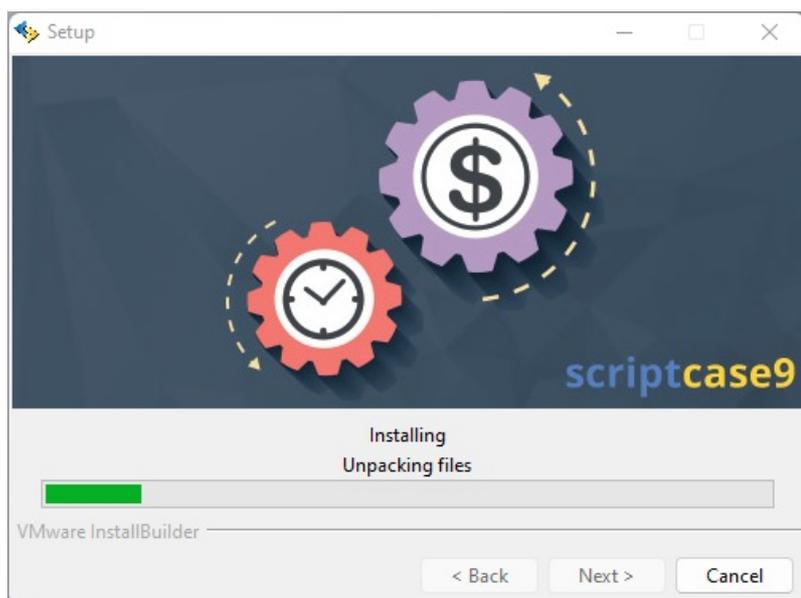

Click **Next** to continue.

7 - Ready to Install

Clicking "Next" will start the installation process.

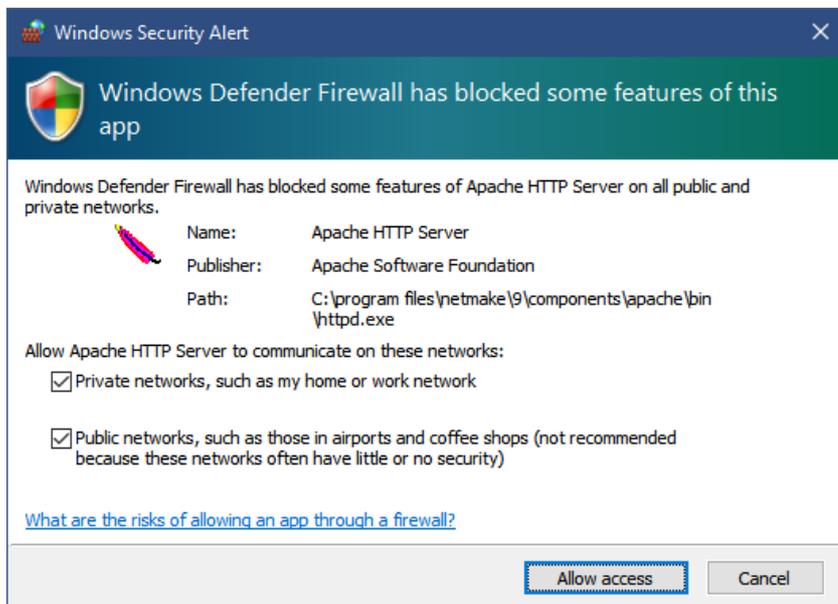

Wait until all components are installing and the environment is set up.

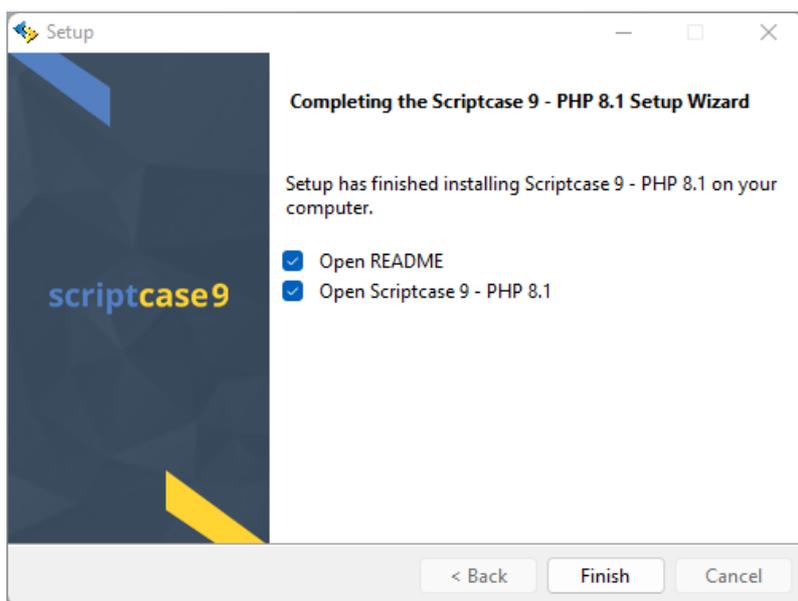

8 - Apache permission

Allow Apache to run on private and public networks (Firewall).

You must check both options to allow Scriptcase Apache to run on the operating system.

9 - Complete the installation

Open README

When you click Finish, you will be directed to a “Read Me” page with all the necessary initial information and useful links.

<https://www.scriptcase.net/readme/>

Open Scriptcase 9

Clicking “Finish”, will open Scriptcase in your default browser.

Access Scriptcase

1 - To access the Scriptcase you can use the shortcut created after installation or access using the browser.

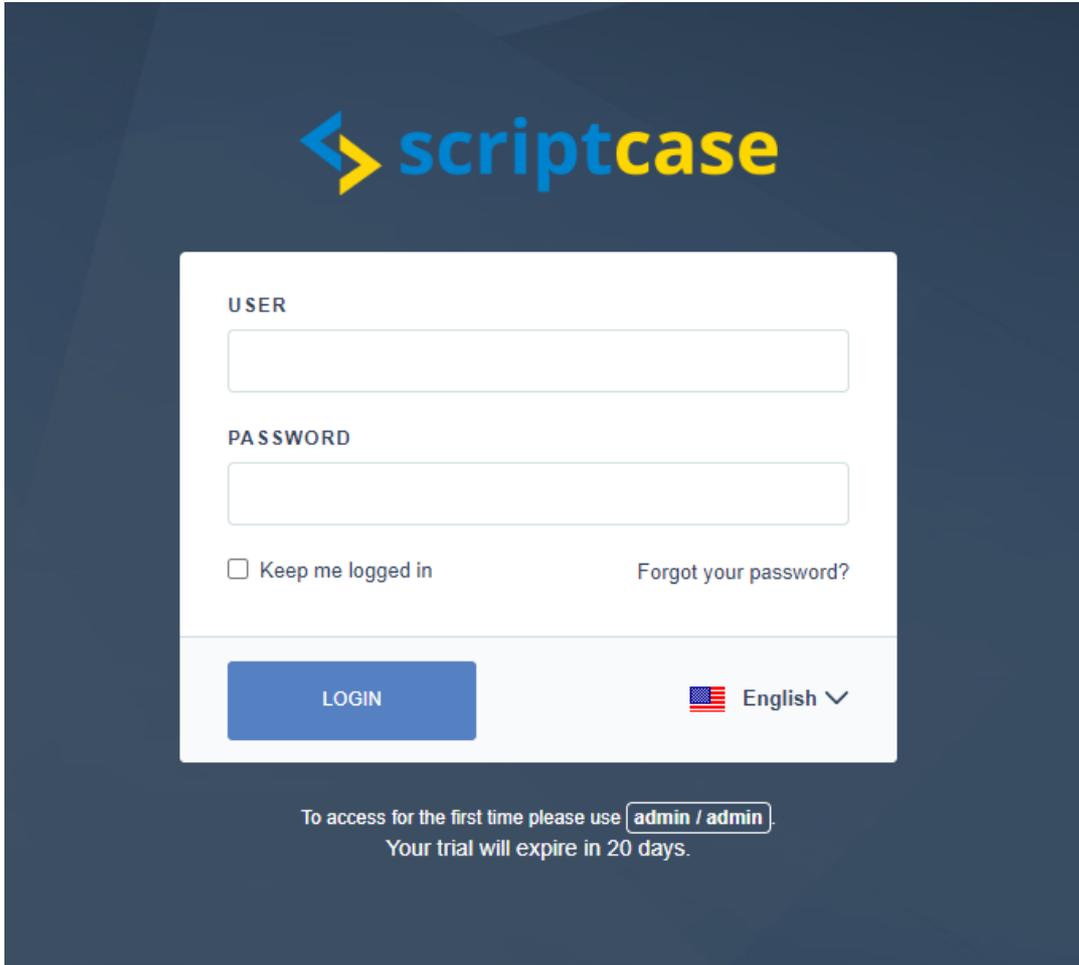

Example to access on the local install

- 127.0.0.1:8092/scriptcase
- localhost:8092/scriptcase

Example to access on the server install

- 180.204.163.144:8092/scriptcase/
- mysc.domain.net/scriptcase/

2 - After accessing the Login page, you must enter the username and password to proceed to your development environment.

scriptcase

To access for the first time please use `admin / admin`.
Your trial will expire in 20 days.

After finishing the installation, you can use the version free of charge for a period of 20 days and you will have access to technical support via chat to help you during the evaluation. If you already have a serial, [see how to register your scriptcase](#).

User

In this field, you must enter the user to login to Scriptcase. By default, the user is **admin**.

Password

In this field, you must enter the password to login to Scriptcase. By default, the password is **admin**.

Keep me logged in

This option keeps the user logged in until they log out through the Scriptcase interface.

Forgot your password?

This option makes it possible it is possible to recover the password to access Scriptcase. This feature is only available after configuring SMTP in Scriptcase settings. [See how to set the SMTP](#)

Installer for Linux

The Scriptcase installer installs **Apache, PHP and Scriptcase** on your operating system. **The installer does not include a database.**

Prerequisites

To download the Scriptcase Installer, go to our download page clicking [here](#).

Listed below are the operating systems approved for Scriptcase use. **Check the list of supported distros:**

The Scriptcase installer is compatible with any distribution with its GLIBC 2.17 or higher

Distro	GLIBC	
RedHat 7	2.17	
RedHat 8	2.28	AlmaLinux, Rocky Linux, CentOS Stream
RedHat 9	2.28	AlmaLinux, Rocky Linux, CentOS Stream
Debian 8	2.19	MX, Q4OS, SparkyLinux, Zorin, Devuan, Deepin, Kali
Debian 9	2.24	MX, Q4OS, SparkyLinux, Zorin, Devuan, Deepin, Kali
Debian 10	2.28	MX, Q4OS, SparkyLinux, Zorin, Devuan, Deepin, Kali
Debian 11	2.31	MX, Q4OS, SparkyLinux, Zorin, Devuan, Deepin, Kali
Debian 12	2.36	MX, Q4OS, SparkyLinux, Zorin, Devuan, Deepin, Kali
Debian 13	2.37	MX, Q4OS, SparkyLinux, Zorin, Devuan, Deepin, Kali
Ubuntu 18.04	2.27	Elementary, Mint, Pop!_OS, Linux Lite, KDE neon
Ubuntu 20.04	2.31	Elementary, Mint, Pop!_OS, Linux Lite, KDE neon
Ubuntu 22.04	2.35	Elementary, Mint, Pop!_OS, Linux Lite, KDE neon
Ubuntu 23.04	2.37	Elementary, Mint, Pop!_OS, Linux Lite, KDE neon
SuSe 15	2.31	

openSUSE leap (15)	2.38	AlmaLinux
openSUSE tumbleweed	2.38	
Fedora 37	2.36	
Fedora 38	2.37	
Fedora 39	2.38	
AWS 1	2.17	Amazon Linux
AWS 2	2.26	Amazon Linux
AWS 3	2.34	Amazon Linux
ArchLinux base-20230910.0.177821	2.38	EndeavourOS, Manjaro, Garuda, ArcoLinux

NOTE: Before proceeding with the installation, it is recommended not to have any other web environments installed (such as LAMP, Zend Server, etc) on your operating system. **It is recommended to have some basic knowledge of Linux/Unix environment to use the Terminal (Shell).**

This documentation will describe Scriptcase installation in 3 simple steps:

- 1 - Run Scriptcase Installer.
- 2 - Choose installer settings.
- 3 - Run Scriptcase.

Running Scriptcase Installer

1 - Browse to the directory where the installer is located.

Before we can run the Scriptcase installer, we need to access the folder where the installer file is located using the `cd` command.

Example: `sudo cd /home/your_user/Downloads`

NOTE: Scriptcase installer requires administrative permissions to make changes to your machine. We will have to use the `sudo` command to run the installer.

2 - Grant permission to the installer file and run it.

For you to run the `chmod` command that changes the permissions of a file or directory, you must also run the `sudo` command.

Example: `sudo chmod +x scriptcase_linux_installer_en_us_v9.9.021-php81.run`

The `chmod + x` command is used to make the installer `.run` file executable.

3 - Run the Installer file.

Example: `sudo ./scriptcase_linux_installer_en_us_v9.9.021-php81.run`

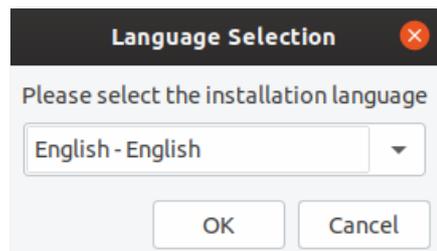

Choosing the Installer settings

NOTE: Installing Scriptcase with PHP 8.1 will not conflict with an existing Scriptcase installation with PHP 7.0 or 7.3. The Installer configures an Apache service (**apachesc9php81**) with a different port (**8092**) than the installer with PHP 7.0. or 7.3

Will be automatically installed on the operating system:

- Apache Web Server **v2.4.53**.
- PHP **8.1** with extensions **MBSTRING**, **ZIP**, **BCMATH** and **GD** enabled.
- SourceGuardian: **13.0.3**.
- Scriptcase.

1 - Choose the installation language.

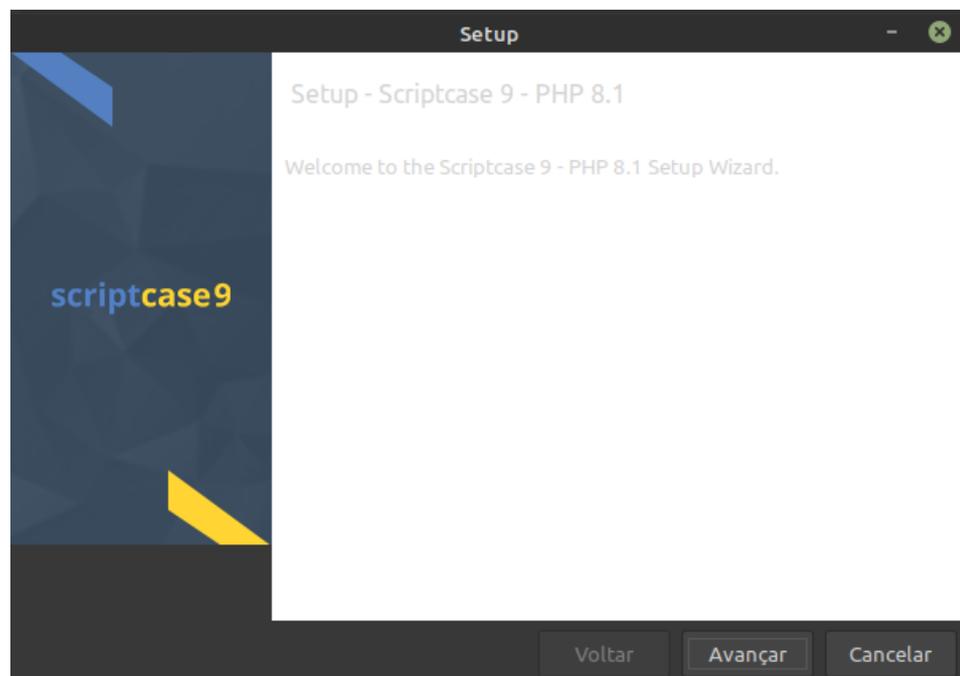

Language

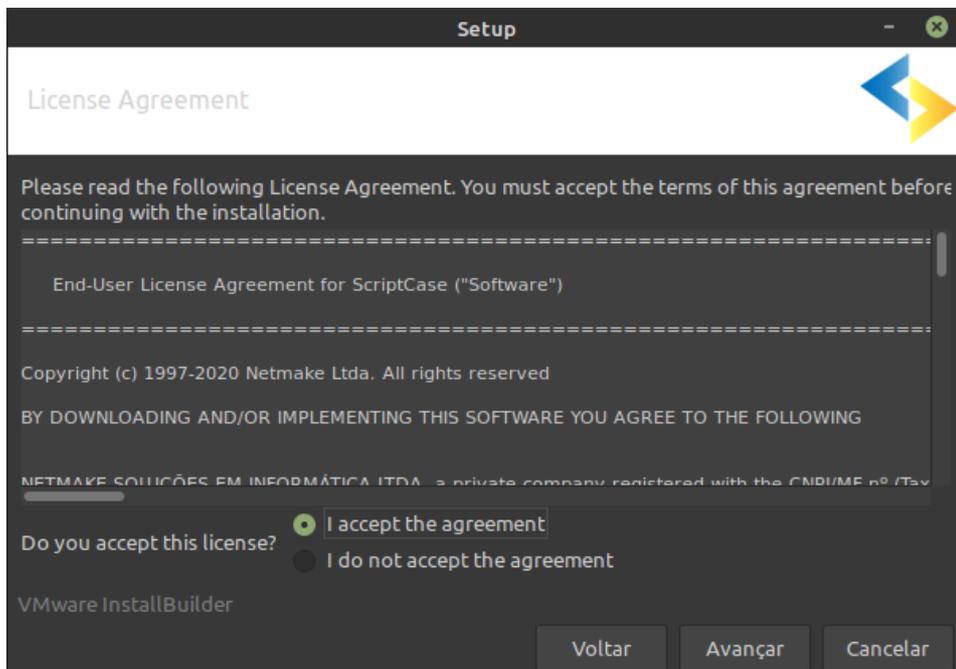

You can select the language that will be displayed in the installation process. This step does not select the Scriptcase interface language, only the installer language.

Click **Ok** to continue

2 - Click "Next" to continue.

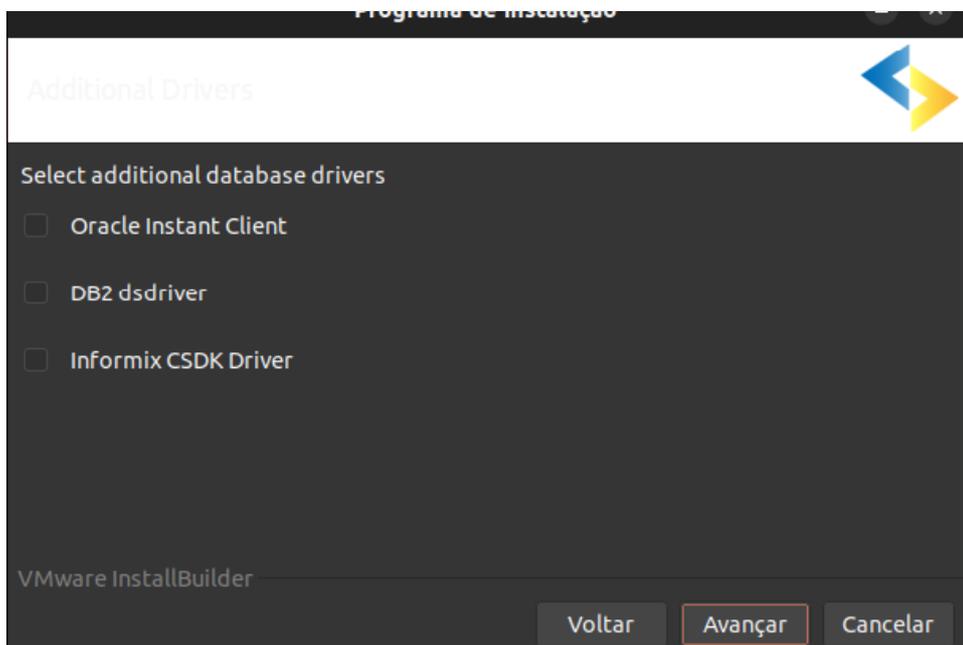

3 - Read and accept the terms of the license agreement.

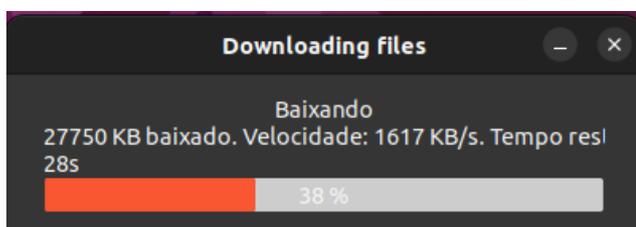

Click **Next** to continue.

4 - Select drivers to install.

The installer will ask if you want to add some additional drivers to the installation process: **Oracle instant Client, DB2 dsdriver and Informix CSDK Driver.**

When you click next, the installer will download the chosen drivers

If you choose not to include any of these drivers at installation time, you can add them manually. The path where you must add the drives follows the following folder structure: **/opt/Scriptcase/v9-php81/components/drivers/driver_folder**

The following table shows the additional drivers, their respective directories and links to downloads

Driver	Path	Driver - link x64
OCI8/PDO_OCI	/opt/Scriptcase/v9-php81/components/drivers/instantclient	Download
PDO_INFORMIX	/opt/Scriptcase/v9-php81/components/drivers/IBM/informix	Download
PDO_IBM, IBM_DB2	/opt/Scriptcase/v9-php81/components/drivers/IBM/Db2/dsdriver/	Download

5 - Configure Scriptcase Apache.

Setup

Apache Configuration

Please type the configuration to apache service

Port: 8092

Email Administrator: admin@example.com

Apache Domain: luan

PHP Timezone: America/Recife

VMware InstallBuilder

Voltar Avançar Cancelar

Port

Here will define in which port the Scriptcase Apache service will run on. We recommend using the value set in this installation (8092).

Admin Email

You can configure Apache administrator email for better control of your environment. This setting serves as information when a server error occurs. A message will appear along with the administrator email to be contacted.

Internal Server Error

The server encountered an internal error or misconfiguration and was unable to complete your request.

Please contact the server administrator at root@localhost to inform them of the time this error occurred, and the actions you performed just before this error.

More information about this error may be available in the server error log.

Apache Domain

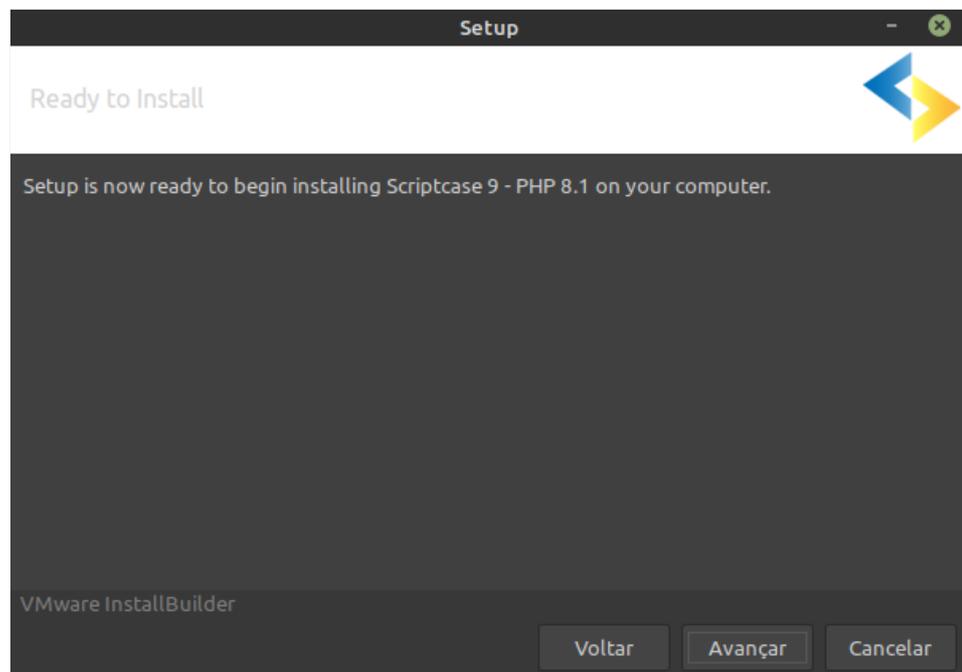

The Apache domain must be set here. We do not recommend making any changes to the default value.

PHP TimeZone

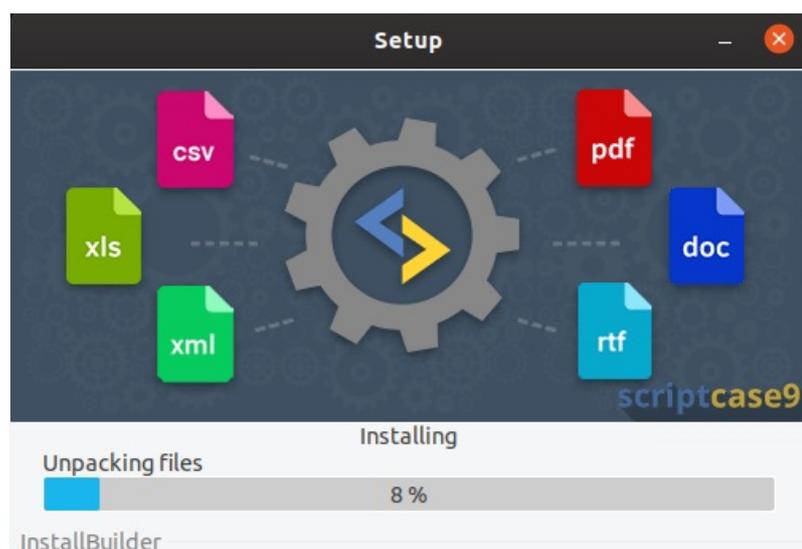

In this option, you can set your PHP TimeZone. It is recommended to select the option corresponding to your time zone. You can check the list of available TimeZones [here](#).

Click **Next** to continue.

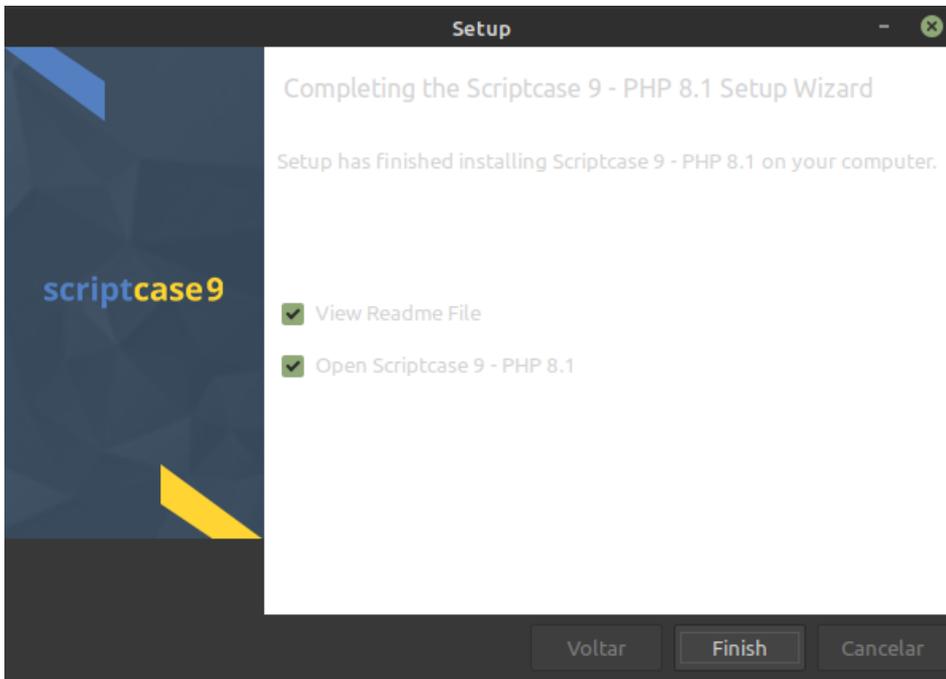

6 - Clicking "Next" will start the installation process.

Wait until all components are installing and the environment is set up.

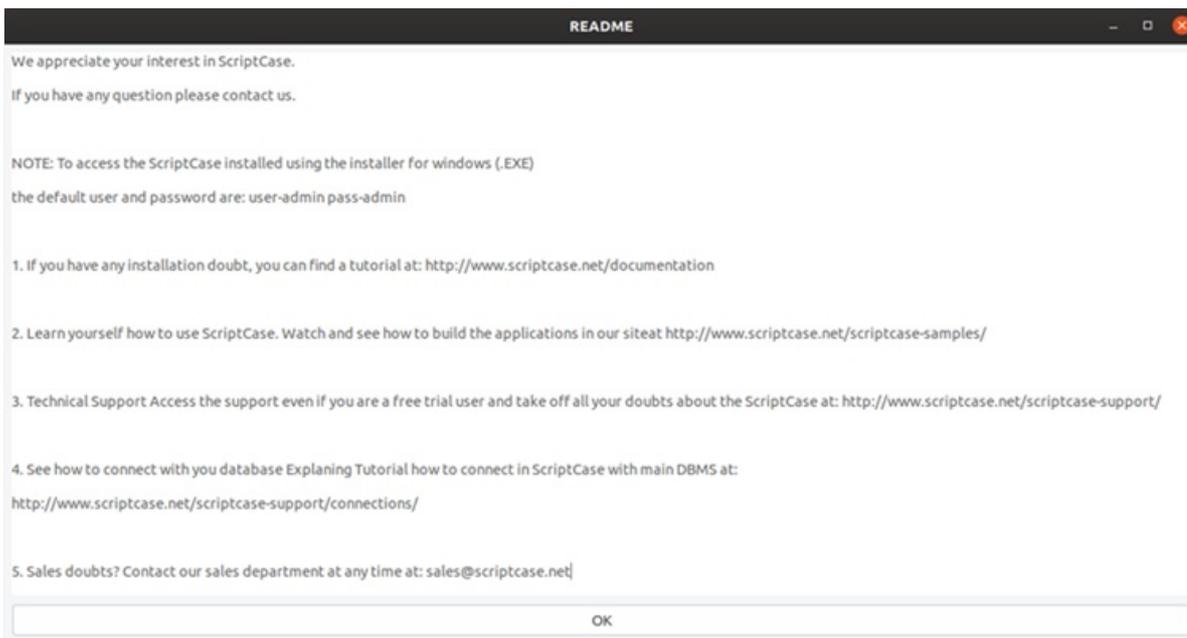

7 - Complete the installation.

View the “Read Me” file

Clicking finish you will be redirected to the “**Read Me**” page with all the necessary initial information and useful links.

Open Scriptcase 9

Clicking “**Finish**”, will open Scriptcase in your default browser.

Access the Scriptcase

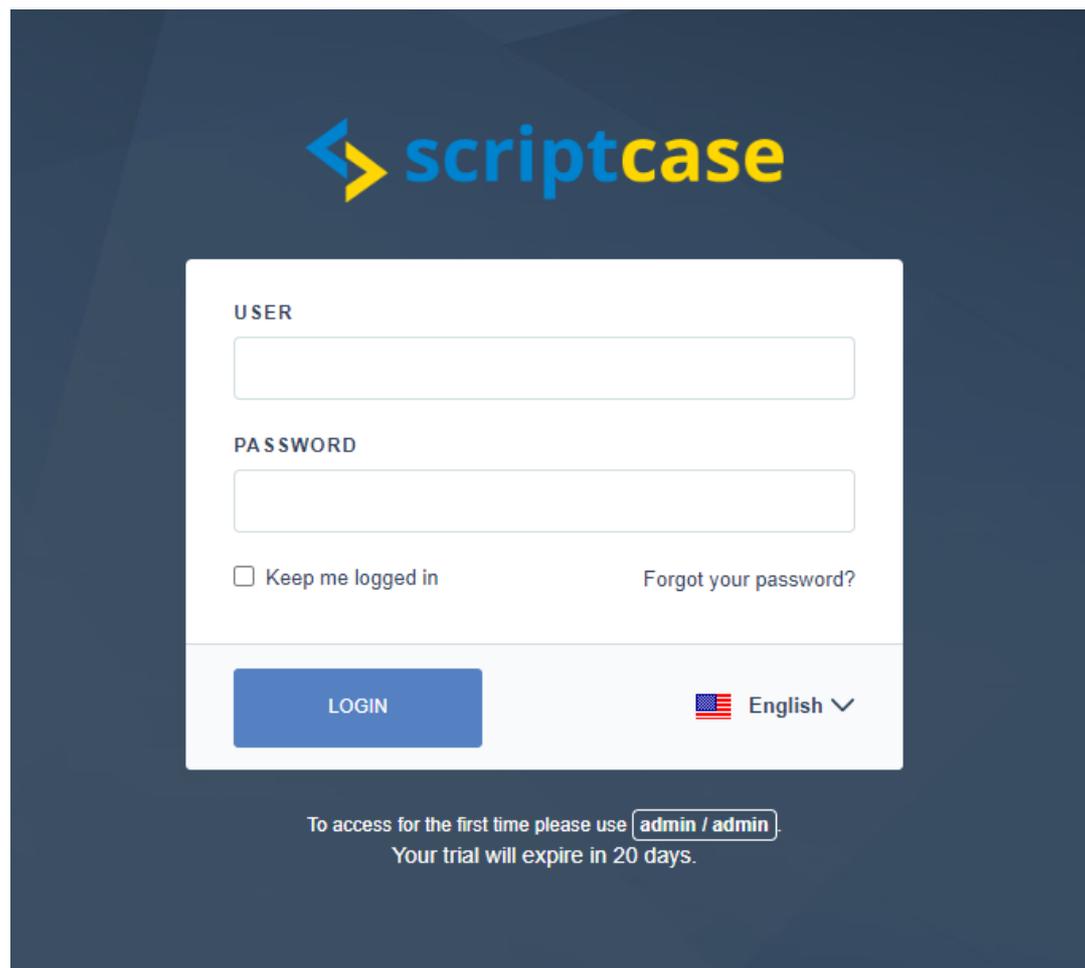

1 - To access your Scriptcase, you need to open your browser and enter the local IP or domain of the ported server you selected in the Apache setup.

Example 1: <http://127.0.0.1:8092/scriptcase>

Example 2: <https://yourdomain.com:8092/scriptcase>

2 - Login to Scriptcase

After accessing the Login page, you must enter the username and password to proceed to your development environment.

PASSWORD

Keep me logged in [Forgot your password?](#)

LOGIN  English ▾

To access for the first time please use `admin / admin`.
Your trial will expire in 20 days.

User

In this field, you must enter the user to login to Scriptcase. By default, the user is **admin**.

Password

In this field, you must enter the password to login to Scriptcase. By default, the password is **admin**.

Keep me logged in

This option keeps the user logged in until they log out through the Scriptcase interface.

Forgot your password?

IMPORTANT: Password recovery will only be possible if you have configured your SMTP information. To access our documentation showing how to perform this configuration click [here](#).

By clicking on this option, it is possible to recover the password of the informed user. An email will be sent to the user so they can access the recovery steps.

Need to register your Scriptcase?

You can access our [knowledge base](#) to understand all the steps for registering a Scriptcase license.

Installer for macOS

The Scriptcase installer installs **Apache, PHP and Scriptcase** on your operating system.

The Scriptcase installer does not include a database.

Prerequisites

To download the Scriptcase Installer, go to our download page clicking [here](#).

IMPORTANT: The Scriptcase installer is a **.app** file. To run the file, you will need to press and hold the **cntrl** key, mouse/touchpad right-click, and then click **Open** to authenticate as an administrator and install Scriptcase.

Listed below are the macOS versions approved for Scriptcase use.

Compatibility Table

Scriptcase Automatic Installer is compatible with the following macOS versions

Version	Codename
macOS 15.0	"Sequoia"
macOS 14.2	"Sonoma"
macOS 13.0	"Ventura"
macOS 12.0	"Monterey"
macOS 11.0	"Big Sur"
macOS 10.15	"Catalina"
macOS v10.14	"Mojave"
macOS v10.13	"High Sierra"
macOS v10.12	"Sierra"
OS X v10.11	"El Capitan"

Before proceeding with the installation, it is recommended not to have any other web environments installed (such as MAMP, Zend Server, etc) on your operating system.

Choosing settings in the Installer

Installing Scriptcase with PHP 8.1 will not conflict with an existing Scriptcase installation using PHP 7.0 or PHP 7.3. The new Installer configures an Apache service (**ApacheScriptcase9php81**) with a different port (**8092**) than the installers with the PHP 7.0 or PHP 7.3.

Will be automatically installed on the operating system:

- Apache Web Server **v2.4.53**.
- PHP **8.1** with extensions **MBSTRING, ZIP, BCMATH** and **GD** enabled.

- SourceGuardian **13.0.3**.
- Scriptcase **9**.

1 - Choose the installation language.

Language

You can select the language that will be displayed in the installation process. This step does not select the Scriptcase interface language, only the installer language.

Click **Ok** to continue

2 - Click "Next" to continue.

3 - Read and mark I accept the agreement.

Click **Next** to continue.

4 - Enter the installation directory.

The default installation path is `"/Applications/Scriptcase/v9-php81"`. It is not recommended to make any changes to this path unless it is necessary.

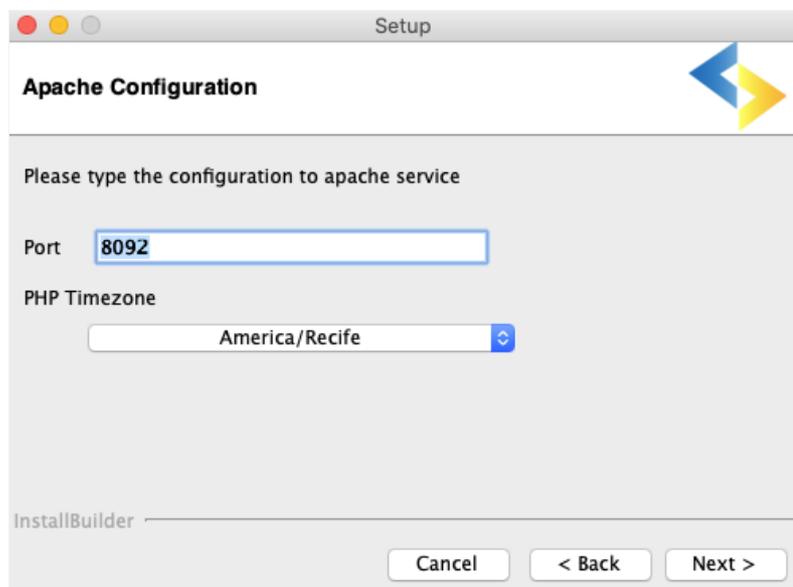

Installation directory

In this option, you can set the installation path.

 : This button lets you select the installation folder or create a new one.

Click **Next** to continue.

5 - Configure Scriptcase Apache.

Port

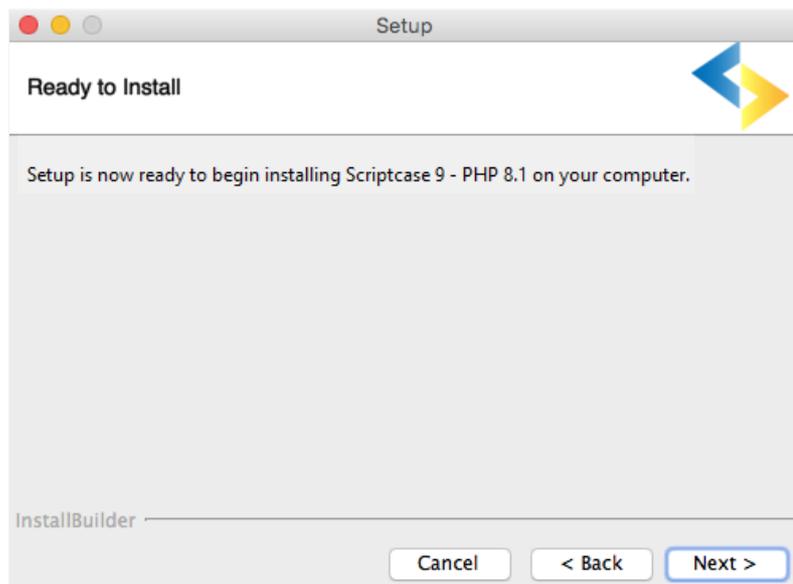

Here will define in which port the Scriptcase Apache service will run on. We recommend using the value set in this installation (8092).

PHP TimeZone

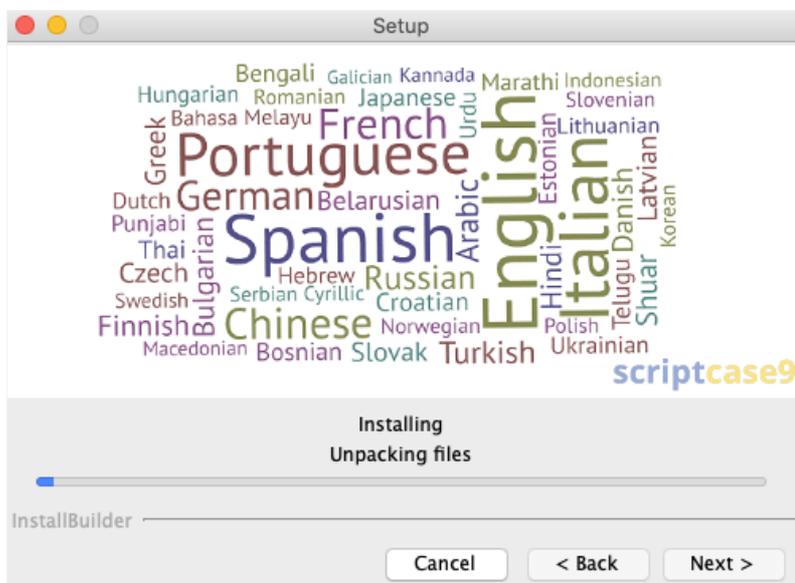

In this option, you can set your PHP TimeZone. It is recommended to select the option corresponding to your time zone. You can check the list of available TimeZones [here](#).

Click **Next** to continue.

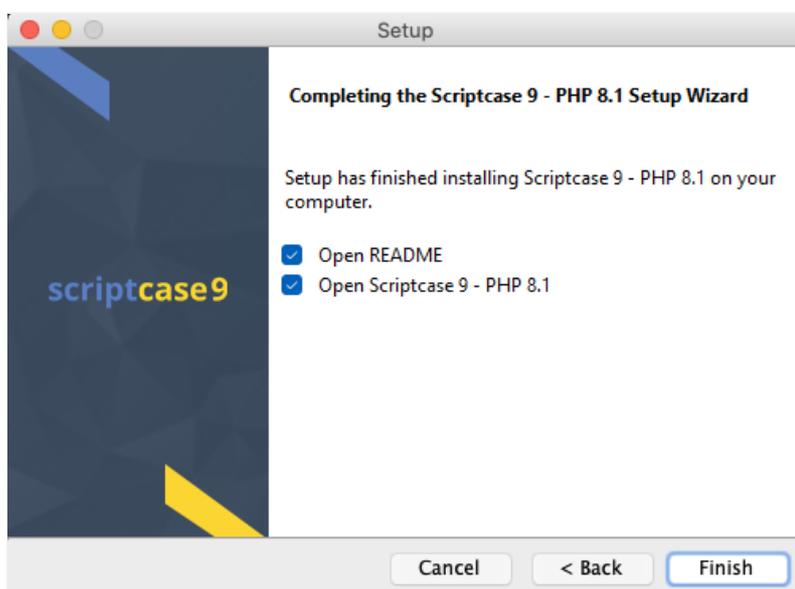

6 - Clicking "Next" will start the installation process.

Wait until all components are installing and the environment is set up.

7 - Complete the installation.

Open README

When you click Finish, you will be directed to a “Read Me” page with all the necessary initial information and useful links.

<https://www.scriptcase.net/readme/>

Open Scriptcase 9

Clicking finish “**Finish**” will open Scriptcase in your default browser.

Access Scriptcase

1 - To access the Scriptcase you can use the shortcut created after installation or access using the browser.

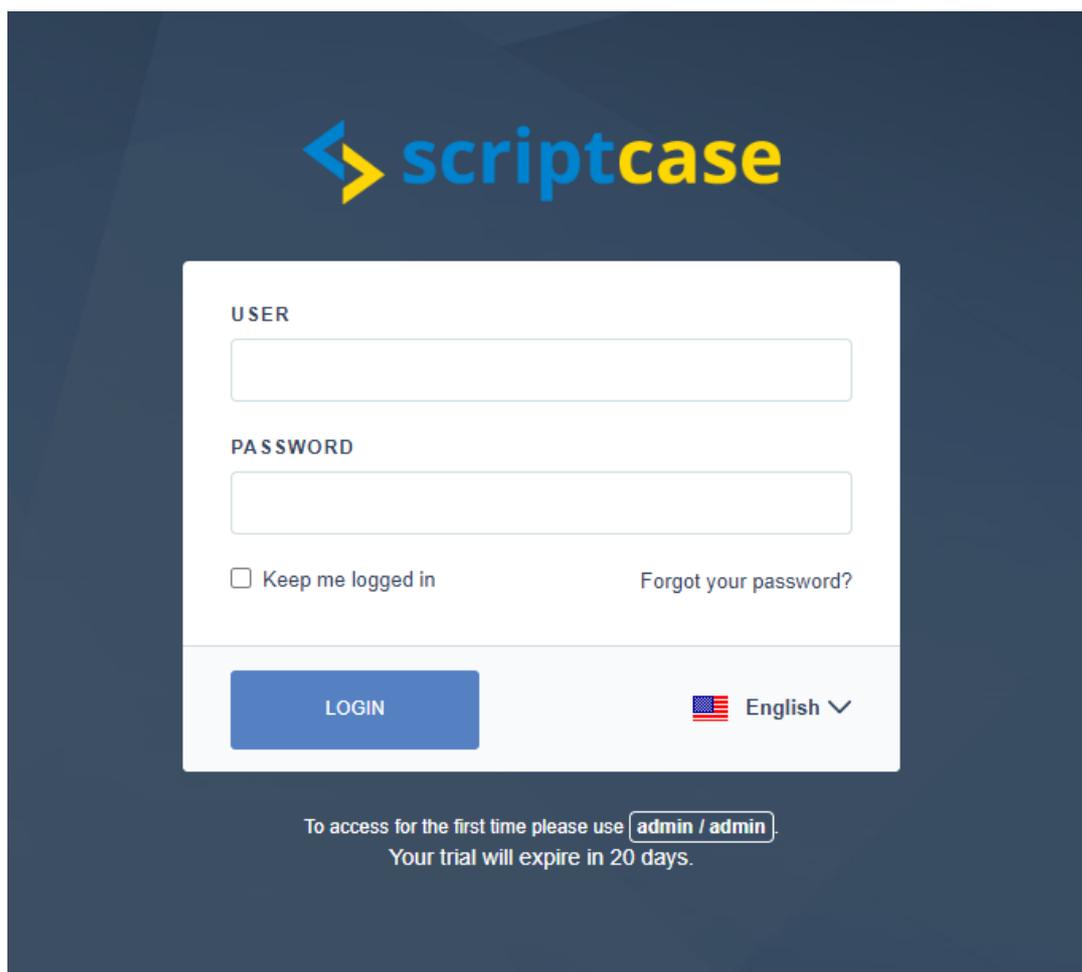

Example to access on the local install

- 127.0.0.1:8092/scriptcase
- localhost:8092/scriptcase

Example to access on the server install

- 180.204.163.144:8092/scriptcase/
- mysc.domain.net/scriptcase/

2 - After accessing the Login page, you must enter the username and password to proceed to your development environment.

Installing PHP 8.1 - Windows

This documentation will walk you through the steps necessary to install PHP 8.1, Apache 2.4, and Scriptcase manually. **When performing this type of installation, you are responsible for configuring your entire environment as well as database extensions.**

You can install the Scriptcase with PHP 7.3 or PHP 7.0: [See how to install with PHP 7.3](#) [See how to install with PHP 7.0](#)

Listed below are all the supported operating systems as well as the libraries that are required to function on a particular system.

Compatibility Table

Scriptcase Automatic Installer is compatible with the following Windows versions

Windows	Windows Server
Windows 11	Windows Server 2022
Windows 10	Windows Server 2019
Windows 8.1	Windows Server 2016
Windows 8	Windows Server 2012 R2
Windows Vista SP2	Windows Server 2012
Windows 7 SP1	Windows server 2008 R2 SP1
	Windows server 2008 SP2

For **Windows 7 SP1**, you must verify if the system has the following items installed: Visual C++ Redistributable Packages for Visual Studio (2008, 2010, 2012, 2013, 2015) **x86** and **x64**.

Prerequisites

If you already have a Web Server with Apache and PHP 8.1 configured, just go to How to [Enable SourceGuardia Loader](#) and proceed to manual installation.

To proceed with the installation, you need to download some files.

Check below for the files you will need:

- PHP **8.1 NTS (x86 or x64)**: [Click Here](#)
- Apache **2.4 (x86 or x64)**: [Click Here](#)
- mod_Fcgi **(x86 or x64)**: [Click Here](#)
- SourceGuardian Loader 13.0.3 for Windows **(x86 or x64)**: [Click Here](#)
- Scriptcase **(.zip)**: [Click Here](#)

NOTE: Before proceeding with the installation, it is recommended not to have any other web environments installed (such as WampServer, XAMPP, Zend Server, etc.) on your operating system.

Below are the actions required after downloading the items specified above::

1 - Unzip the **PHP** and **Apache** files in separate folders on your operating system's C: drive.

2 - Rename the PHP folder to **php**. The result should be like this:

Name	Date modified	Type	Size
Apache24	16/03/2014 08:14	File folder	
PerfLogs	22/08/2013 12:22	File folder	
php	18/07/2014 11:53	File folder	
Program Files	18/07/2014 10:17	File folder	
Program Files (x86)	18/07/2014 10:47	File folder	
Users	17/07/2014 19:30	File folder	
webservice	18/07/2014 10:50	File folder	
Windows	17/07/2014 18:13	File folder	

3 - Unzip the **mod_Fcgi** file, copy the **mod_fcgid.so** file to the `C:\Apache24\modules` folder.

mod_expires.so	22/06/2022 05:00
mod_ext_filter.so	22/06/2022 05:00
mod_fcgid.so	16/06/2019 06:35
mod_file_cache.so	22/06/2022 05:00
mod_filter.so	22/06/2022 05:00

Configure the Apache environment

Listed below are the steps required to configure apache manually. **Follow the steps correctly to avoid problems installing and starting the service.**

NOTE: Since PHP and Apache folders are at the same directory level (**C:**) You do not need to enter the root folder in directives that require you to enter isolated paths or points to a specific file.

1 - Edit the **httpd.conf** file located in the `C:\Apache24\conf\` folder using a text editor in Administrator mode, so that any changes you make are saved.

extra	22/06/2022 05:04
original	22/06/2022 05:04
charset.conv	22/06/2022 05:02
httpd.conf	16/08/2022 14:58
magic	22/06/2022 05:02

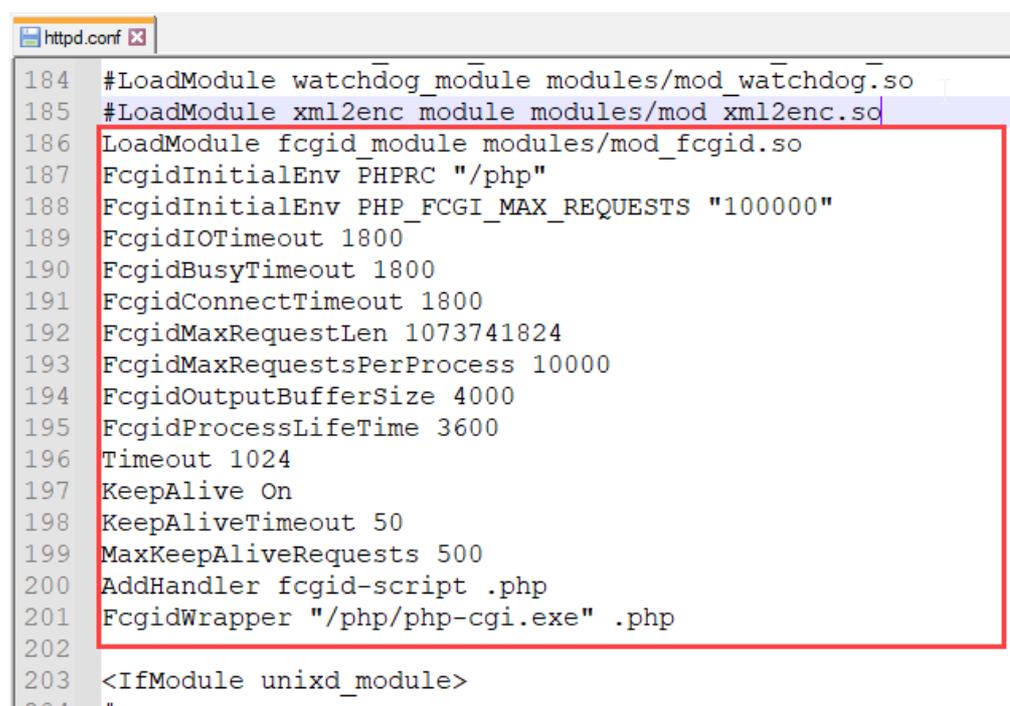

2 - Add the content below after the `#LoadModule xml2enc_module modules/mod_xml2enc.so` line:

```

LoadModule fcgid_module modules/mod_fcgid.so
FcgidInitialEnv PHPRC "/php"
FcgidInitialEnv PHP_FCGI_MAX_REQUESTS "100000"
FcgidIOTimeout 1800
FcgidBusyTimeout 1800
FcgidConnectTimeout 1800
FcgidMaxRequestLen 1073741824
FcgidMaxRequestsPerProcess 10000
FcgidOutputBufferSize 4000
FcgidProcessLifeTime 3600
Timeout 1024
KeepAlive On
KeepAliveTimeout 50
MaxKeepAliveRequests 500
AddHandler fcgid-script .php
FcgidWrapper "/php/php-cgi.exe" .php

```

Example:

```

184 #LoadModule watchdog_module modules/mod_watchdog.so
185 #LoadModule xml2enc_module modules/mod_xml2enc.so
186 LoadModule fcgid_module modules/mod_fcgid.so
187 FcgidInitialEnv PHPRC "/php"
188 FcgidInitialEnv PHP_FCGI_MAX_REQUESTS "100000"
189 FcgidIOTimeout 1800
190 FcgidBusyTimeout 1800
191 FcgidConnectTimeout 1800
192 FcgidMaxRequestLen 1073741824
193 FcgidMaxRequestsPerProcess 10000
194 FcgidOutputBufferSize 4000
195 FcgidProcessLifeTime 3600
196 Timeout 1024
197 KeepAlive On
198 KeepAliveTimeout 50
199 MaxKeepAliveRequests 500
200 AddHandler fcgid-script .php
201 FcgidWrapper "/php/php-cgi.exe" .php
202
203 <IfModule unixd_module>

```

WARNING: This setting will only work if you have copied the `mod_fcgid.so` file to the `C:\Apache24\modules` folder as [previously instructed](#).

3 - Search for `#ServerName www.example.com:80` and change this line to `ServerName localhost:80`.

In this tutorial apache is configured with port 80. To define another port it is necessary to change the value informed in `ServerName`, for example (`localhost:8092`). Also, you will need to change the `Listen`, for example (`Listen 8092`). Before changing you must make sure that the port is not being used by another service

4 - Change the contents of the `DirectoryIndex` directive by adding the following contents to the directive line:: `index.php index.phtml`.

Example:

```

<IfModule dir_module>
    DirectoryIndex index.html index.php index.phtml
</IfModule>

```

```

300 #
301 <IfModule dir_module>
302     DirectoryIndex index.html index.php index.phtml
303 </IfModule>
304

```

5 - Set the `${SRVROOT}` variable with your Apache folder path:

Search for the **Define SRVROOT** and edit it as follows:

```
Define SRVROOT "/Apache24"
```

6 - Add the **Options ExecCGI** command below the **Require all granted** line in the `<Directory "${SRVROOT}/htdocs">` directive.

```

#
Require all granted
Options ExecCGI
</Directory>

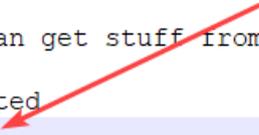

```

Example:

```

288     AllowOverride None
289
290     #
291     # Controls who can get stuff from this server.
292     #
293     Require all granted
294     Options ExecCGI
295 </Directory>
296
297 #
298 # DirectoryIndex: sets the file that Apache will serve
299 # is requested.
300 #

```

7 - Search for the `<IfModule mime_module>` directive and add the content below **above** this directive:

```

<Directory "/php">
#
AllowOverride None
Options None
Require all granted
#
</Directory>

```

Example:

```

413     RequestHeader unset Proxy early
414 </IfModule>
415
416 <Directory "/php">
417     #
418     AllowOverride None
419     Options None
420     Require all granted
421     #
422 </Directory>
423
424 <IfModule mime_module>
425     #
426     # TypesConfig points to the file co
427     # filename extension to MIME-type.
428     #

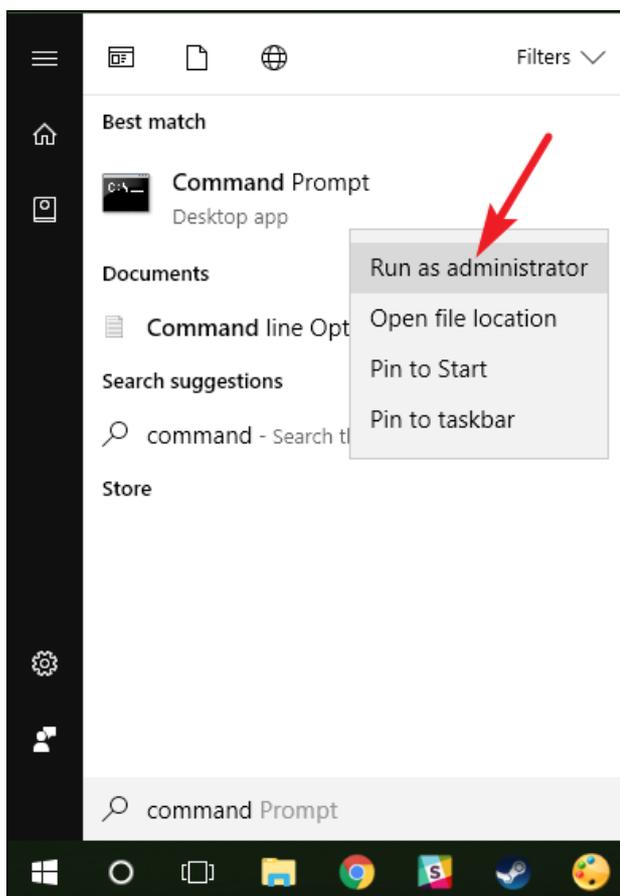

```

After performing all these procedures, save the `httpd.conf` file to proceed with Apache installation and startup and PHP configuration.

Install and start Apache

Now that you have set up your apache service, all you have to do is install and start it. Below are the steps that must be followed to successfully complete this process.

1 - Run the **Command Prompt (CMD)** with **Administrator privileges**:

2 - Go to the Apache `bin` folder to install the `httpd.exe` executable file:

```
cd C:\Apache24\bin\httpd.exe
```

3 - Install Apache with the command below:

```
httpd.exe -k install
```

Wait for the message “The ‘Apache2.4’ service is successfully installed.” to proceed.

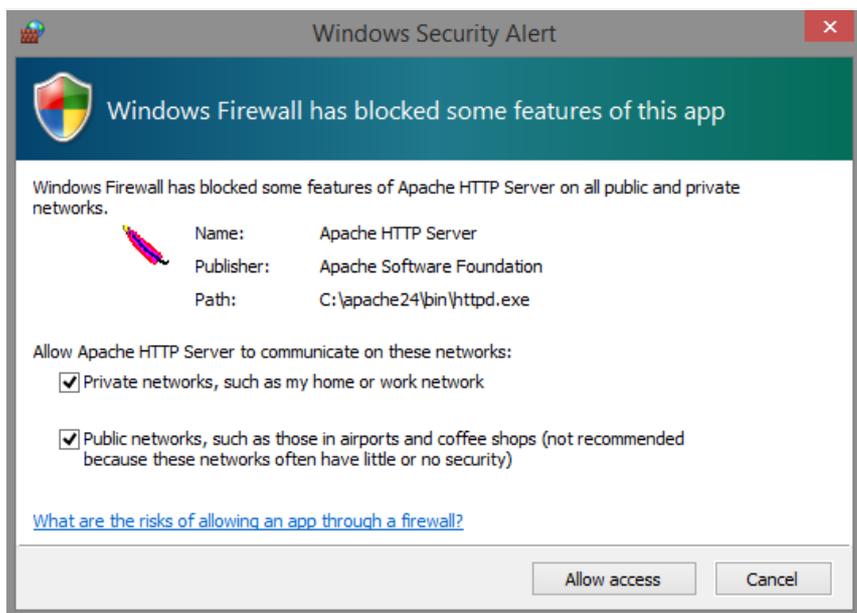

4 - Start the Apache service and verify if it is working.

Use the `httpd.exe -k start` to start your Apache service.

```
C:\Apache24\bin>httpd.exe -k start
C:\Apache24\bin>
```

5 - Grant execution permission to Apache on your Firewall:

Select the two options available to grant permission, so Apache can function properly.

6 - Check if Apache is active.

To verify that the service is active, simply visit the Apache test page in your browser. You can do it in two ways:

`127.0.0.1` or `localhost`

Configure the PHP 8.1

With Apache active and functional, you now need to define and configure the **PHP.ini** file so those database extensions and libraries are available for use by Scriptcase.

1 - Access the PHP folder in `C:\` and rename the **php.ini-development** file to **php.ini**.

pharcommand.phar	02/08/2022 11:48
php.exe	02/08/2022 11:48
php.ini	16/08/2022 16:24
php.ini-production	02/08/2022 11:48
php8.dll	02/08/2022 11:48

2 - Access the **php.ini** file with a text editor using Administrative privileges and search for the `;extension_dir = "ext"` directive.

Assign value **"C:\php\ext"** to this directive and remove `;`.

Example:

```
extension_dir = "C:\php\ext"
```

```
760 ; https://php.net/extension-di
761 ;extension_dir = "."
762 ; On windows:
763 extension_dir = "C:\php\ext"
764
765 ; Directory where the temporar
```

3 - Enable the extensions listed below, by uncommenting them (Remove the semicolon `;` at beginning of line).

Default Extensions

- extension=bz2
- extension=curl
- extension=gd2
- extension=gettext
- extension=imap
- extension=ldap
- extension=fileinfo
- extension=mbstring
- extension=openssl
- extension=exif
- extension=xsl
- extension=soap

Database Extensions:

Extensions	Driver enabled in Scriptcase
<code>extension=mysqli</code>	MySQLi
<code>extension=odbc</code>	DB2 ODBC GENERIC, DB2 ODBC GENERIC 6, Generic ODBC, MS Access ODBC, MS SQL Server ODBC, Oracle ODBC, Progress
<code>extension=pdo_mysql</code>	MySQL PDO
<code>extension=pdo_odbc</code>	DB2 PDO ODBC, Progress PDO ODBC, Sybase PDO ODBC
<code>extension=pdo_pgsql</code>	PostgreSQL PDO
<code>extension=pdo_sqlite</code>	SQLite PDO
<code>extension=pgsql</code>	PostgreSQL 6.3 or below, PostgreSQL 6.4 or above, PostgreSQL 7 ou Acima

NOTE: Some database extensions will depend on third party drivers to be enabled. Click [here](#) to access configuration instructions for your desired database.

4 - Set the recommended minimum value of these PHP directives listed below for Scriptcase to work properly. Search for the directives and assign the value according to this example:

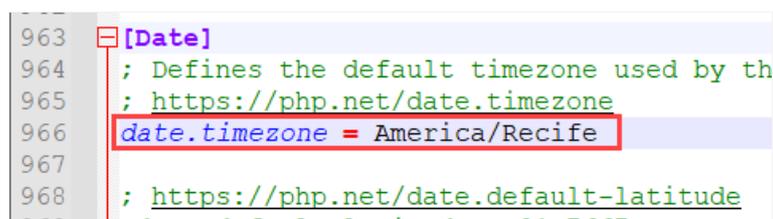

- `max_execution_time = 3600`
- `max_input_time = 3600`
- `max_input_vars = 10000`
- `memory_limit = 1024M`
- `post_max_size = 1024M`
- `upload_max_filesize = 1024M`
- `max_file_uploads = 200`
- `short_open_tag = On`

IMPORTANT: By default PHP can disable some functions that are important for Scriptcase to function properly. Search for the `disable_functions` directive and make sure it is as follows: `disable_functions=` . Click [here](#) to access the list of functions required for Scriptcase to function properly.

5 - Set up PHP **TimeZone** according to your region. You must use the value available in [PHP documentation](#). Search for the `date.timezone` line, uncomment it and edit it according to the selected TimeZone:

Example:

```
date.timezone = America/Recife
```

```

963 [Date]
964 ; Defines the default timezone used by th
965 ; https://php.net/date.timezone
966 date.timezone = America/Recife
967
968 ; https://php.net/date.default-latitude

```

6 - Set the folder where temporary files will be stored. Search for the `session.save_path` line, uncomment it, and enter the path to your temporary folder.

Example:

```
session.save_path = "C:\Windows\Temp"
```

```

1348 ;     session.save_path = "N;MODE;/path"
1349 ;
1350 ; where MODE is the octal representation of
1351 ; does not overwrite the process's umask.
1352 ; https://php.net/session.save-path
1353 session.save_path = "C:\Windows\Temp"
1354
1355 ; Whether to use strict session mode.
1356 ; Strict session mode does not accept an un

```

7 - Save all changes made to the `php.ini` file.

8 - Restart the Apache service using the Command Prompt (CMD) with Administrator privileges the following command:

```
C:\Apache24\bin\httpd.exe -k restart
```

```

Administrador: Prompt de Comando
Microsoft Windows [versão 10.0.18363.476]
(c) 2019 Microsoft Corporation. Todos os direitos reservados.
C:\WINDOWS\system32>C:\Apache24\bin\httpd.exe -k restart
C:\WINDOWS\system32>_

```

9 - Verify changes made through the `info.php` file. You need to create this file and place it in the `C:\Apache24\htdocs` directory with the following content:

```

<?php
    phpinfo();
?>

```

After this, check the generated page in your browser by going to the URL `127.0.0.1/info.php`.

127.0.0.1/info.php

PHP Version 8.1.9 ←

System	Windows NT NETMAKE-A
Build Date	Aug 2 2022 14:14:30
Build System	Microsoft Windows Server
Compiler	Visual C++ 2019
Architecture	x64

NOTE: For more information about the `phpinfo()` function, check the [documentation](#) do PHP.

Enabling the SourceGuardian Loader

Before you start the Scriptcase installation, you need to enable the loader responsible for encrypting Scriptcase in PHP. Follow the steps below to perform this action successfully.

1 - Extract the **SourceGuardian Loader** file downloaded at the beginning of this documentation.

If you haven't downloaded it yet [click here](#) and download the file according to the architecture used.

2 - Copy the `ixed.8.1.win` file and paste it into the PHP extensions directory `C:\php\ext`.

ixed.8.1.win	16/08/2022 10:09
php_bz2.dll	02/08/2022 11:48
php_com_dotnet.dll	02/08/2022 11:48
php_curl.dll	02/08/2022 11:48

3 - Edit the **php.ini** file and below the last line enter the path to the extension within the `zend_extension` parameter:

Example:

```
[SourceGuardian] zend_extension=C:\php\ext\ixed.8.1.win
```

```

1945 ;ffi.enable=preload
1946
1947 ; List of headers files to preload, wildcard patterns allowed.
1948 ;ffi.preload=
1949
1950 [SourceGuardian] zend_extension=C:\php\ext\ixed.8.1.win

```

4 - Restart the Apache service using the Command Prompt (**CMD**) with Administrator privileges the following command:

```
C:\Apache24\bin\httpd.exe -k restart
```

```

Administrador: Prompt de Comando
Microsoft Windows [versão 10.0.18363.476]
(c) 2019 Microsoft Corporation. Todos os direitos reservados.
C:\WINDOWS\system32>C:\Apache24\bin\httpd.exe -k restart
C:\WINDOWS\system32>_

```

Manual Scriptcase Installation

Listed below are the steps needed to do a Scriptcase manual installation. **To do the steps, it is needed that you have a web server configured in your machine.**

1 - Download the Scriptcase (.zip) directly from the [download page](#) from our website.

2 - Extract the .zip file and rename the extracted folder to `scriptcase`.

3 - Move the `scriptcase` to your server root. **Depending of your operating system and the installation the path can be different from the example.** However, by default the paths are:

Windows	Server
C:\Apache24\htdocs\	Apache
C:\inetpub\wwwroot\	IIS

Linux	Server
<code>/var/www/html/</code>	Linux Local
<code>/home/\$(whoami)/public_html/</code>	Linux Server

macOS	Server
<code>/Library/WebServer/Documents</code>	Apache

4 - Access the Scriptcase using your browser:

`127.0.0.1/scriptcase`

- By default the selected language is English.

Installation :: Initiating

STEPS	
Initiating	<p>Welcome to ScriptCase!</p> <p>This wizard will guide you in the installation and configuration process of ScriptCase. You will, step by step, be guided on all the stages necessary to adjust its environment to run the tool correctly.</p> <p>Select the language that will be used during this installation</p> <div style="border: 1px solid #ccc; padding: 2px; display: inline-block;">English ▼</div>

5 - Check the extensions required for Scriptcase to function and database connection modules that are enabled.

Check if the necessary PHP extensions are loaded.

Required Extensions.		Action.
✓	GD This extension is used to create charts and manipulate images	
✓	MBSTRING This extension is used to convert special chars	
✓	SimpleXML The SimpleXML extension provides a very simple and easily usable toolset to convert XML to an object that can be processed with normal property selectors and array iterators.	
✓	ZIP This extension is used to create and extract files from a ZIP archive	
✓	ZLIB This extension is used to extract files from a ZIP archive	
✓	JSON This extension implements the data interchange format JavaScript Object Notation (JSON).	

Database Extensions.		Action.
✓	com_dotnet Generic ADO, MS Access ADO, MS SQL Server ADO	
✗	ibm_db2 DB2, DB2 ODBC NATIVE	Enable.
✓	interbase Firebird, Interbase 6, Interbase 6.5	
✗	mssql MS SQL Server 7	Enable.
✗	mysql MaxSQL, MySQL (Non-Transactional), MySQL (Transactional)	Enable.
✓	mysqli MySQLi	
✓	oci8 Oracle 8, Oracle 8 Portable, Oracle 8.0.5	
✓	odbc DB2 ODBC GENERIC, DB2 ODBC GENERIC 6, Generic ODBC, MS Access ODBC, MS SQL Server ODBC, Oracle ODBC, Progress	
✗	oracle Oracle 7	Enable.
✓	pdo_dblib Sybase PDO DBLIB	
✓	pdo_firebird Firebird PDO	
✗	pdo_ibm PDO IBM	Enable.
✗	pdo_informix Informix PDO	Enable.

Typical Installation

Check the steps below to complete the manual installation of Scriptcase in a typical way.

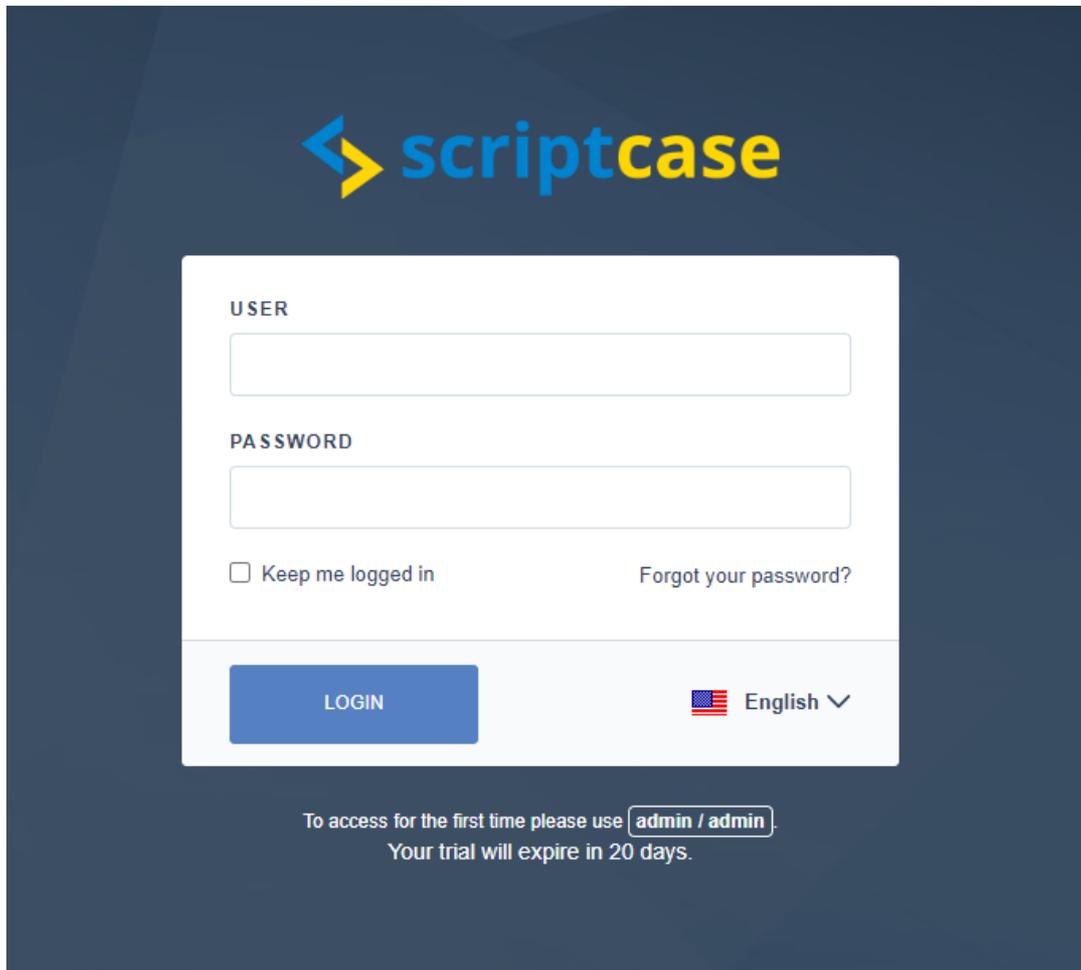

NOTE: By selecting this installation, Scriptcase will set your environment by default. Defining the installation database and the login user in Scriptcase.

Typical Installation:
Scriptcase will install everything automatically.

Customized Installation:
You could choose on which database you wish to install ScriptCase and the default username and password to access it.

[Next](#)

After clicking proceed, you will be redirected to the Scriptcase Login page.

This option keeps the user logged in until they log out through the Scriptcase interface.

Forgot your password?

By clicking this option, it is possible to recover the password of the informed user. An email will be sent to the user in question so they can access the recovery steps.

Important: You can only perform password recovery if you have configured your SMTP information. To access our documentation showing how to perform this configuration click [here](#).

Installing PHP 8.1 - Linux

This documentation will teach all the steps necessary for the installation of the PHP 8.1, Apache 2.4 and the Scriptcase using the manual installation in the Linux environment. **Doing this kind of installation you will be responsible for configuring all your environment settings and the database extensions as well.**

Listed below are the operational systems approved for the Scriptcase usage. **Only these distributions below and their derivatives are approved for the Scriptcase installation.**

Check the list of the supported operating systems:

- RedHat
- Debian\Ubuntu
- Suse\OpenSuse

NOTE: In case you need to make a manual installation of the Scriptcase using **PHP 7.3** in Linux, access the documentation in our [knowledge base](#).

Prerequisites

WARNING: If you already have a Web Server with Apache and PHP 8.1 configured, just go to the [SourceGuardian](#) configuration and proceed to manual installation.

To proceed with the installation, you will need to download some files.

Necessaries Files:

- SourceGuardian for **Linux (x86 ou x64):** [Click Here](#)
- Scriptcase (**.zip**): [Click Here](#)

NOTE: Before continue with the installation is recommended that you do not have any other web environment (as XAMP, Zend Server, etc) installed in your operational system. **It is recommended to know Linux/Unix environment to use the terminal.**

Configuring the PHP - Ubuntu 22.04\Debian 10

Listed below are the necessaries commands for the manual installation of the PHP in the Ubuntu 22.04 or Debian 10. Check correctly the name of the packages in your terminal.

1 - Before run any other command, update your operating system with the following commands:

```
sudo apt-get update
sudo apt-get upgrade
```

2 - Run the command `sudo apt-get install php8.1` to install the PHP 8.1. After that, accept the dependencies installation.

If you are using any Ubuntu version before 19.10, it's necessary to add a repository in your operating system to access the PHP 8.1 packages. See how you can do it below:

```
sudo add-apt-repository ppa:ondrej/php
sudo apt-get update
```

If you are using any Debian version before Debian 10, it's necessary to add a repository in your operating system to access the PHP 8.1 packages. See how you can do it below:

```
sudo apt -y install lsb-release apt-transport-https ca-certificates
sudo wget -O /etc/apt/trusted.gpg.d/php.gpg https://packages.sury.org/php/apt.gpg
echo "deb https://packages.sury.org/php/ $(lsb_release -sc) main" | sudo tee /etc/apt/sources.list.d/php8.1.list
```

```
sudo apt-get update
```

```
sudo apt-get install php8.1
```

Example:

```
netmake@netmake-Vostro-3560:~$ sudo apt-get install php8.1
Lendo listas de pacotes... Pronto
Construindo árvore de dependências
Lendo informação de estado... Pronto
Os pacotes adicionais seguintes serão instalados:
  apache2 apache2-bin apache2-data apache2-utils libapache2-mod-php8.1 libapr1 libaprutil1 libaprutil1-dbd-sqlite3
  libaprutil1-ldap liblua5.2-0 php-common php8.1-cli php8.1-common php8.1-opcache php8.1-readline
Pacotes sugeridos:
  apache2-doc apache2-suexec-pristine | apache2-suexec-custom php-pear
Os NOVOS pacotes a seguir serão instalados:
  apache2 apache2-bin apache2-data apache2-utils libapache2-mod-php8.1 libapr1 libaprutil1 libaprutil1-dbd-sqlite3
  libaprutil1-ldap liblua5.2-0 php-common php8.1 php8.1-cli php8.1-common php8.1-opcache php8.1-readline
0 pacotes atualizados, 16 pacotes novos instalados, 0 a serem removidos e 0 não atualizados.
É preciso baixar 0 B/6.586 kB de arquivos.
Depois desta operação, 29,3 MB adicionais de espaço em disco serão usados.
Você quer continuar? [S/n] S
```

3 - Check the PHP version running the command: `php -v`

Example:

```
netmake@netmake-Vostro-3560:~$ php -v
PHP 8.1.8 (cli) (built: Jul 11 2022 08:29:57) (NTS)
Copyright (c) The PHP Group
Zend Engine v4.1.8, Copyright (c) Zend Technologies
with Zend OPcache v8.1.8, Copyright (c), by Zend Technologies
```

4 - Now, install all the extensions below that are required by Scriptcase:

Default Extensions:

- `sudo apt-get install php8.1-curl`
- `sudo apt-get install php8.1-gd`
- `sudo apt-get install php8.1-bcmath`
- `sudo apt-get install php8.1-cgi`
- `sudo apt-get install php8.1-ldap`
- `sudo apt-get install php8.1-mbstring`
- `sudo apt-get install php8.1-xml`
- `sudo apt-get install php8.1-soap`
- `sudo apt-get install php8.1-xsl`
- `sudo apt-get install php8.1-zip`

Database Extensions:

Extension	Driver enabled in Scriptcase
<code>sudo apt-get install php8.1-pgsql</code>	PostgreSQL PDO, PostgreSQL 6.3 or below, PostgreSQL 6.4 or above, PostgreSQL 7 or above
<code>sudo apt-get install php8.1-mysql</code>	MySQLi, MySQL PDO
<code>sudo apt-get install php8.1-sqlite3</code>	SQLite PDO
<code>sudo apt-get install php8.1-interbase</code>	Firebird, Interbase 6, Interbase 6.5, Firebird PDO
<code>sudo apt-get install php8.1-odbc</code>	DB2 ODBC GENERIC, DB2 ODBC GENERIC 6, Generic ODBC, MS Access ODBC, Oracle ODBC, Progress, DB2 PDO ODBC, Progress PDO ODBC, Sybase PDO ODBC
<code>sudo apt-get install php8.1-sybase</code>	DBLIB, Sybase PDO DBLIB

NOTE: Some database extensions will depend on third party drivers to be enabled. Click [here](#) to access the setup instructions for your database.

5 - Access the **php.ini** file in the directory `/etc/php/8.1/apache2/` and set the recommended values for the PHP directives listed below required by the Scriptcase.

Search for theses directives and set the values as the example:

- `max_execution_time = 3600`
- `max_input_time = 3600`
- `max_input_vars = 10000`
- `memory_limit = 1024M`
- `post_max_size = 1024M`
- `upload_max_filesize = 1024M`
- `max_file_uploads = 200`
- `short_open_tag = On`

6 - By default, the PHP disable some functions that are required by the Scriptcase. Click [here](#) to access the list of these functions.

- Change the line **disable_functions** as the example below:

```
disable_functions =
```

Example:

```
; This directive allows you to disable certain functions for security reasons.
; It receives a comma-delimited list of function names.
; http://php.net/disable-functions
disable_functions =
```

7 - Set up the PHP **TimeZone** according your region. Must use the values available in the PHP [documentation](#). Search for the line **date.timezone** in your **php.ini**, uncomment and edit according with the TimeZone selected.

Example:

```
date.timezone = America/Recife
```

8 - Set up the folders that will store the temporary files. Search for the line `;session.save_path` , uncomment and set the path to your temporary folder.

Example:

```
session.save_path = "/tmp"
```

9 - **Save all the changes made** and restart the Apache service using the following command:

```
sudo service apache2 restart
```

10 - Check if the changes were made using the file **info.php**. You will need to create this file and place it in the `/var/www/html/` path with the following content.

```
<?php
```

```
phpinfo();
```

```
?>
```

After that, check using your browser the page generated accessing the URL `127.0.0.1/info.php` .

NOTE: For more information about the `phpinfo()`, check the PHP [documentation](#).

Enabling the SourceGuardian

Before starting the Scriptcase installation, you need to enable the loader used for the Scriptcase encryption in your PHP. Follow the steps below showing how to do it.

1 - Access the Downloads folder and extract the file downloaded referent to the **SourceGuardian** at the [beginning](#) of this documentation.

Example:

```
cd /home/User/Downloads
```

```
sudo chmod 777 loaders.linux-x86_64.zip && unzip loaders.linux-x86_64.zip
```

2 - Copy the file **ixed.8.1.lin** and past in the **extension_dir** directory of your PHP. We will use the path `/usr/lib/php/20210902` for this example.

Example:

```
Ubuntu 22.04\Debian 10
```

```
/usr/lib/php/20180731
```

```
sudo cp ixed.8.1.lin /usr/lib/php/20210902
```

3 - Edit the **php.ini** file and below the last line set the path to the extension in the `zend_extension` parameter:

Example:

```
zend_extension = "/usr/lib/php/20210902/ixed.8.1.lin"
```

Ubuntu 22.04\Debian 10

`/etc/php/8.1/apache2/`

```
sudo nano /etc/php/8.1/apache2/php.ini
```

```
zend_extension = "/usr/lib/php/20210902/ixed.8.1.lin"
```

4 - Restart the Apache service using the following command:

Ubuntu 22.04\Debian 10

```
sudo service apache2
restart
```

```
sudo systemctl restart httpd
```

Scriptcase Manual Installation

Listed below are the steps needed to do a Scriptcase manual installation. **To do the steps, it is needed that you have a web server configured in your machine.**

1 - Download the Scriptcase (.zip) directly from the [download page](#) from our website.

2 - Extract the .zip file and rename the extracted folder to `scriptcase`.

3 - Move the **scriptcase** to your server root. **Depending of your operating system and the installation the path can be different from the example.** However, by default the paths are:

Windows	Server
<code>C:\Apache24\htdocs\</code>	Apache
<code>C:\inetpub\wwwroot\</code>	IIS

Linux	Server
<code>/var/www/html/</code>	Linux Local
<code>/home/\${whoami}/public_html/</code>	Linux Server

macOS	Server
<code>/Library/WebServer/Documents</code>	Apache

4 - Access the Scriptcase using your browser:

- By default the selected language is English.

Installation :: Initiating

✘	pdo_informix Informix PDO	Enable.

Typical Installation

Check the steps below to complete the manual installation of Scriptcase in a typical way.

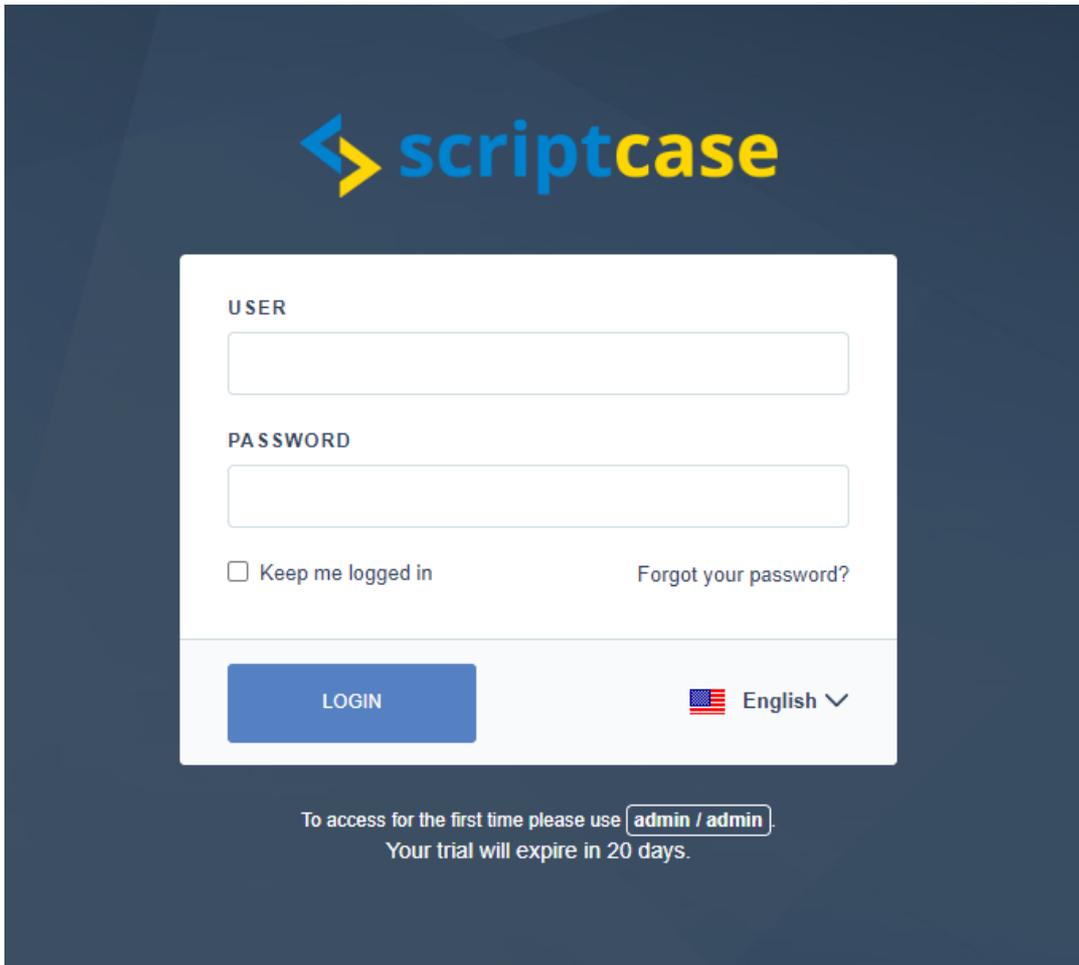

NOTE: By selecting this installation, Scriptcase will set your environment by default. Defining the installation database and the login user in Scriptcase.

Typical Installation:
Scriptcase will install everything automatically.

Customized Installation:
You could choose on which database you wish to install ScriptCase and the default username and password to access it.

[Next](#)

After clicking proceed, you will be redirected to the Scriptcase Login page.

The image shows the Scriptcase login page. At the top, there is the Scriptcase logo, which consists of a blue and yellow arrow pointing right, followed by the word "scriptcase" in a blue, lowercase, sans-serif font. Below the logo is a white login form with a dark blue background. The form has two input fields: "USER" and "PASSWORD". Below the "PASSWORD" field, there is a checkbox labeled "Keep me logged in" and a link labeled "Forgot your password?". At the bottom of the form, there is a blue "LOGIN" button and a language selector showing "English" with a dropdown arrow. Below the form, there is a message: "To access for the first time please use `admin / admin`. Your trial will expire in 20 days."

User

In this field, it is necessary to inform the user to login to Scriptcase. By default, the user is **admin**.

Password

In this field, you must enter the password to login to Scriptcase. By default, the password is **admin**.

Keep me connected

This option keeps the user logged in until they log out through the Scriptcase interface.

Forgot your password?

By clicking this option, it is possible to recover the password of the informed user. An email will be sent to the user in question so they can access the recovery steps.

Important: You can only perform password recovery if you have configured your SMTP information. To access our documentation showing how to perform this configuration click [here](#).

Customized Installation

Check the steps below to complete the manual installation of Scriptcase in a custom manner.

NOTE: By selecting this installation, you will be responsible for setting up your environment. Defining the installation database and the login user for Scriptcase.

Typical Installation:
Scriptcase will install everything automatically.

Important: You can only perform password recovery if you have configured your SMTP information. To access our documentation showing how to perform this configuration click [here](#).

Do you need to register your Scriptcase?

You can access our [knowledge base](#) to understand all the steps to register the Scriptcase serial.

Installing PHP 8.1 - macOS

This documentation will cover how installing PHP 8.1 and ScriptCase manually on macOS. **Performing this type of installation is your responsible for configuring your entire environment as well as database extensions.**

Listed below are versions of macOS approved for use by Scriptcase.

Compatibility Table

Scriptcase Automatic Installer is compatible with the following macOS versions

Version	Codename
macOS 15.0	"Sequoia"
macOS 14.2	"Sonoma"
macOS 13.0	"Ventura"
macOS 12.0	"Monterey"
macOS 11.0	"Big Sur"
macOS 10.15	"Catalina"
macOS v10.14	"Mojave"
macOS v10.13	"High Sierra"
macOS v10.12	"Sierra"
OS X v10.11	"El Capitan"

You can install the Scriptcase with PHP 7.3 or PHP 7.0:

[See how to install with PHP 7.3](#)

[See how to install with PHP 7.0](#)

Requirements

If you already have a Web Server with Apache and PHP 8.1 configured, just go to the [SourceGuardia](#) configuration and proceed to manual installation.

To proceed with the installation, you need to download some files.

Required Files:

- SourceGuardian Loader 13.0.3 for macOS - macOS: [Click here](#)
- Scriptcase (.zip): [Click here](#)

Before proceeding with the installation it is recommended not to have any other web environments (such as XAMP, Zend Server, etc.) installed on the operating system. **Knowledge of Unix environment is recommended to use terminal.**

PHP configuration

Listed below are the commands required for the manual installation of PHP 8.1 on macOS. Check the package naming on your macOS terminal correctly.

1 - You'll need to install **Homebrew** to be able to access PHP 8.1 and other packages. Install **Brew** with the following commands in the macOS terminal:

```
/bin/bash -c "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/HEAD/install.sh)"
```

2 - In the macOS terminal, execute `brew update` to update **Brew**.

3 - Use the command `brew install shivammathur/php@8.1` for installing PHP 8.1.

4 - After the installation process completes, execute `brew info php@8.1` to get the information that we need to proceed with environment setting up.

```
php: stable 8.1.9 (bottled), HEAD
General-purpose scripting language
https://www.php.net/
/opt/homebrew/Cellar/php/8.1.9 (513 files, 81.7MB) *
  Poured from bottle on 2022-08-17 at 09:01:50

krb5 ✔, libpq ✔, libsodium ✔, libzip ✔, oniguruma ✔, openldap ✔, openssl@1.1 ✔, pcre2 ✔, sqlite ✔, tidy-html5 ✔,
unixodbc ✔
==> Options
--HEAD
  Install HEAD version
==> Caveats
To enable PHP in Apache add the following to httpd.conf and restart Apache:
  LoadModule php_module /opt/homebrew/opt/php/lib/httpd/modules/libphp.so

  <FilesMatch \.php$>
    SetHandler application/x-httpd-php
  </FilesMatch>

Finally, check DirectoryIndex includes index.php
  DirectoryIndex index.php index.html

The php.ini and php-fpm.ini file can be found in:
  /opt/homebrew/etc/php/8.1/
```

5 - You need to configure Apache so that PHP 8.1 that was installed in the previous steps will be used as default on your system.

To use PHP on MacOS native Apache, we will need to create a certificate that authorizes its use. Until Monterey this process was optional, but now PHP Code Signed is required. Follow this post to do the [code signing](#)

5.1 - Edit the Apache file `httpd.conf`, find the “**Loadmodule**” line block and add the line according to your equipment:

Exemple:

```
sudo nano /etc/apache2/httpd.conf
```

Chip Intel

```
LoadModule php_module /usr/local/opt/php@8.1/lib/httpd/modules/libphp.so
```

Chip da Apple

```
LoadModule php_module/opt/homebrew/opt/php@8.1/lib/httpd/modules/libphp.so
```

At the end of the file add:

```
<FilesMatch .php$>
SetHandler application/x-httpd-php
</FilesMatch>
```

6 - Add path to PHP 8.1 module installed after last line `LoadModule` in `httpd.conf`.

Example:

```
LoadModule php_module /usr/local/opt/php@8.1/lib/httpd/modules/libphp.so
```

```
LoadModule ssl_module libexec/apache2/mod_ssl.so
#LoadModule rewrite_module libexec/apache2/mod_rewrite.so
#PHP was deprecated in macOS 11 and removed from macOS 12
#LoadModule perl_module libexec/apache2/mod_perl.so
LoadModule hfs_apple_module libexec/apache2/mod_hfs_apple.so
LoadModule php_module /opt/homebrew/opt/php@8.1/lib/httpd/modules/libphp.so "PHP 81"
```

After performing this action, save the file and restart the apache service.

```
sudo apachectl restart
```

7 - Add the path to the installation of PHP 8.1 in the `~/.zshrc` file with the following commands:

```
echo 'export PATH="/opt/homebrew/opt/php@8.1/bin:$PATH"' >> ~/.zshrc
echo 'export PATH="/opt/homebrew/opt/php@8.1/sbin:$PATH"' >> ~/.zshrc
```

8 - Edit the file `~/.bash_profile` and add PHP 8.1 path with these following commands:

```
echo 'export PATH="/opt/homebrew/opt/php@8.1/bin:$PATH"'
```

9 - Verify PHP version by running command: `php -v`

Example:

```
gascriptcase@MacBook-Air-de-scriptcase ~ % php -v
PHP 8.1.9 (cli) (built: Aug 4 2022 05:22:38) (NTS)
Copyright (c) The PHP Group
Zend Engine v4.1.9, Copyright (c) Zend Technologies
with Zend OPcache v8.1.9, Copyright (c), by Zend Technologies
```

10 - Access the `php.ini` file in the directory. `/opt/homebrew/etc/php/8.1/` and set the recommended minimum value correctly of these PHP directives listed below for Scriptcase work properly.

Search for the directives and assign the value according to this example:

- `max_execution_time = 3600`
- `max_input_time = 3600`
- `max_input_vars = 10000`
- `memory_limit = 1024M`
- `post_max_size = 1024M`
- `upload_max_filesize = 1024M`
- `max_file_uploads = 200`
- `short_open_tag = On`

11 - By default, PHP disables some functions that are important to Scriptcase. Click [here](#) to access the necessary functions list for ScriptCase

- Change item line `disable_functions` as example below:

```
disable_functions =
```

Example:

```
; This directive allows you to disable certain functions for security reasons.
; It receives a comma-delimited list of function names.
; http://php.net/disable-functions
disable_functions =
```

12 - Set PHP **TimeZone** according to your region. Use the value available in the PHP [documentation](#). Search for **date.timezone** in your **php.ini** file, uncomment it and edit according to the selected TimeZone.

Example:

```
date.timezone = America/Recife
```

13 - Set the folder where temporary files will be stored. search for `session.save_path`, uncomment it and inform your temporary folder path.

Example:

```
session.save_path = "/tmp"
```

14 - **Save all modifications made** and restart the Apache service using the following command in terminal:

```
sudo apachectl restart
```

15 - Verify changes made through the file **info.php**. You need to create this file and put it in the directory `/Library/WebServer/Documents/` with the following content:

```
<?php
phpinfo();
?>
```

After that, check in your browser the page generated by accessing the URL `127.0.0.1/info.php`.

PHP Version 7.3.12	
System	Darwin Mac-mini-de-Netmake.local 19.0.0 root:xnu-6153.11.26~2/RELEASE_ARM86_6
Build Date	Nov 29 2019 20:06:07
Configure Command	'./configure' '--prefix=/usr/local/Cellar/php@ sysconfdir=/usr/local/etc/php/7.3' '--with-cc

NOTE: For more information about the function **phpinfo()**, verify our PHP [documentation](#).

Enable SourceGuardian Loader

Before you start installing Scriptcase, you need to enable the loader responsible for encrypting Scriptcase in PHP. Follow the steps below to perform this action successfully.

1 - Access the Downloads folder and extract the downloaded file referring to **SourceGuardian Loader** at the beginning of this documentation.

If you have not yet downloaded the SourceGuardian Loader [click here](#) and download the file according to the architecture used.

Exemple:

```
cd /Users/usuario/Downloads
```

```
sudo chmod 777 loaders.macosx-arm64.zip && unzip loaders.macosx-arm64.zip
```

```
cd loaders.macosx-arm64
```

2 - Copy the file **ixed.8.1.dar** and paste it into your PHP **extension_dir** directory. We'll use `/opt/homebrew/lib/php/pecl/20210902` for this example.

Exemple:

```
sudo cp ixed.8.1.dar /opt/homebrew/lib/php/pecl/20210902
```

3 - Edit the **php.ini** file and below the last line enter the path to the extension within the parameter **zend_extension** :

Exemple:

```
sudo bash -c 'echo "zend_extension=/opt/homebrew/lib/php/pecl/20210902/ixed.8.1.dar" > /opt/homebrew/etc/php/8.1/conf.d/sourceguardian.ini'
```

4 - Restart the Apache service with the following terminal command:

```
sudo apachectl restart
```

Manual ScriptCase installation

Listed below are the steps needed to do a Scriptcase manual installation. **To do the steps, it is needed that you have a web server configured in your machine.**

1 - Download the Scriptcase (**.zip**) directly from the [download page](#) from our website.

2 - Extract the **.zip** file and rename the extracted folder to **scriptcase** .

3 - Move the **scriptcase** to your server root. **Depending of your operating system and the installation the path can be different from the example.** However, by default the paths are:

Windows	Server
C:\Apache24\htdocs\	Apache
C:\inetpub\wwwroot\	IIS

Linux	Server
/var/www/html/	Linux Local
/home/\${whoami}/public_html/	Linux Server

macOS	Server
/Library/WebServer/Documents	Apache

4 - Access the Scriptcase using your browser:

```
127.0.0.1/scriptcase
```

- **By default the selected language is English.**

Finishing	

Login

In this option, you will enter the default Scriptcase User Login.

Password

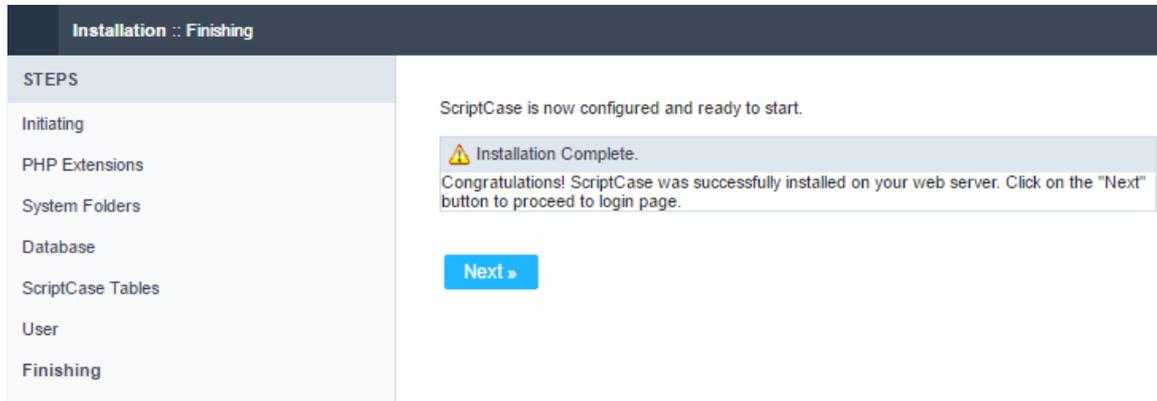

In this option, you must enter the password that will correspond to the user informed.

Confirmation

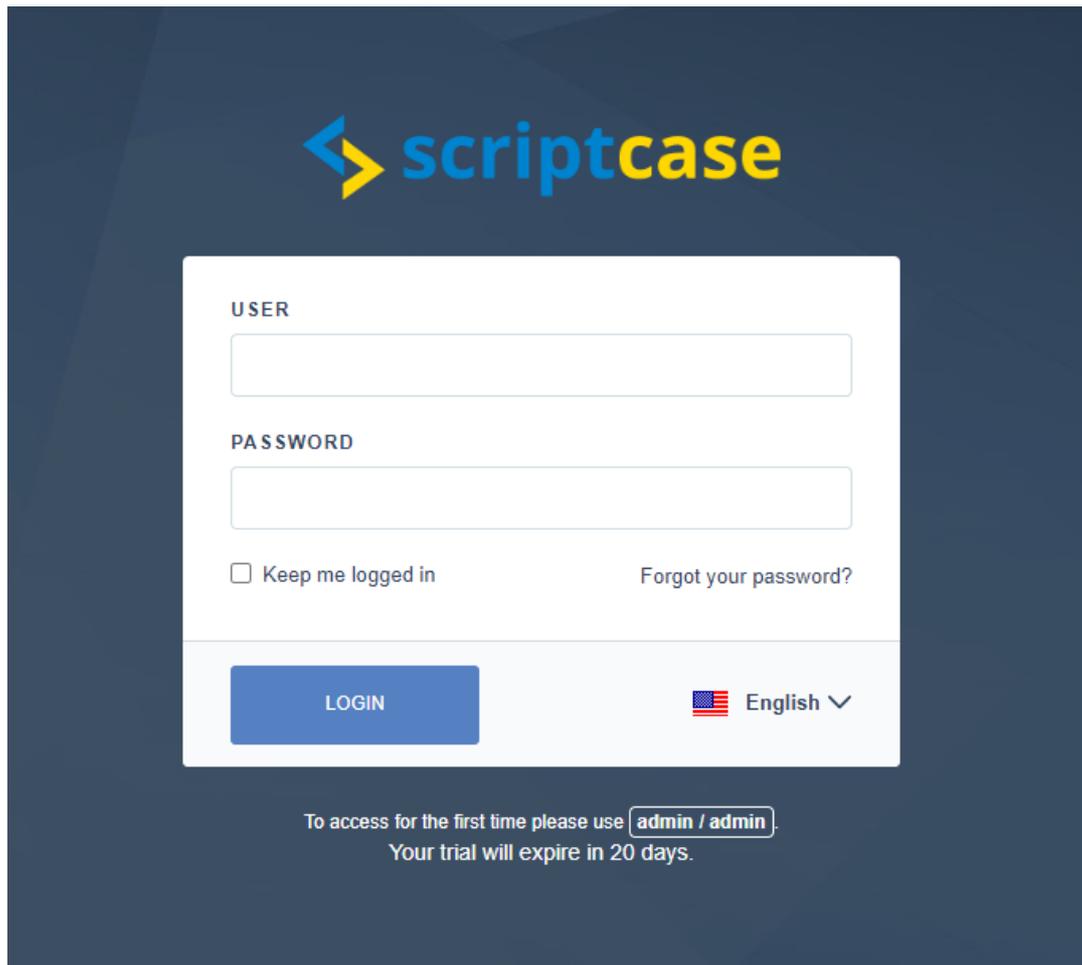

You must repeat the previously entered password for successful user creation.

Click proceed to proceed with the installation process.

5 - Complete Scriptcase custom installation on your web server.

After clicking proceed, you will be redirected to the Scriptcase Login page.

User

In this field, it is necessary to inform the user to login to Scriptcase. By default, the user is **admin**.

Password

In this field, you must enter the password to login to Scriptcase. By default, the password is **admin**.

Keep me connected

This option keeps the user logged in until they log out through the Scriptcase interface.

Forgot your password?

By clicking this option, it is possible to recover the password of the informed user. An email will be sent to the user in question so they can access the recovery steps.

Important: You can only perform password recovery if you have configured your SMTP information. To access our documentation showing how to perform this configuration click [here](#).

Needing register your ScriptCase?

VYou can access our [knowledge base](#) to understand all the steps for registering Scriptcase license.

Scriptcase Manual Installation

Listed below are the steps needed to do a Scriptcase manual installation. **To do the steps, it is needed that you have a web server configured in your machine.**

- 1 - Download the Scriptcase (.zip) directly from the [download page](#) from our website.
- 2 - Extract the .zip file and rename the extracted folder to `scriptcase`.
- 3 - Move the `scriptcase` to your server root. **Depending of your operating system and the installation the path can be different from the example.** However, by default the paths are:

Windows	Server
<code>C:\Apache24\htdocs\</code>	Apache
<code>C:\inetpub\wwwroot\</code>	IIS

Linux	Server
<code>/var/www/html/</code>	Linux Local
<code>/home/\$(whoami)/public_html/</code>	Linux Server

macOS	Server
<code>/Library/WebServer/Documents</code>	Apache

- 4 - Access the Scriptcase using your browser:

`127.0.0.1/scriptcase`

- **By default the selected language is English.**

Installation :: Initiating

STEPS	
Initiating	<p>Welcome to ScriptCase!</p> <p>This wizard will guide you in the installation and configuration process of ScriptCase. You will, step by step, be guided on all the stages necessary to adjust its environment to run the tool correctly.</p> <p>Select the language that will be used during this installation</p> <div style="border: 1px solid #ccc; padding: 2px; display: inline-block;">English ▼</div> <p style="text-align: center; margin-top: 10px;">Next ></p>

Need to register your Scriptcase?

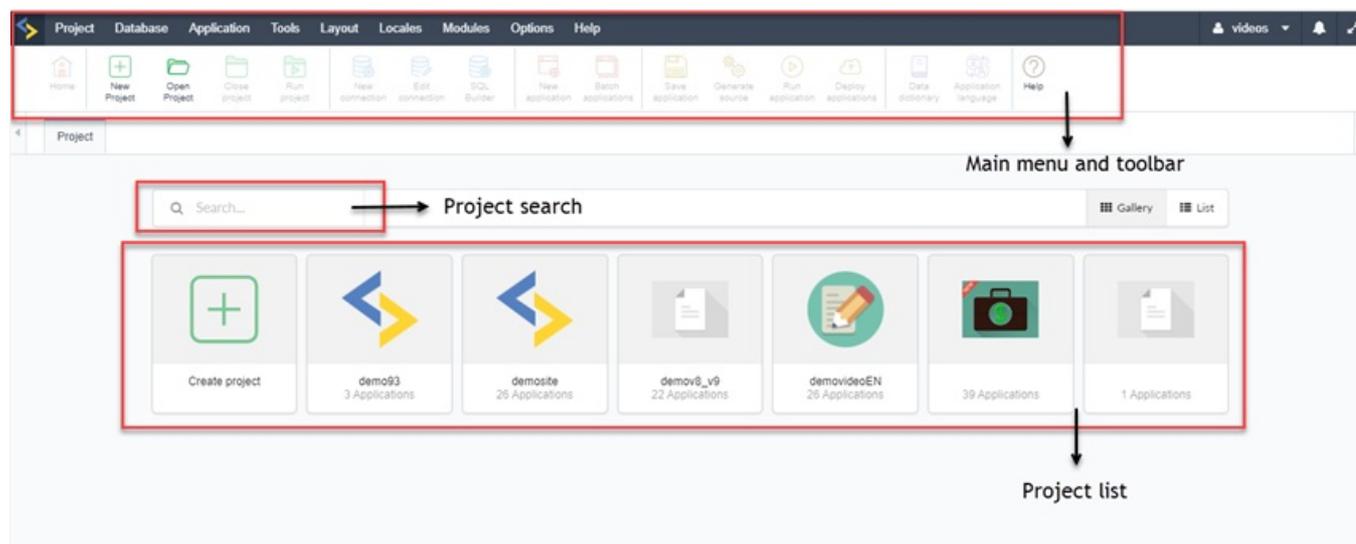

You can access our [knowledge base](#) to understand all the steps for registering a Scriptcase license.

Scriptcase Interface Overview

In this article, we present to you the main options from Scriptcase's interface. There are two important screens: project dashboard and applications management interface.

Project Dashboard

The project dash is the first interface you will see once you log into Scriptcase. It's where you start a new project or select an existing project for editing.

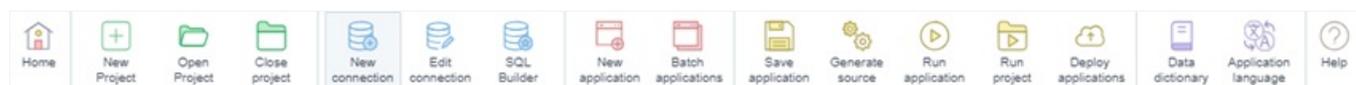

Main Menu

The main menu contains both Scriptcase's and project's general settings, and it is available at the top of the page. Most of the options are related to the project settings and are not available before the project creation.

Toolbar

The toolbar is displayed right below the main menu, where you can find the most frequent used functions used. The toolbar is customizable, and you can create new functions as well as edit the current ones. Learn more about the toolbar by clicking [here](#).

Project List

On this session is displayed a list with all the Scriptcase projects. You can display the project in a gallery or in list (to sort by date, name or creator). You have also a general search option.

	Project	Description	Administrator	Created	Applications
	demo93	Novo Projeto	videos	2019-05-16	3
	demosite	Novo Projeto	videos	2019-05-17	26
	demov8_v9	Novo Projeto	videos	2019-08-16	22
	demovideoEN	New Project	videos	2019-05-24	26
	fbdemo		videos	2017-08-02	39

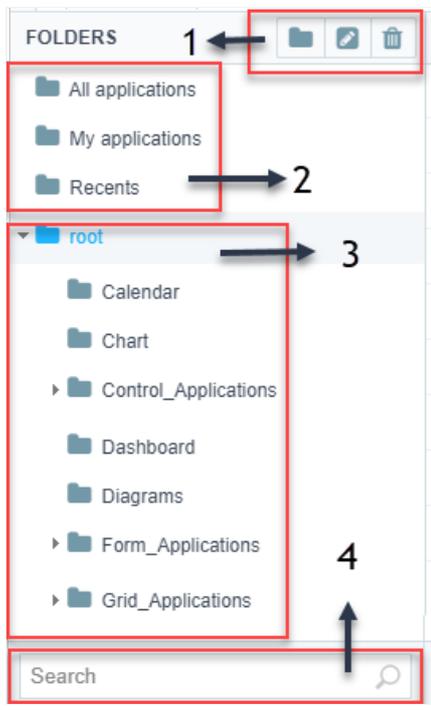

Application management interface

Once you create the project Scriptcase will display the applications management interface, where you can organize all project applications using folders. You are able also to search created applications, sort by date, creator, status, and take some actions such as run, generate, deploy, rename and copy. You can edit one or various applications at a time.

The screenshot displays the Scriptcase application management interface. On the left, the 'Project folders' sidebar shows a tree structure of folders including 'All applications', 'My applications', 'Recents', 'root', 'Calendar', 'Chart', 'Control_Applications', 'Dashboard', 'Diagrams', 'Form_Applications', 'Grid_Applications', 'Internationalization', 'Menu_Applications', 'PDF_Report_Applications', 'Programming', 'Search_Applications', 'Security', and 'Tab_Applications'. The main area, titled 'List of applications', contains a table with the following columns: APPLICATION, FRIENDLY URL, DESCRIPTION, CREATOR, GENERATION, and STATUS. The table lists several applications, including 'login_v9', 'menu', 'calendar01', 'calendar02', 'calendar03', 'calendar05', 'calendar_color_event', 'ctr_login', 'chart05', 'chart06', 'chart_54_1', and 'chart_54_2'. Each application row includes a 'Run Edit Copy Rename' button. At the bottom of the table, there are mass application editing options: Edit, Generate, Deploy, Delete, Copy, Move, and Export.

Project Explorer

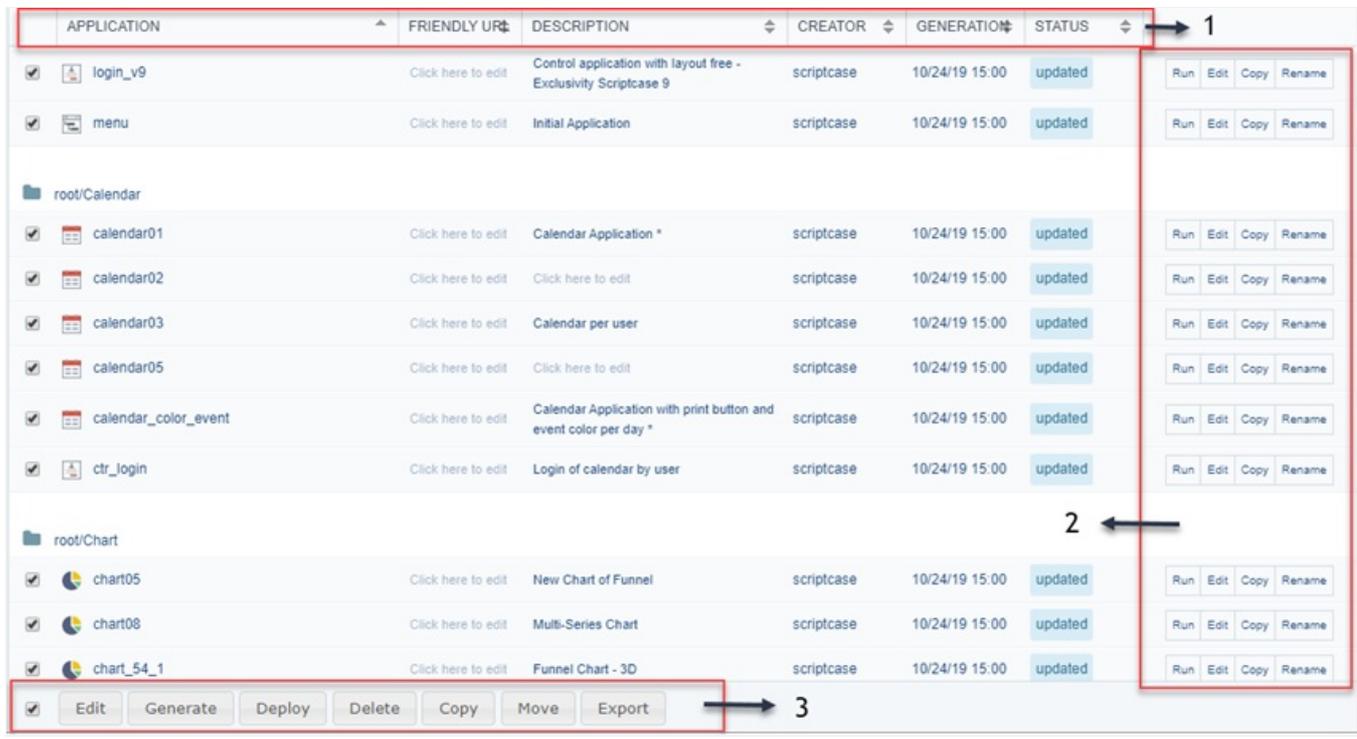

In this session, you can find all the folders created to organize the applications. There's also the folder that contains all the applications of the project in one place.

- 1 - Folders functions;
- 2 - Filters;
- 3 - Folders' structure;
- 4 - Application search.

List of Applications

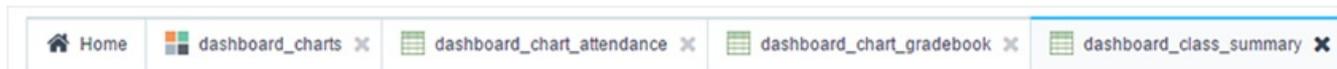

You can view a list of the applications that are in the selected folder in the Project Explorer presented on the left side.

- 1 - Columns;
- 2 - Express options;
- 3 - Footer Options.

Taskbar

This bar holds the tabs of all applications which are open for editing.

Main Menu

The main menu contains both Scriptcase's and project's general settings, and it is available at the top of the page. Most of the options are related to the project settings and are not available before the project creation. See below each item and a resume of its options:

Project

- **New Project:** To create a new project or import one of the system templates.
- **Open Project:** Lists the projects that the user is permitted to access.
- **Close Project:** Closes the current project.
- **Properties:** Allows you to edit some of the project properties such as themes and languages.
- **Default Values:** Allows editing the current project default values.
- **Version History:** Displays a list of project versions.
- **Increment Version:** This option helps you to make the project version control.
- **Export Project:** Allows to export one project at a time, taking all the project's essential content for using in another Scriptcase of the same version.
- **Import Project:** Allows to import a project exported by Scriptcase of the same version.
- **Generate Source Code:** Generates the source code for all applications in the current project.
- **Deploy Applications:** Opens the Publishing Wizard for publishing the applications of the current project.
- **Delete Project:** This option is only available once you are into a project. This option deletes a project.
- **Reports:**
 - **Application List:** Displays the project applications with details of its creation.
 - **Developers Summary:** Displays a summary of the applications and codes created by a developer.
- **Show Diagram:** Displays a complete diagram of the project showing the relationship between the applications.
- **Project Search:** It allows to perform a search for texts in all the project's applications.

Database

- **New Connection:** Allows you to create a connection in the current project.
- **Edit Connection:** Allows you to edit existing connections in the current project.
- **Import ACCESS:** Allows the conversion of an ACCESS data source into a structured database (MySQL, PostgreSQL, SQLite, and SQL Server).
- **Import EXCEL:** Allows the conversion of an EXCEL data source into a structured database (MySQL, PostgreSQL, SQLite, and SQL Server).
- **Import CSV:** Allows the conversion of a CSV data source into a structured database (MySQL, PostgreSQL, SQLite, and SQL Server).
- **SQL Builder:** Tool for creating and executing SQL commands.
- **Database Builder:** Tool for rapidly creating and editing tables in the database.
- **ER Diagram:** Tool that allows the visualization of the relationships between tables of the connected database.

Application

- **New Application:** Create a new application.
- **Batch Applications:** Allows simultaneous creation of Grids and Forms.
- **Restore Applications:** Allows the restoration of applications, where is displayed a list of the last edited applications.
- **Save Application:** Save changes made to the current application.
- **Generate Source:** Generate the Source Code for all the applications in the current project.
- **Run Application:** Saves and executes the current application.
- **Export Applications:** Allows the export of one or more project applications.

- **Import Applications:** Imports a backup file that contains an application from another or the same project.
- **Source Code:** Allows you to visualize the generated source code of the current application.
- **Data in Session:** It displays all Scriptcase session variables, as well as those of the executed applications.

Tools

- **Data Dictionary:** Allows the user to model and standardize the tables fields (names, translation, field types, and general settings).
- **Express Edit:** Project applications mass editing.
- **HelpCase:** Enables the creation of project documentation.
- **External Libraries:** It allows you to import third-party libraries from the web (javascript, CSS, PHP, for example) or to create your libraries to use within your current project or entire Scriptcase projects.
- **Internal Libraries:** Allows you to create PHP scripts, similar to external libraries, but exclusively for PHP.
- **To-Do List:** Enables you to create a task list.
- **Messages:** Send messages among developers of the same Scriptcase installation.
- **Converters:**
 - **Version 6:** Converts your projects from ScriptCase version 6 to this current version.
 - **Version 7:** Converts your projects from ScriptCase version 7 to this current version.
 - **Version 8:** Converts your projects from ScriptCase version 8 to this current version.

Layout

- **CSS Applications (Themes):** This option allows you to create or edit themes for the applications.
- **CSS Buttons:** This option allows you to create or edit button themes.
- **HTML Templates:** This option allows you to create or edit several HTML elements used within the applications.
- **CSS Menus:** This option allows you to edit the CSS of the menus.
- **Menu Icons:** Allows you to edit or create the icons of the menu application.
- **Image Manager:** This option manages the existing images in the project, also allowing you to add, delete and copy images.
- **Chart Themes:** This option allows you to edit or create the themes used within the Chart applications.
- **HTML Editor Templates:** Allows you to configure the functionalities from the Form and Control HTML editor field.

Local

- **Application Language:** Allows to define custom messages in different languages, according to the ones set during the project creation and the data dictionary.
- **Regional Settings:** Allows you to define some parameters of monetary units, date and numbers according to the Country or Region.

Modules

- **Security:** This option allows you to implement access rules to your system, creating a complete system with access control in your project.
- **Log:**
 - **Create/Edit Log Module:** Allows you to create or edit a log module.
 - **Applications Related to the log:** Allows you to reference which applications will use the log.
 - **Create Query with Log Report:** Allows you to create a Grid application that will display a log report.

Options

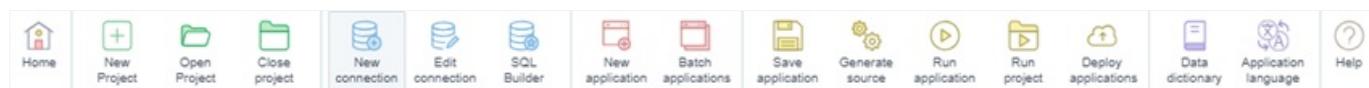

- **Settings:** Access all the ScriptCase settings.
- **My ScriptCase:** Allows you to customize the settings for the current user.
- **Change Password:** Allows the current user to change their password.
- **My Toolbar:** Allows you to change the position of the icons on the toolbar.

Help

- **WebHelp:** Allows you to access the manual.
- **Technical Support:** Access to ScriptCase online support.
- **Diagnosis:** Displays the settings of the Environment/Server where ScriptCase is installed.
- **Check Version:** Verifies if the version is updated.
- **Update Version:** Allows you to update ScriptCase to the latest version available.
- **License Registration:** Access the page to register your ScriptCase.
- **About:** Information about ScriptCase.

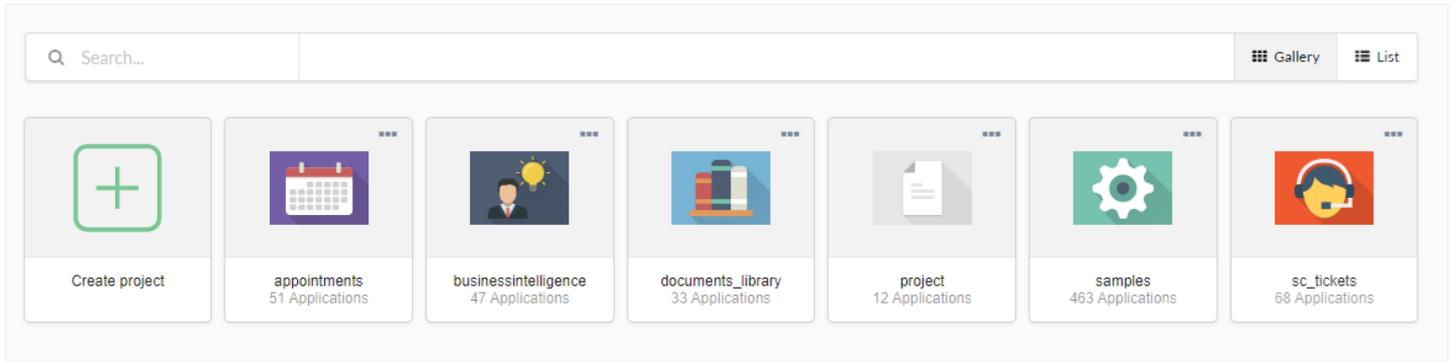

Scriptcase Toolbar

The toolbar is displayed right below the main menu, where you can find the most frequent used functions used. The toolbar is customizable, and you can create new features as well as edit the current ones. Learn how to customize the toolbar by clicking [here](#).

- **Home:** Returns to the Application management interface.
- **New Project:** Starts a new project creation process.
- **Open Project:** Returns to project dash interface where you can see all the projects that your current user has access.
- **Close Project:** Closes the current project.
- **New Connection:** Displays a wizard to add new connections to the current project.
- **Edit Connection:** Edits the project database connections.
- **SQL Builder:** SQL editor to create or test queries inside the connected database. You can also run SQL commands using this feature.
- **New Application:** It opens the new application wizard for you to start a new application.
- **Batch Applications:** Creates various applications (Forms and Grids) simultaneously.
- **Save Application:** Saves the current application changes.
- **Generate Source Code:** Generate the Source Code for the existing Applications.
- **Run Application:** Saves the present application, generates the source code, and runs the applications.
- **Run Project:** Runs the complete project. To do this, you must enter the property in the project properties.
- **Deploy Applications:** Opens the wizard for the deployment procedure.
- **Data Dictionary:** Allows the user to define standards for the tables (Names, Field Types, etc.).
- **Application Language:** Feature to assist within translation of the sistem tables and internal messagers.
- **Help:** Scritcase's documentation.

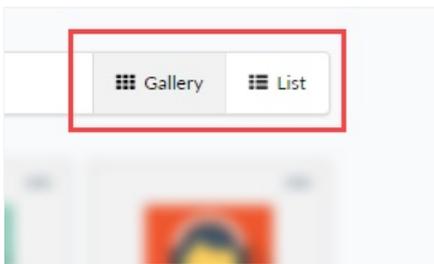

Project Dashboard

This is the initial Scriptcase screen, showed after login. It show the created projects that the user has access, these projects will be show as **Gallery**(default) format.

The definition of projects access should be made by the administrator user at the menu [Options > Settings](#)

Display Options

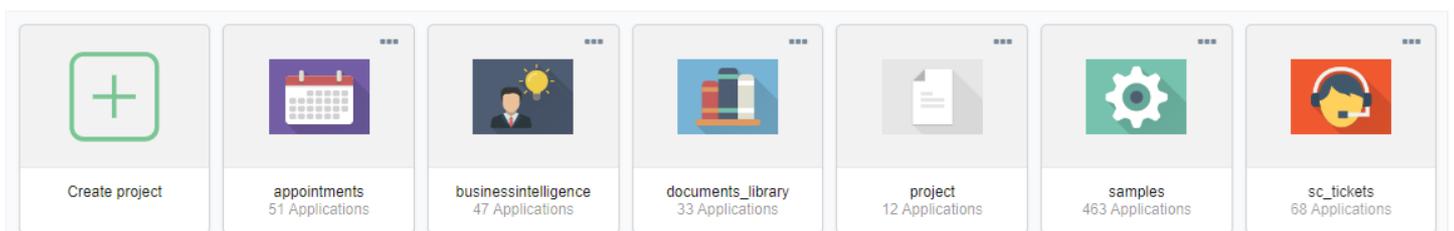

Through these bottom is possible to choose the project display between **Gallery**(Default) and **List**.

Gallery

The default display in the first time in Scriptcase, show the projects in cards with some basic information.

- [Project image](#), it can be change in the project porperties.
- Project's name, choosed at [create project](#).
- How many application at this version.

Sample of Project gallery

List

Show the projects in list with some more details about the project.

- [Project image](#), it can be change in the project porperties.

- **Project** - Project's name, choosed at [create project](#).
- **Description** - An description defined na at project creation. These description can be change at [project porperties](#)
- **Administrator** - List of users with administrator permission at the project. It is done at users manager in [Options > Settings](#)
- **Created** - Date of project creation.
- **Application** - How many application at this version.

Sample of Project list

+ Create project						
		Project ▲	Description	Administrator	Created	Applications
...		appointments	Appointments Scheduling		2015-09-03	51
...		businessintelligence			2016-12-28	47
...		documents_library			2014-03-10	33
...		project			2022-08-19	12
...		samples	Samples		2008-09-29	463
...		sc_tickets	Tickets		2009-08-07	68

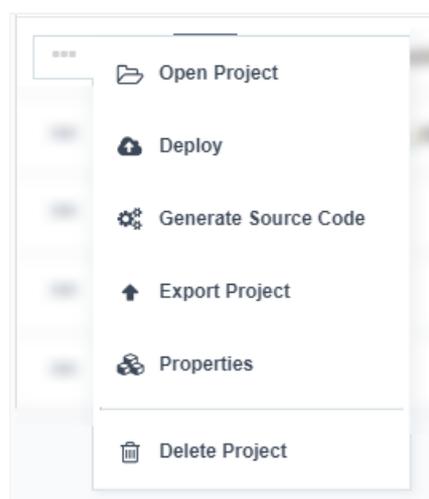

Search field

These field allow to search in the list of projects by the showed information, these way of display can be changed between **Gallery** or **List** also change how the field work because change the displayed information.

Sample of date search

+ Create project						
		Project ▲	Description	Administrator	Created	
Q 2016-12-28						
...		businessintelligence			2016-12-28	

Floating menu

These menu, can be access by the bottom , with some of project's options helping the developer access.

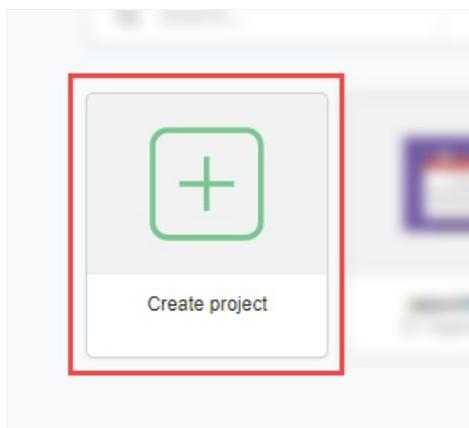

- [Open project](#) - Open the project at the home screen, showing the project's applications.
- [Deploy](#) - Open the project at deploy screen.
- [Generate source](#) - Open the project and generate the source code of all applications.
- [Export Project](#) - Open the project and start the export process.
- [Properties](#) - Open the project at the project's properties.
- [Delete](#) - Delete the project without accessing it.

Create project

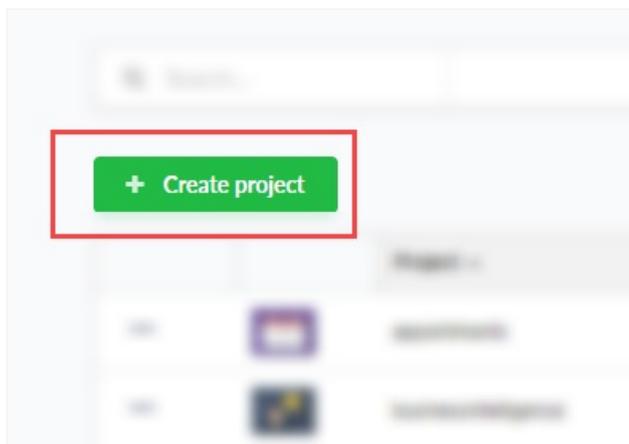

The change of project's display between **Gallery** and **List** also change the bottom display **Create project**.

Click here and see how to [create a blank project](#) or [import a sample project](#)

Create project sample showing at gallery

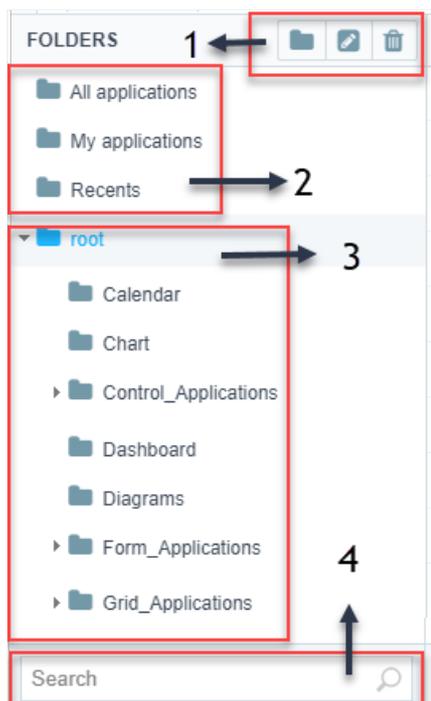

Create project sample showing at list

Project explorer

In this area, you can find all the folders created to organize the applications.

1 - Folders functions

Options for you to manage the folders (create, rename delete) to organize your application folders.

- **Create:** Creates a new folder.
- **Rename:** Renames the selected folder.
- **Delete:** Deletes the selected folder.

2 - Filters

Using the filter, you can quickly find an application per date or user. You can also display all the applications.

- **All Applications:** Lists all applications from the folders and the existing subfolders.
- **My Applications:** Lists all the applications from the folders and subfolders that the current user has created.
- **Recent:** List of all the new generated applications.

3 - Folders' structure

Scriptcase lists all application folders and sub-folders. It's recommendable for you to create folders to organize your project for future updates.

4 - Application search

Searches for the applications names or description.

- **Search:** It searches by name or descriptions of the project. The search occurs within the selected folder, and the search results are highlighted in yellow.

List of Applications

All project applications are available in this area. You can also take some specific actions using this interface, such as add a description, a friendly URL, rename, edit, copy, or run the application, one by one or various simultaneously.

The columns can be edited in **My Scriptcase** menu.

APPLICATION	FRIENDLY URL	DESCRIPTION	CREATOR	GENERATION	STATUS	
<input checked="" type="checkbox"/> login_v9	Click here to edit	Control application with layout free - Exclusivity Scriptcase 9	scriptcase	10/24/19 15:00	updated	Run Edit Copy Rename

1 - Columns

Here you have an editable grid with some suitable options from your applications, such as follows:

- **Application:** Application's Name.
- **Friendly URL:** Friendly URL for the application.
- **Description:** Application Description.
- **Creator:** Application Creator.
- **Generation:** Last Source Code Generation date.
- **Status:** Status of the application: **Updated** means that all changes are within the application, and **Outdated** means that changes are not saved within the source code.

2 - Express options

You can use these options to express editing the applications.

- **Run:** Runs an application;
- **Edit:** Open the Application to edit;
- **Copy:** Creates a copy of the selected application;
- **Rename:** Renames the selected application.

3 - Footer Options

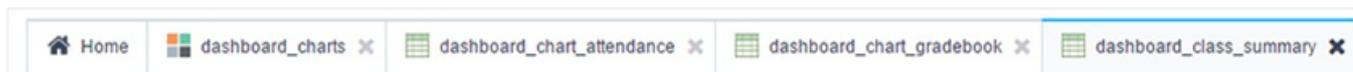

The footer buttons are available when one or more application are selected.

- **Edit:** Opens all the selected applications settings for editing.
- **Generate:** Generates the source code of all selected applications.

- **Deploy:** Opens the Publishing Wizard for all selected applications.
- **Delete:** Delete all selected applications.
- **Copy:** Copy the selected applications to another project.
- **Move:** Moves the selected applications to another folder in the same project.
- **Export:** Allows you to export the selected applications.

Taskbar

This bar contains the tabs of all the applications that were opened for editing.

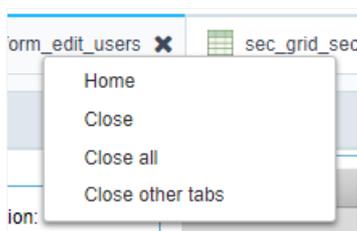

This bar is only displayed when at least one application has been opened.

The applications open in tabs in the taskbar where you can navigate among applications in a fast and easy way.

The “x” presented at the side of the Application name is used to close the application.

When you right-click on one of the tabs on the taskbar, you will see some tab closing options.

Keyboard Hotkeys

Keyboard hotkeys are keys or key combinations that provides an alternate way of doing something that you would normally do with a mouse.

The keyboard hotkeys are available in all browsers compatible with Scriptcase.

Browsers compatible with Scriptcase

 Chrome	All versions
 Firefox	Version 4 or above
 Edge	All versions
 Internet Explorer	Version 11 or above
 Opera	Version 9 or above
 Safari	Version 5.2 or above

Scriptcase Hotkeys

Efficiency is crucial to software development and the Keyboard Hotkeys are important to achieve that efficiently. You can see all the hotkeys that are now available in Scriptcase below:

Hotkeys	Actions
F1	Opens the documentation of the tool
CTRL+H or ⌘+H or F4	Displays the project homepage
CTRL+S or ⌘+S or F7	Saves the changes made in the application
CTRL+B or ⌘+B or F8	Generates the source code of the current application
CTRL+E or ⌘+E or F9	Runs the current application
F2	Opens the application creation screen
CTRL+I or ⌘+I or F6	Access to the SQL Builder
Alt+1~9	Accesses the selected tabs 1~9
Alt+Q	Closes the current tab
Alt+PgDown	Navigates back to the previous tab
Alt+PgUp	Navigates to the next tab

Events Editor Hotkeys - PHP

Using Sublime shortcut patterns, Scriptcase provides a series of shortcuts to streamline its development.

Hotkeys	Actions
Tab	Indents the line or selection
Shift+Tab	Removes line indentation or selection
Ctrl+Shift+K	Deletes the current line
Ctrl+Left	Moves the cursor to the next word
Ctrl+Right	Moves the cursor to the previous word
Ctrl+L	Selects the entire current line
Ctrl+Shift+L	Adds the cursor to all selected lines
Ctrl+	Cancel multiple cursors and moves the cursor to the first instance
Ctrl+Enter	Inserts a line after the current one
Ctrl+Shift+Enter	Inserts a line before the current one
Ctrl+Shift+D	Selects the next occurrence of selected text with the cursor
Ctrl+Shift+Space	Selects the current scope (within parentheses, braces, brackets ...)
Ctrl+Shift+M	Selects the broader context (keys, brackets, parentheses, page)
Ctrl+M	Moves the cursor to the closing or opening of the current context. (braces, brackets, parentheses, tags)
Ctrl+/	Comments or Uncomments line
Ctrl+J	Groups the line or selection
Ctrl+D	Duplicates line or selection
Ctrl+F9	Sorts the lines alphabetically, ignoring upper cases
Backspace	Intelligent Backspace (Removes indentation with line)
Ctrl+K Ctrl+K	Deletes text to the right
Ctrl+K Ctrl+U	Capital letters in the selection or cursor
Ctrl+K Ctrl+L	Lowercase letters in the selection or cursor
Ctrl+K Ctrl+C	Scrolls the line to the center of view
Ctrl+K Ctrl+Backspace	Deletes text to the left

Ctrl+Shift+Up	Moves the cursor to the previous line
Ctrl+Shift+Down	Adds the cursor to the next line
Ctrl+F3	Finds the next occurrence of the selection or cursor
Ctrl+Shift+F3	Finds the next occurrence of the selection or cursor
Ctrl+Shift+[Shows indented tag
Ctrl+Shift+]	Shows Inline tag
Ctrl+Shift+F	Activates search and replaces
Ctrl+F	Activates search
F3	Finds the next occurrence of the search
Shift+F3	Finds the previous occurrence of the search
Ctrl+Alt+I	Auto indentation of the selected code

Events Editor Hotkeys - HTML/CSS

Using Emmet's shortcut patterns, Scriptcase provides a series of shortcuts to streamline its development. With this plug-in it is possible to write HTML and CSS codes through CSS selectors.

[Click Here](#) to view the list of selectors.

For example, just write `ul> li.item $ {This is the item $} * 3` then press the "TAB" key and the following code will be generated.

```
<li class="item1">This is item 1</li>
<li class="item2">This is item 2</li>
<li class="item3">This is item 3</li>
</ul>
```

To use the EMMET hotkeys in Scriptcase events, you must close and open the event PHP. Example: `?> ul> li.item $ {This is the item $} * 3 <? PHP`

Hotkeys	Actions
Tab	Enables EMMET abbreviations Ex. <code>ul>li.item\${item \$}*3</code>
Ctrl+Shift+A or ⌘+Shift+A	Envelopes the selected text in an EMMET abbreviation. Select the text you want to envelop, then use the keys, and enter the tag.
Ctrl+Alt+Right or ⌘+Alt+Right	Edit / selects the next node. Junction between tags, CSS blocks.
Ctrl+Alt+Left or ⌘+Alt+Left	Edit / selects the previous node. Junction between tags, CSS blocks.
Ctrl+Shift+Y or ⌘+Shift+Y	Validates and solves math expressions. Example: <code>2*8+4</code> .
Ctrl+Up or ⌘+Up	Increments numeric value <code>+1</code>
Ctrl+Down or ⌘+Down	Decrements numerical value <code>-1</code>
Ctrl+Shift+. or ⌘+Shift+.	Edit / selects the next item. Attribute, tag name
Ctrl+Shift+, or ⌘+Shift+,	Edit / selects the previous item. Attribute, tag name
Enter	Inserts indented line break.

Scriptcase Variables

Field Variables

In Scriptcase the fields are internally treated as [local variables](#) PHP, however, at Scriptcase interface it's necessary to inform these, using **keys**, so it's possible to retrieve or assign values to the application fields.

These fields can be used at Scriptcase events, but will not work from the **onScriptInit** event because only the events after that will have values in the fields.

In the examples below it's possible to visualize the operation of the fields.

Retrieving field value:

To assign the field value to a local variable to be used within an event, we can perform the steps as below:

```
$var_local = {application_field};
```

To assign the field value to a local variable to be used within an event, we can perform the steps as below:

```
[variavel_global] = {application_field};
```

Assigning Value to Field:

To assign a value to the field, we can do assignment in the same way as done with the variables, and if possible, according to the field type:

Field type Text: {field_text} = "This is a sample text";

Field type Number: {field_number} = 100;

Global Variables (Session Variables)

These are variables that are stored in the application session, these variables can be used to pass parameters through the applications in the project. These variables can be used at any application event.

Unlike the local and field variables, Global variables can be used in the SQL of the applications that allows the manual to be changed, and in the **WHERE** Clause of the Form application, thus enabling a dynamic use of the applications.

SQL Grid sample

```
SELECT
  orderid,
  customerid,
  employeeid,
  orderdate,
  requireddate,
  shippeddate,
  shipvia,
  freight,
  priceorder,
  shipcountry,
  shipregion,
  shipstate,
  shipcity,
  shipname,
  shipaddress,
  shippostalcode
FROM
  orders
WHERE orderid = [order]
```

Sample in the WHERE Clause of the Form

Where clause

```
orderid = [orders]
```

To define a global variable, you only have to enter it in between brackets, for example:

[global_variable].

Assigning value to global variable:

[text_variable] = "This global has a text stored in it";

[number_variable] = "This global has a number stored in it";

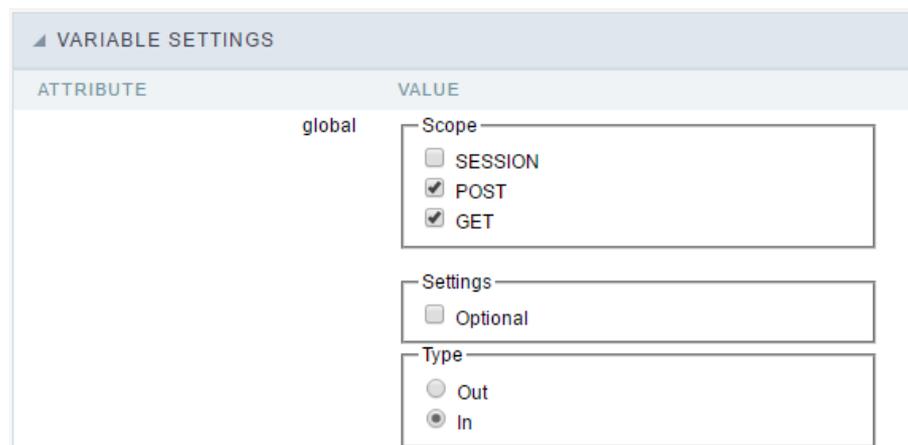

Passing values between applications

To pass values between applications, it is necessary to define the same variable in the applications that will use them, however, in the source application the variable must be defined as **Output** and in the destination application must be defined as **Input**.

To change the variable type, go to the menu **Application > Global Variables**.

After clicking on this menu will show the variables in the application and its settings.

In this configuration screen we have the following configuration options:

Attribute:

In Attributes we can see the variables in our application.

Value:

In Value we can see some options and configurations of our variable.

Type: This option defines whether the variable will be input or output.

Description:

Reports where the variable was declared by the developer.

Local Variables

Local variables are basically PHP's own variables. These variables must be set using a **\$** dollar sign at the beginning and the variable names are case-sensitive.

These variables will only work in events or methods, using a variable in an event it will make it only available in that event.

Variable names follow the same rules as other labels in PHP. A valid variable name begins with a letter or underscore, followed by any number of letters, numbers, or underscores.

Below we can see some examples of local variables:

```
$text = "This variable stores a Text";
```

```
$number = "This variable stores a number";
```

For more information, visit the [php variables](#).

EMMET Hotkeys

Below we have a list of EMMET CSS selectors in our event editor.

Remember that as they are CSS Selectors, to work as expected it is necessary to use inside the tag `<style> @m </style>`

CSS selectors	To open
@i or @import	<code>@import url();</code>
@m or @media	<code>@media screen { }</code>
@f	<code>@font-face {font-family: ; src:url(); }</code>
@f+	<code>@font-face {font-family: 'FontName'; src: url('FileName.eot'); src: url('FileName.eot?#iefix') format('embedded-opentype'), url('FileName.woff') format('woff'), url('FileName.ttf') format('truetype'), url('FileName.svg#FontName') format('svg'); font-style: normal; font-weight: normal; }</code>
anim	<code>animation: ;</code>
anim-	<code>animation: name duration timing-function delay iteration-count direction fill-mode;</code>
animdel	<code>animation-delay: time;</code>
animdir or animdir:n	<code>animation-direction: normal;</code>
animdir:r	<code>animation-direction: reverse;</code>
animdir:a	<code>animation-direction: alternate;</code>
animdir:ar	<code>animation-direction: alternate-reverse;</code>
animdur	<code>animation-duration: 0s;</code>
animfm	<code>animation-fill-mode: both;</code>
animfm:f	<code>animation-fill-mode: forwards;</code>
animfm:b	<code>animation-fill-mode: backwards;</code>
animfm:bt or animfm:bh	<code>animation-fill-mode: both;</code>
animic	<code>animation-iteration-count: 1;</code>
animic:i	<code>animation-iteration-count: infinite;</code>
animn	<code>animation-name: none;</code>

animation-name: none;	
CSS selectors	To open
animation-play-state	animation-play-state: running;
animation-play-state:p	animation-play-state: paused;
animation-play-state:r	animation-play-state: running;
animation-timing-function	animation-timing-function: linear;
animation-timing-function:e	animation-timing-function:ease;
animation-timing-function:ei	animation-timing-function:ease-in;
animation-timing-function:eo	animation-timing-function:ease-out;
animation-timing-function:eio	animation-timing-function:ease-in-out;
animation-timing-function:l	animation-timing-function:linear;
animation-timing-function:cb	animation-timing-function: cubic-bezier(0.1, 0.7, 0.1, 0.1);
appearance	appearance: none;
!	!important"
position or position:r	position: relative;
position:s	position:static;
position:a	position:absolute;
position:f	position:fixed;
top	top: ;
top:a	top:auto;
right	right: ;
right:a	right:auto;
bottom	bottom: ;
bottom:a	bottom:auto;
left	left: ;
left:a	left:auto;
z-index	z-index: ;
z-index:a	z-index:auto;

CSS fl or fl:l selectors	<code>float: left;</code> To open
fl:n	<code>float:none;</code>
fl:r	<code>float:right;</code>
cl or cl:b	<code>clear: both;</code>
cl:n	<code>clear:none;</code>
cl:l	<code>clear:left;</code>
cl:r	<code>clear:right;</code>
colm	<code>columns: ;</code>
colmc	<code>column-count: ;</code>
colmf	<code>column-fill: ;</code>
colmg	<code>column-gap: ;</code>
colmr	<code>column-rule: ;</code>
colmrc	<code>column-rule-color: ;</code>
colmrs	<code>column-rule-style: ;</code>
colmrw	<code>column-rule-width: ;</code>
colms	<code>column-span: ;</code>
colmw	<code>column-width: ;</code>
d or d:b	<code>display: block;</code>
d:n	<code>display:none;</code>
d:f	<code>display:flex;</code>
d:if	<code>display:inline-flex;</code>
d:i	<code>display:inline;</code>
d:ib	<code>display:inline-block;</code>
d:ib+	<code>display: inline-block;\n*display: inline;\n*zoom: 1;</code>
d:li	<code>display:list-item;</code>
d:ri	<code>display:run-in;</code>
d:sp	<code>display:space-between;</code>

u:cp	<code>display:compact;</code>
CSS selectors	display
d:tbl	<code>display:table;</code>
d:itb	<code>display:inline-table;</code>
d:tbc	<code>display:table-caption;</code>
d:tbcl	<code>display:table-column;</code>
d:tbclg	<code>display:table-column-group;</code>
d:tbhg	<code>display:table-header-group;</code>
d:tbf	<code>display:table-footer-group;</code>
d:tbr	<code>display:table-row;</code>
d:tbrg	<code>display:table-row-group;</code>
d:tbc	<code>display:table-cell;</code>
d:rb	<code>display:ruby;</code>
d:rbb	<code>display:ruby-base;</code>
d:rbbg	<code>display:ruby-base-group;</code>
d:rbt	<code>display:ruby-text;</code>
d:rbtg	<code>display:ruby-text-group;</code>
v or v:h	<code>visibility:hidden;</code>
v:v	<code>visibility:visible;</code>
v:c	<code>visibility:collapse;</code>
ov or ov:h	<code>overflow:hidden;</code>
ov:v	<code>overflow:visible;</code>
ov:s	<code>overflow:scroll;</code>
ov:a	<code>overflow:auto;</code>
ovx or ovx:h	<code>overflow-x:hidden;</code>
ovx:v	<code>overflow-x:visible;</code>
ovx:s	<code>overflow-x:scroll;</code>
ovx:a	<code>overflow-x:auto;</code>

CSS ovy selectors	<code>overflow-y: hidden;</code> To open
ovy:v	<code>overflow-y:visible;</code>
ovy:h	<code>overflow-y:hidden;</code>
ovy:s	<code>overflow-y:scroll;</code>
ovy:a	<code>overflow-y:auto;</code>
ovs or ovs:s	<code>overflow-style: scrollbar;</code>
ovs:a	<code>overflow-style:auto;</code>
ovs:p	<code>overflow-style:panner;</code>
ovs:m	<code>overflow-style:move;</code>
ovs:mq	<code>overflow-style:marquee;</code>
zoo	<code>zoom:1;</code>
zm	<code>zoom:1;</code>
cp	<code>clip: ;</code>
cp:a	<code>clip:auto;</code>
cp:r	<code>clip: rect(top right bottom left);</code>
bxz	<code>box-sizing: border-box;</code>
bxz:cb	<code>box-sizing:content-box;</code>
bxz:bb	<code>box-sizing:border-box;</code>

Scriptcase Projects Overview

The notion of a project in Scriptcase is fundamental for the organization and structured development of applications. Each project groups together all the resources needed to create complete systems, from registration forms and queries (grids) to reports and charts. Below is an overview of how projects work in Scriptcase and the main steps to create and manage one:

What is a Project in Scriptcase?

A project is a set of applications (forms, grids, dashboards, menus, etc.) that collectively make up your system. Within it, you control the database connection, layout settings, languages, libraries, and all the code necessary for the applications to run. This way, each project operates independently, allowing for clear organization and easier maintenance.

Creating a New Project

1. **Access Scriptcase:** After logging in, select the option to create a new project.
2. **Define Name and Description:** Give it a title that represents the goal of the system being developed. The description serves as a reference to understand the project's purpose.
3. **Language and Regional Settings:** Choose the main language and any localization configurations.
4. **Database Connection:** Select the type of database to be used (MySQL, PostgreSQL, SQL Server, Oracle, etc.) and define the connection parameters.
5. **Finish and Start Development:** Once the settings are finalized, you can begin creating the necessary applications (Forms, Grids, Reports, etc.) within the project.

Structure and Organization

Within a project, each application can be created and organized in folders, making it easier to access and maintain the code. In addition, Scriptcase allows for the sharing of internal libraries and the configuration of visual themes to ensure a consistent look and feel across all applications.

Best Practices

- **Backup and Versioning:** Perform periodic exports of the project using the “Export Project” feature to preserve settings and changes.
- **Security:** Use Scriptcase's built-in access control features to manage users and permissions.
- **Interface Standardization:** Utilize Default Values, layout tools, and internal libraries to maintain a uniform visual style across all applications.
- **Team Collaboration:** When multiple developers are involved in the project, establishing a version control workflow and clear communication is essential to avoid conflicts.

New Project

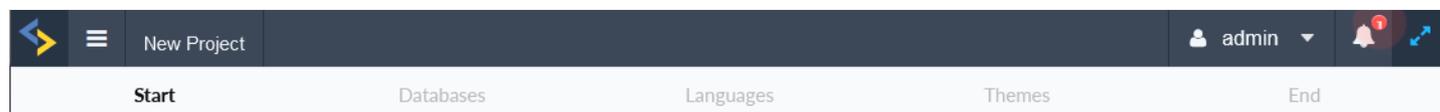

In this article you learn how to create a new project within Scriptcase.

A system made with Scriptcase has always to start by creating a project. A project for Scriptcase is a set of applications with some standard settings. During the project creation, you define some essential options as name and description, languages in which your project might be available, a layout template for the applications, and informs the database system connection data in which the applications fetch the information to form the system.

To start a new project you can access the menu **"Project > New Project"**.

The project creation process has five steps, which are: **Start, Database, Languages, Themes and End** .

Start

In this step, we should choose between a **Blank project**, where we have to create our database connection and every application from scratch, or one select of our **Template projects**, that can serve as a template to the creation of your system.

Create New Project
Connect with your database and create a web system using all Scriptcase applications and tools.

[+ Create Blank Project](#)

Or choose a web system template below:
Import one of our examples, with applications and data, to help you better understand Scriptcase.

Point of Sales New!

Appointments

Recruitments tracker

Documents Library

[See more](#)

NOTE: Click on “See more” button to have access to our [Sample Projects](#) and click in the link here to know how to import them.

After we select **Create Blank project**, it is mandatory to define a name to our project.

Project details
Fill in with your project details, such as: name, description and icon. [Back](#)

[Add an icon](#)

Project Name

Project Description

Additional Project Information

Create a blank project or select from a template system.

Project name

The only mandatory setting for this step is that the name must contain 1 to 32 alphanumeric characters and does not allow it to start with a number.

Project description

A not required that allows us to define a description for the project.

After the creation of the project, we can see the description in the dialog box when we place the mouse over the project when we use the gallery view or in the Description column when the project's view is in **list** format.

Additional Project Information

Not required fields that allow us to add additional information to the project. This information is within the project properties.

Image

Not required fields that allow us to define an image to represent our project.

You can change all non-mandatory fields in this step, and other project settings after project creation by accessing the option [Project Properties](#).

Databases

During the connection creation, Scriptcase lists all database systems according to your license. If you're evaluating, Scriptcase displays all database systems available. You have to select your database and proceed to the next step to inform the database connection details.

You need to have a database system installed and the permissions to connect before you proceed.

Note: If you don't have a database available to create the project, Scriptcase provides a sample database in SQLite with the tables ready for the user to proceed with the creation of the project. To create this database just click on the button **Create Sample Database (SQLite)**.

Create a connection
Select your database system and create a connection for your project. ?

 MySQL/MariaDB	 Oracle	 MSSQL Server	 Postgres	 DB2	 Informix	 MS Access	 SQLite	 SyBase
 InterBase	 Firebird	 Microsoft Azure	 Amazon RDS	 Google Cloud	 Oracle Cloud	 Progress	 Generic ODBC	 ODBC

Or use sample database
If you don't have your own database, Scriptcase will create an example SQLite database. Just click the button below and continue.

 Create Sample Database (SQLite)

The information required to connect is different for each database. In this example we will be using MySQL. To learn more about other connections please access [this link](#).

Using Scriptcase you are able to create as well as to manage database projects and tables. During this step you will need to create or connect to, at least, one database project. We are going to use a "Samples" one. After the project creation you are able to use the [Database manager](#) and [SQL Builder](#) features to manage the database project and queries.

Create a connection MySQL/MariaDB

Enter the connection details for your database MySQL/MariaDB

← Choose another connection

CONNECTION SECURITY FILTER ADVANCED

Connection Name: conn_mysql DBMS Driver: MySQL PDO

Server/Host (Name or IP): 127.0.0.1 Port: 3306

Username: root Password:

Database Name: samples

List Database Create Database

Test Connection

Database connection details.

- **Connection Name:** Define the name of the connection. You are not able to change this name in the future.
- **DBMS Driver :** Defined as MySQL PDO. It can also be MySQLi.
- **Server/Host (Name or IP):** Enter the IP of the server where the database is. If the database is on the same machine of Scriptcase, you can use the IP **127.0.0.1** or **localhost**. If the Database is
- **Port:** Define the port of the connection. By default, the port is 3306.
- **User:** Inform the username that you use to connect to your database.
- **Password:** Inform the password that you use to connect to your database.
- **Database Name:** Click on the “List Database” and select the desired database.
- **Test Connection:** Displays the connection status if it succeeded or not.

All available connections are listed according to on your license type. [Go to our on-line store](#) and view the available licenses.

If you have connection problems, [access our free support](#) to get assistance by chat or remote access.

Language

In this step, you should select the languages that are available for system development.

Scriptcase can easily create multilingual systems. You need to add more than one language in this step of the project. All the languages you choose are available to the project, and you must choose one as standard. You can also have the same language more than once using different regional settings.

Scriptcase will automatically translate and apply the regional settings to your project applications (for buttons and internal messages for example). You can also use another tool from Scriptcase called [Data dictionary](#) to import and translate your database fields. You will be able to see, create or customize the messages inside the menu > Locales > [Application language](#).

Project languages

Choose the languages that you will use for your applications. It is possible to choose regional settings and define a charset for each selected language.

Language	Regional Settings	Charset	Default	Delete
 English	English (United States) ▼	Western (ISO-8859-1) ▼	<input checked="" type="radio"/>	
 Spanish	Spanish (Spain) ▼	Western (ISO-8859-15) ▼	<input type="radio"/>	
 Portuguese Portugal	Portuguese (Portugal) ▼	Western (ISO-8859-15) ▼	<input type="radio"/>	

Select a language ▼ Select the regional setting ▼ [Add](#)

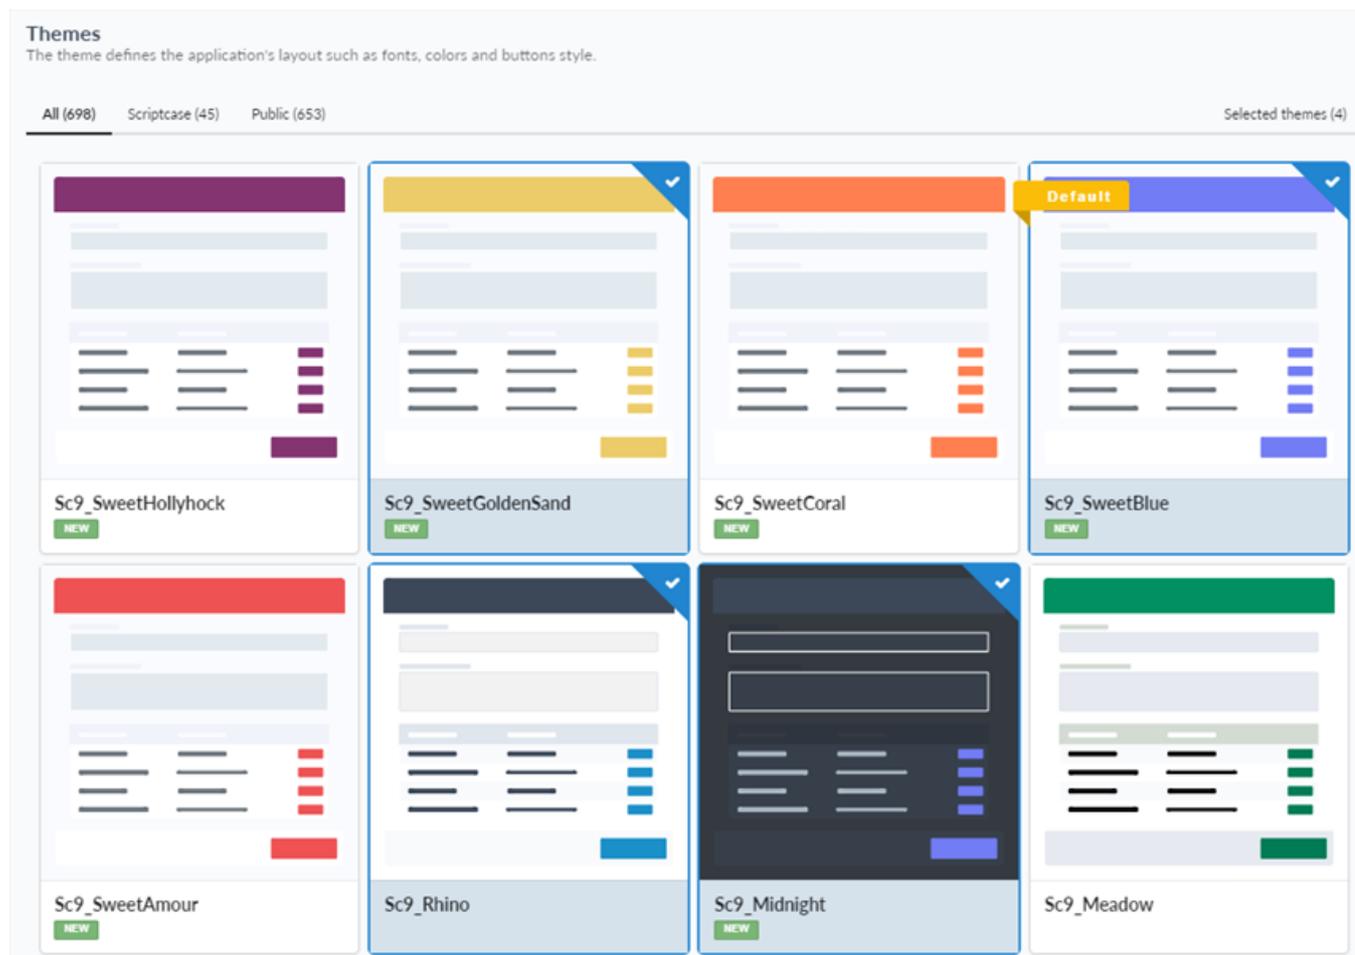

- **Language** - List of languages that are in the projects.
- **Regional Settings** - Contains the standard [regional settings](#) for the selected language. Regional Settings allows you to define some parameters of monetary units, dates, and numbers according to the country or region where your application.
- **Charset** - Sets the character encoding format for the application. This encoding must be the same used in your database. By default, the charset comes according to the language, and you can change after creation in project properties.
- **Default** - Sets the project default language. Project applications are performed and displayed using this default language; it can also be changed individually within the application settings.
- **Delete** - Removes the language of the project. In this way, the language removed will no longer be available. It may also be included or deleted after the project created within the Menu > Project > Properties.

After selecting the language, regional setting, and charset, click “Add” and then “Save” to move forward.

Themes

In the themes selection, you can choose one more than templates for your project. Within this template you will have a complete theme for all applications you create within the project. Ready to use screens with pre made CSS and HTML to all application types.

You can also customize or create new themes from the templates. Once you are inside the projects, access the menu [Layout > CSS Application \(Themes\)](#).

- **All** - Lists all the available themes for use in your project.
- **Scriptcase** - Lists all Scriptcase standards themes.
- **Public** - Lists all themes defined in the Public level.
- **Selected themes** - Lists the themes selected for use in the project.

To add a theme to your project, you only need to select it, and then it is going to be listed inside the selected themes. You should select a theme to use as default, for this click on the “default” icon of the selected theme. The default theme is the one selected every time you create a new application, and you can also select a different one according to the options available within the selected themes. You can also access this option in the future to add new themes.

When you add more than one theme, you can dynamically switch themes before creating the applications, by adding a toolbar button within the applications or using the macro [sc_set_theme](#).

End

The project has been created successfully with the basic settings, and now you can create the applications. Visit the [Applications](#) menu to learn more about each application and to see the steps to create them.

Congratulations! Your project has been created successfully. You can now create Forms, Reports, Charts, Pivot Tables, among others applications to this project.

Close Project

Closes the current project redirecting to the the Project List.

Access **Project > Close Project**

Or simple click on the Close Project Icon on the toolbar.

Properties

This option is only available when accessing a project. It allows the editing of the project's information.

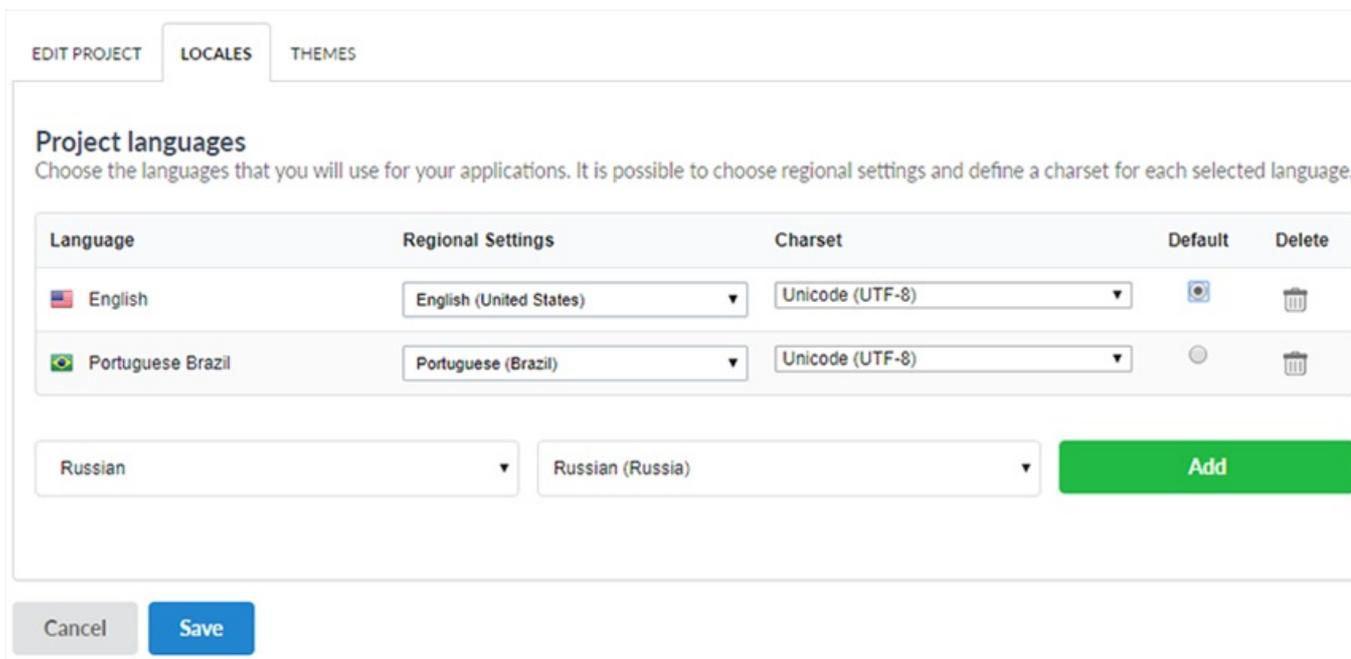

Edit Project

We can edit some of the project information, like the description and the use of the index.

- **Project Name** - The name of the project informed on its creation. It is not possible to change the project name after its creation.
- **Project Description** - Description informed on the project creation. Differently from the project name, it is possible to change it using this interface.
- **Choose the initial application** - Allows you to define the initial project application for the **Run Project** button. So every time you run the project, this application opens automatically, it can be a login screen, for example.
- **Use Index Page** - Allows the use of friendly URLs in the applications. Scriptcase enables this option by default.
- **Charset conversion to UTF8 by database** - With this option enabled, the database will convert the characters sent by the server according to the charset of the database.
- **Keep old layout of file upload** - Option defined for users who do not use the slash symbol (/) when creating a subdirectory, in the image and document type fields. In this scenario, files were stored directly in the "file" directory. If your file structure is like this, it is necessary to enable this flag. In the latest versions, images and documents are being saved in the directories informed in the installation, that is, "file / img" for images and "file / doc" for documents.
- **Project Information** - Detailed description of the project.

Locales

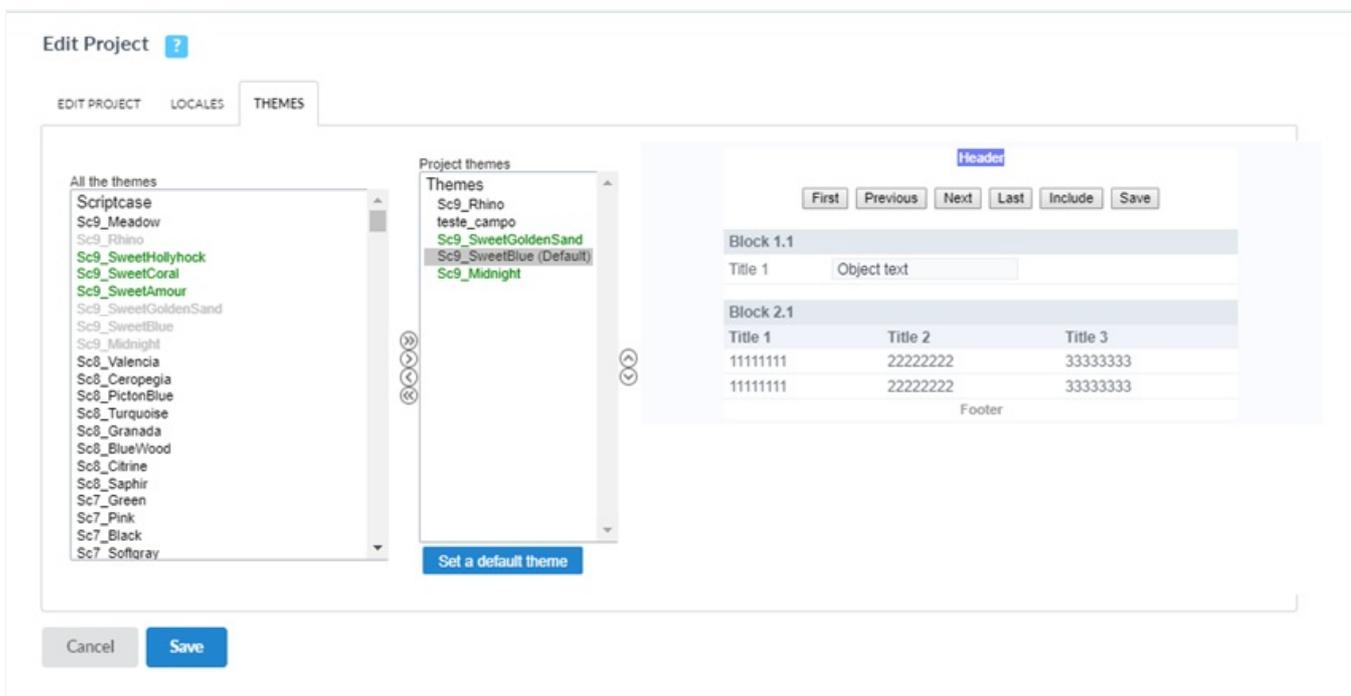

Define the languages for the project applications. The languages are select as you create your project, you can edit this option to add or remove languages anytime.

- **Language** - List of languages from the project.
- **Regional Settings** - Standard regional settings for the selected language. Regional Settings allows you to define some parameters of monetary units, dates, and numbers according to the country or region where your application.
- **Charset** - Encoding used by the selected language.
- **Default** - Default a language for the project. All the applications created are executed on the default selected language.
- **Trash Can** - Removes the language from the project. The removed language won't be available for changing dynamically in runtime.

Themes

It defines the available themes in the project and the default theme used by the applications. To set a default theme for your project, select the theme and click on **Set a default Theme**, the "default" notation appears beside the theme name. In this image, the default theme is **Sc9_Rhino**.

- **All Themes** - List of all the themes from ScriptCase.

- **Project Themes** - List of available themes within the project.

Default Values

With this configuration, it is possible to standardize the creation of the applications of the current project, increasing productivity in the development of the applications.

Calendar

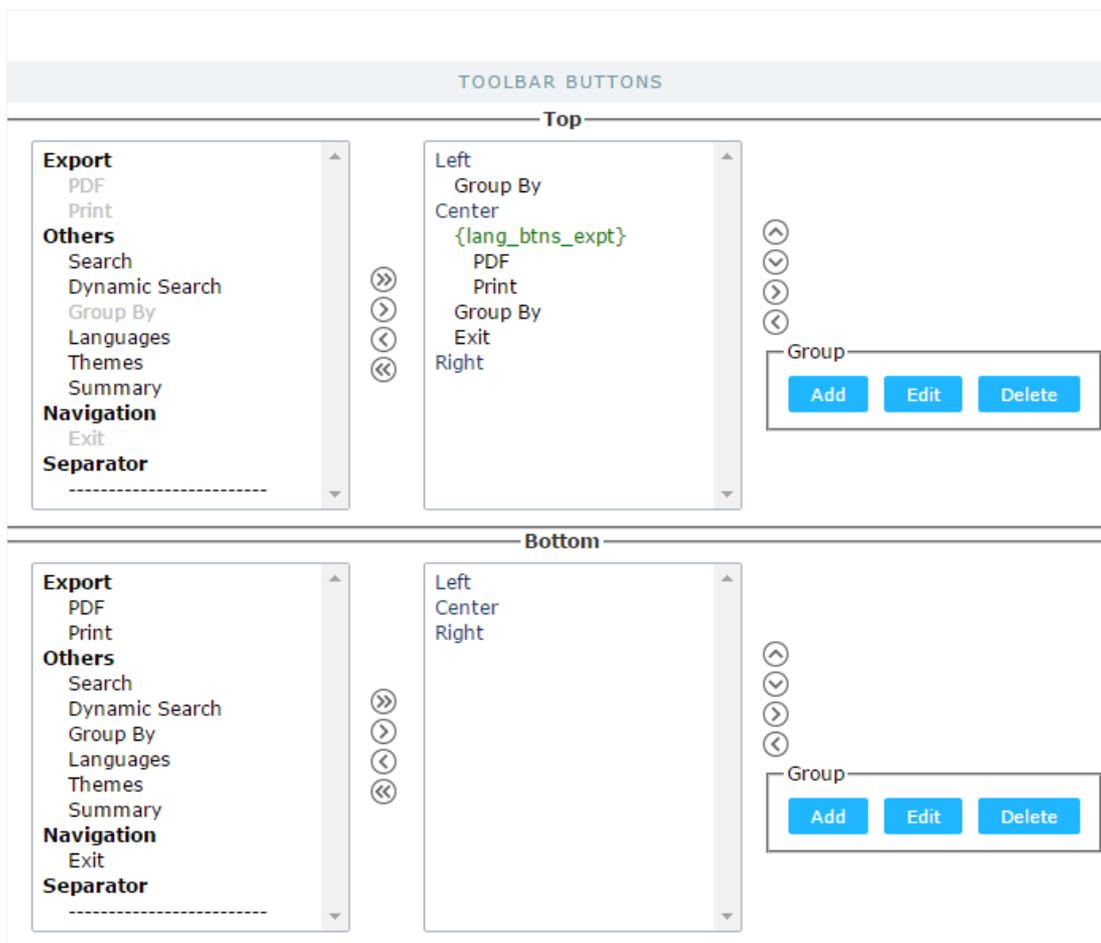

- **Toolbar Buttons** - Define the default buttons in the toolbar for the new applications.

New Chart

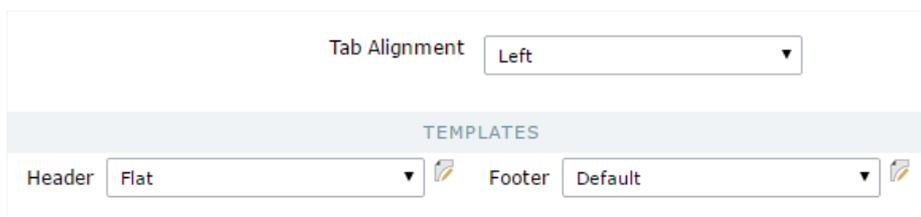

- **Toolbar Buttons** - Define the buttons that will be set up by default in the toolbar for the new applications.

Old Chart

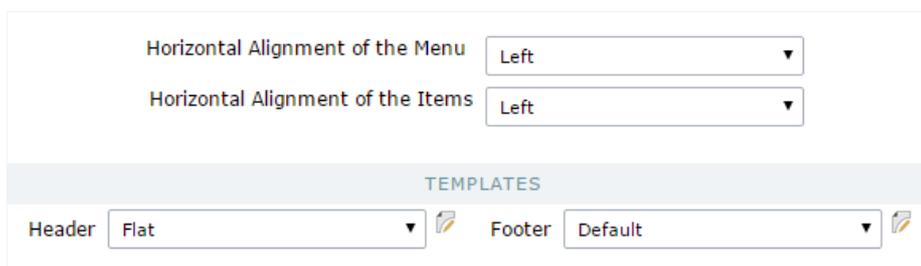

- **Toolbar Buttons** - Define the default buttons in the toolbar for the new applications.

Tab

- **Tab Alignment** - Display alignment of the tabs in the application.
- **Templates** - Defines the templates used by default on the Header and Footer. It's possible to inform the values to the variables of the selected templates, clicking on the editing icon right beside the field of the template selection.

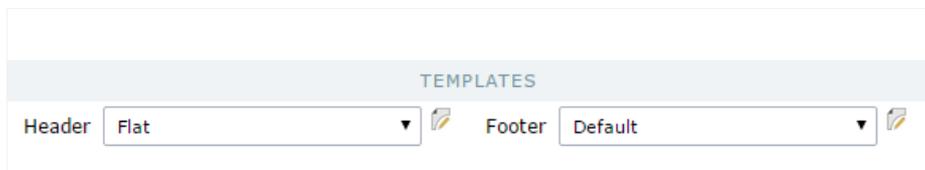

Menu

- **Horizontal Alignment of the Menu** - Menu alignment.

- **Horizontal Alignment of the Items** - Menu item alignment
- **Templates** - Defines the templates used by default on the Header and Footer. It's possible to inform the values to the variables of the selected templates, clicking on the editing icon right beside the field of the template selection.

Dashboard

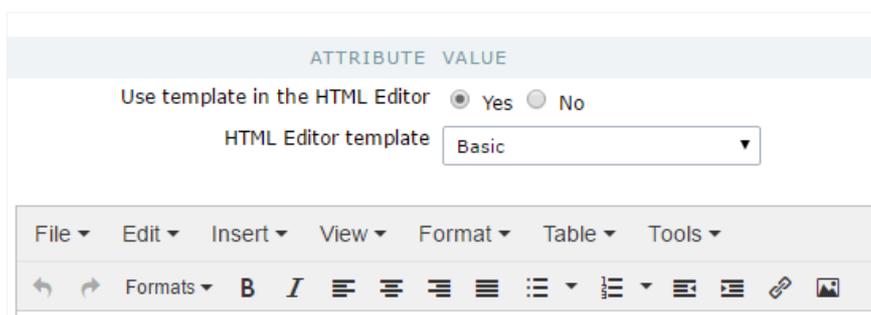

- **Templates** - Defines the templates used by default on the Header and Footer. It's possible to inform the values to the variables of the selected templates, clicking on the editing icon right beside the field of the template selection.

HTML Editor

The HTML Editor has two options of configurations, depending on the option selected on **Use template in the HTML Editor**.

- **Use template in the HTML Editor** - Selecting Yes (Image Below), you use the new templated of the HTML Editor field, these themes should be set up in **Layout > HTML Editor Templates**.
- **HTML Editor template** - Defines the template for editing of the field HTML Editor.
- **Field Preview** - Default Text of the HTML Editor Fields.

- **Use template in the HTML Editor** - Selecting No (Image Below), you won't be using the new templated of the HTML Editor field. In this case, the options should be set up in the field.
- **Properties** - Defines the display properties.
- **Location** - Defines the position of the items in the field. Top or Bottom
- **Buttons Alignment** - Defines the alignment of the items in the field. Left, Center, Right.
- **Status bar** - Position of the Status Bar.
- **Toolbar Count** - Amount of the bars to organize the items.
- **Buttons' Organization** - Set the available items in the bars.

Version History

Lists all the versions of the current project. The Version History page manages the versions of the project, created in the option of version incrementation, here we can return to earlier versions, open a previous version or delete created versions.

Version's description ?

Version	Description	Creation	Delete	Status	Edit
1.0.0	Prj:samples-v.1	03/21/17 09:57			

- **Version** - Project Version.
- **Description** - Project version description.
- **Creation** - Date of the version creation.
- **Delete** - Delete the selected version of the project and all its applications. Applications from the other versions are not affected.
- **Status** - Defines if the version of the project is opened or closed.
- **Edit** - Allows to edit the selected version of the project. This option is available for the version that have the status Open.

Version Incrementing

Allows the control over the project in development, separating it in versions. The project version control allows you to protect the functionalities existing in the system, before doing any important modifications, by creating a new version of the current project.

The version increment allows that only the latest version of the project to be increased.

Increment Project Version samples

Current Version 1.0

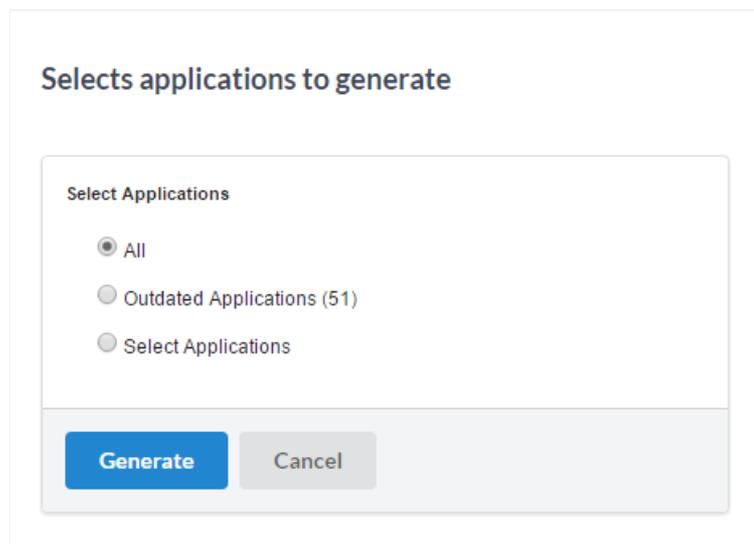

New Version

Description

- **Current Version** - Informs the current version of the project.
- **New Version** - Defines the number of the new version of the project.
- **Description** - New project description.

Generating Source Code

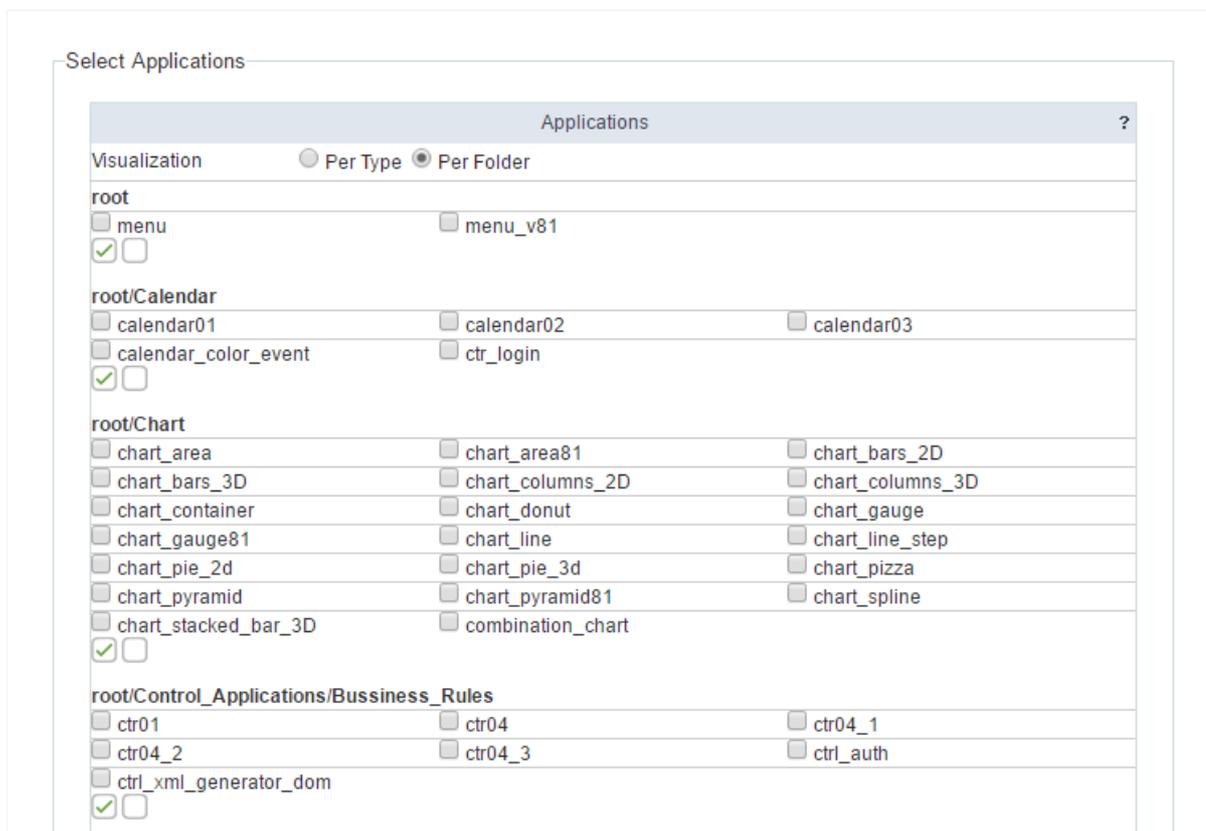

Allows you to generate the source code for all the applications in the project, select the chosen application, or generate the source code for the outdated ones.

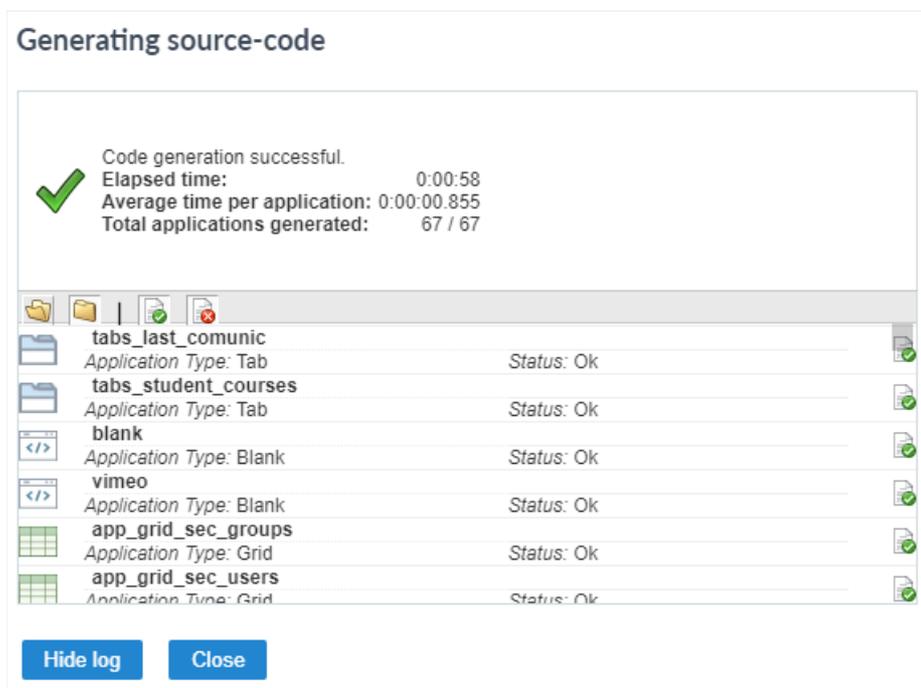

- **All** - Generates the source code for all the applications in the current project when selecting this option, you are redirected to the page where the code is generated, where you can also see the log.
- **Outdated Applications** - Generates the source code only for the outdated applications (recently modified applications that weren't generated yet), when selecting this option, you will be redirected to the page where the code will be generated, where you can see the log.
- **Select Applications** - This option allows you to select the applications that you want to generate the source code, when selecting this option, you will be redirected to the application selection page.

Selecting Applications

All the applications from the project are listed here, and you should select the applications that you want the source code to be generated. The application can be listed in two ways, using the filter to list by Application types or by folders, as shown below.

After selecting the application that will be generated, you will be redirected to the page where the code will be generated, where you can also see the log.

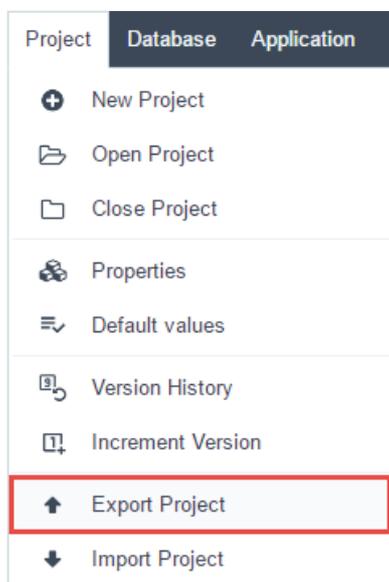

We can see in the highlighted folder of the image some filter options.

- **Open Folder Icon** - Allows possible errors to be displayed when generating the code.
- **Closed Folder Icon** - Allows to hide the possible errors when generating the code.
- **Document ok** - Displays only the applications that haven't had any problems generating the code.
- **Document error** - Displays only the applications that has had any problems generating the code.

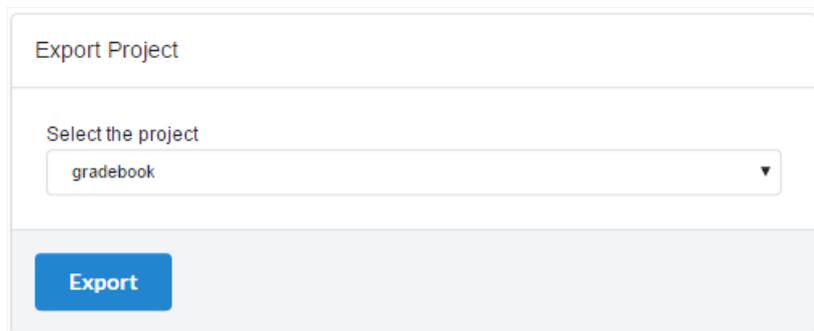

Export Project

This option allows you to create a .zip file with all the applications from the current project and all its required files.

Access **File > Export Project**.

Next, select the project that you want to export.

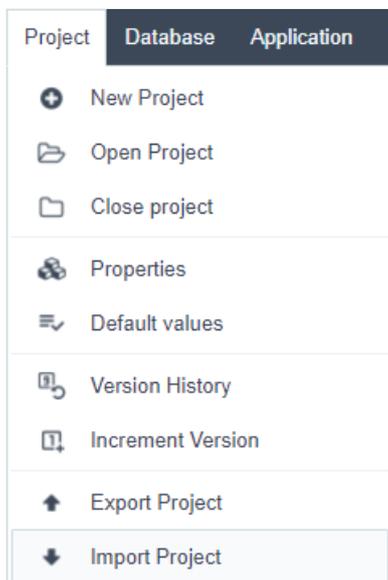

When finishing the process, the file will be available for download.

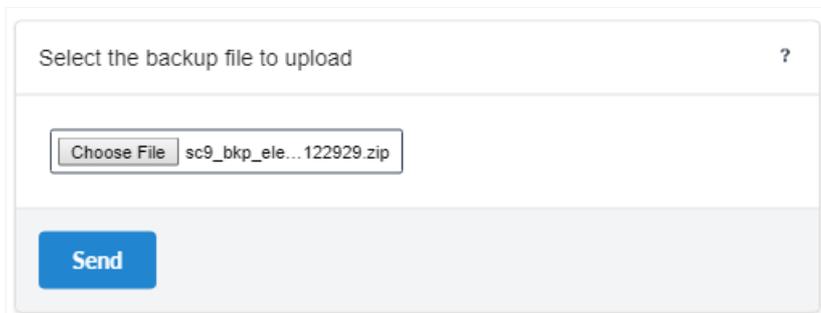

Import Project

Allows you to import a project exported by ScriptCase, with all the required files.

Access **File > Import Project**.

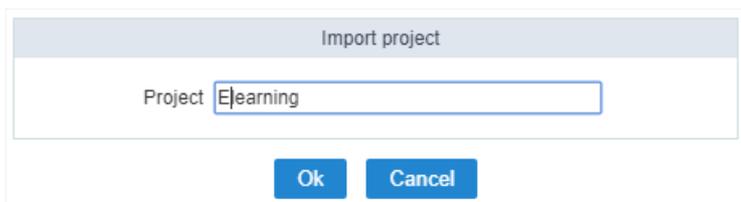

Next, we need to select the project file that we want to import.

After finishing the process, we should inform the name of the project that is being imported.

In case there is a project with the same name in your ScriptCase, the project that is being imported will overwrite the existing project.

After finishing the import, we can open the project.

Import project

100%

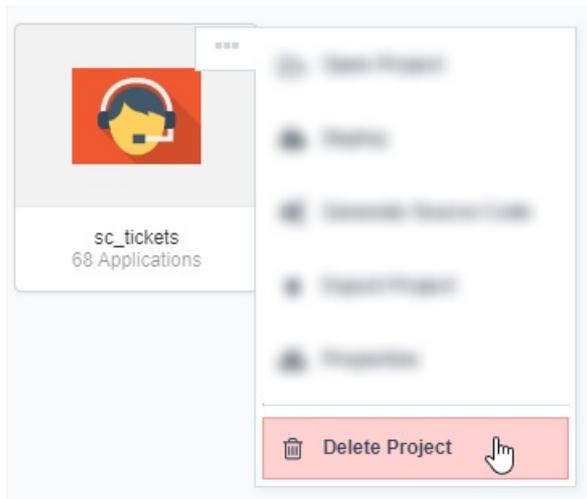

Open project

The image shows a user interface for importing a project. At the top, there is a header bar with the text "Import project". Below this, a blue progress bar is shown, which is completely filled, indicating that the import process is 100% complete. To the right of the progress bar, the text "100%" is displayed. Below the progress bar, there is a blue button with the text "Open project" in white, which is likely used to open the imported project.

Deleting a Project

The project can be deleted by **Floating menu** available in the projects interface. [Click here](#) for more menu details.

Floating menu at project list

Or can be deleted by menu **Project > Delete project**, in this case will be necessary to open the project.

Project Menu

Delete confirmation

Now will open a pop-up to confirmation the action.

Delete a project can't be undone, so we recommend doing a backup to avoid a definition lost of the project.

Project Deletion
✕

You are deleting the project:

project (2.0.0)

This project has more than one version. Choose from the list below which versions to exclude:

<input type="checkbox"/>	Version	Description
<input checked="" type="checkbox"/>	2.0.0	
<input type="checkbox"/>	1.5.0	
<input type="checkbox"/>	1.0.0	Prj:project-v.1

i When confirming the deletion, this action cannot be undone. We recommend backup before deletion.

Manage version history
Cancel
Delete project

On this screen we will have some important information to delete a project.

Confirmation of project name and version

You are deleting the project:

project (2.0.0)

This project has more than one version. Choose from the list below which versions to exclude:

In case the project has more then one version, configured at [increment Project](#), it will show them with the possibility to delete or not.

After deleting a project, we have to delete the open version, unless it has the close status. [Click here](#) for more details about it.

List of project versions

<input type="checkbox"/>	Version	Description
<input checked="" type="checkbox"/>	2.0.0	
<input type="checkbox"/>	1.5.0	
<input type="checkbox"/>	1.0.0	Prj:project-v.1

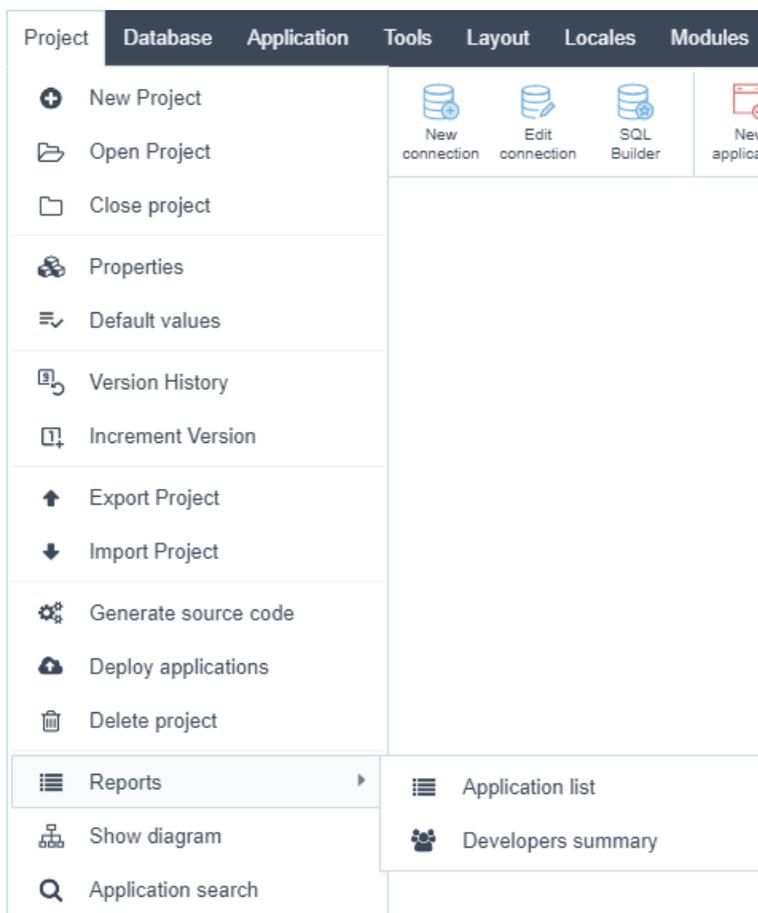

i When confirming the deletion, this action cannot be undone. We recommend backup before deletion.

Reports

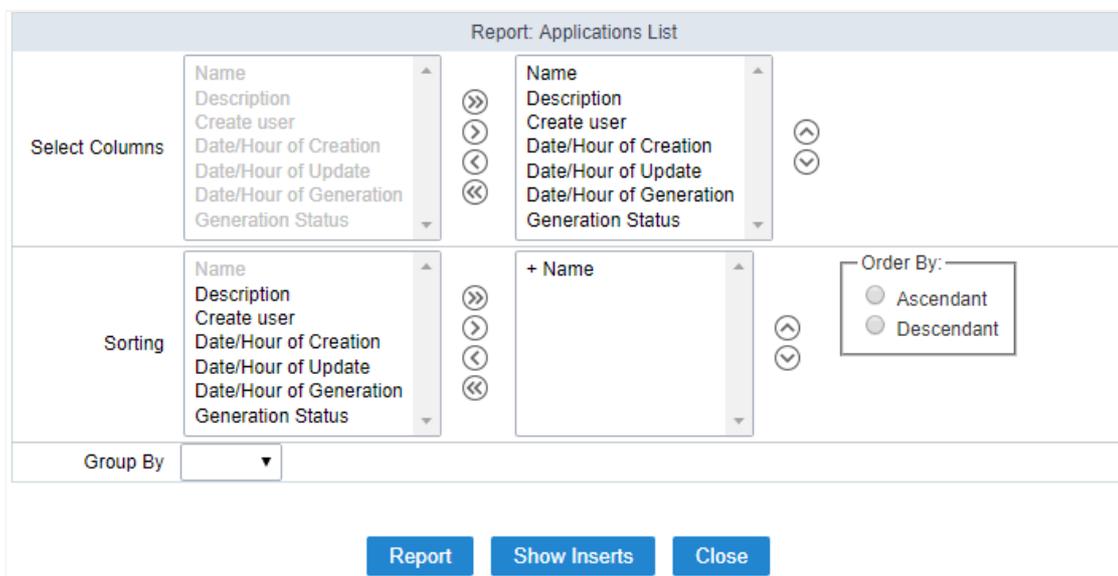

We offer two types of reports for projects: Application List and Developers Summary.

To generate the reports, access **Project > Reports**

Application List

Displays a list with all the existing applications in the current project and the **SQL INSERT Queries** of the tables. To generate the report, first you need to define which information you want to be available.

- **Select Columns** - Defines the columns that will be part of the report.
- **Sorting** - Defines the fields and the sorting that will be available.
- **Order By** - Defines the initial sorting for the report. It will use **Ascendant** by default if not informed.
- **Group By** - Defines the grouping of the report, by type (application) or by folder (Project's File Directory).

After finishing the configurations, click on **Report**.

Report: Applications List						
Name	Description	Create user	Date/Hour of Creation	Date/Hour of Update	Date/Hour of Generation	Generation Status
calendar_calendar		admin	02/05/18 10:52	02/05/18 10:55	02/05/18 10:55	Generated
form_products		admin	02/07/18 16:22	02/07/18 16:24		Outdated
grid_products		admin	02/02/18 14:06	02/02/18 14:06	02/02/18 17:48	Generated
search_products		admin	02/05/18 10:27	02/05/18 10:27		Outdated

Back Close

Developers Summary

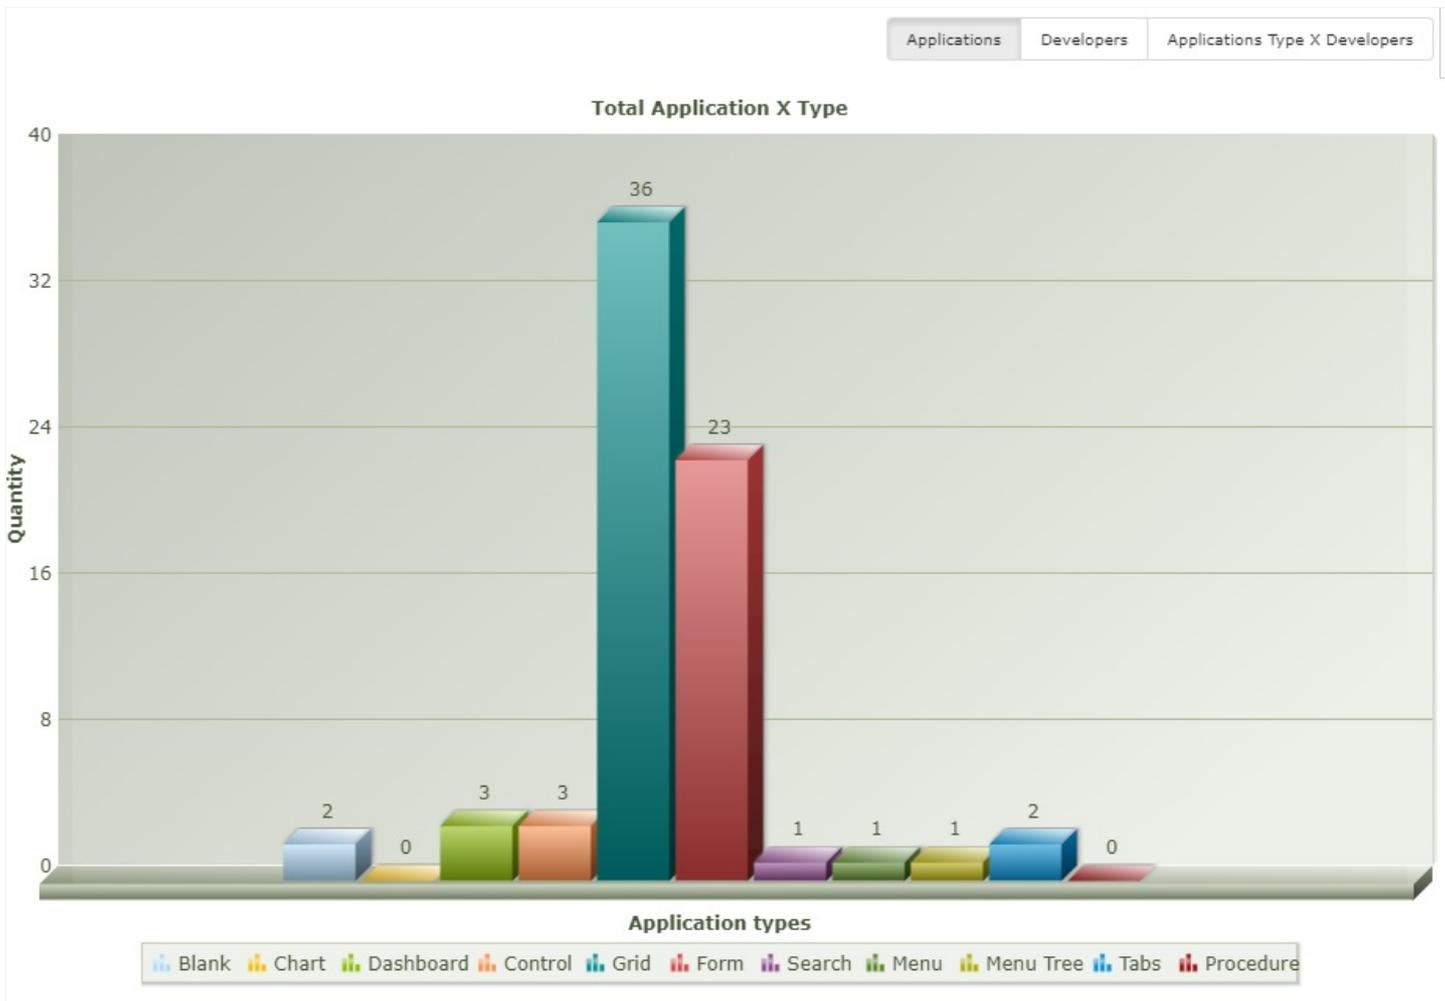

Generates a Summary with every action each developer had done, showing the total applications and their types and the total of code lines that the user wrote in the applications.

REPORT: SUMMARY BY DEVELOPER														?
Developer	Grid	Chart	Form	Control	Tabs	Procedure	Menu	Menu Tree	Search	Dashboard	Blank	Total	Code Lines	
__ldap__ralves	0	0	0	0	0	0	0	0	0	0	0	0	0	
admin	3	0	3	0	0	0	0	0	0	0	0	6	0	
scriptcase	33	0	20	3	2	0	1	1	1	3	2	66	0	
support	0	0	0	0	0	0	0	0	0	0	0	0	0	

Close

This same report is available in Charts, with three types of visualization.

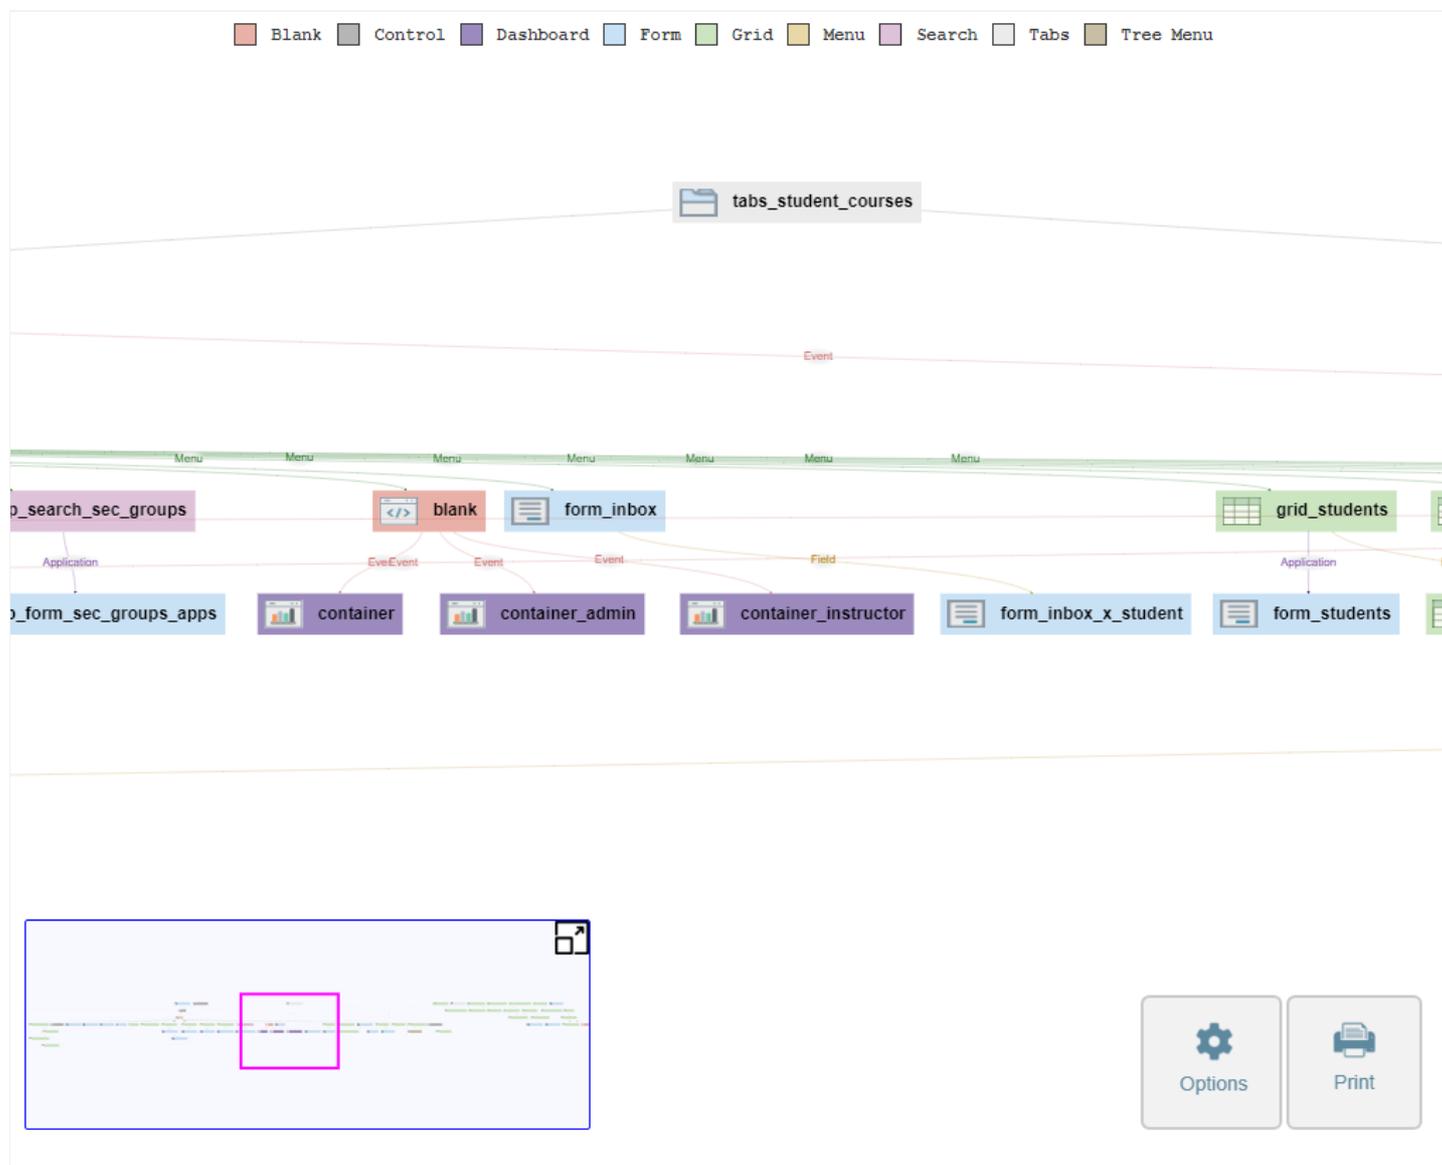

- **Applications** - Total of applications in the project grouped by their type.
- **Developers** - Total of application created by developer in the project.
- **Applications x Developers** - A junction of the other two charts.

Showing Diagram

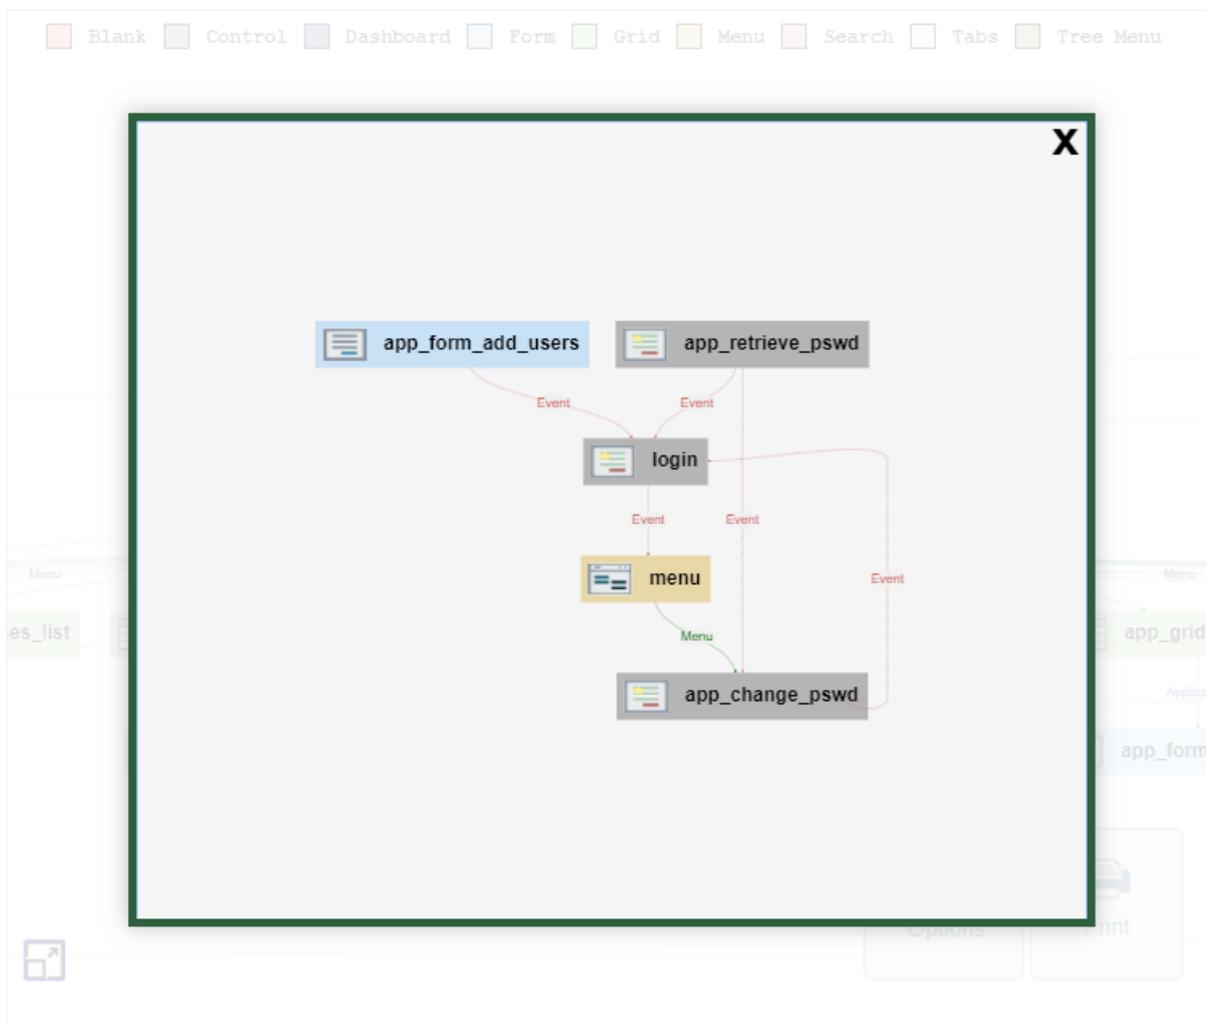

Generates a diagram of relationships between applications in the project. On this diagram, you can see in a clear way which applications are related and which is the method used to create the relationship.

On this example we're showing the relationship of all the applications in the sc_album project.

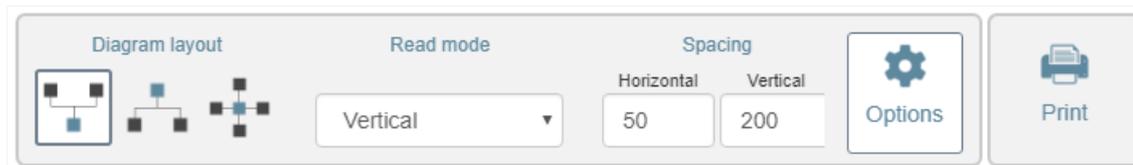

There are some options that can help visualizing the diagram.

We can display a mini map of all the diagrams, to help with the display. In order to visualize it, click on the icon on the lower left side of the diagram.

There are other options of views, instead of the mini map, as shown below.

- **Diagram Format** - Build the Diagram according to the ties positioning.
- **Reading Mode** - Defines the perspective of reading for the diagram when it's created.
- **Space** - Defines the space between the columns(Horizontally) and the layers(Vertically).

Application Search

It performs a search in the project with all the content informed by the search itself.

The location on which the search will look for defined by a checkbox.

At least one of the options need to be selected.

APPLICATION SEARCH

Search word: Anything Words

<input checked="" type="checkbox"/> All	<input type="checkbox"/> Theme
<input type="checkbox"/> SQL	<input type="checkbox"/> Template Name
<input type="checkbox"/> Field Name and Label	<input type="checkbox"/> Libraries
<input type="checkbox"/> Links	<input type="checkbox"/> Header and Footer
<input type="checkbox"/> Lookup	<input type="checkbox"/> Block Name and Label

- **All** - Performs a search in all the options listed below.
- **SQL** - Searches only in the SQL areas of the applications.
- **Field Name and label** - Performs a search for the name and label of the field.
- **Links** - Performs a search only for the name of the applications.
- **Lookup** - Searches inky in the lookup area of the fields.
- **Themes** - Searches only for theme names.
- **Template Name** - Searches only for HTML templates names.
- **Libraries** - Searches for internal libraries that contain this specific name.
- **Header and Footer** - Searches only for the Application Titles.
- **Block Name and Label** - Searches only for the name or label of the block informed.

The results will be displayed as shown below.

Application	Item	Value
chart01 (Grid)	SQL Select Statement	SELECT orderid, customerid, employeeid, orderdate, requireddate, shippeddate, shipvia, freight, priceorder, shipcountry, shipregion, shipstate, shipcity, shipname, shipaddress, shippostalcode FROM orders
	Grid Title Detail Title Blocks	{lang_header_grid_70_title} {lang_header_grid_70_title}
		0 Name => grid_orders Text => grid_orders
chart02 (Grid)	SQL Select Statement	SELECT orderid, customerid, employeeid, orderdate, requireddate, shippeddate, shipvia, freight, priceorder, shipcountry, shipregion, shipstate,

- **Application** - Name of the applications found that satisfies the search.
- **Item** - Location where the search criteria was found.
- **Values** - Values found that satisfies the search.

Importing a template Project

In this tutorial, you learn how to import a project template from Scriptcase. The project templates contain various samples applications for you to copy or learn how to apply Scriptcase features. You can run all the template projects to test by accessing the website [here](#).

The process of importing a template is divided into two steps, which are detailed below. The projects created with access permission for the user, appear in

[Project List](#)

Start

During the first step of the project creation, you can create a [Blank project](#) or **Import a template** according to the options below.

Or choose a web system template below:
Import one of our examples, with applications and data, to help you better understand Scriptcase.

 Point of Sales New!	 Samples Applications	 CRM Project	 Helpdesk
 Business Intelligence	 Appointments	 Recruitments tracker	 Documents Library
 Delivery Tracking	 Health Care	 FluxoCaixa	 Personal Finances
 eLearning	 Online Shop	 Training	 GradeBook
 Project Management	 Security	 News	 Album
 Webservice			

When you import a project template, Scriptcase will delivery some ready to use applications and also the database tables. Here you see the steps to import one template project, the "Samples."

First, you need to choose the project and customize all the details. Description and image are optional.

Project details
Fill in with your project details, such as: name, description and icon. Back

 <input type="button" value="Add an icon"/>	<p>Project Name</p> <input type="text" value="eLearning"/>	<p>Project Description</p> <input type="text" value="eLearning"/>
<p>Additional Project Information</p> <p>Template system for creation of virtual learning environments (EAD). Designed to assist in content management and administration of courses online. With catalog of courses, embedded videos, notifications, user authentication and administration of classes, teachers and students.</p>		

- **Project Icon** - You can select a project icon for display purposes in the project list. This field is not required, and you may change after creation inside project properties.
- **Project Name** - The project name must contain 1-32 alphanumeric characters, without space neither special characters.
- **Project Description** - Here, you give a brief description of the project, not required, also able to inform after the creation of the project.
- **Additional Project information** - Here, you can add some additional information you want for the project. This field is not required, and you may change after the creation of project properties.

Database

Our template projects are available for MySQL, Oracle, SQL Server, PostgreSQL, Access, SQLite, Firebird. You can choose to use the default connection or to configure a new connection to your database.

Use default connection (SQLite)

By clicking on the option “Use default connection (SQLite),” Scriptcase undertakes to create a database, with the SQLite database, and insert all the information of tables and records. The database file with the project tables and some dummy records within the Scriptcase directory.

Creating the new project

Elearning

Step 1/4 - Creating the new project. ✓

Step 2/4 - Preparing the database and the applications to import. ✓

Step 3/4 - Importing the applications (this step may take a few minutes). ✓

Step 4/4 - Creating the database. ✓

67 Imported applications in 00:00:09

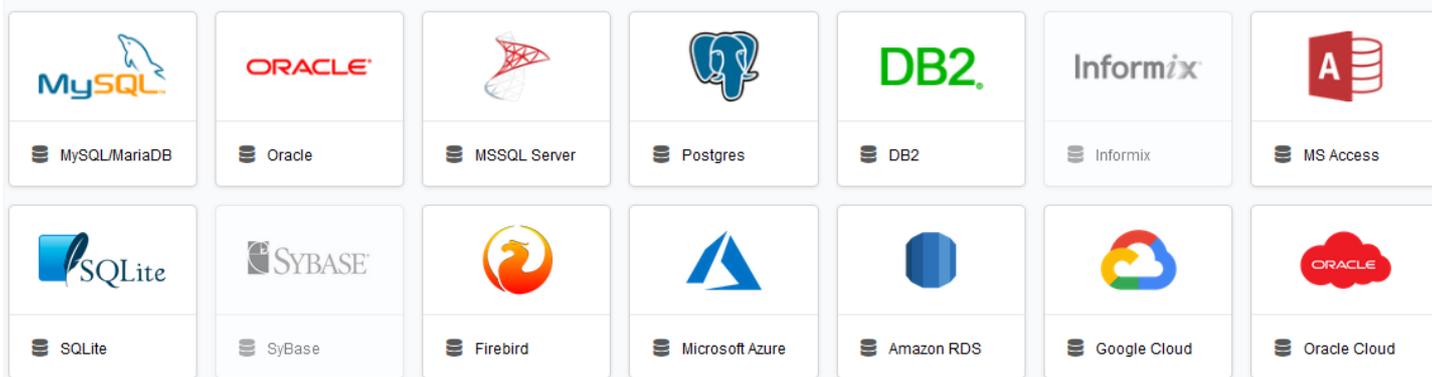

[Generate source-code](#) [Open project](#)

The project will be created and configured with all the essential information. Generate the source code to compile and applications and then “open project” and view all the applications created or “Run” the project to open the initial application

Create a new connection to my database

Create a connection

Select your database system and create a connection for your project.

After selecting the database you want to connect, enter the required data to perform the connection.

The information needed to create a connection varies according to the selected database. In the example below, we show with MySQL connection. For more details on how to connect your database [click here](#).

The screenshot shows the 'CONNECTION' tab of the configuration dialog. It includes the following fields and controls:

- Connection Name:** Input field containing 'conn_mysql'.
- DBMS Driver:** Dropdown menu showing 'MySQL PDO'.
- Server/Host (Name or IP):** Input field containing '127.0.0.1'.
- Port:** Input field containing '3306'.
- Username:** Input field containing 'root'.
- Password:** Password input field with masked characters.
- Database Name:** Dropdown menu showing 'samples'.
- Buttons:** 'List Database' and 'Create Database' buttons.
- Bottom Buttons:** 'Test Connection' (green) and 'Save' (blue) buttons.

- **Connection Name:** Define the name of the connection. You can change this name in the future.
- **DBMS Driver :** Defined as MySQL PDO. It can also be MySQLi.
- **Server/Host (Name or IP):** Enter the IP of the server where the database is. If the database is on the same machine of Scriptcase, you can use the IP **127.0.0.1** or **localhost**.
- **_Port _:** Define the port of the connection. By default, the port is 3306.
- **User:** Inform the user name that you use to connect to your database.
- **Password:** Inform the password that you use to connect to your database.
- **Database Name:** Click on the “List Database” and select the desired database.
- **Test Connection:** Displays the connection status if it succeeded or not.

If you don't have a database created, click on the button “Create Database” and the window below appears.

The option of **Create Database** is available for: **MySQL/MariaDB**, **MSSQL Server** and **PostgreSQL**

Create Database

Database Name

Enter a name for your database and click "OK." After that, the database created will be displayed on the database list. To create a database directly from Scriptcase, you need to have the correct permissions within the database system itself, and sometimes this permission is refused, especially when you have the database in another server. In this example, we have the database located on the same server, localhost.

Project Generation

After you finish, Scriptcase undertakes to create all the tables and insert all the information used in applications.

Creating the new project

Elearning

Step 1/4 - Creating the new project. ✓

Step 2/4 - Preparing the database and the applications to import. ✓

Step 3/4 - Importing the applications (this step may take a few minutes). ✓

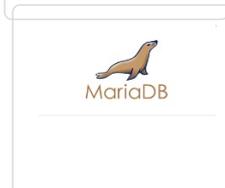

Step 4/4 - Creating the database. ✓

67 Imported applications in 00:00:09

All set! Now the project will be created and configured with all the essential information. Generate the source code to compile the applications and then open project and view all the applications created.

Progress

Generic
ODBC

Access

In ScriptCase we provide two drivers for the MS ACCESS connection, **MS Access ODBC** and **MS Access ADO**.

You can find out if drivers are available by going to diagnosis. See below how to find your diagnostics and check if the driver is enabled.

- Accessing the top menu **help > Diagnosis**, you can find it in the interface.

- you can find it too in your browser:

127.0.0.1:8092/scriptcase/diagnosis.php or domain.net/scriptcase/diagnosis.php

Click on the driver that you need know how to enable.

- [Access ODBC](#)
- [Access ADO](#)

Connecting with MS Access ODBC

The Scriptcase provides two drivers for connecting to the Access database: **ODBC** and **ADO**. For more information on how to enable the MS Access ADO driver see our [documentation](#).

In Scriptcase, it is also possible to convert tables from Access database files (**.mdb** or **.accdb**) to the databases: **MySQL**, **PostgreSQL**, **SQLite** and **SQL Server**. For more information, see our documentation for [Database Convert](#).

Requirements

Before proceeding with this documentation, check your PHP architecture. For the drivers to be enabled correctly, **files must be downloaded according to the architecture used**.

- In your Scriptcase, there is the file **info.php**, access it by the URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find information regarding architecture in the [phpinfo\(\)](#).

- **x86** Architecture = 32 Bits
- **x64** Architecture = 64 Bits

WARNING: The PHP architecture of Scriptcase and MS Access must be equivalent.

In the automatic installation of Scriptcase, the **COM** extension is already enabled in PHP, requiring only the following items below to make the connection with Access:

- The MS Access database (**.mdb** or **.accdb**) must be stored on the same server/machine as Scriptcase with one or more tables created.
- Access Database Engine installed.
- System DSN ODBC created in the Windows ODBC Manager.

Necessary files:

x64

- Access Database Engine **2010**: [Click here](#)

x86

- Access Database Engine **2010**: [Click here](#)

Installing the Microsoft Access Database Engine 2010 Driver

- First we must download Driver Access Database Engine 2010 according to **your PHP** architecture:

Access Database Engine 2010 x86 [Download](#)

Access Database Engine 2010 x64 [Download](#)

After download, run the file to install the engine:

1 - Click "**Next**" to continue the installation.

2 - Accept the license terms and agree to continue.

3 - Set the path of the Access Engine installation. You can also use the default path entered by the installer.

4 - Installation complete, click **“OK”** to finish.

Create an ODBC System DSN

See below for all the tutorials for creating an ODBC data source to connect to Scriptcase.

NOTE: The ODBC must be created on the same server where ScriptCase is installed.

1 - Access the **ODBC Data Manager** and select according to architecture. We will select the x64 version:

2 -When you log into ODBC Data Source Manager, select the **DSN** tab and click **Add** to create your connection to your Access database.

3 - After this, you need to select the controller to connect to Access. Select driver: **Microsoft Access Driver (*mdb, *accdb)**.

4 - Now you need to define the name of the DSN and select the Access database file.

Data Source Name

Here you will define the name of the DSN to be entered in the Scriptcase connection.

Description

In this item, you can create a description for this DSN by distinguishing it from another one created.

Database

In this section, you must select the database file by clicking the **Select...** button, but you can also create new databases, repair or compress existing files.

5 - After clicking **Select**, you must choose the path to the Access file.

6 - Now just click **“OK”** to confirm the creation of DSN, so it will appear in the list of **DSN** available.

Create a connection in Scriptcase

In this documentation we will show the connection through the ODBC driver by [System DSN](#) and in [File path](#) to the Access database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

- Select connection **“MS Access”**.

- Select DBMS driver: **MS Access ODBC(Recommended)**

In this access connection controller, we can connect in two ways: using the ODBC DSN and entering the database path in **“Server/Host (Name or IP)”**.

Connect to Scriptcase using the system DSN:

In this type of connection, we must inform the DSN of the system created in step [Creating an ODBC data source](#) to make the connection.

Connection name

Define the name of your new connection in Scriptcase.

DBMS driver

Select the access connection controller.

Server/Host (Name or IP)

Enter the system DSN created in Windows ODBC.

Username

Inform the user to connect to the Access database. **This option should only be populated if a user is configured as required when connecting to the Access database.**

Password

Enter the password to connect to the Access database. **This option should be completed only if a password is set as needed when connecting to the Access database.**

Connect to Scriptcase using the file path:

In this type of connection, we must enter the full path to the Access database file to make the connection.

Connection name

Define the name of your new connection in Scriptcase.

DBMS driver

Select the access connection controller.

Server/Host (Name or IP)

Enter the full path to the Access database file.

Username

Inform the user to connect to the Access database. **This option should only be populated if a user is configured as required when connecting to the Access database.**

Password

Enter the password to connect to the Access database. **This option should be completed only if a password is set as needed when connecting to the Access database.**

Filter

We can configure the initial filtering of the information that the database will bring and display.

Show

In this option, we will define if the connection will show the **Tables, Views, System Tables** or **Procedures** databases.

Searches

In this option we can configure the display of specific tables by user. If the elements are empty, the user informed in authentication will see all the data available.

- **Tables:** We will list the tables that may or may not be displayed.
- **Owner:** We will inform you of the name of the user who has access to the necessary tables or to the complete database.
- **Show:** We will define if the reported elements will be displayed or not in this connection.

Advanced

You can configure more advanced settings for the connection.

Decimal separator

This option allows you to define the decimal separator of numerical values. You can choose between dot (.) and comma (,).

Persistent Connection

Enabling this option will close connections when script execution completes.

Use the schema before the table name

This option causes Scriptcase to use the database schema before the table names in its actions. For example:

dbo.Account

- **dbo:** It is the name of the scheme used.
- **Account:** This is the name of the table that is used soon after.

Connection with MS Access ADO

Scriptcase provides two drivers for connecting to the Access database: ADO and ODBC. For more information on how to enable the MS Access ODBC driver, see our [documentation](#).

In Scriptcase, you can also convert tables from Access database files (**.mdb** or **.accdb**) for databases: **MySQL, PostgreSQL, SQLite and SQL Server**. For more information, see our documentation for [database import](#).

Prerequisites

To create a Scriptcase connection to the Access Database using the ADO connection, you must use the full path to the database file.

In Scriptcase automatic installation, the **COM** extension is already enabled in PHP, and only requires the following elements:

- The PHP architecture of Scriptcase and Access must be equivalent.
- **Microsoft Access Database Engine 2010** client installed.
- The access database (**.mdb** or **.accdb**) must be stored on the same Scriptcase server/machine with one or more tables created.

Checking the PHP Architecture

Before continuing with this documentation, it is important to check your PHP architecture inside **phpinfo()**. If you are using Scriptcase's automatic installer, the PHP architecture will be the same as that of the downloaded installer.

You can access the [phpinfo](#) of your Scriptcase through your own path, like:

<http://127.0.0.1:8092/scriptcase/info.php>

- **x86** Architecture = 32 Bits
- **x64** Architecture = 64 Bits

Installing the Microsoft Access Database Engine 2010 Driver

- First we must download Driver Access Database Engine 2010 according to **your PHP** architecture:

Access Database Engine 2010 x86 [Download](#)

Access Database Engine 2010 x64 [Download](#)

After download, run the file to install the engine:

1 - Click **"Next"** to continue the installation.

2 - Accept the license terms and agree to continue.

3 - Set the path of the Access Engine installation. You can also use the default path entered by the installer.

4 - Installation complete, click **"OK"** to finish.

Create a connection in Scriptcase

In this documentation we will show the connection to the Access database file.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

- Select connection **"MS Access"**.

- Select DBMS Driver: **MS Access ADO**

Connecting to Scriptcase

In this type of connection, we must enter the full path to the Access database file to make the connection.

Connection name

Define the name of your new connection in Scriptcase.

DBMS Driver

Select the access connection controller.

Server/Host(Name or IP)

Enter the full path to the Access database file.

User

Inform the user to connect to the Access database. **This option should only be completed if a user is configured as required when connecting to the Access database.**

Password

Enter the password to connect to the Access database. **This option should only be completed if a password is set as required when connecting to the Access database.**

Filter

We can configure the initial filtering of the information that the database will bring and display.

Show

In this option we will define if the connection will bring **Tables, Views, System Tables, Procedures**.

Searches

In this option we can configure the display of specific tables by user. If the elements are empty, the user informed in authentication will see all the data available.

- **Tables:** We will list the tables that can be displayed or not.
- **Owner:** We will inform the name of the user who has access to the required tables or to the complete database.

- **Show:** We will define if the reported elements will be shown or not in this connection.

Advanced

You can configure more advanced settings for the connection.

Decimal separator

This option allows you to define the decimal separator of numerical values. You can choose between dot (.) and comma (,).

Persistent Connection

Enabling this option will close connections when script execution completes.

Use the schema before the table name

This option causes Scriptcase to use the database schema before the table names in its actions. For example:

dbo.Account

- **dbo:** It is the name of the scheme used.
- **Account:** This is the name of the table that is used soon after.

IBM DB2

Scriptcase provides some driver options for connecting to DB2.

You can see if drivers are enabled by going to diagnosis.

Acessando pelo menu do Scriptcase.

After login, in the tool's top menu, access **Help > Diagnosis**.

Accessing directly through the browser

In your browser, without having to login to Scriptcase, you can access the diagnosis.

In case of local installations:

127.0.0.1:8092/scriptcase/diagnosis.php ou localhost:8092/scriptcase/diagnosis.php

In case of installation on a server.

domain.com/scriptcase/diagnosis.php

Click on the driver you want to use, according to your operating system.

Windows

- [DB2](#)
- [DB2 Native ODBC](#)

Linux

- [DB2](#)
- [DB2 Native ODBC](#)

Connecting with DB2

In Scriptcase, we have the following drivers available for connection to DB2: **DB2 and DB2 Native ODBC**. If you are using your own, pre-configured environment, DB2 extensions **must be manually enabled** in PHP.

Automatic Installation

If you installed the tool through the automatic installer, and did not install the driver at the time of installation. You must download the DB2 driver installer according to your architecture and install it. The installation will install the client and enable the necessary extensions.

To check the architecture, just access <http://127.0.0.1:8092/scriptcase/info.php>

x64

- scriptcase_database_drivers_v9.9-x64-php8.1: [Download](#)

x86

- scriptcase_database_drivers_v9.9-x64-php8.1: [Download](#)

After installing the drivers, go to how to configure the DSN connection by [clicking here](#)

Manual Installation

Prerequisites

Before proceeding with this documentation, check your PHP architecture. In order for drivers to be enabled correctly, **files must be downloaded according to the used architecture**.

- In your Scriptcase, there is the file **info.php**, access it by the URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find the information regarding the architecture in [phpinfo\(\)](#).

- Architecture **x86 = 32 bits**
- Architecture **x64 = 64 bits**

Listed below are the files required for DB2 drivers to be enabled.

Required files:

x64

- IBM Data Server Runtime Client **11.5(x64)**: [Click here](#)

x86

- IBM Data Server Runtime Client **11.5(x86)**: [Click here](#)

Other Files

- PHP extensions (**PHP_PDO_IBM and PHP_IBM_DB2**): [Click here](#)

Configuring DB2 on Windows

Before installing the IBM Data Server Runtime Client, you need to enable the extensions in PHP for Scriptcase to recognize the DB2 connection drivers. Follow them steps below to correctly enable all drivers in Scriptcase.

1 - Extract the .zip file and copy the downloaded **php_pdo_ibm** and **php_ibm_db2** .dll extension files [previously](#) to your PHP ext folder.

2 - In the `php.ini` file, located in `C:\php`, add the lines referring to the DB2 extensions **php_pdo_ibm** and **php_ibm_db2**. See the example below:

```
extension=ibm_db2
extension=pdo_ibm
```

3 - After downloading, follow the installation wizard by clicking on next, keeping the default values of the installer.

4 - Accept the terms and proceed with the installation.

5 - Click Next, to keep the default values of the installer.

6 - Click Install, to start the installation process.

7 - Click Finish to complete the installation.

8 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Search for the Apache or `apachesc9php81` service and **Restart** the service.

Creating the DSN for connection

To connect to the **DB2 PDO ODBC** Driver, you need to manually create a DataSource Name in the DB2 files. Follow the steps described below to perform this configuration.

ATTENTION: The ODBC must be created on the same server where Scriptcase is installed.

1 - Access your **ODBC Data Source Manager** and select according to your architecture. We will select the x64 version:

2 - When entering the ODBC Data Sources Administrator, select the **DSN System** tab and click **Add** to create your connection to your Access Database.

3 - After that, it is necessary to select the Driver to connect to DB2. Select the Driver: **IBM DB2 ODBC DRIVER**.

4 - Now, you need to define the DSN name and the Database alias.

- **Data Source Name:** Enter the name that the DSN will have so that you can use it in Scriptcase.
- **Database alias:** Include and enter the name of the database you will connect to.
- **Description:** Add a description for the DSN.

4.1 - After entering the name and description, click the button. After informing the name and description, click the **Include** button.

- **User ID:** Inform the user to authenticate with the DB2 database.
- **Password:** Enter the corresponding password to authenticate with the informed user.
- **Save Password:** By checking this option, the password is stored for future authentications and connection tests.

4.2 - Now, to configure the database, click on the **TCP/IP** tab.

- **Database Name:** Inform the database that you will connect to.
- **Database alias:** Enter the database alias, if the database has one. If not, use the same name as the database.
- **Hostname:** Enter the IP or domain of the server where the DB2 database is installed.
- **Port Number:** Enter the port for connection. By default, DB2 banks use port 50000.

To finish, click on **OK**.

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver and the DB2 database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **DB2** connection.

Connection

Enter the parameters for connecting to your database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Driver for connection. In this example, we use Driver **DB2**.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
- **EX:** dominiodoserver.com OR 192.168.254.170
- **Port:** Enter the port to connect to DB2. By default, the defined port is **50000**.
- **Database Name:** Enter the name of the database you will connect to.
- **EX:** SAMPLE
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database .**
- **Username:** Inform the user to authenticate the connection to your database.

- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty .**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above .**
- **View:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use client_encoding **UTF-8**.
 - **By default, this option is left blank by Scriptcase .**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the . dot is selected as a separator .**
- **Persistent Connection:** Define whether connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option .**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.

- **By default, Scriptcase enables this option .**

Connecting with DB2 Native ODBC

In Scriptcase, we have the following drivers available for connection to DB2: **DB2 and DB2 Native ODBC**. If you are using your own, pre-configured environment, DB2 extensions **must be manually enabled** in PHP.

Automatic Installation

If you installed the tool through the automatic installer, and did not install the driver at the time of installation. You must download the DB2 driver installer according to your architecture and install it. The installation will install the client and enable the necessary extensions.

To check the architecture, just access <http://127.0.0.1:8092/scriptcase/info.php>

x64

- scriptcase_database_drivers_v9.9-x64-php8.1: [Download](#)

x86

- scriptcase_database_drivers_v9.9-x86-php8.1: [Download](#)

Manual Installation

Prerequisites

Before proceeding with this documentation, check your PHP architecture. In order for drivers to be enabled correctly, **files must be downloaded according to the used architecture**.

- In your Scriptcase, there is the file **info.php**, access it by the URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find the information regarding the architecture in [phpinfo\(\)](#).

- Architecture **x86 = 32 bits**
- Architecture **x64 = 64 bits**

Listed below are the files required for DB2 drivers to be enabled.

Required files:

x64

- IBM Data Server Runtime Client **11.5(x64)**: [Click here](#)

x86

- IBM Data Server Runtime Client **11.5(x86)**: [Click here](#)

Other Files

- PHP extensions (**PHP_PDO_IBM and PHP_IBM_DB2**): [Click here](#)

Configuring DB2 Native ODBC on Windows

Before installing the IBM Data Server Runtime Client, you need to enable the extensions in PHP for Scriptcase to recognize the DB2 connection drivers. Follow them steps below to correctly enable all drivers in Scriptcase.

1 - Extract the .zip file and copy the downloaded **php_pdo_ibm** and **php_ibm_db2** .dll extension files [previously](#) to your PHP ext folder.

2 - In the php.ini file, located in C:\php, add the lines referring to the DB2 extensions **php_pdo_ibm** and

php_ibm_db2. See the example below:

```
extension=ibm_db2
extension=pdo_ibm
```

3 - After downloading, follow the installation wizard by clicking on next, keeping the default values of the installer.

4 - Accept the terms and proceed with the installation.

5 - Click Next, to keep the default values of the installer.

6 - Click Install, to start the installation process.

7 - Click Finish to complete the installation.

8 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Search for the Apache OR apachesc9php81 service and **Restart** the service.

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver and the DB2 database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **DB2** connection.

Connection

Enter the parameters for connecting to your database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Driver for connection. In this example, we use Driver **DB2 Native ODBC**.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
- **EX:** dominiodoserver.com OR 192.168.254.170

- **Port:** Enter the port to connect to DB2. By default, the defined port is **50000**.
- **Database Name:** Enter the name of the database you will connect to.
- **EX:** SAMPLE
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database .**
- **Username:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Here are the security options available for a DB2 connection and their descriptions:

Security

Defines the security mechanism used for the connection. It can include options like SSL, Kerberos, or other authentication protocols.

sslservercertificate

Specifies the server's SSL certificate file used to establish a secure connection. This helps verify the identity of the database server.

sslclientkeystoredb

Refers to the client-side keystore database file that contains SSL certificates and keys necessary for encrypted communication with the DB2 server.

sslclientkeystash

The keystore stash file that contains the encrypted password for the keystore database, allowing the client to access SSL keys securely without manual intervention.

Authentication

Defines the authentication method used for connecting to the DB2 server. It can include methods such as SERVER, CLIENT, or GSSAPI.

sslclientlabel

Specifies the label of the client certificate stored in the keystore database. This helps identify which certificate should be used when multiple certificates exist in the keystore.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty .**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above .**
- **View:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use client_encoding **UTF-8**.
 - **By default, this option is left blank by Scriptcase .**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the . dot is selected as a separator .**
- **Persistent Connection:** Define whether connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option .**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option .**

Connection to PDO DB2

At Scriptcase, we have the following drivers available for connection to DB2: **DB2 and DB2 Native ODBC**. If you are using your own, pre-configured environment, DB2 extensions must be enabled manually in PHP.

Automatic Installation

If you installed the tool through the automatic installer, and did not install the driver at the time of installation. You must download the DB2 driver installer and install it. The installation will install the client and enable the necessary extensions.

- scriptcase_database_drivers_linux_amd64_v9.9.run : [Download](#)

Running the installer

Enter the folder where the installer is located and grant the installer permission

```
sudo chmod +x scriptcase_database_drivers_linux_amd64_v9.9.run
```

Run the installer

```
./scriptcase_database_drivers_linux_amd64_v9.9.run
```

After installing the drivers, go to how to configure the **db2dsdriver.cfg** [clicking here](#)

Manual Installation

Prerequisites

Before proceeding with this documentation, check your PHP architecture. In order for the drivers to be enabled correctly, **files must be downloaded according to the architecture used**.

- In your Scriptcase, there is the file **info.php**, access it by the URL: `http://127.0.0.1:8092/scriptcase/info.php`, where you will find the information regarding the architecture in `phpinfo()`.

CAUTION: Download the dsdriver according to your PHP architecture.

- Architecture **i386/i686 = 32 bits**
- Architecture **x86_64 = 64 bits**

Required files:

x64

- IBM DsDriver **Linux(x64)**: [click here](#)

x86

- IBM DsDriver **Linux(x86)**: [click here](#)

Follow them steps below to correctly enable all drivers in Scriptcase.

1 - Install the dependencies below:

UBUNTU\DEBIAN

- sudo apt-get update
- sudo apt-get install libaio1
- sudo apt-get install libncurses5
- sudo apt-get install alien
- sudo apt-get install gcc-multilib g++-multilib
- sudo apt-get install libpam0g
- sudo apt-get install ksh

CENTOS\RHEL

- sudo yum update
- sudo yum install libaio-devel
- sudo yum install libaio
- sudo yum install glibc
- sudo yum install compat-libstdc++-33
- sudo yum install glibc-devel
- sudo yum install libstdc++

UBUNTU\DEBIAN

```
- sudo apt-get install unixodbc-dev
unixodbc
```

CENTOS\RHEL

```
- sudo yum install libstdc++
- sudo yum install pam
- sudo yum install ncurses-devel
- sudo yum install unixODBC
- sudo wget ftp://195.220.108.108/linux/centos/6.7/os/i386/Packages/ksh-20120801-28.el6.i686.rpm
- sudo yum install ksh-20120801-28.el6.i686.rpm
- sudo yum install nano
```

2 - Install the IBM DB2 DsDriver:**ARCHITECTURE x86**

```
- sudo mkdir -p /opt/IBM/Db2
- sudo cp sudo cp x86_v10.5fp8_linuxia32_dsdriver.tar.gz
/opt/IBM/Db2
- sudo tar -zxf /opt/IBM/Db2/x86_v10.5fp8_linuxia32_dsdriver.tar.gz
- sudo ksh /opt/IBM/Db2/dsdriver/installDSDriver
```

ARCHITECTURE x64

```
- sudo mkdir -p /opt/IBM/Db2
- sudo cp x64_v10.5fp8_linuxx64_dsdriver.tar.gz /opt/IBM/Db2
- sudo tar -zxf
/opt/IBM/Db2/x64_v10.5fp8_linuxx64_dsdriver.tar.gz
- sudo ksh /opt/IBM/Db2/dsdriver/installDSDriver
```

3 - Restart the Apache service:**UBUNTU\DEBIAN****CENTOS\RHEL**

```
sudo service apache2 restart sudo systemctl restart httpd
```

Configuring the db2dsdriver.cfg file

Before creating the connection in the Scriptcase interface, you need to configure the **db2dsdriver.cfg** file

1 : Give recursive permission on the file directory if you do not have permission to manipulate the file.

Automatic Installation

```
- sudo chmod -R 755 /opt/Scriptcase/v9-
php81/components/drivers/IBM/Db2/dsdriver/cfg/
```

Manual Installation

```
- sudo chmod -R 755
/opt/IBM/Db2/dsdriver/cfg/
```

2 : Open the db2dsdriver.cfg file and configure the file as in the structure below

```
<configuration>
<dsncollection>
  <dsn alias="db2" name="db2" host="hotel53.torolab.ibm.com" port="5000" ldap=1/>
</dsncollection>
<databases>
  <database name="SAMPLE" host="hotel53.torolab.ibm.com" port="5000">
    </database>
  </databases>
</configuration>
```

In automatic installation, you must first rename the **db2dsdriver.cfg.sample** file to **db2dsdriver.cfg**

In manual installation, if you don't find the file, you can create it

After configuring the file, restart Apache and create the connection.

Automatic Installation**Manual Installation**

UBUNTU: sudo service apachesc9php81 restart

sudo service apache2 restart

CENTOS/RHEL: sudo service apachesc9php81 restart sudo systemctl restart httpd

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver and the DB2 database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **DB2** connection.

Connection

Enter the parameters for connecting to your database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Driver for connection. In this example, we use the **DB2 ODBC Genérico** driver.
- **Server/Host (Name or IP):** Enter the System DSN created in the ODBC Data Source.
- **EX:** db2
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database .**
- **Username:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Here are the security options available for a DB2 connection and their descriptions:

Security

Defines the security mechanism used for the connection. It can include options like SSL, Kerberos, or other authentication protocols.

sslservercertificate

Specifies the server's SSL certificate file used to establish a secure connection. This helps verify the identity of the database server.

sslclientkeystoredb

Refers to the client-side keystore database file that contains SSL certificates and keys necessary for encrypted communication with the DB2 server.

sslclientkeystash

The keystore stash file that contains the encrypted password for the keystore database, allowing the client to access SSL keys securely without manual intervention.

Authentication

Defines the authentication method used for connecting to the DB2 server. It can include methods such as SERVER, CLIENT, or GSSAPI.

sslclientlabel

Specifies the label of the client certificate stored in the keystore database. This helps identify which certificate should be used when multiple certificates exist in the keystore.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty .**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above .**
- **View:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use client_encoding **UTF-8**.
 - **By default, this option is left blank by Scriptcase .**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the . dot is selected as a separator .**
- **Persistent Connection:** Define whether connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option .**
- **Use the schema before the table name:** Define whether the database schema will be displayed

before the table names.

- **By default, Scriptcase enables this option .**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connection to DB2 Native ODBC

At Scriptcase, we have the following drivers available for connection to DB2: **DB2 and DB2 Native ODBC**. If you are using your own, pre-configured environment, DB2 extensions must be enabled manually in PHP.

Automatic Installation

If you installed the tool through the automatic installer, and did not install the driver at the time of installation. You must download the DB2 driver installer and install it. The installation will install the client and enable the necessary extensions.

- scriptcase_database_drivers_linux_amd64_v9.9.run : [Download](#)

Running the installer

Enter the folder where the installer is located and grant the installer permission

```
sudo chmod +x scriptcase_database_drivers_linux_amd64_v9.9.run
```

Run the installer

```
./scriptcase_database_drivers_linux_amd64_v9.9.run
```

After the installation, restart Scriptcae apache

```
sudo service apachesc9php81 restart
```

Manual Installation

Prerequisites

Before proceeding with this documentation, check your PHP architecture. In order for the drivers to be enabled correctly, **files must be downloaded according to the architecture used**.

- In your Scriptcase, there is the file **info.php**, access it by the URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find the information regarding the architecture in [phpinfo\(\)](#).

CAUTION: Download the IBM DsDriver client according to your PHP architecture.

- Architecture **i386/i686 = 32 bits**
- Architecture **x86_64 = 64 bits**

Required files:

x64

- IBM DsDriver **Linux(x64)**: [click here](#)

x86

- IBM DsDriver **Linux(x86)**: [click here](#)

Follow the steps below to correctly enable all drivers in Scriptcase.

1 - Install the dependencies below:

UBUNTU\DEBIAN

- sudo apt-get update
- sudo apt-get install libaio1
- sudo apt-get install libncurses5
- sudo apt-get install alien

CENTOS\RHEL

- sudo yum update
- sudo yum install libaio-devel
- sudo yum install libaio
- sudo yum install glibc

UBUNTU\DEBIAN

```
- sudo apt-get install gcc-multilib g++-multilib
- sudo apt-get install libpam0g
- sudo apt-get install ksh
- sudo apt-get install unixodbc-dev
unixodbc
```

CENTOS\RHEL

```
- sudo yum install compat-libstdc++-33
- sudo yum install glibc-devel
- sudo yum install libstdc++
- sudo yum install libstdc++
- sudo yum install pam
- sudo yum install ncurses-devel
- sudo yum install unixODBC
- sudo wget ftp://195.220.108.108/linux/centos/6.7/os/i386/Packages/ksh-20120801-28.el6.i686.rpm
- sudo yum install ksh-20120801-28.el6.i686.rpm
- sudo yum install nano
```

2 - Install the IBM DB2 DsDriver:**ARCHITECTURE x86**

```
- sudo mkdir -p /opt/IBM/Db2
- sudo cp sudo cp x86_v10.5fp8_linuxia32_dsdriver.tar.gz /opt/IBM/Db2
- sudo tar -zxf /opt/IBM/Db2/x86_v10.5fp8_linuxia32_dsdriver.tar.gz
- sudo ksh /opt/IBM/Db2/dsdriver/installDSDriver
```

ARCHITECTURE x64

```
- sudo mkdir -p /opt/IBM/Db2
- sudo cp x64_v10.5fp8_linuxx64_dsdriver.tar.gz /opt/IBM/Db2
- sudo tar -zxf /opt/IBM/Db2/x64_v10.5fp8_linuxx64_dsdriver.tar.gz
- sudo ksh /opt/IBM/Db2/dsdriver/installDSDriver
```

3 - Restart the Apache service:**UBUNTU\DEBIAN****CENTOS\RHEL**

```
sudo service apache2 restart sudo systemctl restart httpd
```

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver and the DB2 database.

1 - Access a project from your Scriptcase.**2 - Click the **New Connection** icon to create a connection**

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **DB2 connection.**

Connection

Enter the parameters for connecting to your database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Driver for connection. In this example, we use Driver **DB2 Native ODBC**.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
- **EX:** dominiodoserver.com OR 192.168.254.170

- **Port:** Enter the port to connect to DB2. By default, the defined port is **50000**.
- **Database Name:** Enter the name of the database you will connect to.
- **EX:** SAMPLE
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database .**
- **Username:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Here are the security options available for a DB2 connection and their descriptions:

Security

Defines the security mechanism used for the connection. It can include options like SSL, Kerberos, or other authentication protocols.

sslservercertificate

Specifies the server's SSL certificate file used to establish a secure connection. This helps verify the identity of the database server.

sslclientkeystoredb

Refers to the client-side keystore database file that contains SSL certificates and keys necessary for encrypted communication with the DB2 server.

sslclientkeystash

The keystore stash file that contains the encrypted password for the keystore database, allowing the client to access SSL keys securely without manual intervention.

Authentication

Defines the authentication method used for connecting to the DB2 server. It can include methods such as SERVER, CLIENT, or GSSAPI.

sslclientlabel

Specifies the label of the client certificate stored in the keystore database. This helps identify which certificate should be used when multiple certificates exist in the keystore.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty .**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above .**
- **View:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use client_encoding **UTF-8**.
 - **By default, this option is left blank by Scriptcase .**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the . dot is selected as a separator .**
- **Persistent Connection:** Define whether connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option .**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option .**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Firebird with Scriptcase

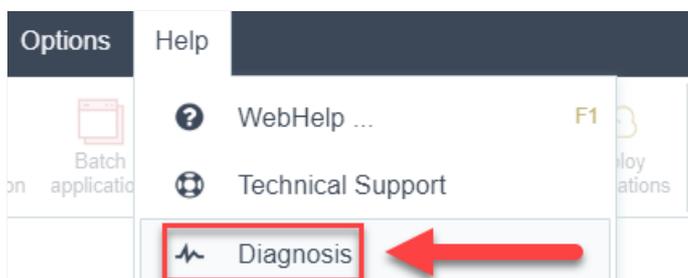

Scriptcase, installed in environments with PHP 8.1, provides only the **Firebird PDO** driver to make the connection with Firebird.

For environments with PHP 7.3 the Firebird driver is also available. See the articles according to your operating system: [Firebird in Scriptcase with PHP 7.3 - Windows](#) [Firebird in Scriptcase with PHP 7.3 - Linux](#) [Firebird in Scriptcase with PHP 7.3 - MacOS](#)

In Scriptcase, we have two drivers to connect with Firebird. You must choose the most suitable for your environment. It is recommended to use **Firebird PDO** which is more faster, however it is up to you to choose the driver. **If you are using your own pre-configured environment, Firebird extensions must be manually enabled in PHP.**

You can check your enabled drivers by accessing your Scriptcase diagnosis. See below on how to locate your diagnosis and check if the driver is enabled.

- Accessing the top menu **Help > Diagnosis**, you can easily find it through the interface.

- Or, by accessing your browser url:

127.0.0.1:8092/scriptcase/diagnosis.php or domain.com/scriptcase/diagnosis.php

If the desired driver is already enabled and you just want to know how to connect with Scriptcase, click on the link below according to the driver that will be used.

- Windows - [Firebird PDO](#)
- Linux - [Firebird PDO](#)
- macOS - [Firebird PDO](#)

Connecting with Firebird PDO

In Scriptcase, we have the following drivers available for Firebird connections: **Firebird PDO**. If you are using your own pre-configured environment, the Firebird extensions must be enabled manually in PHP.

Prerequisites

If you are using a manual installation on Windows, you will need to enable the Firebird extensions in the **php.ini** file. See below for how to do this.

1 - In the `php.ini` file located under `C:\php`, uncomment the line for the Firebird extension **pdo_firebird** by removing the `;` from the start of the line. See the example below:

2 - Restart the Apache service using the **Task Manager**.

- Open Task Manager and click on the **Services** tab.
- Look for the `Apache2.4` or `ApacheScriptcase9php81` service and right click on this service, then **Restart**.

Creating a connection in Scriptcase

Here's how to create a connection in your Scriptcase project using the Firebird database.

1 - Access any project from your Scriptcase.

2 - Click on the **New connection** icon to create a connection.

or go to the **Database > New Connection** menu.

After that a new page will appear with all the database connections.

3 - Select the **Firebird** connection.

Connection

Enter the parameters for connecting to your Firebird database as follows:

- **Connection Name:** Set the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Firebird Driver used to connect. In this example we use the **Firebird PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
 - **Ex:** `serverdomain.com` or `192.168.254.170`.
- **Port:** Enter the numeric port for your database server.
 - **Ex:** `3050`
- **Database Name:** Enter the database created for use by the entered user.
- **Username:** Enter the user to authenticate the connection to your Firebird database.
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click this button to get a response from Scriptcase request to know if the entered parameters are correct.

Filter

By accessing this tab, you can configure which items from the Database will be displayed in the connection, depending on the owner or not.

Show

Allows the Firebird connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** Selecting this option will display your database views.
 - **By default, Scriptcase enables this option.**
- **System tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** When you select this option, the procedures from your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables are displayed. The setting can contain a PREFIX% or name of the tables to be displayed.
 - **By default, Scriptcase leaves this option empty.**
 - **Ex:**

- **Owner:** Inform the user who sees the inserted tables for display.
 - **User must be in capital letters, as in the example above.**
- **Show:** Choose whether tables are displayed for the owner entered.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improve the performance** of your database connection.

Advanced

In this tab, you have access to connection-specific settings. Changes made in this section impact the data display and performance of the application.

Charset

Select the encoding used in your database.

Role

Defines the user role for the database session. Roles are used to manage permissions and access control within Firebird.

You can set more than one role for the user separating them by using the “;”

Dialect

Determines the SQL dialect used in the connection. Firebird supports different dialects (1, 2, or 3), which affect SQL syntax and behavior.

If the option in the database is set to 2, it doesn't matter what option you choose in this field.

- **Options:**
 - **Empty** - Gets the default from the database.
 - **1** - Old version of Firebird (1.5) > Does not support timestamp, Numeric or Decimal
 - **2** - Version with timestamp support
 - **3** - Version - Newer versions (Case sensitive and compatible with Firebird 2.5, 3 and 4)

Decimal Separator

Select the separator type for decimal records, between comma and period.

- **By default, period . is selected as the separator.**

Persistent connection

Set whether connections will be closed after your scripts run in Scriptcase applications.

- **By default, Scriptcase disables this option.**

Use schema before table name

Set whether the database schema is displayed before table names.

- **By default, Scriptcase enables this option.**

- **Ex:**

Connecting with Firebird PDO

In Scriptcase, we have the following driver available for Firebird connection: **Firebird PDO**. If you are using your own pre-configured environment, the Firebird extensions must be enabled manually in PHP.

Prerequisites

If you are using a manual installation on Linux, you will need to install the Firebird php extension. See below for how to do this.

1 - Log into your **Linux** terminal and type this line below according to your operating system to install the Firebird PDO driver.

Ubuntu

```
sudo apt-get install php8.1-interbase
```

CentOS

```
sudo yum install php-interbase
```

2 - Check that the Firebird driver is enabled in your Scriptcase diagnostics. Here is how to locate your diagnostics and verify that the driver is enabled.

- By accessing the top menu **Help > Diagnostics**, you can find it easily through the interface.

- Or, by accessing your Scriptcase installation path:

127.0.0.1/scriptcase/diagnosis.php OR domain.com/scriptcase/diagnosis.php

Creating a connection in Scriptcase

Here's how to create a connection in your Scriptcase project using the Firebird database.

1 - Access any project from your Scriptcase.

2 - Click on the **New connection** icon to create a connection.

or go to the **Database > New Connection** menu.

After that a new page will appear with all the database connections.

3 - Select the **Firebird** connection.

Connection

Enter the parameters for connecting to your Firebird database as follows:

- **Connection Name:** Set the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Firebird Driver used to connect. In this example we use the **Firebird PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
 - **Ex:** serverdomain.com OR 192.168.254.170.
- **Port:** Enter the numeric port for your database server.
 - **Ex:** 3050
- **Database Name:** Enter the database created for use by the entered user.
- **Username:** Enter the user to authenticate the connection to your Firebird database.

- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click this button to get a response from Scriptcase request to know if the entered parameters are correct.

Filter

By accessing this tab, you can configure which items from the Database will be displayed in the connection, depending on the owner or not.

Show

Allows the Firebird connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**

Informix in Scriptcase

In Scriptcase, we have the following driver available for connecting to Informix: **Informix PDO**. If you are using your own pre-configured environment, **the Informix extension must be enabled manually in PHP**.

You can verify that the driver is enabled by accessing your Scriptcase diagnostic. Here is how to locate your diagnostics.

- By accessing the top menu **Help > Diagnostics**, you can easily find it through the interface.

- Or, by accessing the url in your browser:

127.0.0.1:8092/scriptcase/diagnosis.php or domain.com/scriptcase/diagnosis.php

If the driver is already enabled and you just want to know how to connect to Scriptcase, click on the link below according to the operating system that will be used.

Environment	Informix PDO
Windows	Conecte
Linux	Conecte
macOS	Conecte

Connection with Informix - Windows

In Scriptcase, we have the following driver available for connecting to Informix: **Informix PDO**. If you are using your own pre-configured environment, the Informix extension must be enabled manually in PHP.

NOTE: On automatic Scriptcase installation, the Informix PDO driver is already enabled. Just follow the steps to connect by clicking [here](#).

Prerequisites

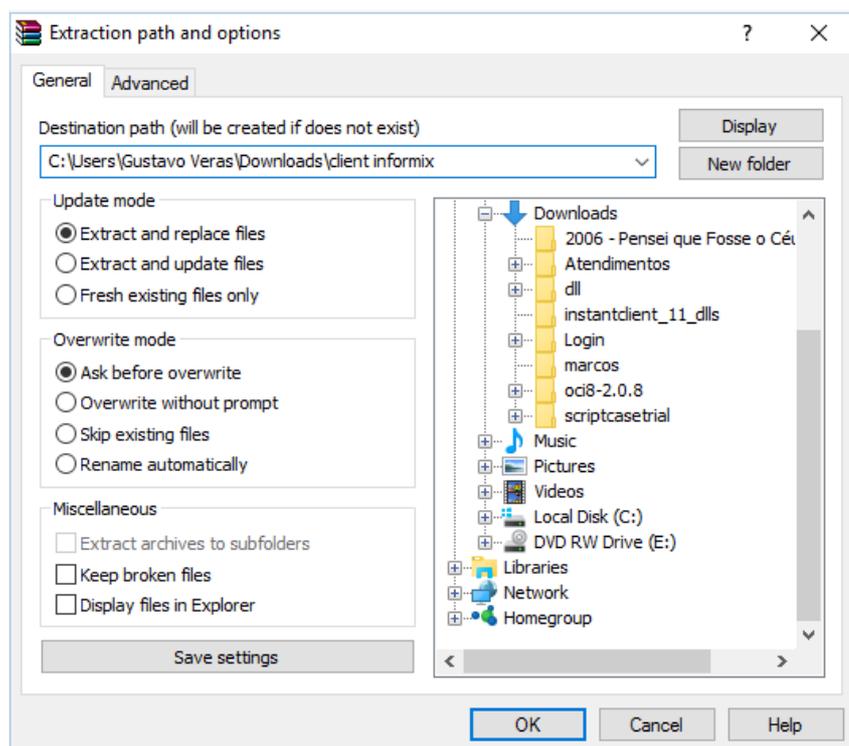

If you are using a manual installation on Windows, you will need to enable the Informix extension in the **php.ini** file and install the **Client SDK**. See below for how to do this.

- Download the instant client SDK compatible with your operating system's **x64** or **x86** architecture. Click [here](#) to access the Informix SDK Client Download page.
 - **x86 = 32 bits**
 - **x64 = 64 bits**

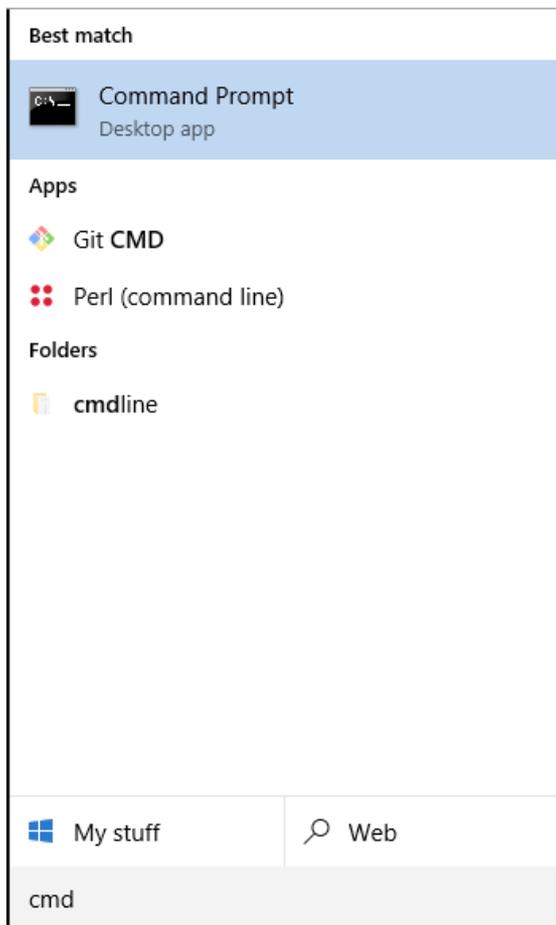

Informix SDK Client Installation

1 - Unzip the file into any folder.

- **Example:** `client informix`

2 - Access your windows **CMD** by searching for command prompt in Windows search or by pressing **ctrl+r** and typing `cmd` in execute.

3 - When starting **CMD**, access the folder where the file was saved after downloading using the **cd** command and entering the path to the folder the SDK client is in. Example:

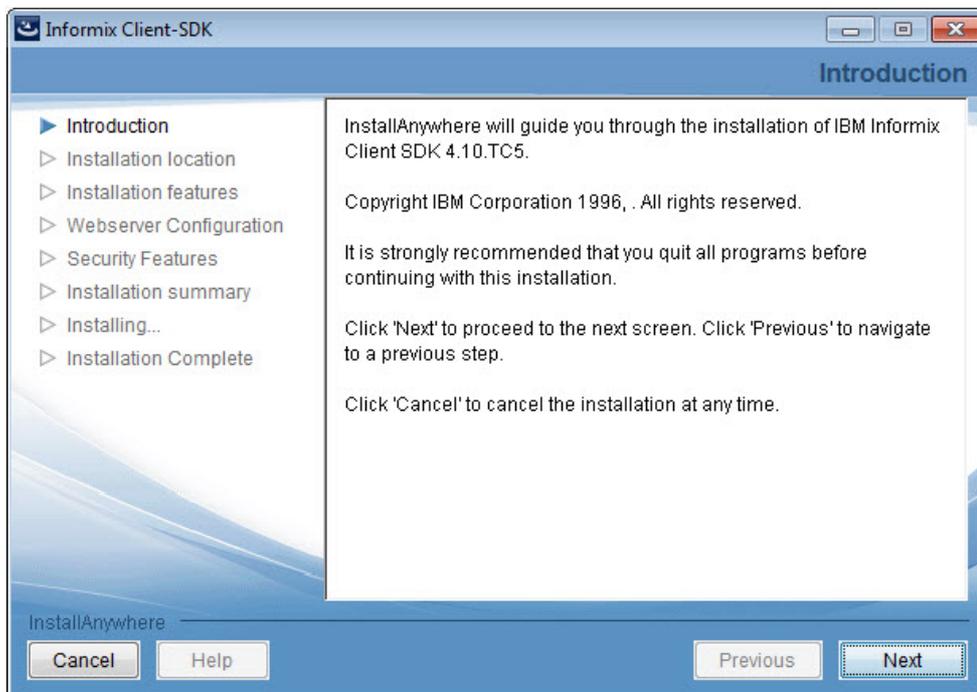

```
C:\WINDOWS\system32\cmd.exe
C:\Users\alvar>cd "Downloads\client informix"
```

4 - Then run the .exe file with the **-i** and **GUI** parameters.

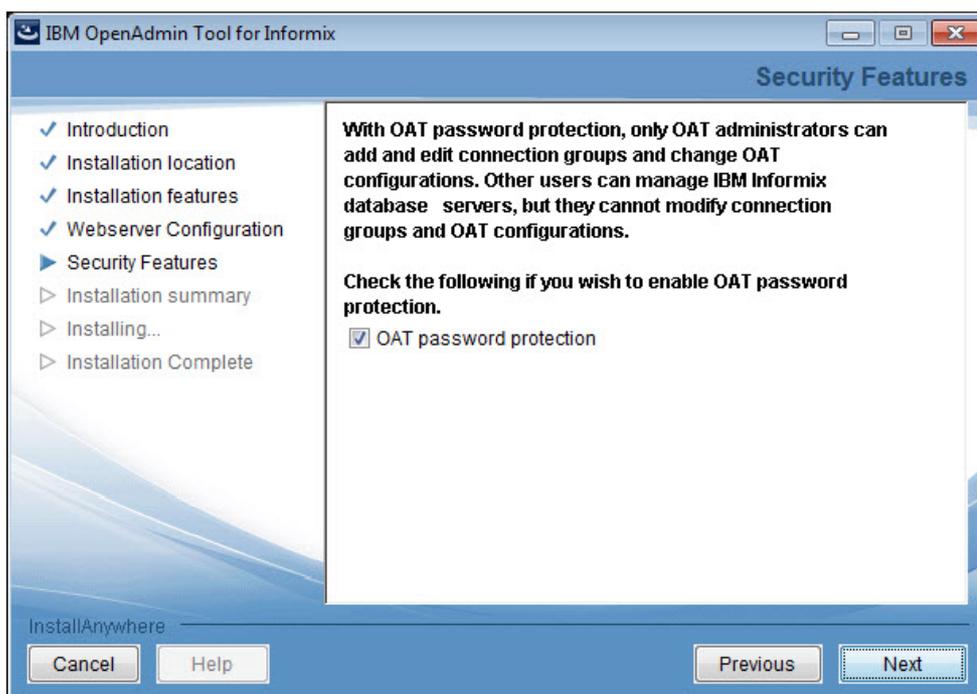

- **Example:** `installclientsdk.exe -i GUI`

```
C:\WINDOWS\system32\cmd.exe
Microsoft Windows [versão 10.0.10586]
(c) 2015 Microsoft Corporation. Todos os direitos reservados.
C:\Users\alvar>cd "Downloads\client informix"
C:\Users\alvar\Downloads\client informix>installclientsdk.exe -i GUI
```

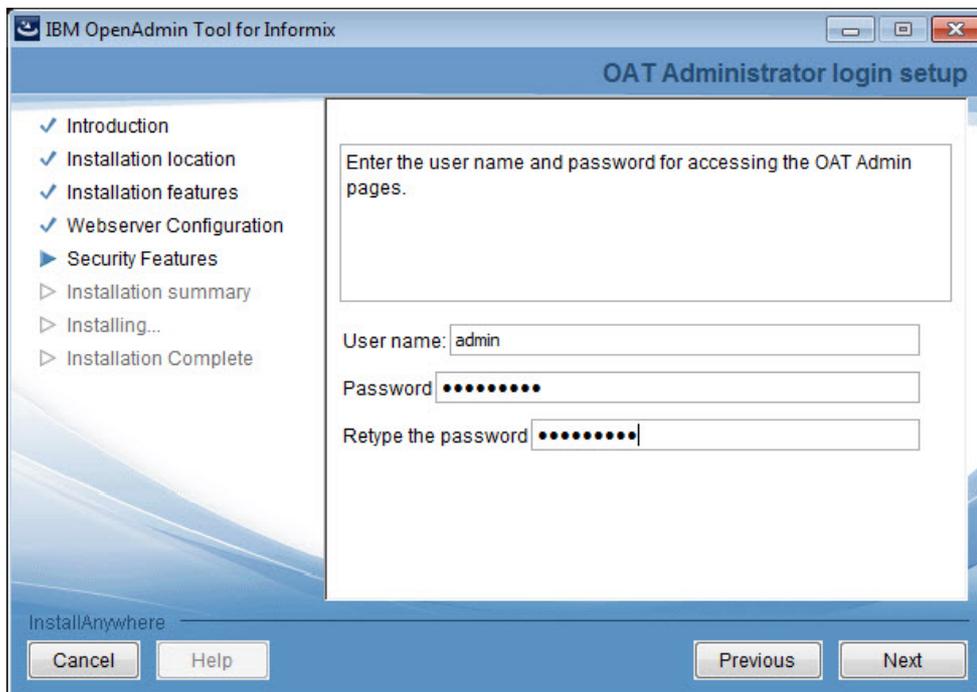

5 - Follow the client installation wizard by clicking next to keep the default values for the installation. Pay attention to the Security Features step.

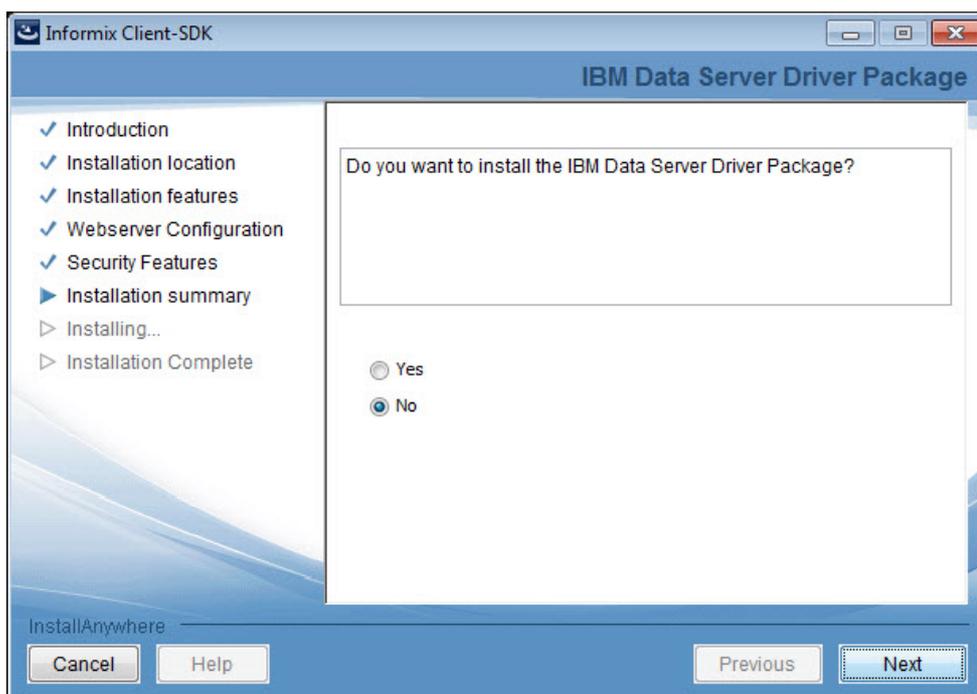

6 - Here you can choose whether or not to use a password to access the OAT (Informix Administration Application)

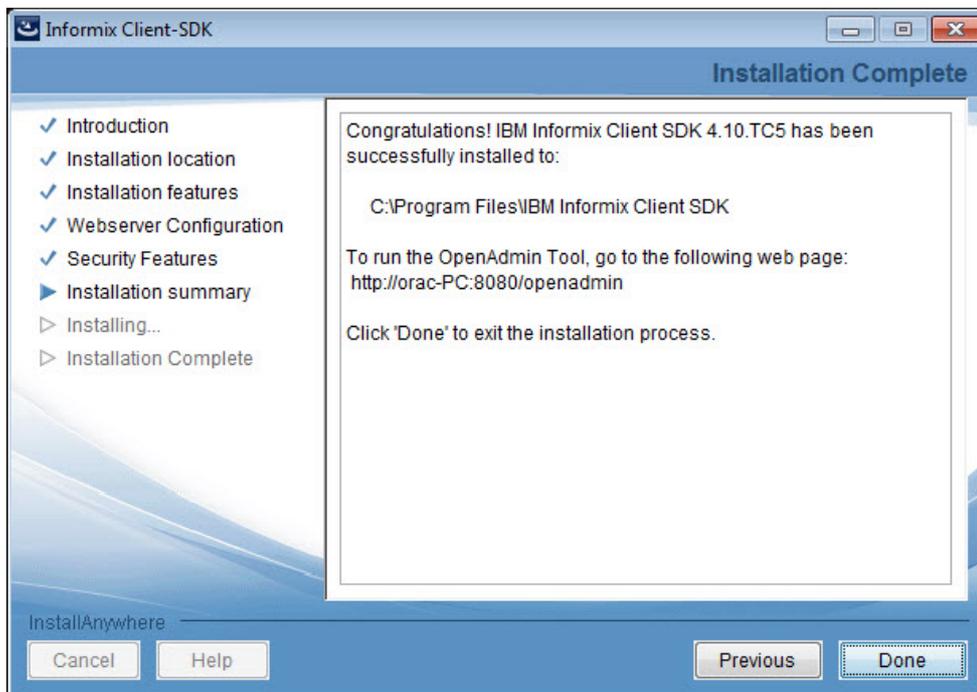

7 - Set your login and password, if you have checked the **OAT password protection** option

8 - Select **NO** and proceed with the installation as usual.

9 - Proceed with the installation by clicking on **Done** and wait for the process to finish.

Setting `php.ini`.

1 - In the `php.ini` file, located under `C:\php`, uncomment the line for the Informix extension `php_pdo_informix` by removing the `;` from the start of the line. See the example below:

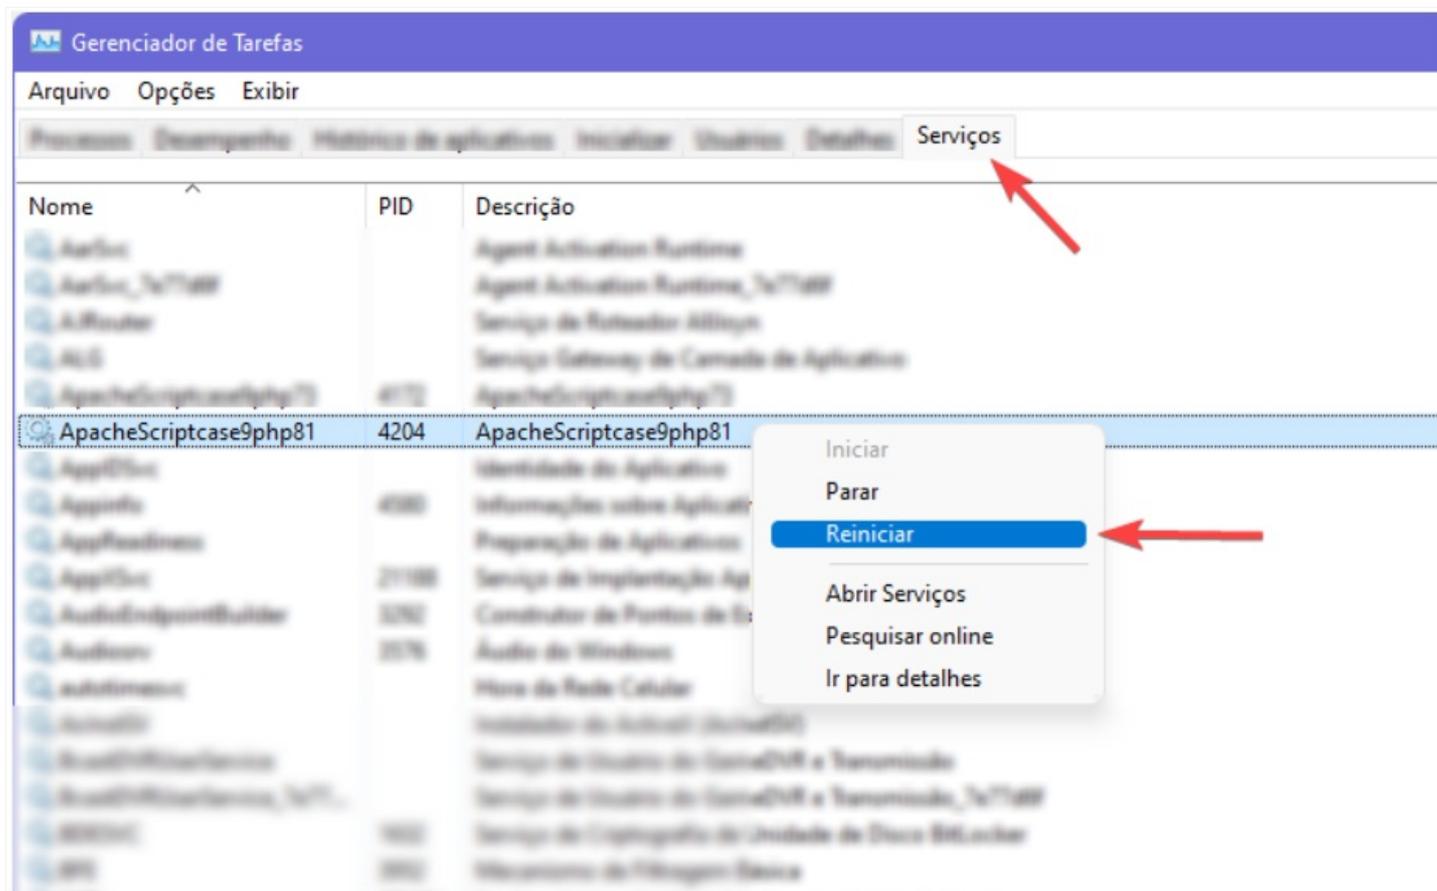

```

906 ;extension=bz2
907 ;extension=curl
908 ;extension=fileinfo
909 ;extension=gd2
910 ;extension=gettext
911 ;extension=gmp
912 ;extension=intl
913 ;extension=imap
914 extension=interbase
915 ;extension=ldap
916 ;extension=mbstring
917 ;extension=exif ; Must be after mbstring as it depends on it
918 extension=mysqli
919 ;extension=oci8_12c ; Use with Oracle Database 12c Instant Client
920 ;extension=odbc
921 ;extension=openssl
922 extension=pdo_firebird
923 extension=pdo_mysql
924 extension=pdo_oci
925 extension=pdo_odbc
926 extension=pdo_pgsql
927 extension=pdo_sqlite
928 extension=pgsql
929 ;extension=shmop
930 extension=php_pdo_informix

```

2 - Restart the Apache service using the **Task Manager**.

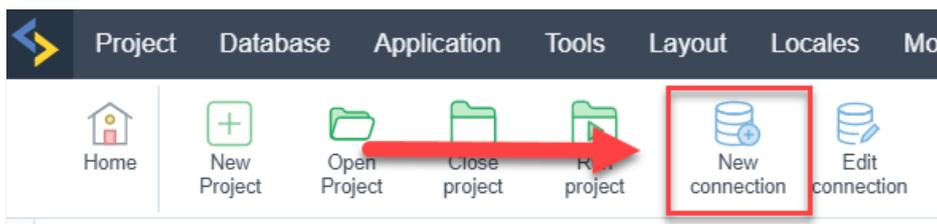

- Open Task Manager and click on the **Services** tab.
- Look for the `Apache2.4` or `ApacheScriptcase9php73` service and right-click on this service, then **Restart**.

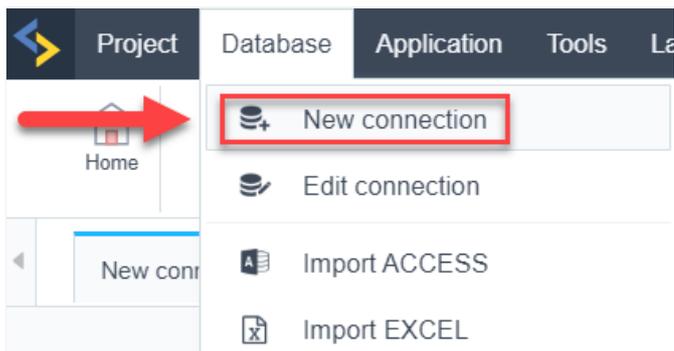

Creating a Connection in Scriptcase

Here is how to create a connection in your Scriptcase project using the Informix database.

- 1 - Access any project from your Scriptcase.
- 2 - Click on the **New Connection** icon to create a connection.

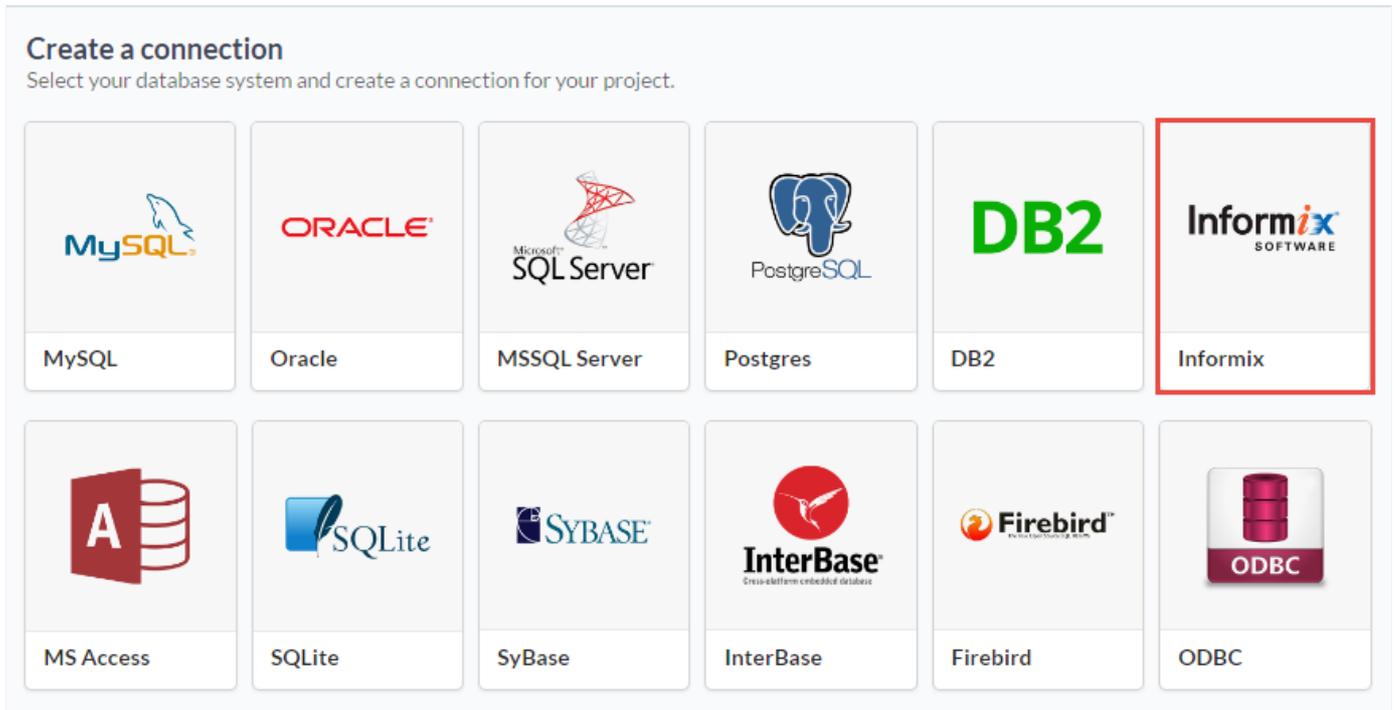

or go to the **Database > New Connection** menu.

After that, a new page will appear with all the database connections.

3 - Select the connection **Informix**.

Create a connection
Select your database system and create a connection for your project.

The screenshot shows a grid of database connection options. The 'Informix' option is highlighted with a red border. The options are:

- MySQL
- Oracle
- MSSQL Server
- Postgres
- DB2
- Informix** (highlighted)
- MS Access
- SQLite
- SyBase
- InterBase
- Firebird
- ODBC

Connection

Enter the parameters for connecting to your Informix database as follows:

Create a connection Informix
Enter the connection details for your database Informix

← Choose another connection

- By default, period `.` is selected as the separator.
- **Persistent connection:** Set whether connections will be closed after your scripts run in Scriptcase applications.
 - By default, Scriptcase disables this option.
- **Use schema before table name:** Set whether the database schema is displayed before table names.
 - By default, Scriptcase enables this option.
 - **Ex:**

Using the schema before table name	Not using the schema before table name
<p>Connection *</p> <p>conn_oracle ▼</p> <p>Table</p> <p>"SYSTEM".COL ▼ </p>	<p>Connection *</p> <p>conn_oracle ▼</p> <p>Table</p> <p>COL ▼ </p>

Connection with Informix - Linux

In Scriptcase, we have the following driver available for connecting to Informix: **Informix PDO**. If you are using your own pre-configured environment, the Informix extension must be enabled manually in PHP.

NOTE: In the automatic installation of Scriptcase, the Informix PDO driver can be enabled if desired, during the installation process. If you have enabled it, just follow the steps to connect by clicking [here](#). If you have not enabled it, see below how to enable the driver.

Enabling driver (Automatic installation)

1 - Download SDK Informix Driver by Clicking [here](#)

2 - Go to the directory `/opt/Scriptcase/v9-php81/components/drivers/` and create the following folders: **IBM/informix**

The full path should be: `/opt/Scriptcase/v9-php81/components/drivers/IBM/informix`

3 - Extract the files inside the folder **informix**

4 - Enter the **informix** folder through the terminal and run the command below

```
sudo tar -xf clientsdk.4.10.FC16_672.LINUX.tar
```

5 - Run the installation file using the command below:

```
sudo ./installclientsdk
```

6 - When entering the installation process, type **1** to accept the terms and then type the absolute path of the driver folder and press ENTER.

The absolute path must be: `/opt/Scriptcase/v9-php81/components/drivers/IBM/informix` as shown in the image below

```

Contrato Internacional de Licença de Programa

Where Would You Like to Install Informix Client-SDK 4.10.FC16?

Default Install Folder: /opt/IBM/Informix_Client-SDK

ENTER AN ABSOLUTE PATH, OR PRESS <ENTER> TO ACCEPT THE DEFAULT
: /opt/Scriptcase/v9-php81/components/drivers/IBM/informix/

```

7 - Then choose the features that will be installed by the installer. Choose all features as shown in the image and press ENTER to proceed

```

=====
Choose ClientSDK Features to Install
-----

ENTER A COMMA_SEPARATED LIST OF NUMBERS REPRESENTING THE FEATURES YOU WOULD
LIKE TO SELECT, OR DESELECT. TO VIEW A FEATURE'S DESCRIPTION, ENTER
'?<NUMBER>'. PRESS <RETURN> WHEN YOU ARE DONE:

 1- [X] Informix Client-SDK
 2-  |-[X] Informix Object Interface for C++
 3-    |-[X] Informix Object Interface for C++ Demos
 4-  |-[X] Informix ESQL/C
 5-    |-[X] Informix ESQL/C Demos
 6-    |-[X] 7.2 Application Compatibility Module
 7-  |-[X] Informix LIBDMI for Client Applications
 8-  |-[X] Informix ODBC Driver
 9-    |-[X] Informix ODBC Driver Demos
10-  |-[X] Informix Common Database Utilities
11- [X] Global Language Support (GLS)
12-  |-[X] West European and Americas
13-  |-[X] East European and Cyrillic
14-  |-[X] Chinese
15-  |-[X] Japanese
16-  |-[X] Korean
17-  |-[X] Thai

Press <ENTER> to install above selected features or choose the corresponding
number to change the feature selection: 1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17

```

8 - Wait for the installation to complete. You should see information that the installation was completed successfully.

```

=====
Installation Complete
-----

Congratulations. Informix Client-SDK 4.10.FC16 has been successfully installed
to:

/opt/Scriptcase/v9-php81/components/drivers/IBM/informix

PRESS <ENTER> TO EXIT THE INSTALLER:
root@jader-VirtualBox: /opt/Scriptcase/v9-php81/components/drivers/IBM/informix#

```

9 - Restart the Apache

```
sudo service apachesc9php81 restart
```

Enabling driver (Manual installation)

Prerequisites

Install the dependencies below:

UBUNTU\DEBIAN	CENTOS\RHEL
- sudo apt-get update	- sudo yum update
- sudo apt-get install libaio1	- sudo yum install libaio-devel
- sudo apt-get install libncurses5	- sudo yum install libaio
- sudo apt-get install alien	- sudo yum install glibc
- sudo apt-get install gcc-multilib g++-multilib	- sudo yum install compat-libstdc++-33
- sudo apt-get install libpam0g	- sudo yum install glibc-devel
- sudo apt-get install ksh	- sudo yum install libstdc++
- sudo apt-get install unixodbc-dev unixodbc	- sudo yum install libstdc++
	- sudo yum install pam
	- sudo yum install ncurses-devel
	- sudo yum install unixODBC
	- sudo wget ftp://195.220.108.108/linux/centos/6.7/os/i386/Packages/ksh-20120801-28.el6.i686.rpm
	- sudo yum install ksh-20120801-28.el6.i686.rpm
	- sudo yum install nano

Informix SDK Client Configuration and Installation

1 - Download the instant client SDK compatible with your operating system's **x64** or **x86** architecture. Click [here](#) to access the Informix SDK Client Download page.

- **x86 = 32 bits**
- **x64 = 64 bits**

NOTE: The Informix client installation directory must be according to your architecture:

- **32 Bits:** /opt/IBM/ifx
- **64 Bits:** /opt/IBM/x64/informix

2 - Realize a instalação do Client SDK:

x86 Architecture	x64 Architecture
1 - sudo tar -xf x86_clientsdk.3.70.UC8DE.LINUX.tar	1 - sudo tar -xf x64_clientsdk.4.10.FC6DE.LINUX.tar
2 - sudo ./installclientsdk	2 - sudo ./installclientsdk
3 - Select 1 to accept the terms.	3 - Select 1 to accept the terms.
4 - Select the options: 1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17	4 - Select the options: 1,2,3,4,5,6,7,8,9,10,11,12,13,14,15,16,17

Proceed with completing the installation.

3 - Restart the Apache service using the following command in the terminal:

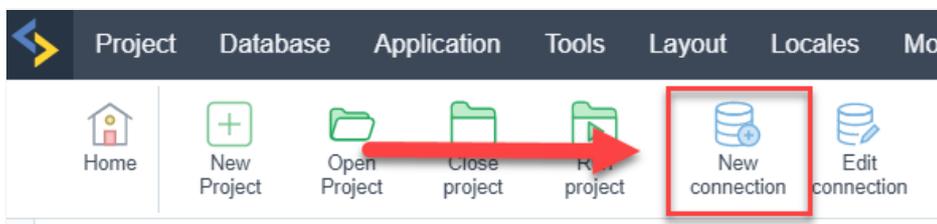

Ubuntu 20\Debian 9 or Higher	CentOS 7/8 or Higher
<code>sudo service apache2 restart</code>	<code>sudo systemctl restart httpd</code>

Creating a Connection in Scriptcase

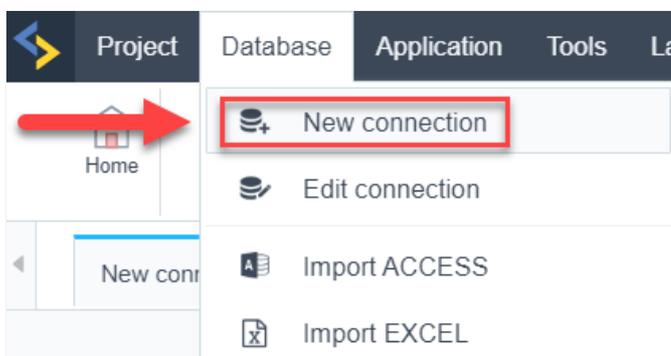

Here is how to create a connection in your Scriptcase project using the Informix database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or go to the **Database > New Connection** menu.

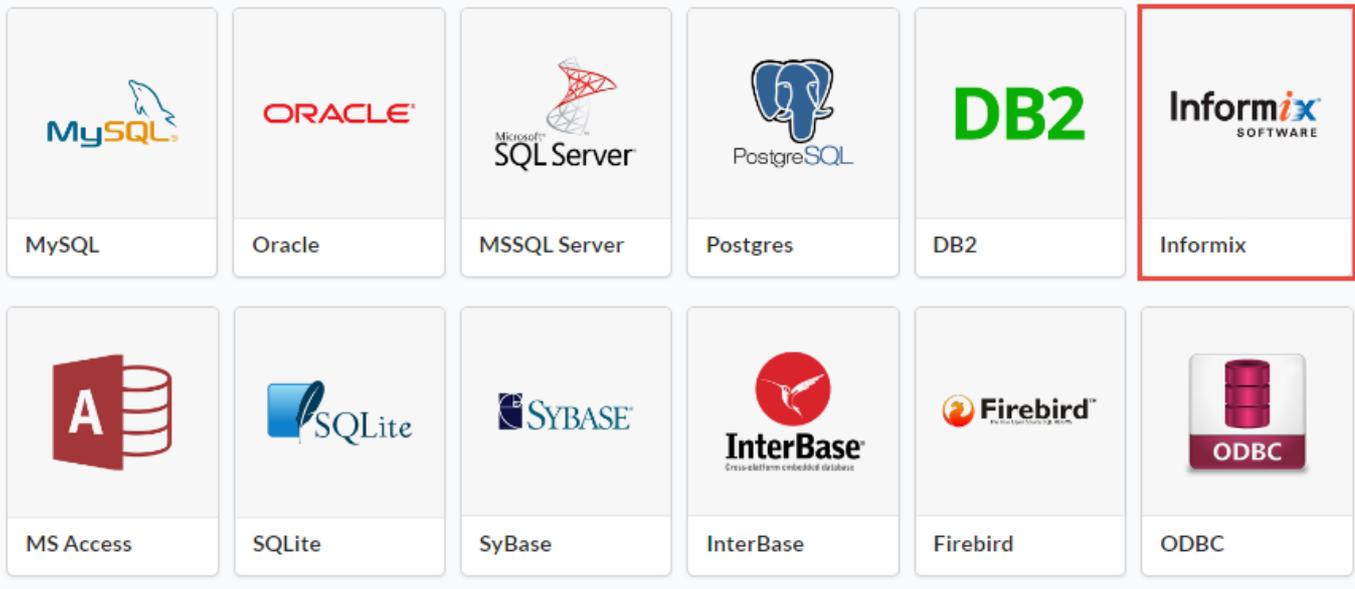

After that, a new page will appear with all the database connections.

3 - Select the connection **Informix**.

Create a connection

Select your database system and create a connection for your project.

Connection

Enter the parameters for connecting to your Informix database as follows:

Create a connection Informix

Enter the connection details for your database Informix ← Choose another connection

CONNECTION
FILTER
ADVANCED
?

Connection Name

DBMS Driver

Informix PDO ▼

Server/Host (Name or IP)

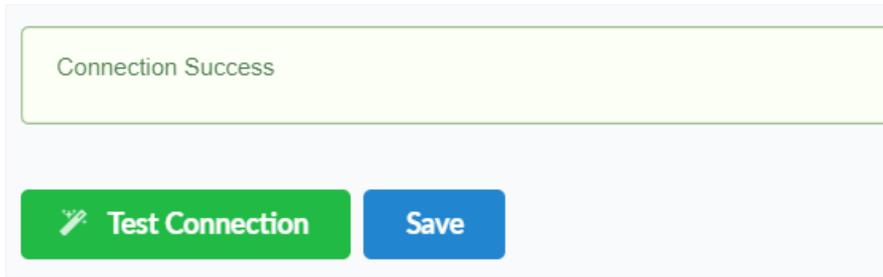

Database Name

Username

Password

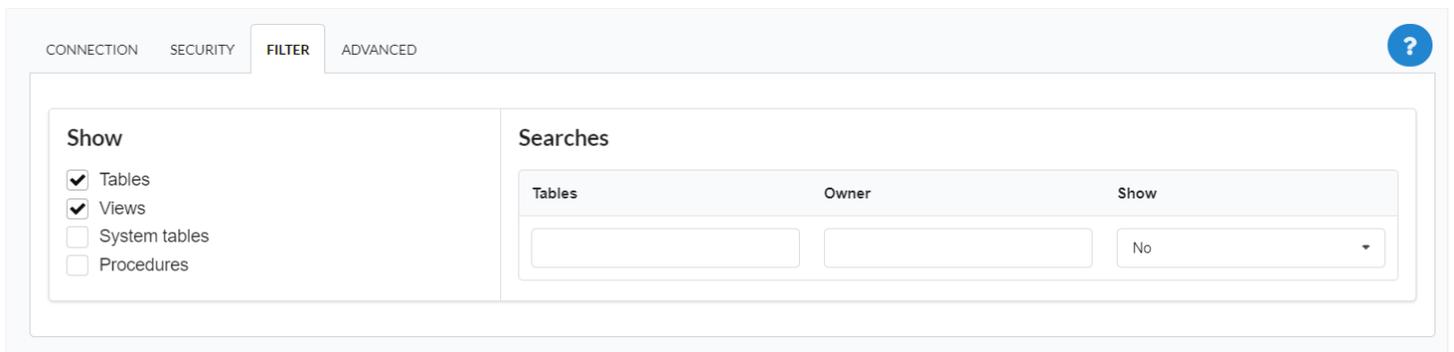

- **Connection Name:** Set the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Informix Driver used to connect. In this example we use the **Informix PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed along with the access port.
 - Ex: `serverdomain.com:9088` or `192.168.254.170:9088`
- **Database Name:** Enter the name of your database to connect to it.
- **Username:** Enter the user to authenticate the connection to your Informix database.
- **Password:** Enter the password to complete the authentication process.

- **Test Connection:** Click this button to get a response from Scriptcase request to know if the parameters entered are correct.

Filter

By accessing this tab, you can configure which items from the Database will be displayed in the connection, depending on the owner or not.

Show

Allows the Informix connection to see tables, views, system tables, and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** Selecting this option will display your database views.
 - **By default, Scriptcase enables this option.**
- **System tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** When you select this option, the procedures from your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The setting can contain a **PREFIX%** or name of the tables to be displayed.
 - **By default, Scriptcase leaves this option empty.**
 - **Ex:**

Using the table prefix

Tables	Owner
SUP%	SYSTEM

Using the table name

Tables	Owner
SUP_ACCOUNT, SUP_ORDEF	SYSTEM

- **Owner:** Enter the user who sees the inserted tables for display.
 - **User must be in capital letters, as in the example above.**
- **Show:** Choose whether tables are displayed for the owner entered.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improve the performance** of your database connection.

Advanced

In this tab, you have access to connection-specific settings. Changes made in this section impact the data display and performance of the application.

- **client_encoding:** Select the encoding used in your database. In the example above, we used client_encoding **UTF-8**.
- **Decimal separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, period . is selected as the separator.**

- **Persistent connection:** Set whether connections will be closed after your scripts run in Scriptcase applications.
 - By default, Scriptcase disables this option.
- **Use schema before table name:** Set whether the database schema is displayed before table names.
 - By default, Scriptcase enables this option.
 - Ex:

Using the schema before table name	Not using the schema before table name
<p>Connection *</p> <p>conn_oracle ▼</p> <p>Table</p> <p>"SYSTEM".COL ▼ </p>	<p>Connection *</p> <p>conn_oracle ▼</p> <p>Table</p> <p>COL ▼ </p>

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH	<input type="checkbox"/>
SSH Server	<input type="text"/>
SSH Port	<input type="text"/>
SSH User	<input type="text"/>
Private cert. file	<input type="text"/>
Local port for port forwarding	<input type="text"/>
Database server from SSH	<input type="text"/>
Database port from SSH	<input type="text"/>

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connection with Informix - MacOs

In Scriptcase, we have the following driver available for connecting to Informix: **Informix PDO**. If you are using your own pre-configured environment, the Informix extension must be enabled manually in PHP.

NOTE: On automatic Scriptcase installation, the Informix PDO driver is already enabled. Just follow the steps to connect by clicking [here](#).

Prerequisites

- Download the instant client SDK compatible with your operating system's **x64** or **x86** architecture. Click [here](#) to access the Informix SDK Client Download page.
 - **x86 = 32 bits**
 - **x64 = 64 bits**

Informix SDK Client Configuration and Installation

1 - Extract the instant Client SDK file.

2 - Perform the installation via terminal, accessing the extracted folder and running the command below:

```
sudo ./installclientsdk
```

NOTE: Install in the default directory (/Applications/IBM/informix).

3 - Choose options 1 through 17 and finish the installation.

4 - After doing so, save the file and restart the apache service.

MacOs "Catalina" 10.15 or Higher

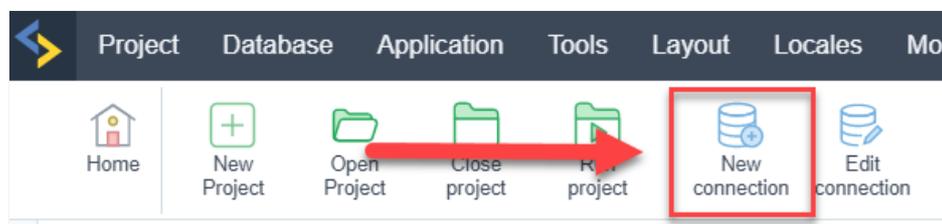

```
sudo apachectl restart
```

Creating a Connection in Scriptcase

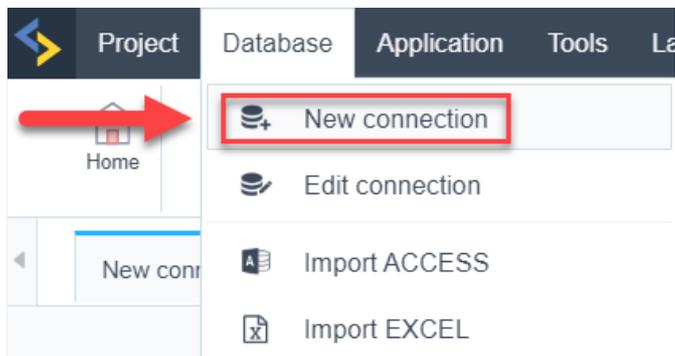

Here is how to create a connection in your Scriptcase project using the Informix database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

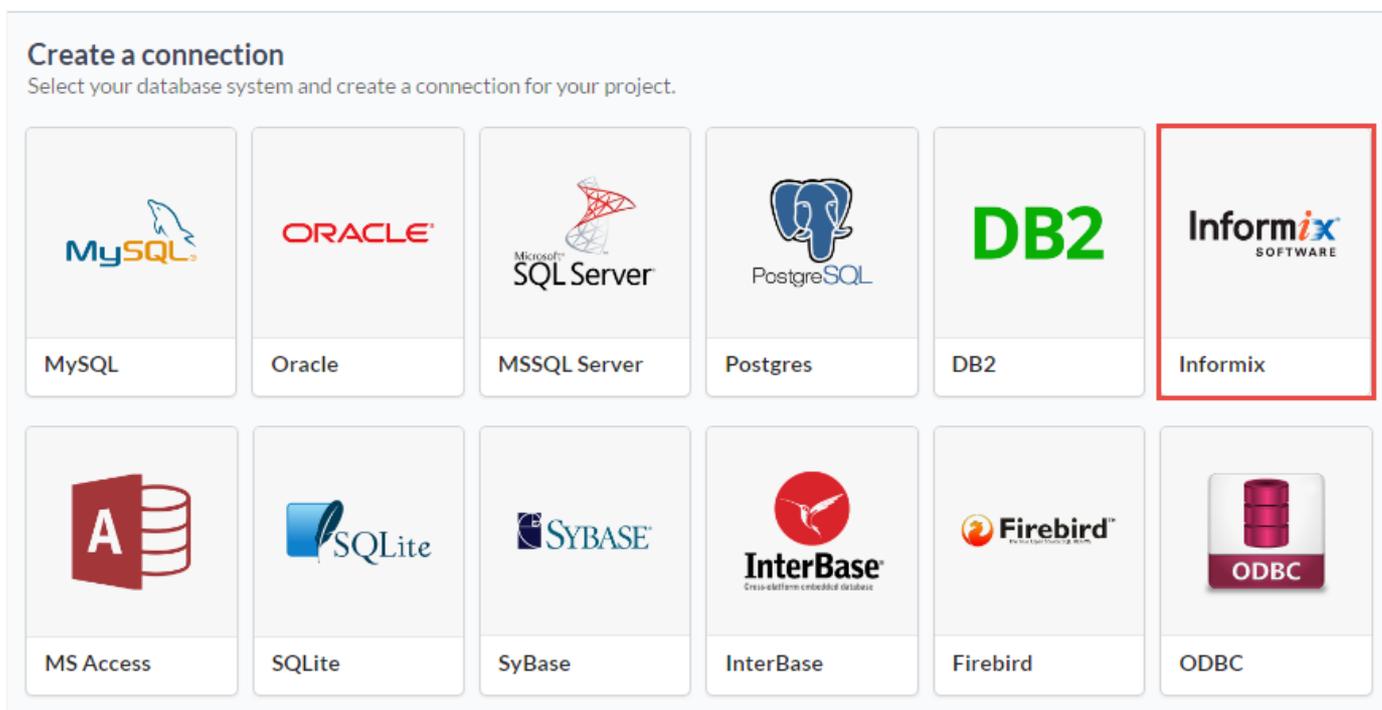

or go to the **Database > New Connection** menu.

After that, a new page will appear with all the database connections.

3 - Select the connection **Informix**.

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH <input type="checkbox"/>
SSH Server <input type="text"/>
SSH Port <input type="text"/>
SSH User <input type="text"/>
Private cert. file <input type="text"/>
Local port for port forwarding <input type="text"/>
Database server from SSH <input type="text"/>
Database port from SSH <input type="text"/>

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

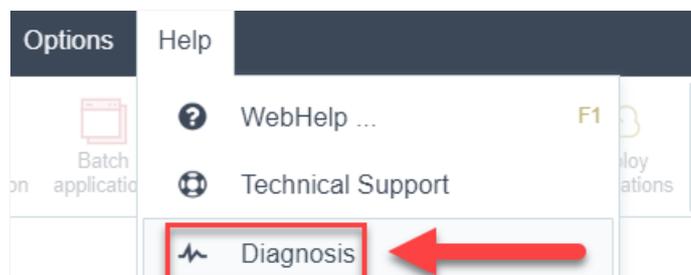

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Interbase with Scriptcase

In Scriptcase, we have only one driver to connect with Interbase: **pdo_firebird**. If you are using your own pre-configured environment, PDO Firebird extension must be manually enabled in PHP.

You can check your enabled drivers by accessing your Scriptcase diagnosis. See below on how to locate your diagnosis and check if the driver is enabled.

- Accessing the top menu **Help > Diagnosis**, you can easily find it through the interface.

- Or, by accessing your browser url:

`127.0.0.1:8092/scriptcase/diagnosis.php` or `domain.com/scriptcase/diagnosis.php`

Connections available

Firebird connection is available for Windows, Linux and MacOS with Firebird PDO driver.

Select the system where Scriptcase will be used and see our documentation about the connection.

- [Interbase on Windows](#)
- [Interbase on Linux](#)
- [Interbase on macOS](#)

Interbase connection with PDO Firebird

In Scriptcase, we have the following driver available for Interbase connections: **PDO Firebird**. If you are using your own pre-configured environment, Interbase extensions must be enabled manually in PHP.

Prerequisites

If you are using a manual installation on Windows, you will need to enable the PDO Firebird extension in the **php.ini** file. See below for how to do this.

1 - In the `php.ini` file, located under `C:\php`, uncomment the line for Firebird extension: **pdo_firebird** by removing the `;` from the beginning of the line. See the example below:

2 - Restart the Apache service using the **Task Manager**.

- Open Task Manager and click on the **Services** tab.
- Look for the `Apache2.4` or `ApacheScriptcase9php81` service and right-click on this service, then **Restart**.

Creating a connection in Scriptcase

Here's how to create a connection in your Scriptcase project using the Firebird database.

1 - Access any project from your Scriptcase.

2 - Click on the **New connection** icon to create a connection.

or go to the **Database > New Connection** menu.

After that a new page will appear with all the database connections.

3 - Select the **Firebird** connection.

Connection

Enter the parameters for connecting to your Firebird database as follows:

- **Connection Name:** Set the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Firebird Driver used to connect. In this example we use the **Firebird PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
 - **Ex:** `serverdomain.com` or `192.168.254.170`.
- **Port:** Enter the numeric port for your database server.
 - **Ex:** `3050`
- **Database Name:** Enter the database created for use by the entered user.
- **Username:** Enter the user to authenticate the connection to your Firebird database.
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click this button to get a response from Scriptcase request to know if the entered parameters are correct.

Filter

By accessing this tab, you can configure which items from the Database will be displayed in the connection, depending on the owner or not.

Show

Allows the Firebird connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** Selecting this option will display your database views.
 - **By default, Scriptcase enables this option.**
- **System tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** When you select this option, the procedures from your database will be displayed.

- **Show:** Choose whether tables are displayed for the owner entered.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improve the performance** of your database connection.

Advanced

In this tab, you have access to connection-specific settings. Changes made in this section impact the data display and performance of the application.

Charset

Select the encoding used in your database.

Role

Defines the user role for the database session. Roles are used to manage permissions and access control within Firebird.

You can set more than one role for the user separating them by using the “;”

Dialect

Determines the SQL dialect used in the connection. Firebird supports different dialects (1, 2, or 3), which affect SQL syntax and behavior.

If the option in the database is set to 2, it doesn't matter what option you choose in this field.

- **Options:**
 - **Empty** - Gets the default from the database.
 - **1** - Old version of Firebird (1.5) > Does not support timestamp, Numeric or Decimal
 - **2** - Version with timestamp support
 - **3** - Version - Newer versions (Case sensitive and compatible with Firebird 2.5, 3 and 4)

Decimal Separator

Select the separator type for decimal records, between comma and period.

- **By default, period . is selected as the separator.**

Persistent connection

Set whether connections will be closed after your scripts run in Scriptcase applications.

- **By default, Scriptcase disables this option.**

Use schema before table name

Set whether the database schema is displayed before table names.

- **By default, Scriptcase enables this option.**

- **Ex:**

Interbase connection with PDO Firebird

In Scriptcase, we have the following driver available for Interbase connections: **PDO Firebird**. If you are using your own pre-configured environment, Interbase extensions must be enabled manually in PHP.

Prerequisites

If you are using a manual installation on Linux, you will need to install the php extension for Firebird. See below for how to do this.

1 - Log into your **Linux** terminal and type this line below according to your operating system to install the Firebird PDO Firebird driver.

Ubuntu/Debian

```
sudo apt-get install php8.1-interbase
```

CentOS

```
sudo yum install php-  
interbase
```

2 - Check if the PDO Firebird driver is enabled in your Scriptcase diagnostic. Here is how to locate your diagnostics and verify that the driver is enabled.

- When you access the top menu **Help > Diagnostics**, you can easily find it through the interface.

- Or, by accessing your Scriptcase installation path:

127.0.0.1/scriptcase/diagnosis.php OR domain.com/scriptcase/diagnosis.php

Creating a connection in Scriptcase

Here's how to create a connection in your Scriptcase project using the Firebird database.

1 - Access any project from your Scriptcase.

2 - Click on the **New connection** icon to create a connection.

or go to the **Database > New Connection** menu.

After that a new page will appear with all the database connections.

3 - Select the **Firebird** connection.

Connection

Enter the parameters for connecting to your Firebird database as follows:

- **Connection Name:** Set the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Firebird Driver used to connect. In this example we use the **Firebird PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
 - **Ex:** serverdomain.com OR 192.168.254.170.
- **Port:** Enter the numeric port for your database server.
 - **Ex:** 3050
- **Database Name:** Enter the database created for use by the entered user.
- **Username:** Enter the user to authenticate the connection to your Firebird database.

- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click this button to get a response from Scriptcase request to know if the entered parameters are correct.

Filter

By accessing this tab, you can configure which items from the Database will be displayed in the connection, depending on the owner or not.

Show

Allows the Firebird connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a

password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Interbase connection with PDO Firebird

In Scriptcase, we have the following drivers available for Firebird connections: **Firebird PDO**, **Firebird**. If you are using your own pre-configured environment, the Firebird extensions must be enabled manually in PHP.

Prerequisites

If you are using a manual installation on MacOS, you will need to install PHP and the Firebird driver will be enabled. Click [here](#) to see how to do this.

1 - Check that the Firebird driver is enabled in your Scriptcase diagnostics. Here is how to locate your diagnostics below and verify that the driver is enabled.

- By going to the top menu **Help > Diagnostics**, you can easily find it through the interface.

- Or, by accessing your Scriptcase installation path:

127.0.0.1/scriptcase/diagnosis.php OR domain.com/scriptcase/diagnosis.php

Creating a connection in Scriptcase

Here's how to create a connection in your Scriptcase project using the Firebird database.

1 - Access any project from your Scriptcase.

2 - Click on the **New connection** icon to create a connection.

or go to the **Database > New Connection** menu.

After that a new page will appear with all the database connections.

3 - Select the **Firebird** connection.

Connection

Enter the parameters for connecting to your Firebird database as follows:

- **Connection Name:** Set the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Firebird Driver used to connect. In this example we use the **Firebird PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
 - **Ex:** serverdomain.com OR 192.168.254.170.
- **Port:** Enter the numeric port for your database server.
 - **Ex:** 3050
- **Database Name:** Enter the database created for use by the entered user.
- **Username:** Enter the user to authenticate the connection to your Firebird database.
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click this button to get a response from Scriptcase request to know if the entered parameters are correct.

Filter

By accessing this tab, you can configure which items from the Database will be displayed in the connection, depending on the owner or not.

Show

Allows the Firebird connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** Selecting this option will display your database views.
 - **By default, Scriptcase enables this option.**
- **System tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** When you select this option, the procedures from your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables are displayed. The setting can contain a PREFIX% or name of the tables to be displayed.
 - **By default, Scriptcase leaves this option empty.**
 - **Ex:**

- **Owner:** Inform the user who sees the inserted tables for display.
 - **User must be in capital letters, as in the example above.**
- **Show:** Choose whether tables are displayed for the owner entered.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improve the performance** of your database connection.

Advanced

In this tab, you have access to connection-specific settings. Changes made in this section impact the data display and performance of the application.

Charset

Select the encoding used in your database.

Role

Defines the user role for the database session. Roles are used to manage permissions and access control within Firebird.

You can set more than one role for the user separating them by using the “;”

Dialect

Determines the SQL dialect used in the connection. Firebird supports different dialects (1, 2, or 3), which affect SQL syntax and behavior.

If the option in the database is set to 2, it doesn't matter what option you choose in this field.

- **Options:**
 - **Empty** - Gets the default from the database.
 - **1** - Old version of Firebird (1.5) > Does not support timestamp, Numeric or Decimal
 - **2** - Version with timestamp support
 - **3** - Version - Newer versions (Case sensitive and compatible with Firebird 2.5, 3 and 4)

Decimal Separator

Select the separator type for decimal records, between comma and period.

- **By default, period . is selected as the separator.**

Persistent connection

Set whether connections will be closed after your scripts run in Scriptcase applications.

- **By default, Scriptcase disables this option.**

Use schema before table name

Set whether the database schema is displayed before table names.

- **By default, Scriptcase enables this option.**

- **Ex:**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

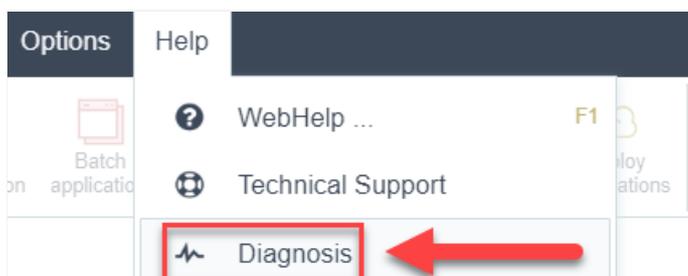

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

MySQL with Scriptcase

In Scriptcase, we have two drivers to connecting with MySQL. You must choose the most suitable for your environment. It is recommended to use **MySQL PDO** which is more faster, however it is up to you to choose the driver. **If you are using your own pre-configured environment, MySQL extensions must be manually enabled in PHP.**

You can check your enabled drivers by accessing your Scriptcase diagnosis. See below on how to locate your diagnosis and check if the driver is enabled.

- Accessing the top menu **Help > Diagnosis**, you can easily find it through the interface.

- Or, by accessing your browser url:

127.0.0.1:8092/scriptcase/diagnosis.php or domain.com/scriptcase/diagnosis.php

If the desired driver is already enabled and you just want to know how to connect with Scriptcase, click on the link below according to the driver that will be used.

Environment	MySQL PDO	MySQLi
Windows	See how to connect	See how to connect
Linux	See how to connect	See how to connect
macOS	See how to connect	See how to connect

Connecting with MySQL PDO

In Scriptcase, we have the following drivers available for connections with MySQL: **MySQL PDO and MySQLi**. If you are using your own pre-configured environment, MySQL extensions must be manually enabled in PHP.

Prerequisites

If you are using a manual installation on Windows, you'll need to enable the MySQL extensions on **php.ini** file. Check below how to do it.

1 - In the `php.ini` file, located in `C:\php`, uncomment the lines referring to the MySQL extensions **`php_pdo_mysql`** and **`php_mysqli`** removing the `;` from the beginning of the line. See the example below:

2 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Search for the `Apache2.4` or `ApacheScriptcase9php81` service and right click on this service, then **Restart**.

Creating a Connection in Scriptcase

Server charset unknown to the client If you are using MySQL 8, and your Scriptcase is using PHP 7.0 or 7.3, due to the PHP 7 bug, an error occurs when trying to connect to the Scriptcase. [Click here](#) and see how to work around this error.

See below how to create a connection in your Scriptcase project using the MySQL database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **MySQL** connection.

Connection

Enter the parameters for connecting to your MySQL database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the MySQL Driver used to connect. In this example, we use the **MySQL PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
 - **E.g.** `serverdomain.com` OR `192.168.254.170`
- **Port:** Inform the number port for your database server.
- **Username:** Inform the user to authenticate the connection to your MySQL database.
- **Password:** Enter the password to complete the authentication process.

- **Database Name:** Type your database name to connect with him. Or, if you want to choose one different database, click on the button **List Database** to show all databases available for your user.
 - **Create Database:** Clicking on this button, you will create a new MySQL database for use.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Security

On this tab you can set your SSL encryption for your database connection. Check below how to do this.

Use SSL

Activates or deactivates the use of secure connections with MySQL.

Client Key

Path to the client's private identification key in the format PEM.

Client Certificate

Path to the client's public certificate key.

CA Path

Path to the directory that contains the Certificate of Authority (CA) in the format PEM, if used, it should specify the same certificate used by the server.

CA Certificate

Path to the Certificate of Authority (AC) in the format PEM. This option, if used, should specify the same certificate as the server.

Specific Chipper

A list of permitted numbers to use with the cryptography of the connection. If one of the numbers is not supported, the SSL connection won't work.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the MySQL connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

Connecting with MySQLi

In Scriptcase, we have the following drivers available for connections with MySQL: **MySQL PDO and MySQLi**. If you are using your own pre-configured environment, MySQL extensions must be manually enabled in PHP.

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connecting with MySQLi

In Scriptcase, we have the following drivers available for connections with MySQL: **MySQL PDO and MySQLi**. If you are using your own pre-configured environment, MySQL extensions must be manually enabled in PHP.

Prerequisites

If you are using a manual installation on Linux, you'll need to install the MySQL php extension. Check below how to do it.

1 - Access your **Linux** terminal and type this line below according to your OS to install MySQLi driver.

Ubuntu

```
sudo apt-get install php8.1-mysql
```

CentOS

```
sudo yum install php-  
mysql
```

2 - Check if the MySQL driver is enabled in your Scriptcase diagnosis. See below on how to locate your diagnosis and check if the driver is enabled.

- Accessing the top menu **Help > Diagnosis**, you can easily find it through the interface.

- Or, by accessing your Scriptcase installation path:

127.0.0.1/scriptcase/diagnosis.php OR domain.com/scriptcase/diagnosis.php

Creating a Connection with ScriptCase

Connecting with MySQL PDO

In Scriptcase, we have the following drivers available for connections with MySQL: **MySQL PDO and MySQLi**. If you are using your own pre-configured environment, MySQL extensions must be manually installed with PHP.

Prerequisites

If you are using a manual installation on MacOS, you'll need to install the PHP and the MySQL driver will be enabled. Click [here](#) to see how to do it.

1 - Check if the MySQL driver is enabled in your Scriptcase diagnosis. See below on how to locate your diagnosis and check if the driver is enabled.

- Accessing the top menu **Help > Diagnosis**, you can easily find it through the interface.

- Or, by accessing your Scriptcase installation path:

127.0.0.1/scriptcase/diagnosis.php OR domain.com/scriptcase/diagnosis.php

Creating a Connection with ScriptCase

Server sent charset unknown to the client If you are using MySQL 8, and your Scriptcase is using PHP 7.0 or 7.3, due to the PHP 7 bug, an error occurs when trying to connect to the Scriptcase. [Click here](#) and see how to work around this error.

See below how to create a connection in your Scriptcase project using the MySQL database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **MySQL** connection.

Connection

Enter the parameters for connecting to your MySQL database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the MySQL Driver used to connect. In this example, we use the **MySQL PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
 - **E.g.** serverdomain.com OR 192.168.254.170
- **Port:** Inform the number port for your database server.
- **Username:** Inform the user to authenticate the connection to your MySQL database.
- **Password:** Enter the password to complete the authentication process.
- **Database Name:** Type your database name to connect with him. Or, if you want to choose one different database, click on the button **List Database** to show all databases availables for your user.

- **Create Database:** Clicking on this button, you will create a new MySQL database for use.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Security

On this tab you can set your SSL encryption for your database connection. Check below how to do this.

Use SSL

Activates or deactivates the use of secure connections with MySQL.

Client Key

Path to the client's private identification key in the format PEM.

Client Certificate

Path to the client's public certificate key.

CA Path

Path to the directory that contains the Certificate of Authority (CA) in the format PEM, if used, it should specify the same certificate used by the server.

CA Certificate

Path to the Certificate of Authority (AC) in the format PEM. This option, if used, should specify the same certificate as the server.

Specific Chipper

A list of permitted numbers to use with the cryptography of the connection. If one of the numbers is not supported, the SSL connection won't work.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the MySQL connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connecting with MySQLi

In Scriptcase, we have the following drivers available for connections with MySQL: **MySQL PDO and MySQLi**. If you are using your own pre-configured environment, MySQL extensions must be manually installed with PHP.

Prerequisites

If you are using a manual installation on MacOS, you'll need to install the PHP and the MySQL driver will be enabled. Click [here](#) to see how to do it.

1 - Check if the MySQL driver is enabled in your Scriptcase diagnosis. See below on how to locate your diagnosis and check if the driver is enabled.

- Accessing the top menu **Help > Diagnosis**, you can easily find it through the interface.

- Or, by accessing your Scriptcase installation path:

127.0.0.1/scriptcase/diagnosis.php OR domain.com/scriptcase/diagnosis.php

Creating a Connection with ScriptCase

Server sent charset unknown to the client If you are using MySQL 8, and your Scriptcase is using PHP 7.0 or 7.3, due to the PHP 7 bug, an error occurs when trying to connect to the Scriptcase. [Click here](#) and see how to work around this error.

See below how to create a connection in your Scriptcase project using the MySQL database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **MySQL** connection.

Connection

Enter the parameters for connecting to your MySQL database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the MySQL Driver used to connect. In this example, we use the **MySQLi** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
 - **E.g.** serverdomain.com OR 192.168.254.170
- **Port:** Inform the number port for your database server.
- **Username:** Inform the user to authenticate the connection to your MySQL database.
- **Password:** Enter the password to complete the authentication process.
- **Database Name:** Type your database name to connect with him. Or, if you want to choose one different database, click on the button **List Database** to show all databases availables for your user.
 - **Create Database:** Clicking on this button, you will create a new MySQL database for use.

- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Security

On this tab you can set your SSL encryption for your database connection. Check below how to do this.

Use SSL

Activates or deactivates the use of secure connections with MySQL.

Client Key

Path to the client's private identification key in the format PEM.

Client Certificate

Path to the client's public certificate key.

CA Path

Path to the directory that contains the Certificate of Authority (CA) in the format PEM, if used, it should specify the same certificate used by the server.

CA Certificate

Path to the Certificate of Authority (AC) in the format PEM. This option, if used, should specify the same certificate as the server.

Specific Chipper

A list of permitted numbers to use with the cryptography of the connection. If one of the numbers is not supported, the SSL connection won't work.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the MySQL connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Oracle with Scriptcase

In Scriptcase, we have several drivers for connecting to Oracle. You must choose the most suitable for your environment. It is recommended to use **Oracle PDO** which is more faster, however it is up to you to choose the driver. **If you are using your own pre-configured environment, Oracle extensions must be manually enabled in PHP.**

You can check your enabled drivers by accessing your diagnosis. See below on how to locate your diagnosis and check if the driver is enabled.

- Accessing the top menu **Help > Diagnosis**, you can easily find it through the interface.

- Or, by accessing your browser url:

127.0.0.1:8092/scriptcase/diagnosis.php or domain.com/scriptcase/diagnosis.php

Automatic Installation

If the desired driver is already enabled and you just want to know how to connect with Scriptcase, click on the link below according to the driver that will be used.

Environment	Oracle PDO	Oracle 8.0.5 ou Acima	Oracle ODBC	Oracle 8
Windows	See how to connect			
Linux	See how to connect			
macOS	See how to connect			

Manual Installation

If the driver you want to use is disabled, see how to enable each one. Click on the link below according to the driver to be used.

Environment	Oracle PDO	Oracle 8.0.5 ou Acima	Oracle ODBC	Oracle 8
Windows	See how to connect			
Linux	See how to connect			
macOS	See how to connect			

Connecting with Oracle PDO

In Scriptcase, we have the following drivers available for connections with Oracle: **Oracle PDO, Oracle 8.0.5 or Higher, Oracle ODBC and Oracle 8**. If you are using your own pre-configured environment, Oracle extensions must be manually enabled in PHP.

Prerequisites

Before proceeding with this documentation, check your PHP architecture. In order for the drivers to be enabled correctly, **the files must be downloaded according to the architecture used**.

- In Scriptcase, there is the **info.php** file, access it through the URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find information regarding the architecture in [phpinfo\(\)](#).

NOTE: If you are using Scriptcase's automatic installer, the PHP architecture will be the same as the installer downloaded. **Download the Oracle Instant Client according to your PHP architecture.**

- x86** Architecture = **32 bits**
- x64** Architecture = **64 bits**

Below are listed the files required for Oracle drivers to be enabled. If you installed the tool using Scriptcase installer, it is not necessary to download the **Microsoft Visual C++ 2017**. For manual installations, **you must download and install both versions of Microsoft Visual C++ 2017**.

Required Files:

x64

- Oracle Instant Client **19.6.0.0(x64)**: [Click Here](#)
- Microsoft Visual C++ **2017(x64)**: [Click Here](#)

x86

- Oracle Instant Client **19.6.0.0(x86)**: [Click Here](#)
- Microsoft Visual C++ **2017(x86)**: [Click Here](#)

WARNING: PHP 8.1 is compatible with **Oracle Instant Client 11 or Higher**.

To download Oracle Instant Client lower than version **19.6.0.0**, you must have an [Oracle Account](#).

Other Files

- Oracle Instant Client **18.5.0.0 or Lower**: [Click Here](#)

Oracle PDO Driver Compatibility Table

Drive	Oracle Database Version	10g	11g R1	11g R2(11.2)	12c	18c	19c
Oracle PDO	9i <input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Instant Client	Versión de base de datos Oracle						
19.6.0.0	9i <input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

Configuring Oracle PDO on Windows

Scriptcase's automatic installation comes with pre-configured Oracle drivers, just missing **Instant_Client** to be configured to make the connection. Follow the steps described below to enable the connection drivers.

- 1 - Extract the [previously downloaded](#) **Instant Client Basic** package to your computer's root folder.

E.g.,

C:\instantclient_19_6

2 - Paste the DLLs listed below into the Scriptcase **PHP** folder C:\Program Files\NetMake\v9-php81\components\php:

- **oci.dll**
- **oraociei19.dll**
- **oraons.dll**

3 - Add in the **Path** parameter of the Environment Variables the full path to the **Instant Client**. Follow the steps below to perform this procedure:

- Go to Control Panel > System > **Advanced System Settings**.

- Click on the **Advanced > Environment Variables** tab.

- Under **System Variables**, Select the **Path** item and click **Edit**.

- Click the **New** button and add the path to the instant client as shown below:

4 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Search for the ApacheScriptcase9php81 service and right click on this service, then **Restart**.

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed along with **Service Name**.

- **E.g.** serverdomain.com/XE OR 192.168.254.170/XE
- For more information about Oracle's **Service Name**, [click here](#).
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
 - **By default, this option is left blank by Scriptcase.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

Configuring Oracle ODBC on Windows

Scriptcase's automatic installation comes with pre-configured Oracle drivers, just missing **instant_client** and the **ODBC** package to be configured to make the connection. Follow the steps described below to enable the

connection drivers.

1 - Extract the [previously downloaded Instant Client Basic](#) package to your computer's root folder.

E.g., C:\instantclient_19_6

2 - Extract the [previously downloaded ODBC](#) package to the Instant Client folder on the root path of your computer.

3 - Run the **odbc_install.exe** file with administrator privileges for the driver to be installed on your system.

4 - Paste the DLLs listed below into the Scriptcase **PHP** folder C:\Program Files\NetMake\v9-php81\components\php:

- **oci.dll**
- **oraociei19.dll**
- **oraons.dll**

5 - Add in the **Path** parameter of the Environment Variables the full path to the **Instant Client**. Follow the steps below to perform this procedure:

- Go to Control Panel > System > **Advanced System Settings**.

- Click on the **Advanced > Environment Variables** tab.

- Under **System Variables**, Select the **Path** item and click **Edit**.

- Click the **New** button and add the path to the instant client as shown below:

6 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Search for the ApacheScriptcase9php81 service and right click on this service, then **Restart**.

Creating a System ODBC Data Source

Check below the entire step by step to create an ODBC data source to connect to Scriptcase.

NOTE: ODBC must be created on the same server where ScriptCase is installed.

1 - Access your **ODBC Data Source Manager** and select according to your architecture. We will be selecting the **x64** version:

2 - When accessing the ODBC Data Sources Administrator, select the **DSN System** tab and click on **Add** to create your connection to your Oracle Database.

3 - After that, it is necessary to select the Driver to connect to Oracle. Select the Driver: **Oracle in instantclient_19_5**

4 - Now, enter the connection parameters as shown below:

- **Data Source Name:** Define here the name of the ODBC object that will be used when connecting to Scriptcase.
- **Description:** Write a definition for the Data Source, e.g., what is the purpose?.
- **TNS Service Name:** Enter the server's IP or domain here followed by the Oracle SERVICE NAME.

- **User ID:** Inform the user that will be used in the connection for authentication.

5 - Test the connection to check if all parameters have been filled in correctly.

You will be asked to enter the password to connect.

6 - Click **OK** to complete this process.

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle ODBC** Driver.
- **Server/Host (Name or IP):** Enter the Data Source Name created in your ODBC manager.
 - **E.G.** oracle
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
 - **By default, this option is left blank by Scriptcase.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

Connecting with Oracle 8

In Scriptcase, we have the following drivers available for connections with Oracle: **Oracle PDO, Oracle 8.0.5 or Higher, Oracle ODBC and Oracle 8**. If you are using your own pre-configured environment, Oracle extensions must be manually enabled in PHP.

Prerequisites

Before proceeding with this documentation, check your PHP architecture. In order for the drivers to be enabled correctly, **the files must be downloaded according to the architecture used**.

- In Scriptcase, there is the **info.php** file, access it through the URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find information regarding the architecture in [phpinfo\(\)](#).

NOTE: If you are using Scriptcase's automatic installer, the PHP architecture will be the same as the installer downloaded. **Download the Oracle Instant Client according to your PHP architecture.**

- x86** Architecture = **32 bits**
- x64** Architecture = **64 bits**

Below are listed the files required for Oracle drivers to be enabled. If you installed the tool using Scriptcase installer, it is not necessary to download the **Microsoft Visual C++ 2017**. For manual installations, **you must download and install both versions of Microsoft Visual C++ 2017**.

Required Files:

x64

- Oracle Instant Client **19.6.0.0(x64)**: [Click Here](#)
- Microsoft Visual C++ **2017(x64)**: [Click Here](#)

x86

- Oracle Instant Client **19.6.0.0(x86)**: [Click Here](#)
- Microsoft Visual C++ **2017(x86)**: [Click Here](#)

WARNING: PHP 8.1 is compatible with **Oracle Instant Client 11 or Higher**.

To download Oracle Instant Client lower than version **19.6.0.0**, you must have an [Oracle Account](#).

Other Files

- Oracle Instant Client **18.5.0.0 or Lower**: [Click Here](#)

Oracle 8 Driver Compatibility Table

Drive	Oracle Database Version	10g	11g R1	11g R2(11.2)	12c	18c	19c
Oracle 8.0.5 or Higher	9i <input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Instant Client	Versión de base de datos Oracle	10g	11g R1	11g R2(11.2)	12c	18c	19c
19.6.0.0	9i <input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

Configuring Oracle 8 on Windows

Scriptcase's automatic installation comes with pre-configured Oracle drivers, just missing **Instant_Client** to be configured to make the connection. Follow the steps described below to enable the connection drivers.

- 1 - Extract the [previously downloaded](#) **Instant Client Basic** package to your computer's root folder.

E.g.,

C:\instantclient_19_6

2 - Paste the DLLs listed below into the Scriptcase **PHP** folder C:\Program Files\NetMake\v9-php81\components\php:

- **oci.dll**
- **oraociei19.dll**
- **oraons.dll**

3 - Add in the **Path** parameter of the Environment Variables the full path to the **Instant Client**. Follow the steps below to perform this procedure:

- Go to Control Panel > System > **Advanced System Settings**.

- Click on the **Advanced > Environment Variables** tab.

- Under **System Variables**, Select the **Path** item and click **Edit**.

- Click the **New** button and add the path to the instant client as shown below:

4 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Search for the ApacheScriptcase9php81 service and right click on this service, then **Restart**.

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle 8** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed along

with **Service Name**.

- **E.g.** serverdomain.com/XE OR 192.168.254.170/XE
- For more information about Oracle's **Service Name**, [click here](#).
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

Configuring Oracle PDO on Windows

It is necessary to enable the extension in PHP and configure **instant_client** to make the connection. Follow the steps described below to enable the connection drivers.

1 - In the `php.ini` file, located in `C:\php`, uncomment the lines referring to the oracle extensions **oci8_12c** and **pdo_oci** removing the `;` from the beginning of the line. See the example below:

2 - Extract the [previously downloaded](#) **Instant Client Basic** package to your computer's root folder.

E.g.,

C:\instantclient_19_6

3 - Paste the DLLs listed below into the Scriptcase **PHP** folder C:\php:

- **oci.dll**
- **oraoci19.dll**
- **oraons.dll**

4 - Add in the **Path** parameter of the Environment Variables the full path to the **Instant Client**. Follow the steps below to perform this procedure:

- Go to Control Panel > System > **Advanced System Settings**.

- Click on the **Advanced > Environment Variables** tab.

- Under **System Variables**, Select the **Path** item and click **Edit**.

- Click the **New** button and add the path to the instant client as shown below:

5 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Search for the Apache2.4 service and right click on this service, then **Restart**.

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

- Click on the **Advanced > Environment Variables** tab.

- Under **System Variables**, Select the **Path** item and click **Edit**.

- Click the **New** button and add the path to the instant client as shown below:

5 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Search for the Apache2.4 service and right click on this service, then **Restart**.

Creating a System ODBC Data Source

Check below the entire step by step to create an ODBC data source to connect to Scriptcase.

NOTE: ODBC must be created on the same server where ScriptCase is installed.

1 - Access your **ODBC Data Source Manager** and select according to your architecture. We will be selecting the **x64** version:

2 - When accessing the ODBC Data Sources Administrator, select the **DSN System** tab and click on **Add** to create your connection to your Oracle Database.

3 - After that, it is necessary to select the Driver to connect to Oracle. Select the Driver: **Oracle in instantclient_19_5**

4 - Now, enter the connection parameters as shown below:

- **Data Source Name:** Define here the name of the ODBC object that will be used when connecting to Scriptcase.
- **Description:** Write a definition for the Data Source, e.g., what is the purpose?.
- **TNS Service Name:** Enter the server's IP or domain here followed by the Oracle SERVICE NAME.
- **User ID:** Inform the user that will be used in the connection for authentication.

5 - Test the connection to check if all parameters have been filled in correctly.

You will be asked to enter the password to connect.

6 - Click **OK** to complete this process.

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle ODBC** Driver.
- **Server/Host (Name or IP):** Enter the Data Source Name created in your ODBC manager.
 - **E.G.** oracle
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items

selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
 - **By default, this option is left blank by Scriptcase.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

Connecting with Oracle 8

In Scriptcase, we have the following drivers available for connections with Oracle: **Oracle PDO, Oracle 8.0.5 or Higher, Oracle ODBC and Oracle 8.**

Prerequisites

Before proceeding with this documentation, check your PHP architecture. In order for the drivers to be enabled correctly, **the files must be downloaded according to the architecture used.**

- In Scriptcase, there is the **info.php** file, access it through the URL: <http://127.0.0.1/scriptcase/info.php>, where you will find information regarding the architecture in [phpinfo\(\)](#).

WARNING: Download the Oracle instant client according to your PHP architecture.

- x86** Architecture = **32 bits**
- x64** Architecture = **64 bits**

Below are listed the files required for Oracle drivers to be enabled. **For manual installations, you must download and install both versions of Microsoft Visual C ++ 2017.**

Required Files:

x64

- Oracle Instant Client **19.6.0.0(x64)**: [Click Here](#)
- Microsoft Visual C++ **2017(x64)**: [Click Here](#)

x86

- Oracle Instant Client **19.6.0.0(x86)**: [Click Here](#)
- Microsoft Visual C++ **2017(x86)**: [Click Here](#)

WARNING: PHP 7.3 is compatible with **Oracle Instant Client 11 or Higher.**

To download Oracle Instant Client lower than version **19.6.0.0**, you must have an [Oracle Account](#).

Other Files

- Oracle Instant Client **18.5.0.0 or Lower**: [Click Here](#)

Oracle 8 Driver Compatibility Table

Drive	Oracle Database Version						
Oracle 8.0.5 or Higher	9i <input type="text"/>	10g <input type="text"/>	11g R1 <input type="text"/>	11g R2(11.2) <input type="text"/>	12c <input type="text"/>	18c <input type="text"/>	19c <input type="text"/>
Instant Client	Versión de base de datos Oracle						
19.6.0.0	9i <input type="text"/>	10g <input type="text"/>	11g R1 <input type="text"/>	11g R2(11.2) <input type="text"/>	12c <input type="text"/>	18c <input type="text"/>	19c <input type="text"/>

Configuring Oracle 8 on Windows

It is necessary to enable the extension in PHP and configure **instant_client** to make the connection. Follow the steps described below to enable the connection drivers.

1 - In the `php.ini` file, located in `C:\php`, uncomment the lines referring to the oracle extensions **oci8_12c** and **pdo_oci** removing the `;` from the beginning of the line. See the example below:

2 - Extract the [previously downloaded Instant Client Basic](#) package to your computer's root folder.

E.g.,

C:\instantclient_19_6

3 - Paste the DLLs listed below into the Scriptcase **PHP** folder C:\php:

- **oci.dll**
- **oraociei19.dll**
- **oraons.dll**

4 - Add in the **Path** parameter of the Environment Variables the full path to the **Instant Client**. Follow the steps below to perform this procedure:

- Go to Control Panel > System > **Advanced System Settings**.

- Click on the **Advanced > Environment Variables** tab.

- Under **System Variables**, Select the **Path** item and click **Edit**.

- Click the **New** button and add the path to the instant client as shown below:

5 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Search for the Apache2.4 service and right click on this service, then **Restart**.

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle 8** Driver.

- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed along with **Service Name**.
 - **E.g.** serverdomain.com/XE OR 192.168.254.170/XE
 - For more information about Oracle's **Service Name**, [click here](#).
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact

the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
 - **By default, this option is left blank by Scriptcase.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

Connecting with Oracle PDO

In Scriptcase, we have the following drivers available for connections with Oracle: **Oracle PDO, Oracle 8.0.5 or Higher, Oracle ODBC and Oracle 8**. If you are using your own pre-configured environment, Oracle extensions must be manually enabled in PHP.

IMPORTANT: If you are using the automatic installer, **the extensions are already configured in PHP**, ready to connect if you have enabled them in the installation process. If you have not enabled them, see below how to enable them.

Configuring Oracle PDO on Linux (Automatic installation)

The automatic installation of Scriptcase already comes with the Oracle drivers pre-configured, with only the **instant_client** to be configured to make the connection. Follow the steps described below to enable connection drivers.

1 - Download the Oracle Instant Client **12.1.0.2** by [clicking here](#).

2 - After downloading, extract the file and copy the folder **instantclient** into the directory: **/opt/Scriptcase/v9-php81/components/drivers/**

3 - Restart the Apache `sudo service apachesc9php81 restart`

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed along with **Service Name**.
 - **E.g.** serverdomain.com/XE OR 192.168.254.170/XE
 - For more information about Oracle's **Service Name**, [click here](#).
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**

- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
 - **By default, this option is left blank by Scriptcase.**

- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connecting with Oracle 8.0.5 or Higher

In Scriptcase, we have the following drivers available for connections with Oracle: **Oracle PDO, Oracle 8.0.5 or Higher, Oracle ODBC and Oracle 8**. If you are using your own pre-configured environment, Oracle extensions must be manually enabled in PHP.

IMPORTANT: If you are using the automatic installer, **the extensions are already configured in PHP**, ready to connect if you have enabled them in the installation process. If you have not enabled them, see below how to enable them.

Configuring Oracle 8.0.5 or Higher on Linux (Automatic installation)

The automatic installation of Scriptcase already comes with the Oracle drivers pre-configured, with only the **instant_client** to be configured to make the connection. Follow the steps described below to enable connection drivers.

1 - Download the Oracle Instant Client **12.1.0.2** by [clicking here](#).

2 - After downloading, extract the file and copy the folder **instantclient** into the directory: **/opt/Scriptcase/v9-php81/components/drivers/**

3 - Restart the Apache `sudo service apachesc9php81 restart`

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle 8.0.5 or Higher** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed along with **Service Name**.
 - **E.g.** serverdomain.com/XE or 192.168.254.170/XE
 - For more information about Oracle's **Service Name**, [click here](#).
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**

- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connecting with Oracle ODBC

In Scriptcase, we have the following drivers available for connections with Oracle: **Oracle PDO, Oracle 8.0.5 or Higher, Oracle ODBC and Oracle 8**. If you are using your own pre-configured environment, Oracle extensions must be manually enabled in PHP.

Prerequisites

Before proceeding with this documentation, check your PHP architecture. In order for the drivers to be enabled correctly, **the files must be downloaded according to the architecture used**.

- In Scriptcase, there is the **info.php** file, access it through the URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find information regarding the architecture in [phpinfo\(\)](#).

NOTE: If you are using Scriptcase's automatic installer, the PHP architecture will be the same as the installer downloaded. **Download the Oracle Instant Client according to your PHP architecture.**

- **i386/i686** Architecture = **32 bits**
- **x86_64** Architecture = **64 bits**

Below are listed the files required for Oracle drivers to be enabled.

Required Files:

x86_64

- Oracle Instant Client - Basic Package **12.1.0.2(x86_64)**: [Click Here](#)
- Oracle Instant Client - Devel Package **12.1.0.2(x86_64)**: [Click Here](#)
- Oracle Instant Client - ODBC Package **12.1.0.2(x86_64)**: [Click here](#)

i386/i686

- Oracle Instant Client - Basic Package **12.1.0.2(i386/i686)**: [Click Here](#)
- Oracle Instant Client - Devel Package **12.1.0.2(i386/i686)**: [Click Here](#)
- Oracle Instant Client - ODBC Package **12.1.0.2(i386/i686)**: [Click here](#)

WARNING: PHP 7.3 is compatible with **Oracle Instant Client 11.2 or Higher**. To download Oracle Instant Client lower than version **19**, you must have an [Oracle Account](#).

Other Files

- Oracle Instant Client **12.2.0 or Higher**: [Click Here](#)

Oracle ODBC Driver Compatibility Table

Drive	Oracle Database Version	10g	11g R1	11g R2(11.2)	12c	18c	19c
Oracle 8.0.5 or Higher	9i <input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Instant Client	Versión de base de datos Oracle	10g	11g R1	11g R2(11.2)	12c	18c	19c
19.6.0.0	9i <input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

Configuring Oracle ODBC on Linux

Scriptcase's automatic installation comes with pre-configured Oracle drivers, just missing **Instant_Client** to be configured to make the connection. Follow the steps described below to enable the connection drivers.

1 - Install the packages below:

UBUNTU\DEBIAN

```
sudo apt-get update
sudo apt-get install libaio1
sudo apt-get install libncurses5
sudo apt-get install alien
sudo apt-get install gcc-multilib g++-multilib
sudo apt-get install libpam0g
sudo apt-get install unixodbc-dev unixodbc
```

CENTOS\RHEL

```
sudo yum update
sudo yum install libaio-devel
sudo yum install libaio
sudo yum install glibc
sudo yum install compat-libstdc++-33
sudo yum install glibc-devel
sudo yum install libstdc++
sudo yum install libstdc++
sudo yum install pam
sudo yum install ncurses-devel
sudo yum install unixODBC
```

2 - Convert and install the [previously downloaded Instant Client Basic](#) packages on your Linux system:

UBUNTU\DEBIAN

```
sudo alien oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
sudo alien oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo dpkg -i oracle-instantclient12.1-basic_12.1.0.2.0-2_amd64.deb
sudo dpkg -i oracle-instantclient12.1-devel_12.1.0.2.0-2_amd64.deb
```

CENTOS\RHEL

```
sudo yum install oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo yum install oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
```

3 - Edit the environment variable file and declare the variable responsible for identifying the Oracle library:

Enter the variable **LD_LIBRARY_PATH** and the path to the library in the file responsible for your system's environment variables. Check the path below according to your operating system:

WARNING: The path to the library may depend on your installation, by default the path is this:
/usr/lib/oracle/12.1/client64/lib/.

UBUNTU\DEBIAN

```
sudo nano
/etc/apache2/envvars
```

CENTOS\RHEL

```
sudo nano
/etc/sysconfig/httpd
```

- Add this variable at the end of the file with the following syntax:

```
export LD_LIBRARY_PATH=/usr/lib/oracle/12.1/client64/lib/
```

E.g.

NOTE: If you are using CentOS/RHEL, it is not necessary to use 'export' before the variable.

4 - Restart the Scriptcase apache service for the changes to take effect. Use the commands below according to your operating system.

UBUNTU\DEBIAN

```
sudo service apachesc9php73 restart
```

CENTOS\RHEL

```
sudo systemctl restart apachesc9php73
```

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle ODBC** Driver.
- **Server/Host (Name or IP):** Enter the Data Source Name created in your ODBC manager.
 - **E.G.** oracle
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**

- **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
 - **By default, this option is left blank by Scriptcase.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connecting with Oracle 8

In Scriptcase, we have the following drivers available for connections with Oracle: **Oracle PDO, Oracle 8.0.5 or Higher, Oracle ODBC and Oracle 8**. If you are using your own pre-configured environment, Oracle extensions must be manually enabled in PHP.

IMPORTANT: If you are using the automatic installer, **the extensions are already configured in PHP**, ready to connect if you have enabled them in the installation process. If you have not enabled them, see below how to enable them.

Configuring Oracle 8 on Linux (Automatic installation)

The automatic installation of Scriptcase already comes with the Oracle drivers pre-configured, with only the **instant_client** to be configured to make the connection. Follow the steps described below to enable connection drivers.

1 - Download the Oracle Instant Client **12.1.0.2** by [clicking here](#).

2 - After downloading, extract the file and copy the folder **instantclient** into the directory: **/opt/Scriptcase/v9-php81/components/drivers/**

3 - Restart the Apache `sudo service apachesc9php81 restart`

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle 8** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed along with **Service Name**.
 - **E.g.** serverdomain.com/XE Or 192.168.254.170/XE
 - For more information about Oracle's **Service Name**, [click here](#).
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**

- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
 - **By default, this option is left blank by Scriptcase.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your

scripts in Scriptcase applications.

- **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connecting with Oracle PDO

In Scriptcase, we have the following drivers available for connections with Oracle: **Oracle PDO, Oracle 8.0.5 or Higher, Oracle ODBC and Oracle 8.**

Prerequisites

Before proceeding with this documentation, check your PHP architecture. In order for the drivers to be enabled correctly, **the files must be downloaded according to the architecture used.**

- In Scriptcase, there is the **info.php** file, access it through the URL: <http://127.0.0.1/scriptcase/info.php>, where you will find information regarding the architecture in [phpinfo\(\)](#).

WARNING: Download the Oracle instant client according to your PHP architecture.

- i386/i686** Architecture = **32 bits**
- x86_64** Architecture = **64 bits**

Below are listed the files required for Oracle drivers to be enabled.

Required Files:

- oci8.so** extension: [Click Here](#)

Ubuntu x64

- Oracle Instant Client - Basic Package **12.1.0.2(x86_64)**: [Click here](#)
- Oracle Instant Client - Devel Package **12.1.0.2(x86_64)**: [Click here](#)

Red-Hat/Centos/OpenSuse

x86_64

- Oracle Instant Client - Basic Package **12.1.0.2(x86_64)**: [Click here](#)
- Oracle Instant Client - Devel Package **12.1.0.2(x86_64)**: [Click here](#)

i386/i686

- Oracle Instant Client - Basic Package **12.1.0.2(i386/i686)**: [Click here](#)
- Oracle Instant Client - Devel Package **12.1.0.2(i386/i686)**: [Click here](#)

WARNING: PHP 8.1 is compatible with **Oracle Instant Client 11.2 or Higher.**

To download Oracle Instant Client lower than version **19**, you must have an [Oracle Account](#).

Other Files

- Oracle Instant Client **12.2.0 or Higher**: [Click Here](#)

Oracle PDO Driver Compatibility Table

Drive	Oracle Database Version	10g	11g R1	11g R2(11.2)	12c	18c	19c
Oracle PDO	9i <input type="text"/>	<input type="text"/>					
Instant Client	Oracle database version						
19.6.0.0	9i <input type="text"/>	<input type="text"/>					

Configuring Oracle PDO on Linux

It is necessary to enable the Oracle extension in PHP and configure **Instant_Client** to make the connection. Follow the steps described below to enable the connection drivers.

1 - Install the packages below:

UBUNTU\DEBIAN

```
sudo apt-get update
sudo apt-get install libaio1
sudo apt-get install libncurses5
sudo apt-get install alien
sudo apt-get install gcc-multilib g++-multilib
sudo apt-get install libpam0g
sudo apt-get install unixodbc-dev unixodbc
```

CENTOS\RHEL

```
sudo yum update
sudo yum install libaio-devel
sudo yum install libaio
sudo yum install glibc
sudo yum install compat-libstdc++-33
sudo yum install glibc-devel
sudo yum install libstdc++
sudo yum install libstdc++
sudo yum install pam
sudo yum install ncurses-devel
sudo yum install unixODBC
```

2 - Convert and install the [previously downloaded](#) **Instant Client Basic** packages on your Linux system:

UBUNTU\DEBIAN

```
sudo alien oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
sudo alien oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo dpkg -i oracle-instantclient12.1-basic_12.1.0.2.0-2_amd64.deb
sudo dpkg -i oracle-instantclient12.1-devel_12.1.0.2.0-2_amd64.deb
```

CENTOS\RHEL

```
sudo yum install oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo yum install oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
```

3 - Copy the [previously downloaded](#) **oci8.so** extension to the PHP extensions directory:

E.g. `sudo cp oci8.so /usr/lib/php/20180731`

Access the **info.php** file and search for the **extension_dir** line. It will tell you the exact path to the directory responsible for PHP extensions.

4 - Edit the **php.ini** file and declare the Oracle extension at the end of the file.

UBUNTU\DEBIAN CENTOS\RHEL

```
/etc/php/8.1/apache2/php.ini    /etc/php.ini
```

E.g. `extension=oci8.so`

5 - Edit the environment variable file and declare the variable responsible for identifying the Oracle library:

Enter the variable **LD_LIBRARY_PATH** and the path to the library in the file responsible for your system's environment variables. Check the path below according to your operating system:

WARNING: The path to the library may depend on your installation, by default the path is this:
`/usr/lib/oracle/12.1/client64/lib/.`

UBUNTU\DEBIAN

```
sudo nano
/etc/apache2/envvars
```

CENTOS\RHEL

```
sudo nano
/etc/sysconfig/httpd
```

- Add this variable at the end of the file with the following syntax:

```
export LD_LIBRARY_PATH=/usr/lib/oracle/12.1/client64/lib/
```

E.g.

NOTE: If you are using CentOS/RHEL, it is not necessary to use 'export' before the variable.

6 - Restart the Scriptcase apache service for the changes to take effect. Use the commands below according to your operating system.

UBUNTU\DEBIAN **CENTOS\RHEL**

sudo service apache2 restart sudo systemctl restart httpd

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed along with **Service Name**.
 - **E.g.** serverdomain.com/XE OR 192.168.254.170/XE
 - For more information about Oracle's **Service Name**, [click here](#).
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
 - **By default, this option is left blank by Scriptcase.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Configuring Oracle 8.0.5 or Higher on Linux

It is necessary to enable the Oracle extension in PHP and configure **Instant_Client** to make the connection. Follow the steps described below to enable the connection drivers.

1 - Install the packages below:

UBUNTU\DEBIAN

```
sudo apt-get update
sudo apt-get install libaio1
sudo apt-get install libncurses5
sudo apt-get install alien
sudo apt-get install gcc-multilib g++-multilib
sudo apt-get install libpam0g
sudo apt-get install unixodbc-dev unixodbc
```

CENTOS\RHEL

```
sudo yum update
sudo yum install libaio-devel
sudo yum install libaio
sudo yum install glibc
sudo yum install compat-libstdc++-33
sudo yum install glibc-devel
sudo yum install libstdc++
sudo yum install libstdc++
sudo yum install pam
sudo yum install ncurses-devel
sudo yum install unixODBC
```

2 - Convert and install the [previously downloaded](#) **Instant Client Basic** packages on your Linux system:

UBUNTU\DEBIAN

```
sudo alien oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
sudo alien oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo dpkg -i oracle-instantclient12.1-basic_12.1.0.2.0-2_amd64.deb
sudo dpkg -i oracle-instantclient12.1-devel_12.1.0.2.0-2_amd64.deb
```

CENTOS\RHEL

```
sudo yum install oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo yum install oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
```

3 - Copy the [previously downloaded](#) **oci8.so** extension to the PHP extensions directory:

E.g. `sudo cp oci8.so /usr/lib/php/20180731`

Access the **info.php** file and search for the **extension_dir** line. It will tell you the exact path to the directory responsible for PHP extensions.

4 - Edit the **php.ini** file and declare the Oracle extension at the end of the file.

UBUNTU\DEBIAN CENTOS\RHEL

```
/etc/php/8.1/apache2/php.ini    /etc/php.ini
```

E.g. `extension=oci8.so`

5 - Edit the environment variable file and declare the variable responsible for identifying the Oracle library:

Enter the variable **LD_LIBRARY_PATH** and the path to the library in the file responsible for your system's environment variables. Check the path below according to your operating system:

WARNING: The path to the library may depend on your installation, by default the path is this:
`/usr/lib/oracle/12.1/client64/lib/.`

UBUNTU\DEBIAN

```
sudo nano
/etc/apache2/envvars
```

CENTOS\RHEL

```
sudo nano
/etc/sysconfig/httpd
```

- Add this variable at the end of the file with the following syntax:

```
export LD_LIBRARY_PATH=/usr/lib/oracle/12.1/client64/lib/
```

E.g.

NOTE: If you are using CentOS/RHEL, it is not necessary to use 'export' before the variable.

6 - Restart the Scriptcase apache service for the changes to take effect. Use the commands below according to your operating system.

UBUNTU\DEBIAN CENTOS\RHEL

sudo service apache2 restart sudo systemctl restart httpd

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle 8.0.5 or Higher** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed along with **Service Name**.
 - **E.g.** serverdomain.com/XE OR 192.168.254.170/XE
 - For more information about Oracle's **Service Name**, [click here](#).
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
 - **By default, this option is left blank by Scriptcase.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connecting with Oracle ODBC

In Scriptcase, we have the following drivers available for connections with Oracle: **Oracle PDO, Oracle 8.0.5 or Higher, Oracle ODBC and Oracle 8.**

Prerequisites

Before proceeding with this documentation, check your PHP architecture. In order for the drivers to be enabled correctly, **the files must be downloaded according to the architecture used.**

- In Scriptcase, there is the **info.php** file, access it through the URL: <http://127.0.0.1/scriptcase/info.php>, where you will find information regarding the architecture in [phpinfo\(\)](#).

WARNING: Download the Oracle instant client according to your PHP architecture.

Oracle ODBC Driver Compatibility Table

Drive	Oracle Database Version	10g	11g R1	11g R2(11.2)	12c	18c	19c
Oracle ODBC	9i <input type="text"/>	<input type="text"/>					
Instant Client	Oracle database version						
19.6.0.0	9i <input type="text"/>	<input type="text"/>					

Configuring Oracle ODBC on Linux

It is necessary to enable the Oracle extension in PHP and configure **Instant_Client** to make the connection. Follow the steps described below to enable the connection drivers.

1 - Install the packages below:

UBUNTU\DEBIAN

```
sudo apt-get update
```

CENTOS\RHEL

```
sudo yum update
```

UBUNTU\DEBIAN CENTOS\RHEL

sudo service apache2 restart sudo systemctl restart httpd

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle ODBC Driver**.
- **Server/Host (Name or IP):** Enter the Data Source Name created in your ODBC manager.
 - **E.G.** oracle
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**

- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
 - **By default, this option is left blank by Scriptcase.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connecting with Oracle 8

In Scriptcase, we have the following drivers available for connections with Oracle: **Oracle PDO, Oracle 8.0.5 or Higher, Oracle ODBC and Oracle 8.**

Prerequisites

Before proceeding with this documentation, check your PHP architecture. In order for the drivers to be enabled correctly, **the files must be downloaded according to the architecture used.**

- In Scriptcase, there is the **info.php** file, access it through the URL: <http://127.0.0.1/scriptcase/info.php>, where you will find information regarding the architecture in [phpinfo\(\)](#).

WARNING: Download the Oracle instant client according to your PHP architecture.

- i386/i686** Architecture = **32 bits**
- x86_64** Architecture = **64 bits**

Below are listed the files required for Oracle drivers to be enabled.

Required Files:

- oci8.so** extension: [Click Here](#)

Ubuntu x64

- Oracle Instant Client - Basic Package **12.1.0.2(x86_64)**: [Click here](#)
- Oracle Instant Client - Devel Package **12.1.0.2(x86_64)**: [Click here](#)

Red-Hat/Centos/OpenSuse

x86_64

- Oracle Instant Client - Basic Package **12.1.0.2(x86_64)**: [Click here](#)
- Oracle Instant Client - Devel Package **12.1.0.2(x86_64)**: [Click here](#)

i386/i686

- Oracle Instant Client - Basic Package **12.1.0.2(i386/i686)**: [Click here](#)
- Oracle Instant Client - Devel Package **12.1.0.2(i386/i686)**: [Click here](#)

WARNING: PHP 8.1 is compatible with **Oracle Instant Client 11.2 or Higher.**

To download Oracle Instant Client lower than version **19**, you must have an [Oracle Account](#).

Other Files

- Oracle Instant Client **12.2.0 or Higher**: [Click Here](#)

Oracle 8 Driver Compatibility Table

Drive	Oracle Database Version	10g	11g R1	11g R2(11.2)	12c	18c	19c
Oracle 8	9i <input type="text"/>	<input type="text"/>					
Instant Client	Oracle database version	10g	11g R1	11g R2(11.2)	12c	18c	19c
19.6.0.0	9i <input type="text"/>	<input type="text"/>					

Configuring Oracle 8 on Linux

It is necessary to enable the Oracle extension in PHP and configure **Instant_Client** to make the connection. Follow the steps described below to enable the connection drivers.

1 - Install the packages below:

UBUNTU\DEBIAN

```
sudo apt-get update
sudo apt-get install libaio1
sudo apt-get install libncurses5
sudo apt-get install alien
sudo apt-get install gcc-multilib g++-multilib
sudo apt-get install libpam0g
sudo apt-get install unixodbc-dev unixodbc
```

CENTOS\RHEL

```
sudo yum update
sudo yum install libaio-devel
sudo yum install libaio
sudo yum install glibc
sudo yum install compat-libstdc++-33
sudo yum install glibc-devel
sudo yum install libstdc++
sudo yum install libstdc++
sudo yum install pam
sudo yum install ncurses-devel
sudo yum install unixODBC
```

2 - Convert and install the [previously downloaded](#) **Instant Client Basic** packages on your Linux system:

UBUNTU\DEBIAN

```
sudo alien oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
sudo alien oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo dpkg -i oracle-instantclient12.1-basic_12.1.0.2.0-2_amd64.deb
sudo dpkg -i oracle-instantclient12.1-devel_12.1.0.2.0-2_amd64.deb
```

CENTOS\RHEL

```
sudo yum install oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo yum install oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
```

3 - Copy the [previously downloaded](#) **oci8.so** extension to the PHP extensions directory:

E.g. `sudo cp oci8.so /usr/lib/php/20180731`

Access the **info.php** file and search for the **extension_dir** line. It will tell you the exact path to the directory responsible for PHP extensions.

4 - Edit the **php.ini** file and declare the Oracle extension at the end of the file.

UBUNTU\DEBIAN CENTOS\RHEL

```
/etc/php/8.1/apache2/php.ini    /etc/php.ini
```

E.g. `extension=oci8.so`

5 - Edit the environment variable file and declare the variable responsible for identifying the Oracle library:

Enter the variable **LD_LIBRARY_PATH** and the path to the library in the file responsible for your system's environment variables. Check the path below according to your operating system:

WARNING: The path to the library may depend on your installation, by default the path is this:
`/usr/lib/oracle/12.1/client64/lib/.`

UBUNTU\DEBIAN

```
sudo nano
/etc/apache2/envvars
```

CENTOS\RHEL

```
sudo nano
/etc/sysconfig/httpd
```

- Add this variable at the end of the file with the following syntax:

```
export LD_LIBRARY_PATH=/usr/lib/oracle/12.1/client64/lib/
```

E.g.

NOTE: If you are using CentOS/RHEL, it is not necessary to use 'export' before the variable.

6 - Restart the Scriptcase apache service for the changes to take effect. Use the commands below according to your operating system.

UBUNTU\DEBIAN **CENTOS\RHEL**

sudo service apache2 restart sudo systemctl restart httpd

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle 8** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed along with **Service Name**.
 - **E.g.** serverdomain.com/XE OR 192.168.254.170/XE
 - For more information about Oracle's **Service Name**, [click here](#).
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connecting with Oracle PDO

At Scriptcase, we have the following drivers available for connection to Oracle: **Oracle PDO, Oracle 8.0.5 or Higher, Oracle ODBC and Oracle 8**. If you are using your own pre-configured environment, Oracle extensions must be manually enabled in PHP.

Prerequisites

Before proceeding at this documentation, check your PHP architecture. For drivers to be enabled correctly, **the files must be downloaded according to the architecture used**.

- In your Scriptcase, there is the file **info.php**, access it by URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find information regarding architecture in the [phpinfo\(\)](#).

NOTE: If you are using Scriptcase's automatic installer, the PHP architecture will be the same as the one you downloaded. **Download the Oracle instant client according to your PHP architecture.**

- Architecture **i386/i686 = 32 bits**
- Architecture **x86_64 = 64 bits**

Below are listed the files required for Oracle drivers to be enabled.

Required files:

x86_64

- Oracle Instant Client **12.1.0.2(x86_64)**: [Click Here](#)

IMPORTANT: The PHP 8.1 is compatible with **Oracle Instant Client 11.2 or Higher**. To download the Oracle Instant Client below the version **19.5.0.0**, it is necessary to have a [Oracle account](#).

Other Files

- Oracle Instant Client **12.2.0 or Higher**: [Click Here](#)

Oracle PDO Driver Compatibility Table

Drive	Oracle Database Version	10g	11g R1	11g R2(11.2)	12c	18c	19c
Oracle PDO	9i <input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Instant Client	Versión de base de datos Oracle						
19.6.0.0	9i <input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

Configuring Oracle PDO on MacOs

The automatic installation of Scriptcase comes with pre-configured Oracle drivers, with only **instant_client** missing to be configured to make the connection. Follow the steps outlined below to enable the connection drivers.

1 - On your Mac terminal, log in as **root** and create a folder with instant client numbering in `/usr/local/instantclient/12.1.0.2/`.

EX:

- `mkdir -p /usr/local/instantclient/12.1.0.2/`

2 - Extract all content from the **Instant Client** downloaded [previously](#) on your Mac system and copy to the folder created in the previous step:

EX:

- unzip oci_client_macosx_12.zip
- cp -avr __MACOSX/ oci_client_macosx_12/ /usr/local/instantclient/12.1.0.2/

3 - Restart the Scriptcase apache service for the changes to be saved. Use the command below for this:

EX:

```
sudo /Applications/Scriptcase/v9-php81/components/apache/bin/apachectl restart
```

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed along with **Service Name**.
 - **E.g.** serverdomain.com/XE OR 192.168.254.170/XE
 - For more information about Oracle's **Service Name**, [click here](#).
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**

 - **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connecting with Oracle ODBC

At Scriptcase, we have the following drivers available for connection to Oracle: **Oracle PDO, Oracle 8.0.5 or Higher, Oracle ODBC and Oracle 8**. If you are using your own pre-configured environment, Oracle extensions must be manually enabled in PHP.

Prerequisites

Before proceeding at this documentation, check your PHP architecture. For drivers to be enabled correctly, **the files must be downloaded according to the architecture used**.

- In your Scriptcase, there is the file **info.php**, access it by URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find information regarding architecture in the [phpinfo\(\)](#).

NOTE: If you are using Scriptcase's automatic installer, the PHP architecture will be the same as the one you downloaded. **Download the Oracle instant client according to your PHP architecture.**

- Architecture **i386/i686 = 32 bits**
- Architecture **x86_64 = 64 bits**

Below are listed the files required for Oracle drivers to be enabled.

Required files:

x86_64

- Oracle Instant Client **12.1.0.2(x86_64)**: [Click Here](#)

IMPORTANT: The PHP 7.3 is compatible with **Oracle Instant Client 11.2 or Higher**. To download the Oracle Instant Client below the version **19.5.0.0**, it is necessary to have a [Oracle account](#).

Other Files

- Oracle Instant Client **12.2.0 or Higher**: [Click Here](#)

Oracle ODBC Driver Compatibility Table

Drive	Oracle Database Version	10g	11g R1	11g R2(11.2)	12c	18c	19c
Oracle 8.0.5 or Higher	9i <input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Instant Client	Versión de base de datos Oracle						
19.6.0.0	9i <input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

Configuring Oracle ODBC on MacOs

The automatic installation of Scriptcase comes with pre-configured Oracle drivers, with only **instant_client** missing to be configured to make the connection. Follow the steps outlined below to enable the connection drivers.

1 - On your Mac terminal, log in as **root** and create a folder with instant client numbering in `/usr/local/instantclient/12.1.0.2/`.

EX:

- `mkdir -p /usr/local/instantclient/12.1.0.2/`

2 - Extract all content from the **Instant Client** downloaded [previously](#) on your Mac system and copy to the

folder created in the previous step:

EX:

- unzip oci_client_macosx_12.zip
- cp -avr __MACOSX/ oci_client_macosx_12/ /usr/local/instantclient/12.1.0.2/

3 - Restart the Scriptcase apache service for the changes to be saved. Use the command below for this:

EX:

```
sudo /Applications/Scriptcase/v9-php81/components/apache/bin/apachectl restart
```

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle ODBC Driver**.
- **Server/Host (Name or IP):** Enter the Data Source Name created in your ODBC manager.
 - **E.G.** oracle
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
 - **By default, this option is left blank by Scriptcase.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connecting with Oracle 8

At Scriptcase, we have the following drivers available for connection to Oracle: **Oracle PDO, Oracle 8.0.5 or Higher, Oracle ODBC and Oracle 8**. If you are using your own pre-configured environment, Oracle extensions must be manually enabled in PHP.

Prerequisites

Before proceeding at this documentation, check your PHP architecture. For drivers to be enabled correctly, **the files must be downloaded according to the architecture used**.

Configuring Oracle PDO on MacOs

It is necessary to enable the Oracle extension in PHP and configure **Instant_Client** to make the connection. Follow the steps described below to enable the connection drivers.

1 - On your Mac terminal, log in as **root** and create a folder with instant client numbering in `/usr/local/instantclient/12.1.0.2/`.

EX:

- `mkdir -p /usr/local/instantclient/12.1.0.2/`

2 - Extract all content from the **Instant Client** downloaded [previously](#) on your Mac system and copy to the folder created in the previous step:

EX:

- unzip oci_client_macosx_12.zip
- cp -avr __MACOSX/oci_client_macosx_12/ /usr/local/instantclient/12.1.0.2/

3 - Copy the [previously downloaded oci8.so](#) extension to the PHP extensions directory:

ATENÇÃO: If you followed our [documentation](#) to install Scriptcase manually on macOS, the extension is already in the extensions directory. You can proceed to item **5**.

EX:

```
sudo cp oci8.so /usr/local/lib/php/pecl/20180731
```

Access the **info.php** file and search for the **extension_dir** line. It will tell you the exact path to the directory responsible for PHP extensions.

4 - Edit the **php.ini** file(/usr/local/etc/php/8.1/php.ini) and declare the Oracle extension at the end of the file.

EX:

```
extension=oci8.so
```

5 - Restart the apache service for the changes to be saved. Use the command below for this:

EX:

```
sudo apachectl restart
```

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed along with **Service Name**.
 - **E.g.** serverdomain.com/XE OR 192.168.254.170/XE
 - For more information about Oracle's **Service Name**, [click here](#).
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.

- **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.

Configuring Oracle 8.0.5 or Higher on MacOs

It is necessary to enable the Oracle extension in PHP and configure **Instant_Client** to make the connection. Follow the steps described below to enable the connection drivers.

1 - On your Mac terminal, log in as **root** and create a folder with instant client numbering in `/usr/local/instantclient/12.1.0.2/`.

EX:

- `mkdir -p /usr/local/instantclient/12.1.0.2/`

2 - Extract all content from the **Instant Client** downloaded [previously](#) on your Mac system and copy to the folder created in the previous step:

EX:

- unzip oci_client_macosx_12.zip
- cp -avr __MACOSX/ oci_client_macosx_12/ /usr/local/instantclient/12.1.0.2/

3 - Copy the [previously downloaded oci8.so](#) extension to the PHP extensions directory:

ATENÇÃO: If you followed our [documentation](#) to install Scriptcase manually on macOS, the extension is already in the extensions directory. You can proceed to item **5**.

EX:

```
sudo cp oci8.so /usr/local/lib/php/pecl/20180731
```

Access the **info.php** file and search for the **extension_dir** line. It will tell you the exact path to the directory responsible for PHP extensions.

4 - Edit the **php.ini** file(/usr/local/etc/php/8.1/php.ini) and declare the Oracle extension at the end of the file.

EX:

```
extension=oci8.so
```

5 - Restart the apache service for the changes to be saved. Use the command below for this:

EX:

```
sudo apachectl restart
```

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle 8.0.5 or Higher** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed along with **Service Name**.
 - **E.g.** serverdomain.com/XE OR 192.168.254.170/XE
 - For more information about Oracle's **Service Name**, [click here](#).

- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the

client_encoding **UTF-8**.

- **By default, this option is left blank by Scriptcase.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connecting with Oracle ODBC

At Scriptcase, we have the following drivers available for connection to Oracle: **Oracle PDO, Oracle 8.0.5 or Higher, Oracle ODBC and Oracle 8.**

Prerequisites

Before proceeding at this documentation, check your PHP architecture. For drivers to be enabled correctly, **the files must be downloaded according to the architecture used.**

- In your Scriptcase, there is the file **info.php**, access it by URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find information regarding architecture in the [phpinfo\(\)](#).

NOTE: Download the Oracle instant client according to your PHP architecture.

- Architecture **i386/i686 = 32 bits**
- Architecture **x86_64 = 64 bits**

Below are listed the files required for Oracle drivers to be enabled.

Required files:

- Extension **oci8.so**: [Clique Aqui](#)

x86_64

- Oracle Instant Client **12.1.0.2(x86_64)**: [Clique Aqui](#)

IMPORTANT: The PHP 7.3 is compatible with **Oracle Instant Client 11.2 or Higher.**

To download the Oracle Instant Client below the version **19.5.0.0**, it is necessary to have a [Oracle account](#).

Other Files

- Oracle Instant Client **12.2.0 or Higher**: [Click Here](#)

Oracle ODBC Driver Compatibility Table

Drive	Oracle Database Version	10g	11g R1	11g R2(11.2)	12c	18c	19c
Oracle 8.0.5 or Higher	9i <input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Instant Client	Versión de base de datos Oracle	10g	11g R1	11g R2(11.2)	12c	18c	19c
19.6.0.0	9i <input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

Configuring Oracle ODBC on MacOs

It is necessary to enable the Oracle extension in PHP and configure **Instant_Client** to make the connection. Follow the steps described below to enable the connection drivers.

1 - On your Mac terminal, log in as **root** and create a folder with instant client numbering in `/usr/local/instantclient/12.1.0.2/`.

EX:

- `mkdir -p /usr/local/instantclient/12.1.0.2/`

2 - Extract all content from the **Instant Client** downloaded [previously](#) on your Mac system and copy to the folder created in the previous step:

EX:

- unzip oci_client_macosx_12.zip
- cp -avr __MACOSX/ oci_client_macosx_12/ /usr/local/instantclient/12.1.0.2/

3 - Copy the [previously downloaded oci8.so](#) extension to the PHP extensions directory:

ATENÇÃO: If you followed our [documentation](#) to install Scriptcase manually on macOS, the extension is already in the extensions directory. You can proceed to item **5**.

EX:

```
sudo cp oci8.so /usr/local/lib/php/pecl/20180731
```

Access the **info.php** file and search for the **extension_dir** line. It will tell you the exact path to the directory responsible for PHP extensions.

4 - Edit the **php.ini** file(/usr/local/etc/php/8.1/php.ini) and declare the Oracle extension at the end of the file.

EX:

```
extension=oci8.so
```

5 - Restart the apache service for the changes to be saved. Use the command below for this:

EX:

```
sudo apachectl restart
```

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle ODBC** Driver.
- **Server/Host (Name or IP):** Enter the Data Source Name created in your ODBC manager.
 - **E.G.** oracle
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**

- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
 - **By default, this option is left blank by Scriptcase.**

- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connecting with Oracle 8

At Scriptcase, we have the following drivers available for connection to Oracle: **Oracle PDO, Oracle 8.0.5 or Higher, Oracle ODBC and Oracle 8.**

Prerequisites

Before proceeding at this documentation, check your PHP architecture. For drivers to be enabled correctly, **the files must be downloaded according to the architecture used.**

- In your Scriptcase, there is the file **info.php**, access it by URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find information regarding architecture in the [phpinfo\(\)](#).

NOTE: Download the Oracle instant client according to your PHP architecture.

- Architecture **i386/i686 = 32 bits**
- Architecture **x86_64 = 64 bits**

Below are listed the files required for Oracle drivers to be enabled.

Required files:

- Extension **oci8.so**: [Clique Aqui](#)

x86_64

- Oracle Instant Client **12.1.0.2(x86_64)**: [Clique Aqui](#)

IMPORTANT: The PHP 7.3 is compatible with **Oracle Instant Client 11.2 or Higher.**

To download the Oracle Instant Client below the version **19.5.0.0**, it is necessary to have a [Oracle account](#).

Other Files

- Oracle Instant Client **12.2.0 or Higher**: [Click Here](#)

Oracle 8 Driver Compatibility Table

Oracle 8.0.5 or Higher	9i <input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Instant Client	Versión de base de datos Oracle						
19.6.0.0	9i <input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

Configuring Oracle 8 on MacOs

It is necessary to enable the Oracle extension in PHP and configure **Instant_Client** to make the connection. Follow the steps described below to enable the connection drivers.

1 - On your Mac terminal, log in as **root** and create a folder with instant client numbering in `/usr/local/instantclient/12.1.0.2/`.

EX:

- `mkdir -p /usr/local/instantclient/12.1.0.2/`

2 - Extract all content from the **Instant Client** downloaded [previously](#) on your Mac system and copy to the folder created in the previous step:

EX:

- unzip oci_client_macosx_12.zip
- cp -avr __MACOSX/ oci_client_macosx_12/ /usr/local/instantclient/12.1.0.2/

3 - Copy the [previously downloaded oci8.so](#) extension to the PHP extensions directory:

ATENÇÃO: If you followed our [documentation](#) to install Scriptcase manually on macOS, the extension is already in the extensions directory. You can proceed to item **5**.

EX:

```
sudo cp oci8.so /usr/local/lib/php/pecl/20180731
```

Access the **info.php** file and search for the **extension_dir** line. It will tell you the exact path to the directory responsible for PHP extensions.

4 - Edit the **php.ini** file(/usr/local/etc/php/8.1/php.ini) and declare the Oracle extension at the end of the file.

EX:

```
extension=oci8.so
```

5 - Restart the apache service for the changes to be saved. Use the command below for this:

EX:

```
sudo apachectl restart
```

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle 8** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed along with **Service Name**.
 - **E.g.** serverdomain.com/XE OR 192.168.254.170/XE
 - For more information about Oracle's **Service Name**, [click here](#).
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.

- **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.

- **By default, this option is left blank by Scriptcase.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

PostgreSQL with Scriptcase

In Scriptcase, we have four drivers to connect with PostgreSQL. You must choose the most suitable for your environment.

It is recommended to use PostgreSQL PDO which is faster, however, it is up to you to choose the driver. If you are using your own pre-configured environment, PostgreSQL extensions must be manually enabled in PHP.

Check below the PostgreSQL versions that you can use in the Scriptcase 9

PostgreSQL versions list supported in Scriptcase 9

PostgreSQL Version	PostgreSQL PDO (recommended)	PostgreSQL 7 or Higher	PostgreSQL 6.4 or Higher	PostgreSQL 6.3 or Lower
15	✓	✓	✓	✓
14	✓	✓	✓	✓
13	✓	✓	✓	✓
12	✓	✓	✓	✓
11	✓	✓	✓	✓
10	✓	✓	✓	✓
9.6	✓	✓	✓	✓
9.5	✓	✓	✓	✓
9.4	✓	✓	✓	✓
9.3	✓	✓	✓	✓
9.2	✓	✓	✓	✓
9.1	✓	✓	✓	✓
9.0	✓	✓	✓	✓

Check if PostgreSQL drivers in enable

You can check your enabled drivers by accessing your Scriptcase diagnosis. See below on how to locate your diagnosis and check if the driver is enabled.

- Accessing the top menu **Help > Diagnosis**, you can easily find it through the interface.

- Or, by accessing your browser url:

127.0.0.1:8092/scriptcase/diagnosis.php or domain.com/scriptcase/diagnosis.php

Make sure the driver is enabled, as in the image below:

The extension **PDO PostGreSQL** enable all drivers. The extension **PostGreSQL** enable this drivers: PostgreSQL 7 or Higher, PostgreSQL 6.4 or Higher and PostgreSQL 6.3 or Lower.

Connecting with PostgreSQL PDO

In Scriptcase, we have the following drivers available for connections with PostgreSQL: **PostgreSQL PDO, PostgreSQL 7 or Higher, PostgreSQL 6.4 or Higher and PostgreSQL 6.3 or Lower**. If you are using your own pre-configured environment, PostgreSQL extensions must be manually enabled in PHP.

Prerequisites

If you are using a manual installation on Windows, you'll need to enable the PostgreSQL extensions on **php.ini** file. Check below how to do it.

1 - In the `php.ini` file, located in `C:\php`, uncomment the lines referring to the PostgreSQL extensions **`pdo_pgsql`** and **`php_pgsql`** removing the `;` from the beginning of the line. See the example below:

2 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Search for the `Apache2.4` or `ApacheScriptcase9php81` service and right click on this service, then **Restart**.

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project using the PostgreSQL database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Postgres** connection.

Connection

Enter the parameters for connecting to your PostgreSQL database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the PostgreSQL Driver used to connect. In this example, we use the **PostgreSQL PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
 - **E.g.** `serverdomain.com` OR `192.168.254.170`
- **Port:** Inform the number port for your database server.
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your PostgreSQL database.
- **Password:** Enter the password to complete the authentication process.

- **Database Name:** Type your database name to connect with him. Or, if you want to choose one different database, click on the button **List Database** to show all databases available for your user.
 - **Create Database:** Clicking on this button, you will create a new PostgreSQL database for use.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Security

Use SSL

Allows you to define whether the connection will use SSL. Note that the option is disabled by default.

sslmode

sslmode		protection	MITM protection	Statement
disable	No	No	No	I don't care about security, and I don't want to pay the overhead of encryption.
allow	Maybe	No	No	I don't care about security, but I will pay the overhead of encryption if the server insists on it.
prefer	Maybe	No	No	I don't care about encryption, but I wish to pay the overhead of encryption if the server supports it.
require	Yes	No	No	I want my data to be encrypted, and I accept the overhead.
verify-ca	Yes	Depends on CA policy	Depends on CA policy	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server that I trust.
verify-full	Yes	Yes	Yes	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server I trust, and that it's the one I specify.

sslrootcert (SSL Root Certificate)

This parameter refers to the SSL/TLS root certificate used to verify the authenticity of the certificate presented by the server during secure communication. Usage: The value of this parameter must be the full path to the file containing the root certificate.

sslkey (SSL Private Key)

This parameter represents the private key associated with the SSL/TLS certificate used by the server for authentication. Usage: The full path to the file containing the private key must be specified.

sslcert (SSL Certificate)

The sslcert parameter refers to the server's SSL/TLS certificate, which is presented during the security negotiation process for authentication. Usage: The full path to the file containing the server's SSL/TLS certificate must be provided.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the PostgreSQL connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.

- **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

Connecting with PostgreSQL 7 or Higher

In Scriptcase, we have the following drivers available for connections with PostgreSQL: **PostgreSQL PDO, PostgreSQL 7 or Higher, PostgreSQL 6.4 or Higher and PostgreSQL 6.3 or Lower**. If you are using your own pre-configured environment, PostgreSQL extensions must be manually enabled in PHP.

Prerequisites

If you are using a manual installation on Windows, you'll need to enable the PostgreSQL extensions on **php.ini** file. Check below how to do it.

1 - In the `php.ini` file, located in `C:\php`, uncomment the lines referring to the PostgreSQL extensions **`pdo_pgsql`** and **`php_pgsql`** removing the `;` from the beginning of the line. See the example below:

2 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Search for the `Apache2.4` or `ApacheScriptcase9php81` service and right click on this service, then **Restart**.

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project using the PostgreSQL database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Postgres** connection.

Connection

Enter the parameters for connecting to your PostgreSQL database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the PostgreSQL Driver used to connect. In this example, we use the **PostgreSQL 7 or Higher** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
 - **E.g.** `serverdomain.com` OR `192.168.254.170`
- **Port:** Inform the number port for your database server.
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your PostgreSQL database.
- **Password:** Enter the password to complete the authentication process.

- **Database Name:** Type your database name to connect with him. Or, if you want to choose one different database, click on the button **List Database** to show all databases available for your user.
 - **Create Database:** Clicking on this button, you will create a new PostgreSQL database for use.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Security

Use SSL

Allows you to define whether the connection will use SSL. Note that the option is disabled by default.

sslmode

sslmode	protection	MITM protection	Statement
disable	No	No	I don't care about security, and I don't want to pay the overhead of encryption.
allow	Maybe	No	I don't care about security, but I will pay the overhead of encryption if the server insists on it.
prefer	Maybe	No	I don't care about encryption, but I wish to pay the overhead of encryption if the server supports it.
require	Yes	No	I want my data to be encrypted, and I accept the overhead.
verify-ca	Yes	Depends on CA policy	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server that I trust.
verify-full	Yes	Yes	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server I trust, and that it's the one I specify.

sslrootcert (SSL Root Certificate)

This parameter refers to the SSL/TLS root certificate used to verify the authenticity of the certificate presented by the server during secure communication. Usage: The value of this parameter must be the full path to the file containing the root certificate.

sslkey (SSL Private Key)

This parameter represents the private key associated with the SSL/TLS certificate used by the server for authentication. Usage: The full path to the file containing the private key must be specified.

sslcert (SSL Certificate)

The sslcert parameter refers to the server's SSL/TLS certificate, which is presented during the security negotiation process for authentication. Usage: The full path to the file containing the server's SSL/TLS certificate must be provided.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the PostgreSQL connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.

- **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

Connecting with PostgreSQL 6.4 or Higher

In Scriptcase, we have the following drivers available for connections with PostgreSQL: **PostgreSQL PDO, PostgreSQL 7 or Higher, PostgreSQL 6.4 or Higher and PostgreSQL 6.3 or Lower**. If you are using your own pre-configured environment, PostgreSQL extensions must be manually enabled in PHP.

Prerequisites

If you are using a manual installation on Windows, you'll need to enable the PostgreSQL extensions on **php.ini** file. Check below how to do it.

1 - In the `php.ini` file, located in `C:\php`, uncomment the lines referring to the PostgreSQL extensions **`pdo_pgsql`** and **`php_pgsql`** removing the `;` from the beginning of the line. See the example below:

2 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Search for the `Apache2.4` or `ApacheScriptcase9php81` service and right click on this service, then **Restart**.

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project using the PostgreSQL database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Postgres** connection.

Connection

Enter the parameters for connecting to your PostgreSQL database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the PostgreSQL Driver used to connect. In this example, we use the **PostgreSQL 6.4 or Higher** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
 - **E.g.** `serverdomain.com` OR `192.168.254.170`
- **Port:** Inform the number port for your database server.
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your PostgreSQL database.
- **Password:** Enter the password to complete the authentication process.

- **Database Name:** Type your database name to connect with him. Or, if you want to choose one different database, click on the button **List Database** to show all databases available for your user.
 - **Create Database:** Clicking on this button, you will create a new PostgreSQL database for use.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Security

Use SSL

Allows you to define whether the connection will use SSL. Note that the option is disabled by default.

sslmode

sslmode	protection	MITM protection	Statement
disable	No	No	I don't care about security, and I don't want to pay the overhead of encryption.
allow	Maybe	No	I don't care about security, but I will pay the overhead of encryption if the server insists on it.
prefer	Maybe	No	I don't care about encryption, but I wish to pay the overhead of encryption if the server supports it.
require	Yes	No	I want my data to be encrypted, and I accept the overhead.
verify-ca	Yes	Depends on CA policy	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server that I trust.
verify-full	Yes	Yes	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server I trust, and that it's the one I specify.

sslrootcert (SSL Root Certificate)

This parameter refers to the SSL/TLS root certificate used to verify the authenticity of the certificate presented by the server during secure communication. Usage: The value of this parameter must be the full path to the file containing the root certificate.

sslkey (SSL Private Key)

This parameter represents the private key associated with the SSL/TLS certificate used by the server for authentication. Usage: The full path to the file containing the private key must be specified.

sslcert (SSL Certificate)

The sslcert parameter refers to the server's SSL/TLS certificate, which is presented during the security negotiation process for authentication. Usage: The full path to the file containing the server's SSL/TLS certificate must be provided.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the PostgreSQL connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.

- **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

Connecting with PostgreSQL 6.3 or Lower

In Scriptcase, we have the following drivers available for connections with PostgreSQL: **PostgreSQL PDO, PostgreSQL 7 or Higher, PostgreSQL 6.4 or Higher and PostgreSQL 6.3 or Lower**. If you are using your own pre-configured environment, PostgreSQL extensions must be manually enabled in PHP.

Prerequisites

If you are using a manual installation on Windows, you'll need to enable the PostgreSQL extensions on **php.ini** file. Check below how to do it.

1 - In the `php.ini` file, located in `C:\php`, uncomment the lines referring to the PostgreSQL extensions **`pdo_pgsql`** and **`php_pgsql`** removing the `;` from the beginning of the line. See the example below:

2 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Search for the `Apache2.4` or `ApacheScriptcase9php81` service and right click on this service, then **Restart**.

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project using the PostgreSQL database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Postgres** connection.

Connection

Enter the parameters for connecting to your PostgreSQL database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the PostgreSQL Driver used to connect. In this example, we use the **PostgreSQL 6.3 or lower** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
 - **E.g.** `serverdomain.com` OR `192.168.254.170`
- **Port:** Inform the number port for your database server.
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your PostgreSQL database.
- **Password:** Enter the password to complete the authentication process.

- **Database Name:** Type your database name to connect with him. Or, if you want to choose one different database, click on the button **List Database** to show all databases available for your user.
 - **Create Database:** Clicking on this button, you will create a new PostgreSQL database for use.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Security

Use SSL

Allows you to define whether the connection will use SSL. Note that the option is disabled by default.

sslmode

sslmode	protection	MITM protection	Statement
disable	No	No	I don't care about security, and I don't want to pay the overhead of encryption.
allow	Maybe	No	I don't care about security, but I will pay the overhead of encryption if the server insists on it.
prefer	Maybe	No	I don't care about encryption, but I wish to pay the overhead of encryption if the server supports it.
require	Yes	No	I want my data to be encrypted, and I accept the overhead.
verify-ca	Yes	Depends on CA policy	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server that I trust.
verify-full	Yes	Yes	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server I trust, and that it's the one I specify.

sslrootcert (SSL Root Certificate)

This parameter refers to the SSL/TLS root certificate used to verify the authenticity of the certificate presented by the server during secure communication. Usage: The value of this parameter must be the full path to the file containing the root certificate.

sslkey (SSL Private Key)

This parameter represents the private key associated with the SSL/TLS certificate used by the server for authentication. Usage: The full path to the file containing the private key must be specified.

sslcert (SSL Certificate)

The sslcert parameter refers to the server's SSL/TLS certificate, which is presented during the security negotiation process for authentication. Usage: The full path to the file containing the server's SSL/TLS certificate must be provided.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the PostgreSQL connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.

- **By default, Scriptcase enables this option.**

 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

Connecting with PostgreSQL PDO

In Scriptcase, we have the following drivers available for connections with PostgreSQL: **PostgreSQL PDO, PostgreSQL 7 or Higher, PostgreSQL 6.4 or Higher and PostgreSQL 6.3 or Lower**. If you are using your own pre-configured environment, PostgreSQL extensions must be manually enabled in PHP.

Prerequisites

If you are using a manual installation on Linux, you'll need to install the PostgreSQL php extension. Check below how to do it.

1 - Access your **Linux** terminal and type this line below according to your OS to install PostgreSQL PDO driver.

Ubuntu

```
sudo apt-get install php8.1-pgsql
```

CentOS

```
sudo yum install php-pgsql
```

2 - Check if the PostgreSQL driver is enabled in your Scriptcase diagnosis. See below on how to locate your diagnosis and check if the driver is enabled.

- Accessing the top menu **Help > Diagnosis**, you can easily find it through the interface.

- Or, by accessing your Scriptcase installation path:

127.0.0.1/scriptcase/diagnosis.php OR domain.com/scriptcase/diagnosis.php

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project using the PostgreSQL database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Postgres** connection.

Connection

Enter the parameters for connecting to your PostgreSQL database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the PostgreSQL Driver used to connect. In this example, we use the **PostgreSQL PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
 - **E.g.** serverdomain.com OR 192.168.254.170
- **Port:** Inform the number port for your database server.
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**

- **Username:** Inform the user to authenticate the connection to your PostgreSQL database.
- **Password:** Enter the password to complete the authentication process.
- **Database Name:** Type your database name to connect with him. Or, if you want to choose one different database, click on the button **List Database** to show all databases available for your user.
 - **Create Database:** Clicking on this button, you will create a new PostgreSQL database for use.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Security

Use SSL

Allows you to define whether the connection will use SSL. Note that the option is disabled by default.

sslmode

sslmode	protection	MITM protection	Statement
disable	No	No	I don't care about security, and I don't want to pay the overhead of encryption.
allow	Maybe	No	I don't care about security, but I will pay the overhead of encryption if the server insists on it.
prefer	Maybe	No	I don't care about encryption, but I wish to pay the overhead of encryption if the server supports it.
require	Yes	No	I want my data to be encrypted, and I accept the overhead.
verify-ca	Yes	Depends on CA policy	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server that I trust.
verify-full	Yes	Yes	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server I trust, and that it's the one I specify.

sslrootcert (SSL Root Certificate)

This parameter refers to the SSL/TLS root certificate used to verify the authenticity of the certificate presented by the server during secure communication. Usage: The value of this parameter must be the full path to the file containing the root certificate.

sslkey (SSL Private Key)

This parameter represents the private key associated with the SSL/TLS certificate used by the server for authentication. Usage: The full path to the file containing the private key must be specified.

sslcert (SSL Certificate)

The sslcert parameter refers to the server's SSL/TLS certificate, which is presented during the security negotiation process for authentication. Usage: The full path to the file containing the server's SSL/TLS certificate must be provided.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the PostgreSQL connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

 - **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connecting with PostgreSQL 7 or Higher

In Scriptcase, we have the following drivers available for connections with PostgreSQL: **PostgreSQL PDO, PostgreSQL 7 or Higher, PostgreSQL 6.4 or Higher and PostgreSQL 6.3 or Lower**. If you are using your own pre-configured environment, PostgreSQL extensions must be manually enabled in PHP.

Prerequisites

If you are using a manual installation on Linux, you'll need to install the PostgreSQL php extension. Check below how to do it.

1 - Access your **Linux** terminal and type this line below according to your OS to install PostgreSQL PDO driver.

Ubuntu

```
sudo apt-get install php8.1-pgsql
```

CentOS

```
sudo yum install php-pgsql
```

2 - Check if the PostgreSQL driver is enabled in your Scriptcase diagnosis. See below on how to locate your diagnosis and check if the driver is enabled.

- Accessing the top menu **Help > Diagnosis**, you can easily find it through the interface.

- Or, by accessing your Scriptcase installation path:

127.0.0.1/scriptcase/diagnosis.php OR domain.com/scriptcase/diagnosis.php

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project using the PostgreSQL database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Postgres** connection.

Connection

Enter the parameters for connecting to your PostgreSQL database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the PostgreSQL Driver used to connect. In this example, we use the **PostgreSQL 7 or Higher** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
 - **E.g.** serverdomain.com OR 192.168.254.170
- **Port:** Inform the number port for your database server.
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**

- **Username:** Inform the user to authenticate the connection to your PostgreSQL database.
- **Password:** Enter the password to complete the authentication process.
- **Database Name:** Type your database name to connect with him. Or, if you want to choose one different database, click on the button **List Database** to show all databases available for your user.
 - **Create Database:** Clicking on this button, you will create a new PostgreSQL database for use.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Security

Use SSL

Allows you to define whether the connection will use SSL. Note that the option is disabled by default.

sslmode

sslmode	protection	MITM protection	Statement
disable	No	No	I don't care about security, and I don't want to pay the overhead of encryption.
allow	Maybe	No	I don't care about security, but I will pay the overhead of encryption if the server insists on it.
prefer	Maybe	No	I don't care about encryption, but I wish to pay the overhead of encryption if the server supports it.
require	Yes	No	I want my data to be encrypted, and I accept the overhead.
verify-ca	Yes	Depends on CA policy	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server that I trust.
verify-full	Yes	Yes	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server I trust, and that it's the one I specify.

sslrootcert (SSL Root Certificate)

This parameter refers to the SSL/TLS root certificate used to verify the authenticity of the certificate presented by the server during secure communication. Usage: The value of this parameter must be the full path to the file containing the root certificate.

sslkey (SSL Private Key)

This parameter represents the private key associated with the SSL/TLS certificate used by the server for authentication. Usage: The full path to the file containing the private key must be specified.

sslcert (SSL Certificate)

The sslcert parameter refers to the server's SSL/TLS certificate, which is presented during the security negotiation process for authentication. Usage: The full path to the file containing the server's SSL/TLS certificate must be provided.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connecting with PostgreSQL 6.4 or Higher

In Scriptcase, we have the following drivers available for connections with PostgreSQL: **PostgreSQL PDO, PostgreSQL 7 or Higher, PostgreSQL 6.4 or Higher and PostgreSQL 6.3 or Lower**. If you are using your own pre-configured environment, PostgreSQL extensions must be manually enabled in PHP.

Prerequisites

If you are using a manual installation on Linux, you'll need to install the PostgreSQL php extension. Check below how to do it.

1 - Access your **Linux** terminal and type this line below according to your OS to install PostgreSQL PDO driver.

Ubuntu

```
sudo apt-get install php8.1-pgsql
```

CentOS

```
sudo yum install php-pgsql
```

2 - Check if the PostgreSQL driver is enabled in your Scriptcase diagnosis. See below on how to locate your diagnosis and check if the driver is enabled.

- Accessing the top menu **Help > Diagnosis**, you can easily find it through the interface.

- Or, by accessing your Scriptcase installation path:

127.0.0.1/scriptcase/diagnosis.php OR domain.com/scriptcase/diagnosis.php

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project using the PostgreSQL database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Postgres** connection.

Connection

Enter the parameters for connecting to your PostgreSQL database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the PostgreSQL Driver used to connect. In this example, we use the **PostgreSQL 6.4 or Higher** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
 - **E.g.** serverdomain.com OR 192.168.254.170
- **Port:** Inform the number port for your database server.
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**

- **Username:** Inform the user to authenticate the connection to your PostgreSQL database.
- **Password:** Enter the password to complete the authentication process.
- **Database Name:** Type your database name to connect with him. Or, if you want to choose one different database, click on the button **List Database** to show all databases available for your user.
 - **Create Database:** Clicking on this button, you will create a new PostgreSQL database for use.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Security

Use SSL

Allows you to define whether the connection will use SSL. Note that the option is disabled by default.

sslmode

sslmode	protection	MITM protection	Statement
disable	No	No	I don't care about security, and I don't want to pay the overhead of encryption.
allow	Maybe	No	I don't care about security, but I will pay the overhead of encryption if the server insists on it.
prefer	Maybe	No	I don't care about encryption, but I wish to pay the overhead of encryption if the server supports it.
require	Yes	No	I want my data to be encrypted, and I accept the overhead.
verify-ca	Yes	Depends on CA policy	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server that I trust.
verify-full	Yes	Yes	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server I trust, and that it's the one I specify.

sslrootcert (SSL Root Certificate)

This parameter refers to the SSL/TLS root certificate used to verify the authenticity of the certificate presented by the server during secure communication. Usage: The value of this parameter must be the full path to the file containing the root certificate.

sslkey (SSL Private Key)

This parameter represents the private key associated with the SSL/TLS certificate used by the server for authentication. Usage: The full path to the file containing the private key must be specified.

sslcert (SSL Certificate)

The sslcert parameter refers to the server's SSL/TLS certificate, which is presented during the security negotiation process for authentication. Usage: The full path to the file containing the server's SSL/TLS certificate must be provided.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the PostgreSQL connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connecting with PostgreSQL 6.3 or Lower

In Scriptcase, we have the following drivers available for connections with PostgreSQL: **PostgreSQL PDO, PostgreSQL 7 or Higher, PostgreSQL 6.4 or Higher and PostgreSQL 6.3 or Lower**. If you are using your own pre-configured environment, PostgreSQL extensions must be manually enabled in PHP.

Prerequisites

If you are using a manual installation on Linux, you'll need to install the PostgreSQL php extension. Check below how to do it.

1 - Access your **Linux** terminal and type this line below according to your OS to install PostgreSQL PDO driver.

Ubuntu

```
sudo apt-get install php8.1-pgsql
```

CentOS

```
sudo yum install php-pgsql
```

2 - Check if the PostgreSQL driver is enabled in your Scriptcase diagnosis. See below on how to locate your diagnosis and check if the driver is enabled.

- Accessing the top menu **Help > Diagnosis**, you can easily find it through the interface.

- Or, by accessing your Scriptcase installation path:

127.0.0.1/scriptcase/diagnosis.php OR domain.com/scriptcase/diagnosis.php

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project using the PostgreSQL database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Postgres** connection.

Connection

Enter the parameters for connecting to your PostgreSQL database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the PostgreSQL Driver used to connect. In this example, we use the **PostgreSQL 6.3 or lower** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
 - **E.g.** serverdomain.com OR 192.168.254.170
- **Port:** Inform the number port for your database server.
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**

- **Username:** Inform the user to authenticate the connection to your PostgreSQL database.
- **Password:** Enter the password to complete the authentication process.
- **Database Name:** Type your database name to connect with him. Or, if you want to choose one different database, click on the button **List Database** to show all databases available for your user.
 - **Create Database:** Clicking on this button, you will create a new PostgreSQL database for use.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Security

Use SSL

Allows you to define whether the connection will use SSL. Note that the option is disabled by default.

sslmode

sslmode	protection	MITM protection	Statement
disable	No	No	I don't care about security, and I don't want to pay the overhead of encryption.
allow	Maybe	No	I don't care about security, but I will pay the overhead of encryption if the server insists on it.
prefer	Maybe	No	I don't care about encryption, but I wish to pay the overhead of encryption if the server supports it.
require	Yes	No	I want my data to be encrypted, and I accept the overhead.
verify-ca	Yes	Depends on CA policy	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server that I trust.
verify-full	Yes	Yes	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server I trust, and that it's the one I specify.

sslrootcert (SSL Root Certificate)

This parameter refers to the SSL/TLS root certificate used to verify the authenticity of the certificate presented by the server during secure communication. Usage: The value of this parameter must be the full path to the file containing the root certificate.

sslkey (SSL Private Key)

This parameter represents the private key associated with the SSL/TLS certificate used by the server for authentication. Usage: The full path to the file containing the private key must be specified.

sslcert (SSL Certificate)

The sslcert parameter refers to the server's SSL/TLS certificate, which is presented during the security negotiation process for authentication. Usage: The full path to the file containing the server's SSL/TLS certificate must be provided.

This parameter refers to the SSL/TLS root certificate used to verify the authenticity of the certificate presented by the server during secure communication. Usage: The value of this parameter must be the full path to the file containing the root certificate.

sslkey (SSL Private Key)

This parameter represents the private key associated with the SSL/TLS certificate used by the server for authentication. Usage: The full path to the file containing the private key must be specified.

sslcert (SSL Certificate)

The sslcert parameter refers to the server's SSL/TLS certificate, which is presented during the security negotiation process for authentication. Usage: The full path to the file containing the server's SSL/TLS certificate must be provided.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the PostgreSQL connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.

- **By default, Scriptcase enables this option.**

- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connecting with PostgreSQL 6.3 or Lower

In Scriptcase, we have the following drivers available for connections with PostgreSQL: **PostgreSQL PDO, PostgreSQL 7 or Higher, PostgreSQL 6.4 or Higher and PostgreSQL 6.3 or Lower**. If you are using your own pre-configured environment, PostgreSQL extensions must be manually enabled in PHP.

Prerequisites

If you are using a manual installation on MacOS, you'll need to install the PHP and the PostgreSQL driver will be enabled. Click [here](#) to see how to do it.

1 - Check if the PostgreSQL driver is enabled in your Scriptcase diagnosis. See below on how to locate your diagnosis and check if the driver is enabled.

- Accessing the top menu **Help > Diagnosis**, you can easily find it through the interface.

![Accessing diagnosis - Help Menu][diagnosis_sc]

- Or, by accessing your Scriptcase installation path:

127.0.0.1/scriptcase/diagnosis.php OR domain.com/scriptcase/diagnosis.php

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project using the PostgreSQL database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Postgres** connection.

Connection

Enter the parameters for connecting to your PostgreSQL database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the PostgreSQL Driver used to connect. In this example, we use the **PostgreSQL 6.3 or lower** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
 - **E.g.** serverdomain.com OR 192.168.254.170
- **Port:** Inform the number port for your database server.
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your PostgreSQL database.
- **Password:** Enter the password to complete the authentication process.
- **Database Name:** Type your database name to connect with him. Or, if you want to choose one different database, click on the button **List Database** to show all databases availables for your user.
 - **Create Database:** Clicking on this button, you will create a new PostgreSQL database for use.

- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Security

Use SSL

Allows you to define whether the connection will use SSL. Note that the option is disabled by default.

sslmode

sslmode	protection	MITM protection	Statement
disable	No	No	I don't care about security, and I don't want to pay the overhead of encryption.
allow	Maybe	No	I don't care about security, but I will pay the overhead of encryption if the server insists on it.
prefer	Maybe	No	I don't care about encryption, but I wish to pay the overhead of encryption if the server supports it.
require	Yes	No	I want my data to be encrypted, and I accept the overhead.
verify-ca	Yes	Depends on CA policy	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server that I trust.
verify-full	Yes	Yes	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server I trust, and that it's the one I specify.

sslrootcert (SSL Root Certificate)

This parameter refers to the SSL/TLS root certificate used to verify the authenticity of the certificate presented by the server during secure communication. Usage: The value of this parameter must be the full path to the file containing the root certificate.

sslkey (SSL Private Key)

This parameter represents the private key associated with the SSL/TLS certificate used by the server for authentication. Usage: The full path to the file containing the private key must be specified.

sslcert (SSL Certificate)

The sslcert parameter refers to the server's SSL/TLS certificate, which is presented during the security negotiation process for authentication. Usage: The full path to the file containing the server's SSL/TLS certificate must be provided.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the PostgreSQL connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

MSSQL Server

Scriptcase provides some driver options for connecting to MSSQL Server, compatible with the latest versions of Windows, Linux and MacOS.

You can see if drivers are enabled by going to diagnosis.

Accessing from the Scriptcase menu.

After login, in the top menu of the tool access Help > Diagnosis.

Accessing directly through the browser

In your browser, without having to login to Scriptcase, you can access the diagnosis.

When installation is local:

127.0.0.1:8092/scriptcase/diagnosis.php ou localhost:8092/scriptcase/diagnosis.php

In case of installation on a server.

domain.com/scriptcase/diagnosis.php

Click on the driver you want to use, according to your operating system.

Windows

- [MSSQL Server NATIVE SRV](#)
- [MSSQL Server NATIVE SRV PDO](#)
- [MSSQL Server ODBC](#)

Linux

- [PDO DBLIB](#)

Mac OS

- [PDO DBLIB](#)

Compatibility Table

Check below the list of drivers available for each operating system.

OS x Drivers	Native SRV PDO	Native SRV	ODBC	PDO DBlib
Windows Server 2016	✓	✓	✓	✗
Windows Server 2019	✓	✓	✓	✗
Windows Server 2012 /R2	✓	✓	✓	✗
Windows 10	✓	✓	✓	✗
Windows 8 / 8.1	✓	✓	✓	✗
Windows Server 2008 SP2 / R2 SP1	✓	✓	✓	✗
Windows 7 SP1	✗	✗	✓	✗
Windows Vista SP2	✗	✗	✓	✗
Linux	✗	✗	✗	✓
Mac OS	✗	✗	✗	✓

Connection to MSSQL Server NATIVE SRV

At Scriptcase, we have the following drivers available for connecting to SQL Server on Windows: **MSSQL Server NATIVE SRV, MSSQL Server NATIVE SRV PDO and MSSQL Server ODBC** . If you are using your own PHP, as a pre-configured MSSQL environment, it can be manually configured in PHP.

Requirements

Before proceeding with this documentation, check your PHP architecture. For drivers to be enabled correctly, **files must be downloaded according to the architecture used.**

- In your Scriptcase, there is the file **info.php**, access it by the URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find the information regarding the architecture in [phpinfo\(\)](#).

NOTE: If you are using Scriptcase's automatic installer, the PHP architecture will be the same as the one you downloaded. **Download Microsoft ODBC Driver 13 For SQL Server according to your PHP architecture .**

- **x86** Architecture = **32 bits**
- **x64** Architecture = **64 bits**

File list

Listed below are the necessary files for the drivers to be enabled.

- [Download Microsoft ODBC Driver 13 For SQL Server x64](#)
- [Download Microsoft ODBC Driver 13 For SQL Server x86](#)
- [SQL Server extensions for PHP](#)

Compatibility Table

	Server 2016	Server 2012 /R2	Windows 10	Windows 8 / 8.1	Server 2008 R2 SP1	Windows 7 SP1	Windows Vista SP2
Native SRV PDO	<input type="checkbox"/>						
Native SRV	<input type="checkbox"/>						
ODBC	<input type="checkbox"/>						

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(") instead of the brackets([]) because of the conflict with the of [Global Variables syntax](#) Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

Configuring and enabling MSSQL Server SRV PDO on Windows

If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP** , requiring only the installation of the client. **Proceed to item 3**

1 - Extract the .zip file and copy the files from the **php_pdo_sqlsrv_81_nts_x64** and **php_sqlsrv_81_nts_x64** .dll extensions [previously](#) downloaded to your PHP's ext folder.

2 - In the php.ini file, located in C:\php, add the lines referring to the MSSQL Server extensions **php_pdo_sqlsrv_81_nts_x64** and **php_sqlsrv_81_nts_x64**. See the example below:

```
extension=pdo_sqlsrv_81_nts_x64
extension=sqlsrv_81_nts_x64
```

3 - After downloading the Microsoft ODBC Driver 13 For SQL Server file, run the installer and follow the steps below:

4 - Accept the terms of the license agreement and click Next.

5 - Check the option **“ODBC Driver for SQL Server SDK”**, because the components that we will need are also in this option.

- **In this option, leave the option “Client Components” checked.**

6 - Click Install to start the client installation.

7 - The program features you selected are being installed.

8 - Click finish to exit.

9 - Restart Apache service through **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the ApacheScriptcase9php81 or Apache2.4 service and right click on that service, then click **Reiniciar**.

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver and the Microsoft SQL Server database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **MSSQL Server** connection.

Connection

Enter the parameters for connecting to your MSSQL Server database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the DB2 Driver to connect. In this example, we use the **MSSQL Server NATIVE SRV PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed and its instance separated by a backslash.
- **EX:** dominioserver.com\SQLEXPRESS OR 192.168.254.170\SQLEXPRESS

- **Port:** Enter the port to connect to the MSSQL Server. By default, the port defined is **1433**.
- **Database Name:** List and select the database you will connect to.
- **EX:** samples
- **Username:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Security tab, where the connection encryption settings are defined.

Encrypt

This property specifies whether communication with the SQL server should be encrypted. To enable encryption, you must set this property to “true”. This ensures that data sent between the client and server is protected by encryption.

trustservercertificate

Set to “true” to specify that the driver does not validate the server’s TLS/SSL certificate.

If “true”, the server’s TLS/SSL certificate is automatically trusted when the communication layer is encrypted using TLS.

trustStore

The path (including the file name) to the certificate’s trustStore file. The trustStore file contains the list of certificates that the client trusts.

When this property is not specified or is set to null, the driver relies on the trust manager factory query rules to determine which certificate store to use.

trustStorePassword

The password used to verify the integrity of trustStore data.

If the trustStore property is set but the trustStorePassword property is not set, the integrity of the trustStore is not checked.

hostnameInCertificate

The hostname to use to validate the SQL Server TLS/SSL certificate.

This property allows you to specify the expected hostname in the SQL server certificate. This is useful to ensure that the connection is only made to the correct server and not to a malicious server that may be using an invalid certificate.

Note: This property is used in combination with the **encrypt**/authentication properties and the **trustServerCertificate** property. This property affects certificate validation if the connection uses **TLS** encryption and **trustServerCertificate** is set to “false”. Ensure that the value passed to **hostnameInCertificate** matches the Common Name (CN) or DNS name in the Subject Alternative Name (SAN) in the server certificate for a **TLS** connection to be successful. For more information about encryption support, see Understanding encryption support.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty .**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above .**
- **View:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the . dot is selected as a separator .**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option .**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option .**

Connection to MSSQL Server NATIVE SRV PDO

At Scriptcase, we have the following drivers available for connecting to SQL Server on Windows: **MSSQL Server NATIVE SRV**, **MSSQL Server NATIVE SRV PDO** and **MSSQL Server ODBC** .. If you are using your own PHP, as a pre-configured MSSQL environment, it can be manually configured in PHP.

Requirements

Before proceeding with this documentation, check your PHP architecture. For drivers to be enabled correctly, **files must be downloaded according to the architecture used.**

- In your Scriptcase, there is the file **info.php**, access it by the URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find the information regarding the architecture in [phpinfo\(\)](#).

NOTE: If you are using Scriptcase's automatic installer, the PHP architecture will be the same as the one you downloaded. **Download Microsoft ODBC Driver 13 For SQL Server according to your PHP architecture .**

- **x86** Architecture = **32 bits**
- **x64** Architecture = **64 bits**

File list

Listed below are the necessary files for the drivers to be enabled.

- [Download Microsoft ODBC Driver 13 For SQL Server x64](#)
- [Download Microsoft ODBC Driver 13 For SQL Server x86](#)
- [SQL Server extensions for PHP](#)

Compatibility Table

	Server 2016	Server 2012 /R2	Windows 10	Windows 8 / 8.1	Server 2008 R2 SP1	Windows 7 SP1	Windows Vista SP2
Native SRV PDO	<input type="checkbox"/>						
Native SRV	<input type="checkbox"/>						
ODBC	<input type="checkbox"/>						

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(") instead of the brackets([]) because of the conflict with the of [Global Variables syntax](#) Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

Configuring and enabling MSSQL Server SRV PDO on Windows

If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, requiring only the installation of the client. **Proceed to item 3**

1 - Extract the .zip file and copy the files from the **php_pdo_sqlsrv_81_nts_x64** and **php_sqlsrv_81_nts_x64** .dll extensions [previously](#) downloaded to your PHP's ext folder.

2 - In the php.ini file, located in C:\php, add the lines referring to the MSSQL Server extensions **php_pdo_sqlsrv_81_nts_x64** and **php_sqlsrv_81_nts_x64**. See the example below:

```
extension=pdo_sqlsrv_81_nts_x64
extension=sqlsrv_81_nts_x64
```

3 - After downloading the Microsoft ODBC Driver 13 For SQL Server file, run the installer and follow the steps below:

4 - Accept the terms of the license agreement and click Next.

5 - Check the option **“ODBC Driver for SQL Server SDK”**, because the components that we will need are also in this option.

- **In this option, leave the option “Client Components” checked.**

6 - Click Install to start the client installation.

7 - The program features you selected are being installed.

8 - Click finish to exit.

9 - Restart Apache service through **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the ApacheScriptcase9php81 or Apache2.4 service and right click on that service, then click **Reiniciar**.

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver and the Microsoft SQL Server database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **MSSQL Server** connection.

Connection

Enter the parameters for connecting to your MSSQL Server database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the DB2 Driver to connect. In this example, we use the **MSSQL Server NATIVE SRV PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed and its instance separated by a backslash.
- **EX:** dominioserver.com\SQLEXPRESS OR 192.168.254.170\SQLEXPRESS

- **Port:** Enter the port to connect to the MSSQL Server. By default, the port defined is **1433**.
- **Database Name:** List and select the database you will connect to.
- **EX:** samples
- **Username:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Security tab, where the connection encryption settings are defined.

Encrypt

This property specifies whether communication with the SQL server should be encrypted. To enable encryption, you must set this property to “true”. This ensures that data sent between the client and server is protected by encryption.

trustservercertificate

Set to “true” to specify that the driver does not validate the server’s TLS/SSL certificate.

If “true”, the server’s TLS/SSL certificate is automatically trusted when the communication layer is encrypted using TLS.

trustStore

The path (including the file name) to the certificate’s trustStore file. The trustStore file contains the list of certificates that the client trusts.

When this property is not specified or is set to null, the driver relies on the trust manager factory query rules to determine which certificate store to use.

trustStorePassword

The password used to verify the integrity of trustStore data.

If the trustStore property is set but the trustStorePassword property is not set, the integrity of the trustStore is not checked.

hostnameInCertificate

The hostname to use to validate the SQL Server TLS/SSL certificate.

This property allows you to specify the expected hostname in the SQL server certificate. This is useful to ensure that the connection is only made to the correct server and not to a malicious server that may be using an invalid certificate.

Note: This property is used in combination with the **encrypt**/authentication properties and the **trustServerCertificate** property. This property affects certificate validation if the connection uses **TLS** encryption and **trustServerCertificate** is set to “false”. Ensure that the value passed to **hostnameInCertificate** matches the Common Name (CN) or DNS name in the Subject Alternative Name (SAN) in the server certificate for a **TLS** connection to be successful. For more information about encryption support, see Understanding encryption support.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(") instead of the brackets([]) because of the conflict with the of [Global Variables syntax](#) Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

Configuring and enabling MSSQL Server SRV PDO on Windows

If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP** , requiring only the installation of the client. **Proceed to item 3**

1 - Extract the .zip file and copy the files from the **php_pdo_sqlsrv_81_nts_x64** and **php_sqlsrv_81_nts_x64** .dll extensions [previously](#) downloaded to your PHP's ext folder.

2 - In the php.ini file, located in C:\php, add the lines referring to the MSSQL Server extensions **php_pdo_sqlsrv_81_nts_x64** and **php_sqlsrv_81_nts_x64**. See the example below:

```
extension=pdo_sqlsrv_81_nts_x64
extension=sqlsrv_81_nts_x64
```

3 - After downloading the Microsoft ODBC Driver 13 For SQL Server file, run the installer and follow the steps below:

4 - Accept the terms of the license agreement and click Next.

5 - Check the option “**ODBC Driver for SQL Server SDK**”, because the components that we will need are also in this option.

- **In this option, leave the option “Client Components” checked.**

6 - Click Install to start the client installation.

7 - The program features you selected are being installed.

8 - Click finish to exit.

9 - Restart Apache service through **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the ApacheScriptcase9php81 or Apache2.4 service and right click on that service, then click **Reiniciar**.

Creating the DSN for connection

To connect to the **MSSQL Server ODBC** Driver, you need to configure a System DSN. Follow the steps described below to perform this configuration.

ATTENTION: ODBC must be created on the same Server where ScriptCase is installed.

1 - Access your **ODBC Data Source Manager** and select according to your architecture. We will select the x64 version:

2 - When entering the ODBC Data Sources Administrator, select the **DSN System** tab and click on *_Add* to create your connection to your Database.

3 - After that, it is necessary to select the Driver to connect to the MSSQL Server. Select the Driver: **ODBC Driver 11 for SQL Server** .

4 - Now, you need to define the name of the DSN, the description and the database connection server.

- **Name:** Enter the name that the DSN will have so that you can use it in Scriptcase.
- **Description:** Add a description for the DSN.
- **Server:** inform the database server, port and instance that you will connect to.

4.1 - After entering the data, click on the **Next** button to enter the user name and password required for connection.

- **Login ID:** Inform the user to authenticate with the database.

- **Password:** Enter the corresponding password to authenticate with the informed user.

4.2 - Now, click **Next** to select the default database.

To finish, click **Next** and finally, click **Finish**.

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver and the Microsoft SQL Server database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the menu **Database > New connection**.

After that, a screen will appear with all database connections.

3 - Select the **MSSQL Server** connection.

Connection

Enter the parameters for connecting to your MSSQL Server database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the DB2 Driver to connect. In this example, we use the **MSSQL Server ODBC Driver**.
- **Server/Host (Name or IP):** Enter the system DSN that was configured in ODBC Manager.
- **EX:** mssql
- **Username:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Security tab, where the connection encryption settings are defined.

Encrypt

This property specifies whether communication with the SQL server should be encrypted. To enable encryption, you must set this property to "true". This ensures that data sent between the client and server is protected by encryption.

trustservercertificate

Set to "true" to specify that the driver does not validate the server's TLS/SSL certificate.

If “true”, the server’s TLS/SSL certificate is automatically trusted when the communication layer is encrypted using TLS.

trustStore

The path (including the file name) to the certificate’s trustStore file. The trustStore file contains the list of certificates that the client trusts.

When this property is not specified or is set to null, the driver relies on the trust manager factory query rules to determine which certificate store to use.

trustStorePassword

The password used to verify the integrity of trustStore data.

If the trustStore property is set but the trustStorePassword property is not set, the integrity of the trustStore is not checked.

hostnameInCertificate

The hostname to use to validate the SQL Server TLS/SSL certificate.

This property allows you to specify the expected hostname in the SQL server certificate. This is useful to ensure that the connection is only made to the correct server and not to a malicious server that may be using an invalid certificate.

Note: This property is used in combination with the **encrypt**/authentication properties and the **trustServerCertificate** property. This property affects certificate validation if the connection uses **TLS** encryption and **trustServerCertificate** is set to “false”. Ensure that the value passed to **hostnameInCertificate** matches the Common Name (CN) or DNS name in the Subject Alternative Name (SAN) in the server certificate for a **TLS** connection to be successful. For more information about encryption support, see Understanding encryption support.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty .**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above .**
- **View:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the . dot is selected as a separator .**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option .**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option .**

Connection to MSSQL Server DBLIB

In Scriptcase installed on Linux, we have the following driver available for connection to MSSQL Server: **DBLIB**. If you are using your own preconfigured environment, the MSSQL Server extensions must be manually enabled in the PHP.

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(") instead of the brackets([]) because of the conflict with the of [Global Variables syntax](#) Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

Enabling DBLIB on Linux

IMPORTANT: If you are using Scriptcase automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - If you do not have the extension enabled you can install the extension with this command in the terminal:

```
sudo apt-get install php8.1-pdo-dblib
```

- If you are unable to execute the above command because you cannot find packages, install the repository below and update.

```
sudo add-apt-repository ppa:ondrej/php
sudo apt-get update
```

Install the basic packages using the terminal for this procedure:

Ubuntu\Debian

```
sudo apt-get install unixodbc unixodbc-dev gcc nano wget
make
```

RHEL\CentOS

```
sudo yum install unixODBC unixODBC-devel gcc nano wget
make
```

- Download and Unzip the freeTDS:

```
wget https://www.freetds.org/files/stable/freetds-0.95.95.tar.gz
```

```
tar -zxf freetds-0.95.95.tar.gz
```

- Access the freeTDS directory and run the following command to compile and install FreeTDS:

```
sudo ./configure --with-tdsver=7.4 --with-unixodbc=/usr --disable-libiconv --disable-static --disable-threadsafelibs --enable-msdblib --disable-sspi --with-gnu-ld --enable-sybase-compat && make && make install
```

- Edit the FreeTDS configuration file:

Ubuntu\Debian

```
sudo nano /usr/local/etc/freetds.conf
```

RHEL\CentOS

```
sudo vim /usr/local/freetds/freetds.conf
```

- Add your MSSQL Server connection informations, like this example:

```
[MSSQLServer] host = 192.18.72.03
port = 1433
tds version = 7.2
```

2 - Restart the Apache service via the terminal.

```
sudo service apache2 restart
```

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the Enabled Driver **DBLIB** and the MSSQL Server database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **MSSQL Server** connection.

Connection

Enter the parameters for connecting to your MSSQL Server database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the MSSQL Server Driver to connect. In this example, we use the Driver **DBLIB**.
- **Server/Host (Name or IP):** Enter the name of the data source you have configured on your `freetds.conf` file.
- **EX:** MSSQLServer
- **Port:** Enter the port to connect to the MSSQL Server. By default, the port defined is **1433**.
- **Database Name:** List and select the database you will connect to.
- **EX:** samples
- **Username:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Security tab, where the connection encryption settings are defined.

Encrypt

This property specifies whether communication with the SQL server should be encrypted. To enable encryption, you must set this property to "true". This ensures that data sent between the client and server is protected by encryption.

trustservercertificate

Set to "true" to specify that the driver does not validate the server's TLS/SSL certificate.

If "true", the server's TLS/SSL certificate is automatically trusted when the communication layer is encrypted using TLS.

trustStore

The path (including the file name) to the certificate's trustStore file. The trustStore file contains the list of certificates that the client trusts.

When this property is not specified or is set to null, the driver relies on the trust manager factory query rules to determine which certificate store to use.

trustStorePassword

The password used to verify the integrity of trustStore data.

If the trustStore property is set but the trustStorePassword property is not set, the integrity of the trustStore is not checked.

hostnameInCertificate

The hostname to use to validate the SQL Server TLS/SSL certificate.

This property allows you to specify the expected hostname in the SQL server certificate. This is useful to ensure that the connection is only made to the correct server and not to a malicious server that may be using an invalid certificate.

Note: This property is used in combination with the **encrypt**/authentication properties and the **trustServerCertificate** property. This property affects certificate validation if the connection uses **TLS** encryption and **trustServerCertificate** is set to "false". Ensure that the value passed to **hostnameInCertificate** matches the Common Name (CN) or DNS name in the Subject Alternative Name (SAN) in the server certificate for a **TLS** connection to be successful. For more information about encryption support, see Understanding encryption support.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty .**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above .**
- **View:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the . dot is selected as a separator .**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option .**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option .**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connection to MSSQL NATIVE SRV PDO

In Scriptcase installed on Linux, we have the following drivers available for connection to MSSQL Server: **DBLIB, NATIVE SRV PDO and NATIVE SRV**. If you are using your own preconfigured environment, the MSSQL Server extensions must be manually enabled in the PHP.

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(") instead of the brackets([]) because of the conflict with the of [Global Variables syntax](#) Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

Microsoft Driver Installation Tutorial for PHP and SQL Server

IMPORTANT: If you are using Scriptcase automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - Enter the Shell (terminal) as root and install the following packages:

Ubuntu\Debian

```
sudo apt-get install unixodbc-dev sudo yum install unixODBC-devel
```

RHEL\CentOS

In the linux terminal, you will need to run the following commands to install the drivers:

Ubuntu\Debian

```
sudo pecl install pdo_sqlsrv
sudo su
printf "; priority=30\nextension=pdo_sqlsrv.so\n" > /etc/php/8.1/mods-available/pdo_sqlsrv.ini
exit
sudo phpenmod -v 8.1 pdo_sqlsrv
```

RHEL\CentOS

```
sudo pecl install pdo_sqlsrv
sudo su
echo extension=pdo_sqlsrv.so >> `php --ini | grep "Scan for additional .ini files" | sed -e "s|.*:|`"/30-pdo_sqlsrv.ini
exit
```

- If you are unable to execute the above command because you cannot find packages, install the repository below and update.

```
sudo su
add-apt-repository ppa:ondrej/php -y
sudo apt-get update
```

2 - Restart the Apache service via the terminal.

```
sudo service apache2 restart
```

Important: Continue to the Microsoft ODBC Driver installation in order to enable the drivers and complete the process.

Installing Microsoft ODBC Driver for SQL Server (Linux)

1 - Using the terminal, run the following commands:

Ubuntu

```
if ! [[ "16.04 18.04 20.04 22.04" == *$(lsb_release -rs)* ]];
then
echo "Ubuntu $(lsb_release -rs) is not currently supported.";
```

```

exit;
fi

sudo su
curl https://packages.microsoft.com/keys/microsoft.asc | apt-key add -

curl https://packages.microsoft.com/config/ubuntu/$(lsb_release -rs)/prod.list > /etc/apt/sources.list.d/mssql-release.list

exit

sudo apt-get update

sudo ACCEPT_EULA=Y apt-get install -y msodbcsql17

```

Debian

```

sudo su

curl https://packages.microsoft.com/keys/microsoft.asc | apt-key add -

#Download appropriate package for the OS version
#Choose only ONE of the following, corresponding to your OS version

#Debian 9
curl https://packages.microsoft.com/config/debian/9/prod.list > /etc/apt/sources.list.d/mssql-release.list

#Debian 10
curl https://packages.microsoft.com/config/debian/10/prod.list > /etc/apt/sources.list.d/mssql-release.list

#Debian 11
curl https://packages.microsoft.com/config/debian/11/prod.list > /etc/apt/sources.list.d/mssql-release.list

sudo apt-get update

sudo ACCEPT_EULA=Y apt-get install -y msodbcsql17

```

RHEL\CentOS

```

sudo su

#Download appropriate package for the OS version
#Choose only ONE of the following, corresponding to your OS version

#RHEL 7 and Oracle Linux 7
curl https://packages.microsoft.com/config/rhel/7/prod.repo > /etc/yum.repos.d/mssql-release.repo

#RHEL 8 and Oracle Linux 8
curl https://packages.microsoft.com/config/rhel/8/prod.repo > /etc/yum.repos.d/mssql-release.repo

#RHEL 9
curl https://packages.microsoft.com/config/rhel/9.0/prod.repo > /etc/yum.repos.d/mssql-release.repo

sudo yum remove unixODBC-utf16 unixODBC-utf16-devel #to avoid conflicts

sudo ACCEPT_EULA=Y yum install -y msodbcsql17

```

2 - Restart the Apache service via the terminal.

```
sudo service apache2 restart
```

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver and the Microsoft SQL Server database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **MSSQL Server** connection.

Connection

Enter the parameters for connecting to your MSSQL Server database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the DB2 Driver to connect. In this example, we use the **MSSQL Server NATIVE SRV PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed and its instance separated by a backslash.
- **EX:** dominiodoserver.com\SQLEXPRESS or 192.168.254.170\SQLEXPRESS
- **Port:** Enter the port to connect to the MSSQL Server. By default, the port defined is **1433**.
- **Database Name:** List and select the database you will connect to.
- **EX:** samples
- **Username:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Security tab, where the connection encryption settings are defined.

Encrypt

This property specifies whether communication with the SQL server should be encrypted. To enable encryption, you must set this property to "true". This ensures that data sent between the client and server is protected by encryption.

trustservercertificate

Set to "true" to specify that the driver does not validate the server's TLS/SSL certificate.

If "true", the server's TLS/SSL certificate is automatically trusted when the communication layer is encrypted using TLS.

trustStore

The path (including the file name) to the certificate's trustStore file. The trustStore file contains the list of certificates that the client trusts.

When this property is not specified or is set to null, the driver relies on the trust manager factory query rules to determine which certificate store to use.

trustStorePassword

The password used to verify the integrity of trustStore data.

If the trustStore property is set but the trustStorePassword property is not set, the integrity of the trustStore is not checked.

hostnameInCertificate

The hostname to use to validate the SQL Server TLS/SSL certificate.

This property allows you to specify the expected hostname in the SQL server certificate. This is useful to ensure that the connection is only made to the correct server and not to a malicious server that may be using an invalid certificate.

Note: This property is used in combination with the **encrypt**/authentication properties and the **trustServerCertificate** property. This property affects certificate validation if the connection uses **TLS** encryption and **trustServerCertificate** is set to "false". Ensure that the value passed to **hostnameInCertificate** matches the Common Name (CN) or DNS name in the Subject Alternative Name (SAN) in the server certificate for a **TLS** connection to be successful. For more information about encryption support, see Understanding encryption support.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty .**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above .**
- **View:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the . dot is selected as a separator .**

- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option .**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option .**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connection to MSSQL NATIVE SRV

In Scriptcase installed on Linux, we have the following drivers available for connection to MSSQL Server: **DBLIB, NATIVE SRV PDO and NATIVE SRV**. If you are using your own preconfigured environment, the MSSQL Server extensions must be manually enabled in the PHP.

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(") instead of the brackets([]) because of the conflict with the of [Global Variables syntax](#) Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

Microsoft Driver Installation Tutorial for PHP and SQL Server

IMPORTANT: If you are using Scriptcase automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - Enter the Shell (terminal) as root and install the following packages:

Ubuntu\Debian

```
sudo apt-get install unixodbc-dev sudo yum install unixODBC-devel
```

RHEL\CentOS

In the linux terminal, you will need to run the following commands to install the drivers:

Ubuntu\Debian

```
sudo pecl install sqlsrv
sudo su
printf "; priority=20\nextension=sqlsrv.so\n" > /etc/php/8.1/mods-available/sqlsrv.ini
exit
sudo phpenmod -v 8.1 sqlsrv
```

RHEL\CentOS

```
sudo pecl install sqlsrv
sudo su
echo extension=sqlsrv.so >> `php --ini | grep "Scan for additional .ini files" | sed -e "s|.*:|s*|"/20-sqlsrv.ini
exit
```

- If you are unable to execute the above command because you cannot find packages, install the repository below and update.

```
sudo su
add-apt-repository ppa:ondrej/php -y
sudo apt-get update
```

2 - Restart the Apache service via the terminal.

```
sudo service apache2 restart
```

Important: Continue to the Microsoft ODBC Driver installation in order to enable the drivers and complete the process.

Installing Microsoft ODBC Driver for SQL Server (Linux)

1 - Using the terminal, run the following commands:

Ubuntu

```
if ! [[ "16.04 18.04 20.04 22.04" == *$(lsb_release -rs)* ]];
then
echo "Ubuntu $(lsb_release -rs) is not currently supported.";
exit;
```

```
fi
sudo su
curl https://packages.microsoft.com/keys/microsoft.asc | apt-key add -
curl https://packages.microsoft.com/config/ubuntu/$(lsb_release -rs)/prod.list > /etc/apt/sources.list.d/mssql-release.list
exit
sudo apt-get update
sudo ACCEPT_EULA=Y apt-get install -y msodbcsql17
```

Debian

```
sudo su
curl https://packages.microsoft.com/keys/microsoft.asc | apt-key add -
#Download appropriate package for the OS version
#Choose only ONE of the following, corresponding to your OS version
#Debian 9
curl https://packages.microsoft.com/config/debian/9/prod.list > /etc/apt/sources.list.d/mssql-release.list
#Debian 10
curl https://packages.microsoft.com/config/debian/10/prod.list > /etc/apt/sources.list.d/mssql-release.list
#Debian 11
curl https://packages.microsoft.com/config/debian/11/prod.list > /etc/apt/sources.list.d/mssql-release.list
sudo apt-get update
sudo ACCEPT_EULA=Y apt-get install -y msodbcsql17
```

RHEL\CentOS

```
sudo su
#Download appropriate package for the OS version
#Choose only ONE of the following, corresponding to your OS version
#RHEL 7 and Oracle Linux 7
curl https://packages.microsoft.com/config/rhel/7/prod.repo > /etc/yum.repos.d/mssql-release.repo
#RHEL 8 and Oracle Linux 8
curl https://packages.microsoft.com/config/rhel/8/prod.repo > /etc/yum.repos.d/mssql-release.repo
#RHEL 9
curl https://packages.microsoft.com/config/rhel/9.0/prod.repo > /etc/yum.repos.d/mssql-release.repo
sudo yum remove unixODBC-utf16 unixODBC-utf16-devel #to avoid conflicts
sudo ACCEPT_EULA=Y yum install -y msodbcsql17
```

2 - Restart the Apache service via the terminal.

```
sudo service apache2 restart
```

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver and the Microsoft SQL Server database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **MSSQL Server** connection.

Connection

Enter the parameters for connecting to your MSSQL Server database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the DB2 Driver to connect. In this example, we use the **MSSQL Server NATIVE SRV** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed and its instance separated by a backslash.
- **EX:** dominiodoserver.com\SQLEXPRESS or 192.168.254.170\SQLEXPRESS
- **Port:** Enter the port to connect to the MSSQL Server. By default, the port defined is **1433**.
- **Database Name:** List and select the database you will connect to.
- **EX:** samples
- **Username:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Security tab, where the connection encryption settings are defined.

Encrypt

This property specifies whether communication with the SQL server should be encrypted. To enable encryption, you must set this property to "true". This ensures that data sent between the client and server is protected by encryption.

trustservercertificate

Set to "true" to specify that the driver does not validate the server's TLS/SSL certificate.

If "true", the server's TLS/SSL certificate is automatically trusted when the communication layer is encrypted using TLS.

trustStore

The path (including the file name) to the certificate's trustStore file. The trustStore file contains the list of certificates that the client trusts.

When this property is not specified or is set to null, the driver relies on the trust manager factory query rules to determine which certificate store to use.

trustStorePassword

The password used to verify the integrity of trustStore data.

If the trustStore property is set but the trustStorePassword property is not set, the integrity of the trustStore is not checked.

hostnameInCertificate

The hostname to use to validate the SQL Server TLS/SSL certificate.

This property allows you to specify the expected hostname in the SQL server certificate. This is useful to ensure that the connection is only made to the correct server and not to a malicious server that may be using an invalid certificate.

Note: This property is used in combination with the **encrypt**/authentication properties and the **trustServerCertificate** property. This property affects certificate validation if the connection uses **TLS** encryption and **trustServerCertificate** is set to "false". Ensure that the value passed to **hostnameInCertificate** matches the Common Name (CN) or DNS name in the Subject Alternative Name (SAN) in the server certificate for a **TLS** connection to be successful. For more information about encryption support, see Understanding encryption support.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty .**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above .**
- **View:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the . dot is selected as a separator .**

- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option .**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option .**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connection to PDO DBLIB

In Scriptcase installed on Linux, we have the following driver available for connection to MSSQL Server: **PDO DBLIB** . If you are using your own pre-configured environment, MSSQL Server extensions must be enabled manually in PHP.

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(") instead of the brackets([]) because of the conflict with the of [Global Variables syntax](#) Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

Configuring and enabling the DBLIB PDO on macOS

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase .**

If you have installed PHP 8.1 through our documentation using homebrew, **PDO DBLIB is already enabled in PHP**, requiring only the connection. Check below our documentation for installing PHP 8.1 with homebrew on macOS.

PHP 8.1 on macOS: [click here](#)

Connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the Enabled Driver (**MSSQL Server NATIVE SRV or MSSQL Server NATIVE SRV PDO**) and the Azure MSSQL Server database.

- 1 - Access a project from your Scriptcase.
- 2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

- 3 - Select the **MSSQL Server** connection.

Connection

Enter the parameters for connecting to your Azure MSSQL Server database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the MSSQL Server Driver to connect. In this example, we use the Driver **PDO DBLIB**.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed and its instance separated by a backslash.
- **EX:** dominiodoserver.com\SQLEXPRESS OR 192.168.254.170\SQLEXPRESS
- **Port:** Enter the port to connect to the MSSQL Server. By default, the port defined is **1433**.
- **Database Name:** List and select the database you will connect to.
- **EX:** samples
- **Username:** Inform the user to authenticate the connection to your database.

- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

SQLite with Scriptcase

In Scriptcase, we only have one driver to connect to SQLite: **SQLite PDO**. If you are using your own pre-configured environment, the **SQLite extension must be enabled manually in PHP**.

You can check if your driver is enabled by accessing your Scriptcase diagnostics. See below for how to locate your diagnostics:

- When you go to the top menu **Help > Diagnostics**, you can easily find it through the interface.

- Or, by accessing the url in your browser:

127.0.0.1:8092/scriptcase/diagnosis.php or domain.com/scriptcase/diagnosis.php

If the driver is already enabled, you only need to connect to Scriptcase, click on the link below to be directed to the driver that will be used.

Environment	SQLite PDO
Windows	Connect
Linux	Connect
macOS	Connect

Windows

In Scriptcase, we only have one driver to connect to SQLite: **SQLite PDO**. If you are using your own pre-configured environment, the **SQLite extension must be enabled manually in PHP**.

Prerequisites

If you are using a manual installation on Windows, you will need to enable the SQLite extension in the **php.ini** file. See below for how to do this.

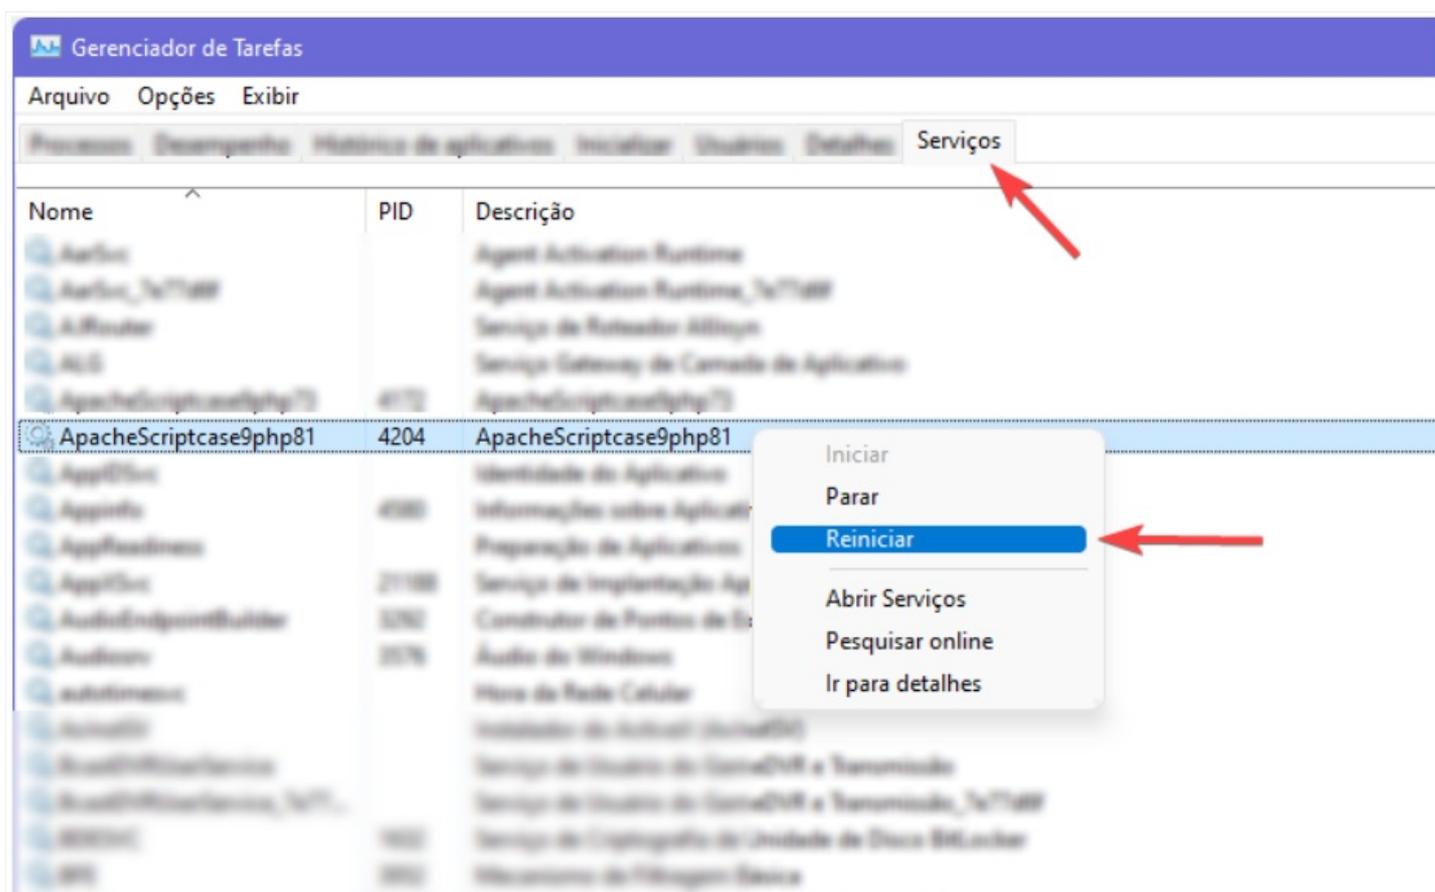

NOTE: If you are using an automatic Scriptcase installation, the SQLite driver will be enabled automatically.

1 - In the **php.ini** file, located under **C:\php**, uncomment the line for the SQLite extension **pdo_sqlite** by removing the **;** from the start of the line. See the example below:

```
922 ;extension=pdo_firebird
923 ;extension=pdo_mysql
924 ;extension=pdo_oci
925 ;extension=pdo_odbc
926 ;extension=pdo_pgsql
927 extension=pdo_sqlite
928 ;extension=pgsql
929 ;extension=shmop
930
```

2 - Restart the Apache service using the **Task Manager**.

- Open Task Manager and click on the **Services** tab.
- Look for the **Apache2.4** or **ApacheScriptcase9php73** service and right-click on this service, then **Restart**.

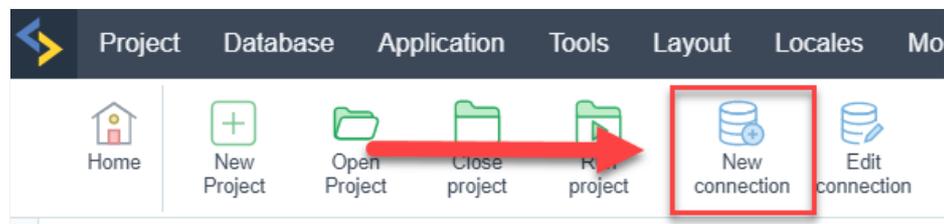

Creating a connection in Scriptcase

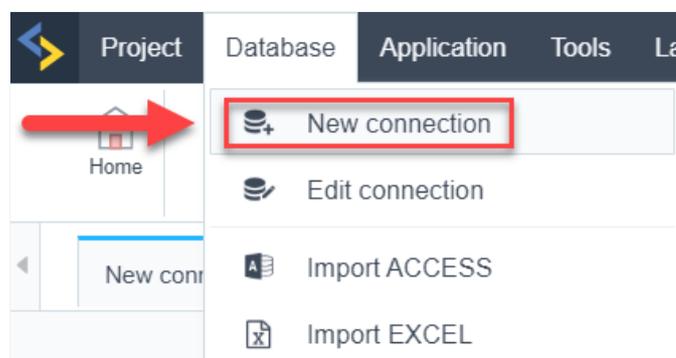

Here is how to create a connection in your Scriptcase project using the SQLite database.

1 - Access any project from within your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

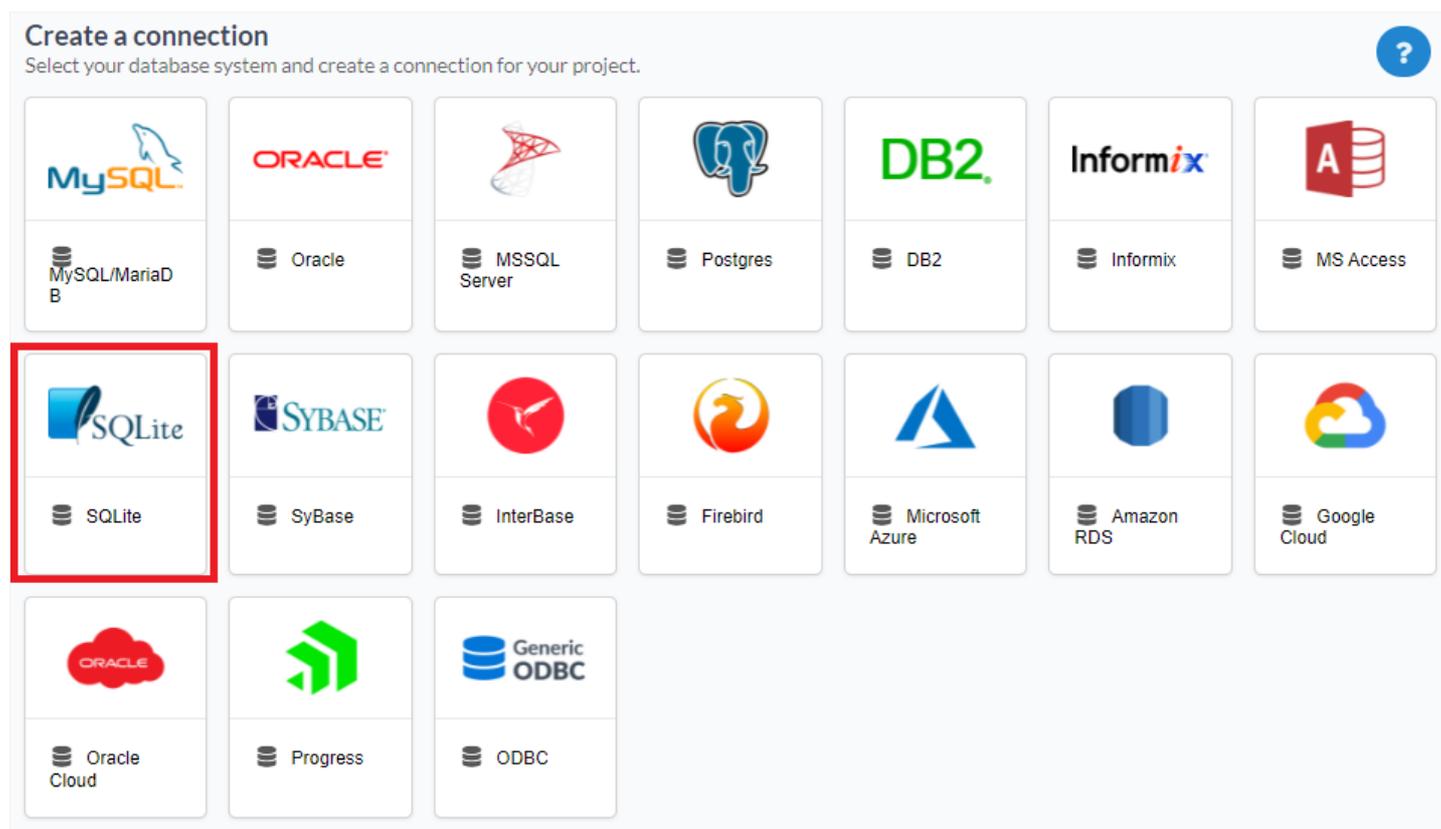

or go to the **Database > New Connection** menu.

After that, a new page will appear with all the database connections.

3 - Select the **SQLite** connection.

Connection

Enter the parameters for connecting to your SQLite database as follows:

The screenshot shows the 'CONNECTION' tab of the configuration interface. It includes a 'Connection Name' field with the value 'conn_sqlite', a 'DBMS Driver' dropdown menu set to 'SQLite PDO', a 'Server/Host (Name or IP)' text field containing the path 'C:\Program Files\NetMake\v9-php81\wwwroot\scriptcase9\database.db', and an empty 'Password' field. At the bottom, there are two buttons: a green 'Test Connection' button and a blue 'Save' button.

- **Connection Name:** Set the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the SQLite Driver used to connect. By default, the driver will be **SQLite PDO**.
- **Server/Host(Name or IP):** Enter the full path to your SQLite database file. **EX:** `C:\Apache24\htdocs\client_data`
- **Password:** Enter the password to complete the authentication process if you have it set for your DB file.
- **Test Connection:** Click this button to get a response from the Scriptcase request to see if the parameters you entered are correct.

The screenshot shows a confirmation message in a light green box with the text 'Connection Success'. Below the message, there are two buttons: a green 'Test Connection' button and a blue 'Save' button.

Filter

By accessing this tab, you can configure which items from the Database will be displayed in the connection, depending on the owner or not.

The screenshot shows the 'FILTER' tab of the configuration interface. It is divided into two main sections: 'Show' and 'Searches'. The 'Show' section has four checkboxes: 'Tables' (checked), 'Views' (checked), 'System tables' (unchecked), and 'Procedures' (unchecked). The 'Searches' section has three input fields: 'Tables', 'Owner', and 'Show'. The 'Show' dropdown menu is currently set to 'No'.

Show

Allows the SQLite connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** When you select this option, the procedures from your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The setting can contain a **PREFIX%** or name of the tables to be displayed.
 - **By default, Scriptcase leaves this option empty.**
 - **Ex:**

Using the table prefix

Tables	Owner
SUP%	SYSTEM

Using the table name

Tables	Owner
SUP_ACCOUNT, SUP_ORDEF	SYSTEM

- **Owner:** Inform the user who sees the inserted tables for display.
 - **User must be in capital letters, as in the example above**
- **Show:** Choose whether tables are displayed for the owner entered.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improve the performance** of your database connection.

Advanced

In this tab, you have access to settings specific to the connection. Changes made in this section impact the data display and performance of the application.

CONNECTION SECURITY FILTER **ADVANCED**

Use the schema before table name
 Yes

- **client_encoding:** Select the encoding used in your database. In the example above, we used client_encoding **UTF-8**.
- **Decimal separator:** Select the separator type for decimal records, between comma and period.
 - By default, period **.** is selected as the separator.
- **Persistent connection:** Set whether connections will be closed after your scripts run in Scriptcase applications.
 - By default, Scriptcase disables this option.
- **Use the schema before table name:** Set whether the database schema is displayed before the table names.
 - By default, Scriptcase enables this option.
 - Ex:

Using the schema before table name	Not using the schema before table name
<p>Connection *</p> <p>conn_oracle</p> <p>Table</p> <p>"SYSTEM".COL</p>	<p>Connection *</p> <p>conn_oracle</p> <p>Table</p> <p>COL</p>

Linux

In Scriptcase, we only have one driver to connect to SQLite: **SQLite PDO**. If you are using your own pre-configured environment, the **SQLite extension must be enabled manually in PHP**.

Prerequisites

If you are using a manual installation on Linux, you will need to install the SQLite php extension. See below for how to do this:

NOTE: If you are using an automatic Scriptcase installation, the SQLite driver will be enabled automatically.

1 - Log into your **Linux** terminal and type this line below according to your operating system to install the SQLite PDO driver.

Ubuntu	CentOS
<code>sudo apt-get install php8.1-sqlite</code>	<code>sudo yum install php-sqlite</code>

2 - Make sure that the SQLite driver is enabled in your Scriptcase diagnostic:

- When you go to the top menu **Help > Diagnostics**, you can easily find it through the interface.

- Or, by accessing your Scriptcase installation path:

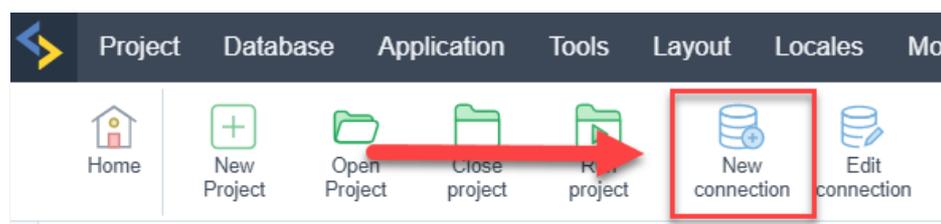

`127.0.0.1/scriptcase/diagnosis.php` or `domain.com/scriptcase/diagnosis.php`

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH	<input type="checkbox"/>
SSH Server	<input type="text"/>
SSH Port	<input type="text"/>
SSH User	<input type="text"/>
Private cert. file	<input type="text"/>
Local port for port forwarding	<input type="text"/>
Database server from SSH	<input type="text"/>
Database port from SSH	<input type="text"/>

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

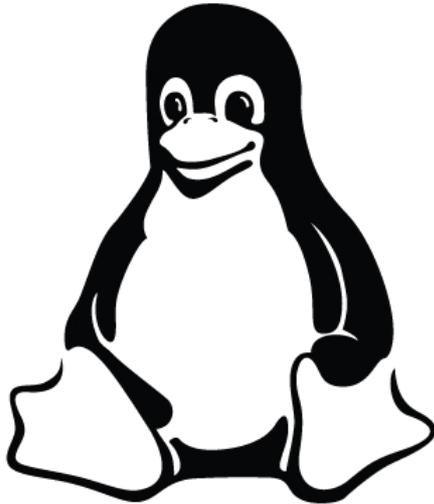

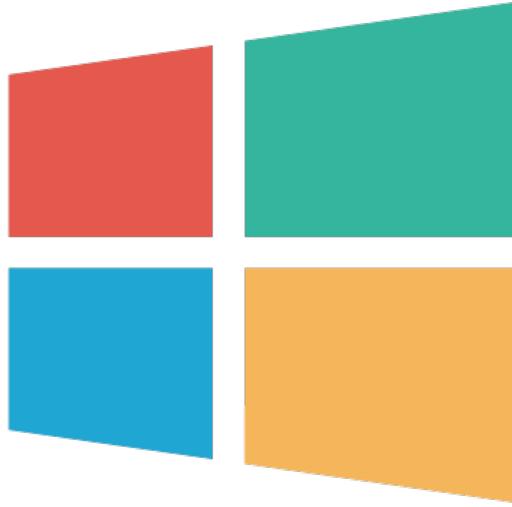

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

ODBC

Windows

The ODBC Generic connection is normally used to create connections with the databases: dBase (.dbf), Dataflex, Paradox, Visual FoxPro, etc.

You only need have the corresponding ODBC driver with the database installed.

If you are using your own previously configured environment, you will need to enable the ODBC extension in PHP.

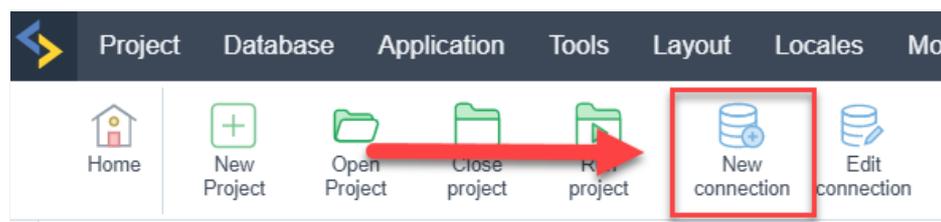

Generic ODBC

Setting up ODBC on Windows

The automatic installation already comes with the ODBC only needing to connect with the database with ScriptCase.

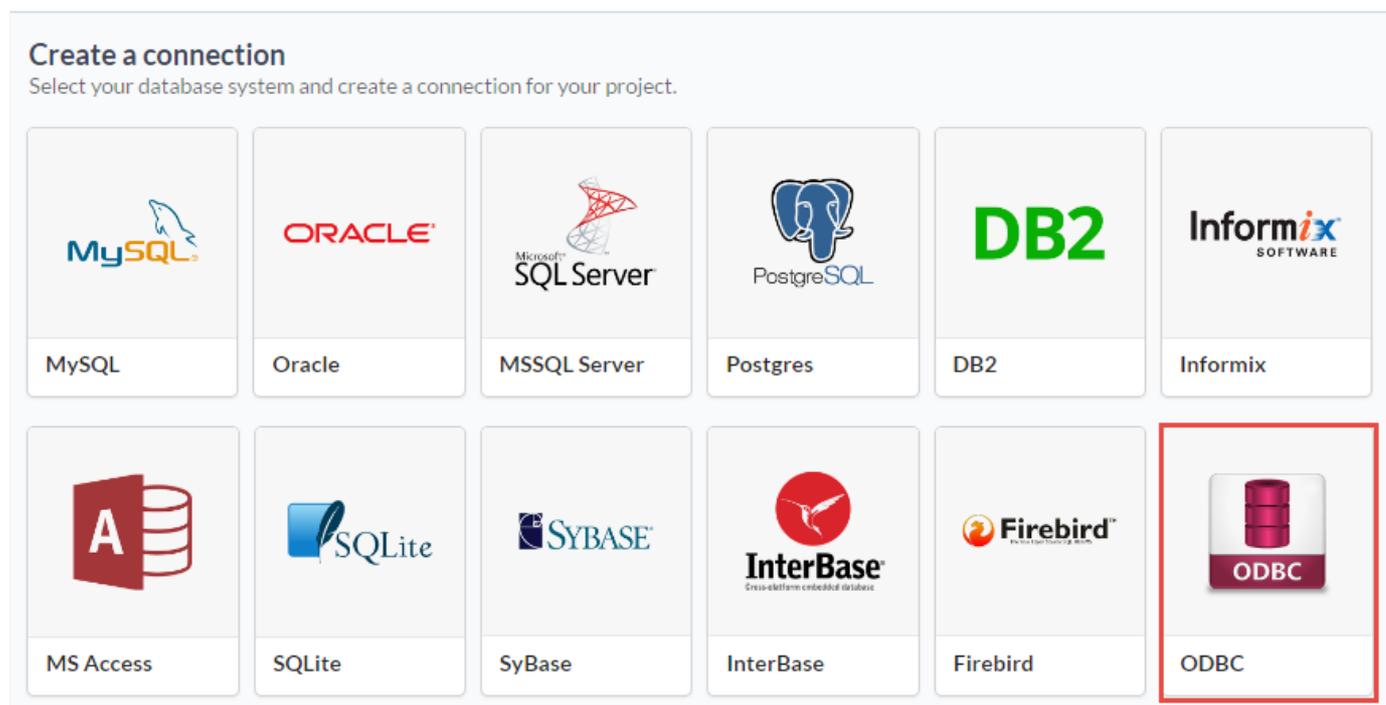

Creating a Connection with ScriptCase

- Access ScriptCase using the URL <http://127.0.0.1:8092/scriptcase>
- After accessing ScriptCase, access or create a new project, click on the new connection icon or access “Database > New Connection”

Creating a new connection

- After that, you will see a page with all the database connections that you can create. Select a “ODBC” connection

Selecting a Windows database connection

- **New connection** : You will place the information of the connection to your database here:

Create a connection ODBC

Enter your database connection details for ODBC

Advanced setup for the Windows database

- **Decimal Separator** - Select the separator type, between a dot or a comma.
- **Persistent Connection** - Persistent Connection are connections that do not close when finishing a script.
- **Use the schema before table name** - Allows the use of schema before the name of the tables.
- **Filter** : Accessing this tab, we can setup which tables will be listed on this connection:

The screenshot shows a configuration window with three tabs: 'CONNECTION', 'FILTER', and 'ADVANCED'. The 'FILTER' tab is active. It contains two main sections: 'Show' and 'Searches'. The 'Show' section has four checkboxes: 'Tables' (checked), 'Views' (checked), 'System tables' (unchecked), and 'Procedures' (unchecked). The 'Searches' section has three input fields: 'Tables' (empty), 'Owner' (empty), and 'Show' (a dropdown menu with 'No' selected). At the bottom of the window are two buttons: 'Test Connection' (green) and 'Save' (blue).

Filtering the Windows database

- **Show** - Allows the display of the the filters on the tables, views, System Tables and procedures.
 - **Tables** - Allows to setup the display of Tables from your database.
 - **Views** - Allows to setup the display of Views from your database.
 - **System Tables** - Allows to setup the display of System Tables from your database.
 - **Procedures** - Allows to setup the display of Procedures from your database.
- **Searches** - Allows to define which tables and Owner will be displayed.
 - **Tables** - Allows to define a prefix (prefix%) or name of the tables for display.
 - **Owner** - Allows to define the owner of the tables for listing.
 - **Show** - Allows to define what will be displayed or not from the table an owner's setup.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

Linux

The ODBC Generic connection is normally used to create connections with the databases: dBase (.dbf), Dataflex, Paradox, Visual FoxPro, etc.

You only need have the corresponding ODBC driver with the database installed.

If you are using your own previously configured environment, you will need to enable the ODBC extension in PHP.

Generic ODBC

Setting up ODBC on Linux

The automatic installation already comes with the ODBC only needing to install the UnixODBC driver so that you can do the connection.

UBUNTU\DEBIAN x86_64

- sudo apt-get update

- sudo apt-get install unixodbc-dev unixodbc

CENTOS\RHEL x86_64

- sudo yum update

- sudo yum install unixODBC

UBUNTU\DEBIAN i386 (x86)

- sudo apt-get update

- sudo apt-get install unixodbc-dev unixodbc

CENTOS\RHEL i686 (x86)

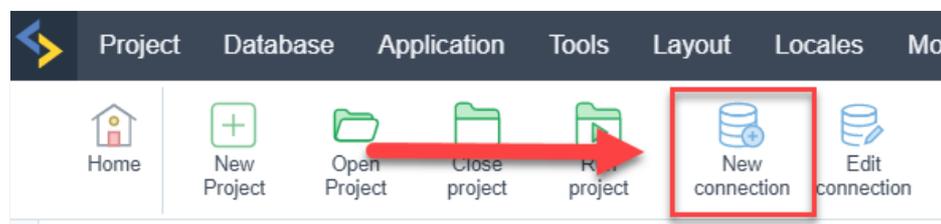

- sudo yum update

Restart the Apache Server:

```
sudo /etc/init.d/apachesc9 restart
```

Creating a Connection with ScriptCase

- Access ScriptCase using the URL <http://127.0.0.1:8092/scriptcase>
- After accessing ScriptCase, access or create a new project, click on the new connection icon or access "Database > New Connection"

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH
<input type="checkbox"/>
SSH Server
<input type="text"/>
SSH Port
<input type="text"/>
SSH User
<input type="text"/>
Private cert. file
<input type="text"/>
Local port for port forwarding
<input type="text"/>
Database server from SSH
<input type="text"/>
Database port from SSH
<input type="text"/>

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Progress

Windows

Before proceeding with this tutorial check the architecture of your PHP within the [phpinfo \(\)](#). Accessing the phpinfo of your scriptcase, for example <http://127.0.0.1:8092/scriptcase/info.php>, you will find the PHP architecture.

PHP Version 7.0.15	
System	Windows NT DESKTOP-EB1KEI
Build Date	Jan 17 2017 13:40:02
Compiler	MSVC14 (Visual C++ 2015)
Architecture	x64
Configure Command	<pre> cscript /nologo configure.js "--enable-sockets --with-zlib --with-openssl --with-mcrypt=static" "--without-ansi-c" </pre>
Server API	CGI/FastCGI
Virtual Directory Support	disabled
Configuration File (php.ini) Path	C:\Windows

- Architecture **x86** = **32 bits**
- Architecture **x64** = **64 bits**

If you are using Scriptcase automatic installer the PHP architecture will be the same as the installer you downloaded.

Progress OpenEdge ODBC

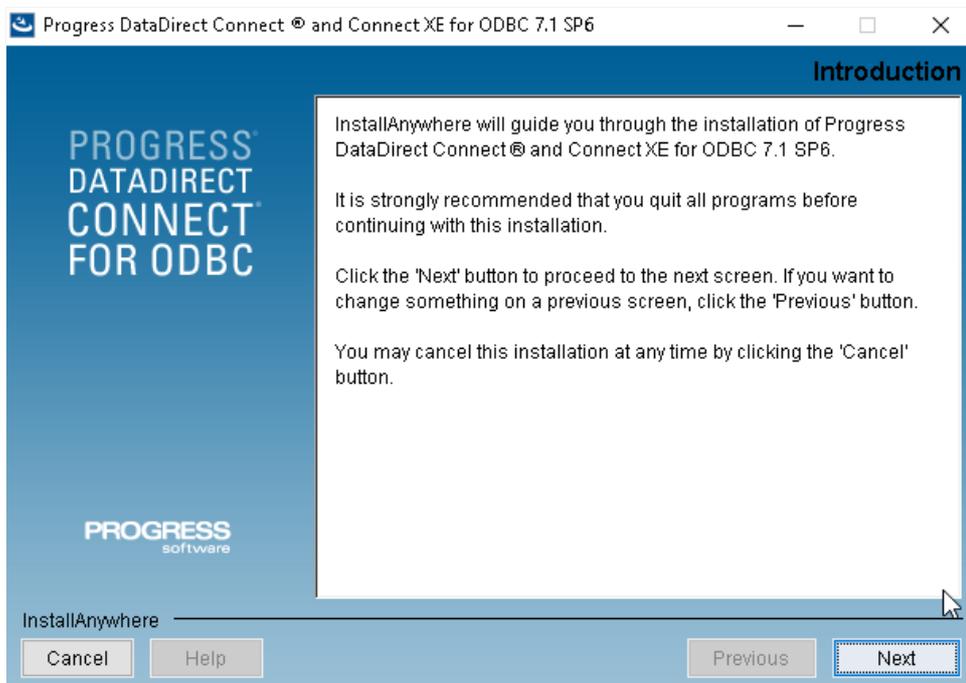

Setting up Progress connection using ODBC on Windows

Requirements

- The Progress Database needs to be installed.
- Have one or more tables created.
- Driver Progress® OpenEdge® ODBC Connector for Windows installed.

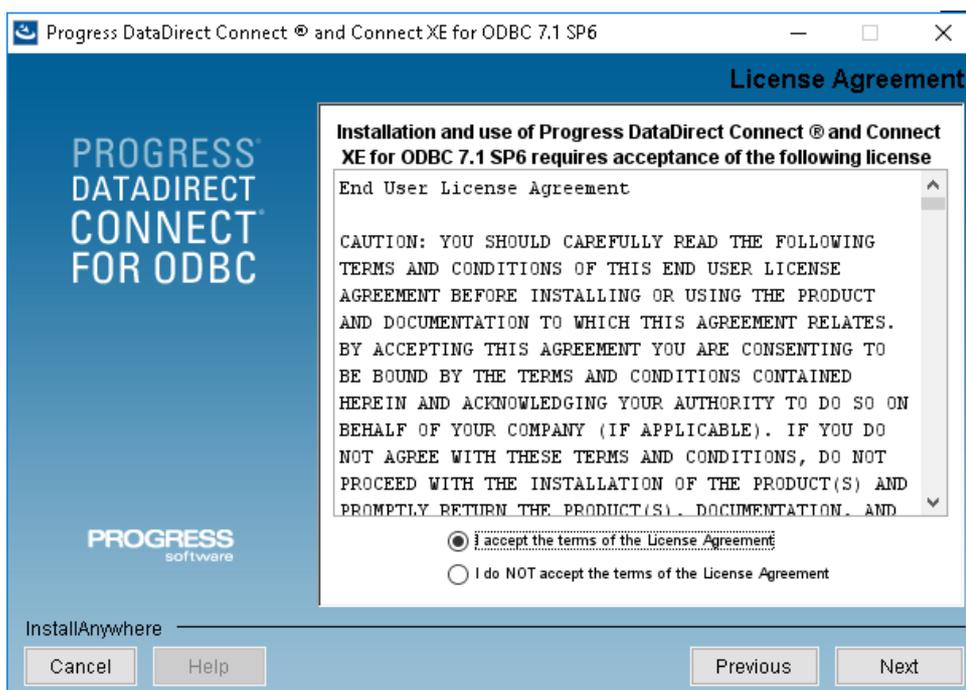

Enabling the extension

- First we must download the Progress® OpenEdge® ODBC Connector for Windows according to the architecture of your PHP.
 - To download the 64-bit engine [click here](#)
 - To download the 32-bit engine [click here](#)
- At the end of the download, follow the Progress OpenEdge ODBC Connector installation wizard.

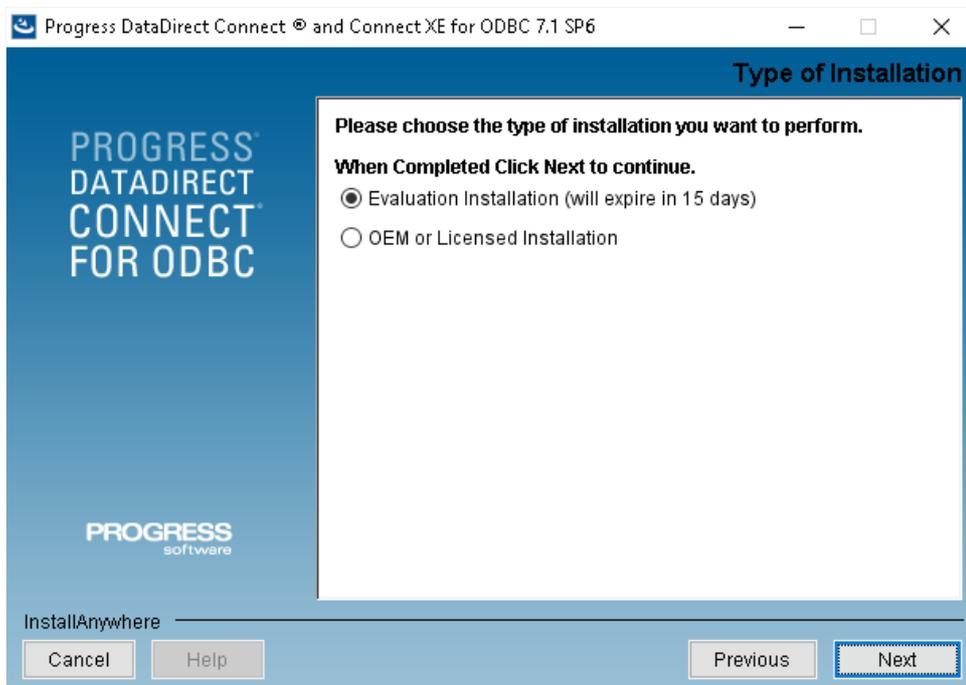

Installing the Progress OpenEdge ODBC

Connector.

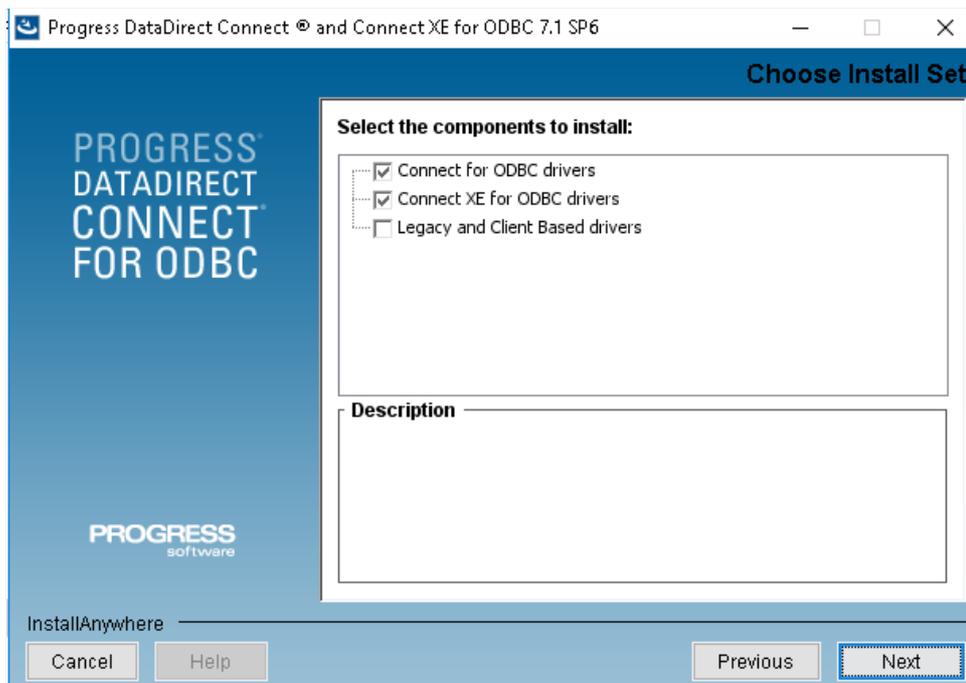

Installing the Progress OpenEdge ODBC

Connector.

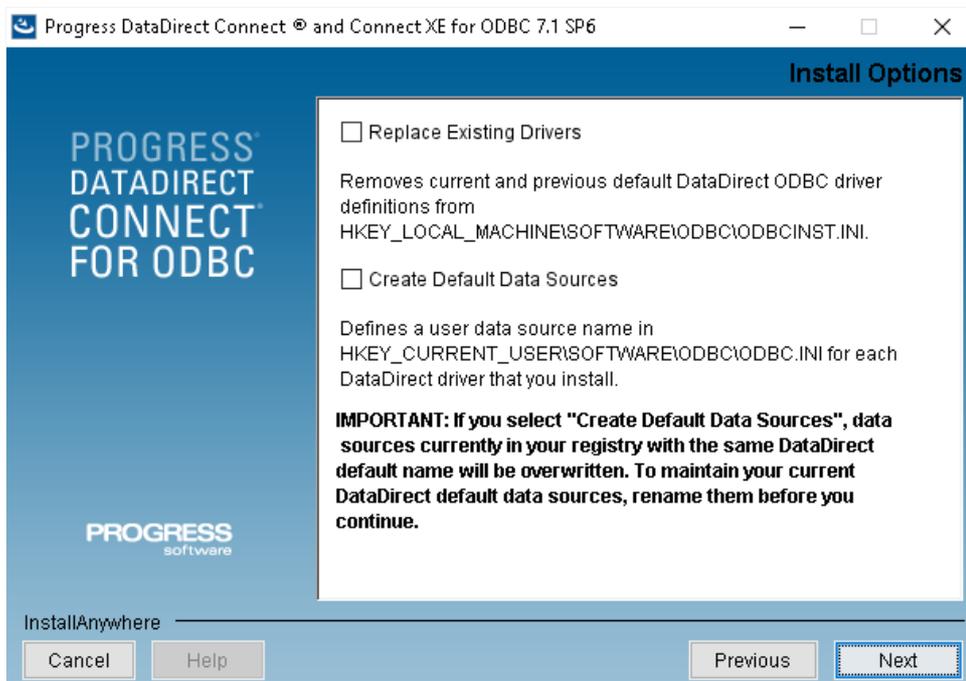

Installing the Progress OpenEdge ODBC

Connector.

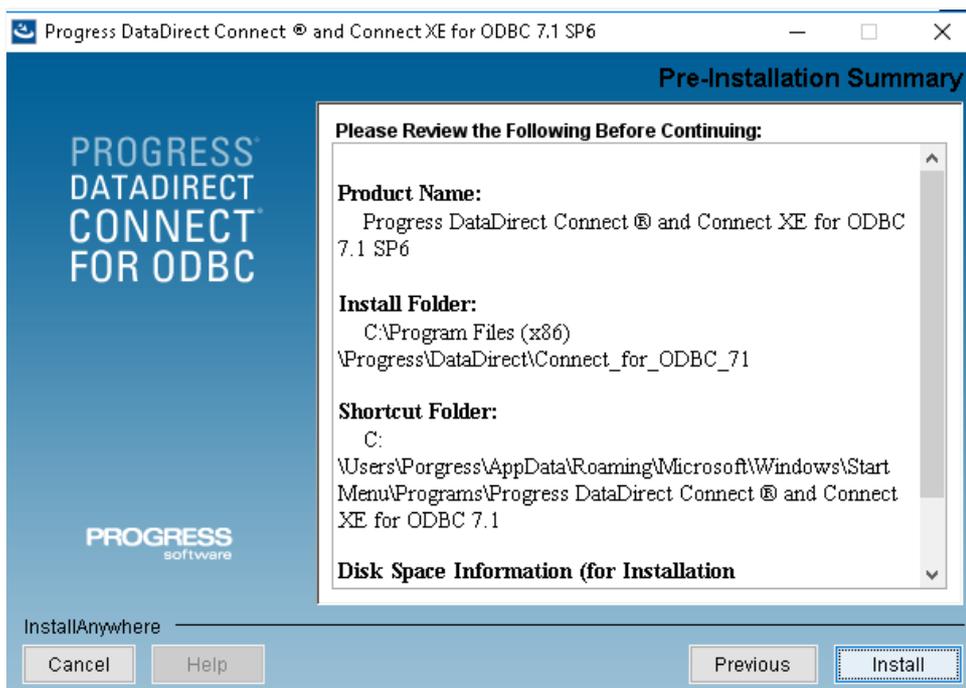

Installing the Progress OpenEdge ODBC

Connector.

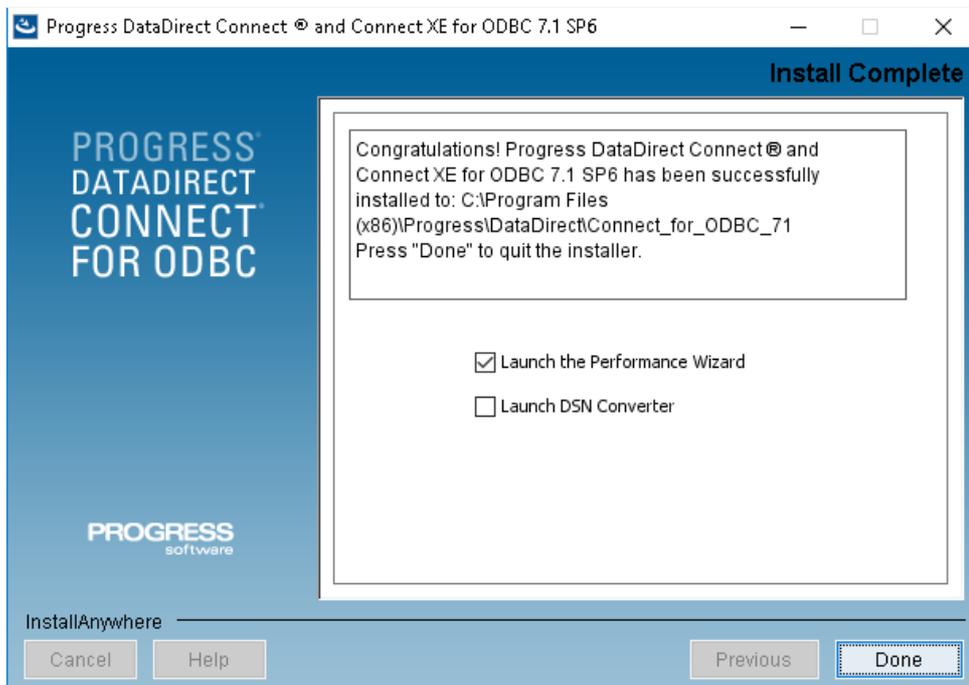

Installing the Progress OpenEdge ODBC

Connector.

Installing the Progress OpenEdge ODBC

Connector.

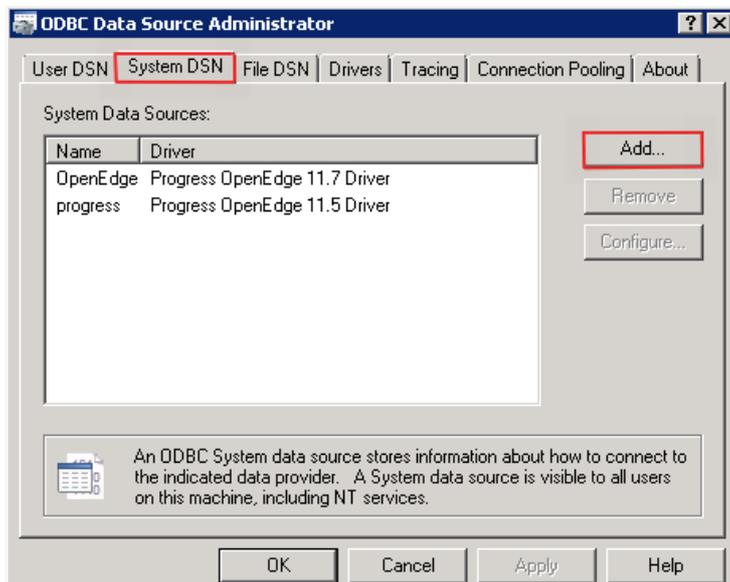

Installing the Progress OpenEdge ODBC

Connector.

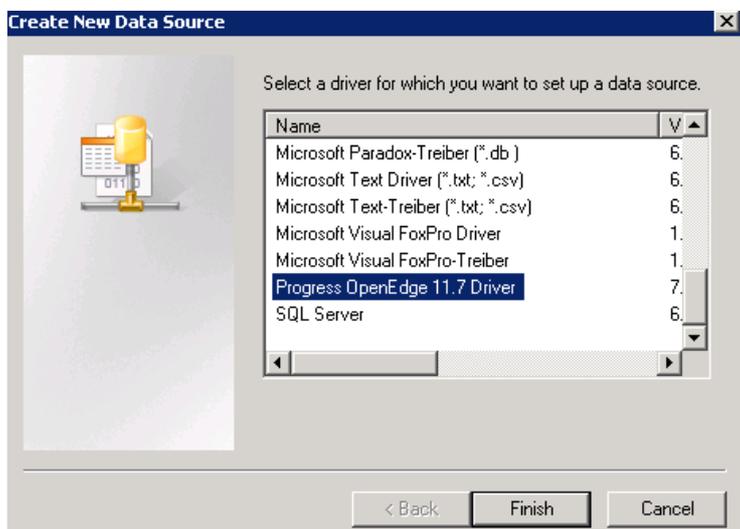

Creating a Data Source (ODBC)

- Go to Control Panel > Systems and Security > Administrative Tools > ODBC Data Sources (32 or 64 bits), according to your PHP architecture.
 - If you have a data source configured, proceed to [Creating a Connection in ScriptCase](#).
- Select the System DNS tab and click Add.

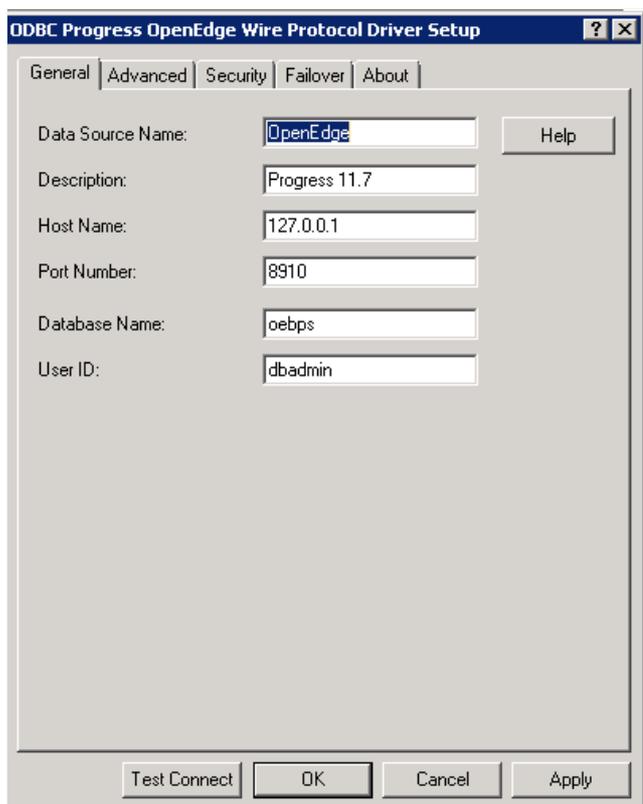

Accessing and Configuring the ODBC Data Source.

- Chose the following driver:
 - Progress OpenEdge 11.7 Driver

Accessing and Configuring the ODBC Data Source.

- After selecting the driver, the following screen will be displayed:
 - Six fields are required for data source configuration:
 - **Data Source Name:** Name of the data source that will be used when creating the connection in Scriptcase;
 - **Description:** A description for your driver;
 - **Host Name:** IP from where the database is installed;
 - **Port Number:** Port Number;
 - **Data Base Name:** Database name that will be used in the connection;
 - **User ID:** User name;

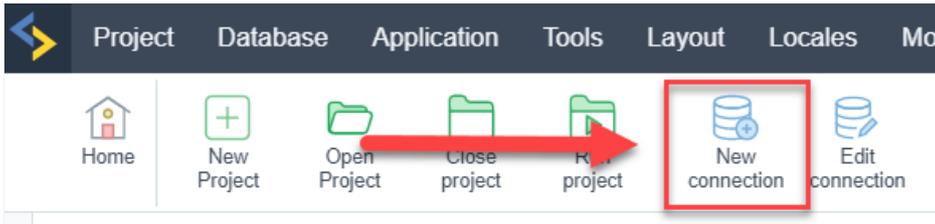

Creating the Data Source.

- After selecting the database, click OK to complete the configuration.
- Returning to the ODBC Data Source Administrator screen you can view the already configured connections.

Creating a Connection with ScriptCase

- Access ScriptCase using the URL <http://127.0.0.1:8092/scriptcase>

- After accessing ScriptCase, access or create a new project, click on the new connection icon or access “Database > New Connection”

Creating a new connection

- After that, you will see a page with all the database connections that you can create. Select a “” connection

Selecting a Windows database connection

- **New connection** : You will place the information of the connection to your database here:

Connecting with Windows database

- For more options on connecting, click on the **Advanced** tab:

Advanced setup for the Windows database

- **Filter** : Accessing this tab, we can setup which tables will be listed on this connection:

Filtering the Windows database

- **Show** - Allows the display of the the filters on the tables, views, System Tables and procedures.
 - **Tables** - Allows to setup the display of Tables from your database.
 - **Views** - Allows to setup the display of Views from your database.
 - **System Tables** - Allows to setup the display of System Tables from your database.
 - **Procedures** - Allows to setup the display of Procedures from your database.
- **Searches** - Allows to define which tables and Owner will be displayed.
 - **Tables** - Allows to define a prefix (prefix%) or name of the tables for display.
 - **Owner** - Allows to define the owner of the tables for listing.
 - **Show** - Allows to define what will be displayed or not from the table an owner's setup.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

![Advanced database connection configuration][conexao_avancado]

- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.

- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option .**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option .**

.png

Microsoft Azure in Scriptcase

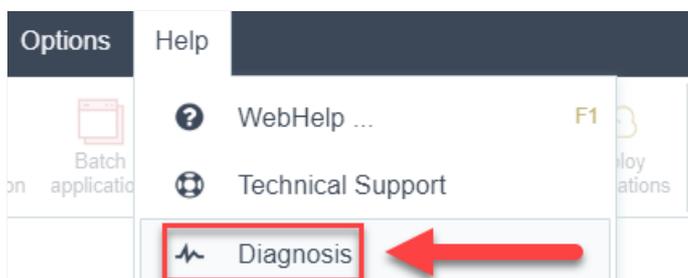

At Scriptcase, we have several banks (**MySQL**, **PostgreSQL** and **MSSQL Server**) and their respective drivers for connecting to Azure. You must choose the most suitable for your environment and need.

If you do not have an Azure database created from the ones available on Scriptcase, check below how to create a database:

- **Creation of Azure MySQL database:** [click here](#)
- **Creation of Azure PostgreSQL database:** [click here](#)
- **Creation of Azure MSSQL Server database:** [click here](#)

You can check your enabled drivers by accessing your diagnosis. See below on how to locate your diagnosis and check if the driver is enabled.

- Accessing the top menu **Help > Diagnosis**, you can easily find it through the interface.

- Or, by accessing your browser url:

`127.0.0.1:8092/scriptcase/diagnosis.php` or `dominio.com/scriptcase/diagnosis.php`

Check below how to enable each database in Scriptcase according to your operating system:

MySQL

- **Windows:** [click here](#)
- **Linux:** [click here](#)
- **macOS:** [click here](#)

MariaDB

- **Windows:** [click here](#)
- **Linux:** [click here](#)
- **macOS:** [click here](#)

PostgreSQL

- **Windows:** [click here](#)
- **Linux:** [click here](#)
- **macOS:** [click here](#)

MSSQL Server

- **Windows:** [click here](#)
- **Linux:** [click here](#)
- **macOS:** [click here](#)

Enabling Azure MySQLi

In the Scriptcase, we have the following drivers available for connection to MySQL: **MySQL PDO, MySQLi**. If you are using your own pre-configured environment, MySQL extensions must be enabled manually in PHP.

Configuring and enabling the MySQLi on Windows

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - In the php.ini file, located in C:\php, look for lines referring to MySQL extensions: **mysqli** and **pdo_mysql** and remove the ; from the beginning of the lines for the extension to be used by PHP. See the example below:

```
extension=mysqli  
extension=pdo_mysql
```

2 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the ApacheScriptcase9php73 or Apache2.4 service and right click on this service, then **Restart**.

Connection with Scriptcase

Check below which Driver you want to connect to.

- **MySQLi:** [Click Here](#)

Enabling Azure MySQL PDO

In the Scriptcase, we have the following drivers available for connection to MySQL: **MySQL PDO**, **MySQLi**. If you are using your own pre-configured environment, MySQL extensions must be enabled manually in PHP.

Configuring and enabling the MySQL PDO

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - In the `php.ini` file, located in `C:\php`, look for lines referring to MySQL extensions: **mysqli** and **pdo_mysql** and remove the `;` from the beginning of the lines for the extension to be used by PHP. See the example below:

```
extension=mysqli  
extension=pdo_mysql
```

2 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the `ApacheScriptcase9php73` or `Apache2.4` service and right click on this service, then **Restart**.

Connection with Scriptcase

Check below which Driver you want to connect to.

- **MySQL PDO:** [Click here](#)

Connection with Azure MySQL

If you do not have the **MySQLi** or **MySQL PDO** drivers enabled, check below our documentation on how to enable both in Scriptcase for connection.

- To enable the **MySQLi**: [Click Here](#)
- To enable the **MySQL PDO**: [Click Here](#)

Attention: If you do not have an Azure MySQL base created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver (**MySQLi** or **MySQL PDO**) and the Azure MySQL database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection.

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Microsoft Azure** connection.

4 - And choose the database **Azure MySQL**.

Connection

Enter the parameters for connecting to your Azure MySQL database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **SGDB Driver:** Select the MySQL Driver for connection. In this example, we use the **MySQL PDO** Driver.
- **SGDB Server:** Enter the domain of the Azure server where the database is installed.
- **EX:** serverdomain.mysql.database.azure.com
- **Port:** Enter the port for connection. By default, the defined port is **3306**.
- **Database:** List and select the database you will connect to.
- **EX:** samples
- **User:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Accessing this tab, you can configure all the security of your Azure MySQL database.

- **Use SSL:** Choose whether the SSL protocol will be active on the connection.
 - **By default, Scriptcase disables this option.**

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** Selecting this option, the procedures of your database will be displayed.

Filters

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **EX:**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and __ improve the performance__ of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **utf8**.
 - **By default, the utf8 charset is set.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.

- **By default, the point . is selected as a separator.**
 - **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
 - **Use the schema before the table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
-

Enabling Azure MySQLi

At Scriptcase, we have the following drivers available for connection to MySQL: **MySQL PDO, MySQLi** . If you are using your own pre-configured environment, MySQL extensions must be enabled manually in PHP.

Configuring and enabling the MySQLi on Linux

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - On your linux terminal, you only need to run one line to install MySQL extensions. See below for how to proceed.

```
sudo apt-get install php8.1-mysql
```

- If you are unable to execute the above command because you cannot find packages, install the repository below and update.

```
sudo add-apt-repository ppa:ondrej/php
```

```
sudo apt-get update
```

2 - Restart the Apache service via the terminal.

```
sudo service apache2 restart
```

Connection to Scriptcase

- **MySQLi:** [Clique aqui](#)

Enabling Azure MySQL PDO

At Scriptcase, we have the following drivers available for connection to MySQL: **MySQL PDO**, **MySQLi**. If you are using your own pre-configured environment, MySQL extensions must be enabled manually in PHP.

Configuring and enabling the MySQL PDO on Linux

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - On your linux terminal, you only need to run one line to install MySQL extensions. See below for how to proceed.

```
sudo apt-get install php8.1-mysql
```

- If you are unable to execute the above command because you cannot find packages, install the repository below and update.

```
sudo add-apt-repository ppa:ondrej/php
```

```
sudo apt-get update
```

2 - Restart the Apache service via the terminal.

```
sudo service apache2 restart
```

Connection to Scriptcase

- **MySQL PDO:** [Click Here](#)

Connection with Azure MySQL

If you do not have the **MySQLi** or **MySQL PDO** drivers enabled, check below our documentation on how to enable both in Scriptcase for connection.

- To enable the **MySQLi**: [Click Here](#)
- To enable the **MySQL PDO**: [Click Here](#)

Attention: If you do not have an Azure MySQL base created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver (**MySQLi** or **MySQL PDO**) and the Azure MySQL database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection.

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Microsoft Azure** connection.

4 - And choose the database **Azure MySQL**.

Connection

Enter the parameters for connecting to your Azure MySQL database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **SGDB Driver:** Select the MySQL Driver for connection. In this example, we use the **MySQL PDO** Driver.
- **SGDB Server:** Enter the domain of the Azure server where the database is installed.
- **EX:** serverdomain.mysql.database.azure.com
- **Port:** Enter the port for connection. By default, the defined port is **3306**.
- **Database:** List and select the database you will connect to.
- **EX:** samples
- **User:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Accessing this tab, you can configure all the security of your Azure MySQL database.

- **Use SSL:** Choose whether the SSL protocol will be active on the connection.
 - **By default, Scriptcase disables this option.**

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** Selecting this option, the procedures of your database will be displayed.

Filters

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **EX:**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and __ improve the performance__ of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **utf8**.
 - **By default, the utf8 charset is set.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.

- **By default, the point . is selected as a separator.**
 - **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
 - **Use the schema before the table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
-

Enabling Azure MySQLi

At Scriptcase, we have the following drivers available for connection to MySQL: **MySQL PDO, MySQLi** . If you are using your own pre-configured environment, MySQL extensions must be enabled manually in PHP.

Configuring and enabling the MySQLi on macOS

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

If you have installed PHP 8.1 through our documentation using homebrew, **MySQL is already enabled in PHP**, requiring only a connection. Check below our documentation for installing PHP 8.1 with homebrew on macOS.

Connection to Scriptcase

- **MySQL PDO:** [Click Here](#)

Connection with Azure MySQL

If you do not have the **MySQLi** or **MySQL PDO** drivers enabled, check below our documentation on how to enable both in Scriptcase for connection.

- To enable the **MySQLi**: [Click Here](#)
- To enable the **MySQL PDO**: [Click Here](#)

Attention: If you do not have an Azure MySQL base created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver (**MySQLi** or **MySQL PDO**) and the Azure MySQL database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection.

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Microsoft Azure** connection.

4 - And choose the database **Azure MySQL**.

Connection

Enter the parameters for connecting to your Azure MySQL database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **SGDB Driver:** Select the MySQL Driver for connection. In this example, we use the **MySQL PDO** Driver.
- **SGDB Server:** Enter the domain of the Azure server where the database is installed.
- **EX:** serverdomain.mysql.database.azure.com
- **Port:** Enter the port for connection. By default, the defined port is **3306**.
- **Database:** List and select the database you will connect to.
- **EX:** samples
- **User:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Accessing this tab, you can configure all the security of your Azure MySQL database.

- **Use SSL:** Choose whether the SSL protocol will be active on the connection.
 - **By default, Scriptcase disables this option.**

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** Selecting this option, the procedures of your database will be displayed.

Filters

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **EX:**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**

 - **By default, Scriptcase disables this option.**
 - **Use the schema before the table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
-

Enabling Azure PostgreSQL PDO

In Scriptcase, we have the following drivers available for connection to PostgreSQL: **PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below**. If you are using your own pre-configured environment, PostgreSQL extensions must be enabled manually in PHP.

Configuring and enabling Azure PostgreSQL PDO on Windows

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - In the `php.ini` file, located in `C:\php`, look for lines referring to PostgreSQL extensions: **`pgsql`** and **`pdo_pgsql`** and remove the `;` from the beginning of the lines so that the extension is used by PHP. See the example below:

```
extension=pgsql  
extension=pdo_pgsql
```

2 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the `ApacheScriptcase9php73` or `Apache2.4` service and right click on this service, then **Restart**.

Connection to Scriptcase

- **PostgreSQL PDO:** [Click Here](#)

Enabling Azure PostgreSQL 7 or Above

In Scriptcase, we have the following drivers available for connection to PostgreSQL: **PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below**. If you are using your own pre-configured environment, PostgreSQL extensions must be enabled manually in PHP.

Configuring and enabling Azure PostgreSQL 7 on Windows

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - In the `php.ini` file, located in `C:\php`, look for lines referring to PostgreSQL extensions: **`pgsql`** and **`pdo_pgsql`** and remove the `;` from the beginning of the lines so that the extension is used by PHP. See the example below:

```
extension=pgsql  
extension=pdo_pgsql
```

2 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the `ApacheScriptcase9php73` or `Apache2.4` service and right click on this service, then **Restart**.

Connection to Scriptcase

- **PostgreSQL PDO:** [Click Here](#)

Enabling Azure PostgreSQL 6.4 or Above

In Scriptcase, we have the following drivers available for connection to PostgreSQL: **PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below**. If you are using your own pre-configured environment, PostgreSQL extensions must be enabled manually in PHP.

Configuring and enabling Azure PostgreSQL 6.4 on Windows

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - In the `php.ini` file, located in `C:\php`, look for lines referring to PostgreSQL extensions: **`pgsql`** and **`pdo_pgsql`** and remove the `;` from the beginning of the lines so that the extension is used by PHP. See the example below:

```
extension=pgsql  
extension=pdo_pgsql
```

2 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the `ApacheScriptcase9php73` or `Apache2.4` service and right click on this service, then **Restart**.

Connection to Scriptcase

- **PostgreSQL PDO:** [Click Here](#)

Enabling Azure PostgreSQL 6.3 or Below

In Scriptcase, we have the following drivers available for connection to PostgreSQL: **PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below**. If you are using your own pre-configured environment, PostgreSQL extensions must be enabled manually in PHP.

Configuring and enabling Azure PostgreSQL 6.3 on Windows

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - In the `php.ini` file, located in `C:\php`, look for lines referring to PostgreSQL extensions: **`pgsql`** and **`pdo_pgsql`** and remove the `;` from the beginning of the lines so that the extension is used by PHP. See the example below:

```
extension=pgsql  
extension=pdo_pgsql
```

2 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the `ApacheScriptcase9php73` or `Apache2.4` service and right click on this service, then **Restart**.

Connection to Scriptcase

- **PostgreSQL PDO:** [Click Here](#)

Connection to Azure PostgreSQL

If you do not have the **PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below** drivers enabled, check below our documentation on how to enable both in Scriptcase for connection.

- To enable the **PostgreSQL PDO**: [Click Here](#)
- To enable the **PostgreSQL 7 or Above**: [Click Here](#)
- To enable the **PostgreSQL 6.4 or Above**: [Click Here](#)
- To enable the **PostgreSQL 6.3 or Below**: [Click Here](#)

ATTENTION: If you do not have an Azure PostgreSQL base created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver (**PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below.**) and the Azure PostgreSQL database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection.

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Microsoft Azure** connection.

4 - And choose the **Azure Postgres** database.

Connection

Enter the parameters for connecting to your Azure PostgreSQL database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **SGDB Driver:** Select the PostgreSQL Driver for connection. In this example, we use the **PostgreSQL PDO** Driver.
- **SGDB server:** Enter the domain of the Azure server where the database is installed.
- **EX:** domain-postgres.postgres.database.azure.com
- **Port:** Enter the port for connection. By default, the defined port is **5432**.
- **Schema:** Enter the schema for connecting to the database.
- **Database:** List and select the database you will connect to.
- **EX:** samples
- **User:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the

parameters entered are correct.

Security

Use SSL

Allows you to define whether the connection will use SSL. Note that the option is disabled by default.

sslmode

sslmode	protection	MITM protection	Statement
disable	No	No	I don't care about security, and I don't want to pay the overhead of encryption.
allow	Maybe	No	I don't care about security, but I will pay the overhead of encryption if the server insists on it.
prefer	Maybe	No	I don't care about encryption, but I wish to pay the overhead of encryption if the server supports it.
require	Yes	No	I want my data to be encrypted, and I accept the overhead.
verify-ca	Yes	Depends on CA policy	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server that I trust.
verify-full	Yes	Yes	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server I trust, and that it's the one I specify.

sslrootcert (SSL Root Certificate):

This parameter refers to the SSL/TLS root certificate used to verify the authenticity of the certificate presented by the server during secure communication. Usage: The value of this parameter must be the full path to the file containing the root certificate.

sslkey (SSL Private Key):

This parameter represents the private key associated with the SSL/TLS certificate used by the server for authentication. Usage: The full path to the file containing the private key must be specified.

sslcert (SSL Certificate):

The sslcert parameter refers to the server's SSL/TLS certificate, which is presented during the security negotiation process for authentication. Usage: The full path to the file containing the server's SSL/TLS certificate must be provided.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Enabling Azure PostgreSQL 6.3 or below

In Scriptcase, we have the following drivers available for connection to PostgreSQL: **PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below**. If you are using your own pre-configured environment, PostgreSQL extensions must be enabled manually in PHP.

Configuring and enabling PostgreSQL 6.3 or below on Windows

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

If you have installed PHP 8.1 through our documentation using homebrew, **PostgreSQL is already enabled in PHP**, requiring only a connection. Check below our documentation for installing PHP 8.1 with homebrew on macOS.

PHP 8.1 on macOS: [Click Here](#)

Connection to Scriptcase

- **PostgreSQL 6.3 or Below:** [Click Here](#)

Connection to Azure PostgreSQL

If you do not have the **PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below** drivers enabled, check below our documentation on how to enable both in Scriptcase for connection.

- To enable the **PostgreSQL PDO**: [Click Here](#)
- To enable the **PostgreSQL 7 or Above**: [Click Here](#)
- To enable the **PostgreSQL 6.4 or Above**: [Click Here](#)
- To enable the **PostgreSQL 6.3 or Below**: [Click Here](#)

ATTENTION: If you do not have an Azure PostgreSQL base created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver (**PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below.**) and the Azure PostgreSQL database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection.

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Microsoft Azure** connection.

4 - And choose the **Azure Postgres** database.

Connection

Enter the parameters for connecting to your Azure PostgreSQL database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **SGDB Driver:** Select the PostgreSQL Driver for connection. In this example, we use the **PostgreSQL PDO** Driver.
- **SGDB server:** Enter the domain of the Azure server where the database is installed.
- **EX:** domain-postgres.postgres.database.azure.com
- **Port:** Enter the port for connection. By default, the defined port is **5432**.
- **Schema:** Enter the schema for connecting to the database.
- **Database:** List and select the database you will connect to.
- **EX:** samples
- **User:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the

parameters entered are correct.

Security

Use SSL

Allows you to define whether the connection will use SSL. Note that the option is disabled by default.

sslmode

sslmode	protection	MITM protection	Statement
disable	No	No	I don't care about security, and I don't want to pay the overhead of encryption.
allow	Maybe	No	I don't care about security, but I will pay the overhead of encryption if the server insists on it.
prefer	Maybe	No	I don't care about encryption, but I wish to pay the overhead of encryption if the server supports it.
require	Yes	No	I want my data to be encrypted, and I accept the overhead.
verify-ca	Yes	Depends on CA policy	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server that I trust.
verify-full	Yes	Yes	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server I trust, and that it's the one I specify.

sslrootcert (SSL Root Certificate):

This parameter refers to the SSL/TLS root certificate used to verify the authenticity of the certificate presented by the server during secure communication. Usage: The value of this parameter must be the full path to the file containing the root certificate.

sslkey (SSL Private Key):

This parameter represents the private key associated with the SSL/TLS certificate used by the server for authentication. Usage: The full path to the file containing the private key must be specified.

sslcert (SSL Certificate):

The sslcert parameter refers to the server's SSL/TLS certificate, which is presented during the security negotiation process for authentication. Usage: The full path to the file containing the server's SSL/TLS certificate must be provided.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.

• **System Tables:** Selecting this option, the system tables of your database will be displayed.

- **Procedures:** Selecting this option, the procedures of your database will be displayed.

Filter

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **EX:**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Display:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improve the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **utf8**.
 - **By default, the utf8 charset is set.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the point . is selected as a separator.**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option.**

Enabling Azure MSSQL Server SRV

At Scriptcase, we have the following drivers available for connection to Azure MSSQL Server: **MSSQL Server NATIVE SRV, MSSQL Server NATIVE SRV PDO and MSSQL Server ODBC** . If you are using your own pre-configured environment, the MSSQL Server extensions must be enabled manually in PHP.

Prerequisites

Before proceeding with this documentation, check your PHP architecture. For drivers to be enabled correctly, **files must be downloaded according to the architecture used.**

- In your Scriptcase, there is the file **info.php**, access it by the URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find the information regarding the architecture in [phpinfo\(\)](#).

NOTE: If you are using Scriptcase's automatic installer, the PHP architecture will be the same as the one you downloaded. **Download Microsoft ODBC Driver 11 For SQL Server according to your PHP architecture .**

- Architecture **x86 = 32 bits**
- Architecture **x64 = 64 bits**

Listed below are the necessary files for the drivers to be enabled.

Required files:

x64

- Microsoft ODBC Driver 11 For SQL Server (**x64**): [Click Here](#)

x86

- Microsoft ODBC Driver 11 For SQL Server (**x86**): [Click Here](#)

Other Files

- PHP extensions (**php_pdo_sqlsrv_73_nts_x64 and php_sqlsrv_73_nts_x64**): [Click Here](#)

Compatibility Table

	Server 2016	Server 2012 /R2	Windows 10	Windows 8 / 8.1	Server 2008 R2 SP1	Windows 7 SP1	Windows Vista SP2
Native SRV PDO	<input type="checkbox"/>						
Native SRV	<input type="checkbox"/>						
ODBC	<input type="checkbox"/>						

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(") instead of the brackets([]) because of the conflict with the of [Global Variables syntax](#) Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

Configuring and enabling Azure MSSQL Server SRV on Windows

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, requiring only the installation of the client. **Proceed to item 3.**

1 - Extract the .zip file and copy the files from the **php_pdo_sqlsrv_73_nts_x64** and **php_sqlsrv_73_nts_x64** .dll extensions [previously](#) downloaded to your PHP's ext folder.

2 - In the php.ini file, located in C:\php, add the lines referring to the MSSQL Server extensions **php_pdo_sqlsrv_73_nts_x64** and **php_sqlsrv_73_nts_x64**. See the example below:

```
extension=php_pdo_sqlsrv_73_nts_x64
```

extension=php_sqlsrv_73_nts_x64

3 - After downloading the Microsoft ODBC Driver 11 For SQL Server file, run the installer and follow the steps below:

4 - Accept the terms of the license agreement and click next.

5 - Check the option "**ODBC Driver for SQL Server SDK**", because the components that we will need are also in this option.

- **In this option, leave the option "Client Components" checked.**

6 - Click Install to start the client installation.

7 - The program features you selected are being installed.

8 - Click finish to exit.

9 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the ApacheScriptcase9php73 or Apache2.4 service and right click on this service, then **Restart**.

Connection to Scriptcase

- **MSSQL Server NATIVE SRV:** [Click here](#)

Enabling Azure MSSQL Server SRV PDO

At Scriptcase, we have the following drivers available for connection to Azure MSSQL Server: **MSSQL Server NATIVE SRV, MSSQL Server NATIVE SRV PDO and MSSQL Server ODBC** . If you are using your own pre-configured environment, the MSSQL Server extensions must be enabled manually in PHP.

Prerequisites

Before proceeding with this documentation, check your PHP architecture. For drivers to be enabled correctly, **files must be downloaded according to the architecture used.**

- In your Scriptcase, there is the file **info.php**, access it by the URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find the information regarding the architecture in [phpinfo\(\)](#).

NOTE: If you are using Scriptcase's automatic installer, the PHP architecture will be the same as the one you downloaded. **Download Microsoft ODBC Driver 11 For SQL Server according to your PHP architecture .**

Connection to Scriptcase

- **MSSQL Server ODBC:** [Click here](#)

Connection to Azure MSSQL

If you do not have the **MSSQL Server NATIVE SRV**, **MSSQL Server NATIVE SRV PDO** and **MSSQL Server ODBC** drivers enabled, check below our documentation on how to enable both in Scriptcase for connection.

- To enable the **MSSQL Server NATIVE SRV**: [Click here](#)
- To enable the **MSSQL Server NATIVE SRV PDO**: [Click here](#)

ATTENTION: If you do not have an Azure MSSQL Server base created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the Enabled Driver (**MSSQL Server NATIVE SRV** or **MSSQL Server NATIVE SRV PDO**) and the Azure MSSQL Server database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database> New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Microsoft Azure** connection.

4 - And choose the **Azure SQL** database.

Connection

Enter the parameters for connecting to your Azure MSSQL Server database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the MSSQL Server Driver to connect. In this example, we use the **MSSQL Server NATIVE SRV PDO** Driver.
- **Server/Host (Name or IP):** Enter the domain of the Azure server where the database is installed.
- **EX:** domain-sql.database.windows.net
- **Port:** Enter the port to connect to the MSSQL Server. By default, the port defined is **1433**.
- **Database Name:** List and select the database you will connect to.
- **EX:** samples
- **Username:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty .**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above .**
- **View:** Choose whether to display the tables for the informed owner.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **utf8**.
 - **The utf8 charset is set by default.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the . dot is selected as a separator .**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option .**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option.**

Connection to Azure MSSQL ODBC

If you do not have the **MSSQL Server NATIVE SRV, MSSQL Server NATIVE SRV PDO and MSSQL Server ODBC** drivers enabled, check below our documentation on how to enable both in Scriptcase for connection.

- To enable the **MSSQL Server ODBC**: [Click here](#)

ATTENTION: If you do not have an Azure MSSQL Server base created, check how to create it by clicking [here](#).

Creating the DSN for connection

To connect to the **MSSQL Server ODBC** Driver, you need to configure a System DSN. Follow the steps described below to perform this configuration.

ATTENTION: ODBC must be created on the same server where ScriptCase is installed.

1 - Access your **ODBC Data Source Manager** and select according to your architecture. We will select the x64 version:

2 - When entering the ODBC Data Sources Administrator, select the **DSN System** tab and click on **_Add** to create your connection to your Database.

3 - After that, it is necessary to select the Driver to connect to the MSSQL Server. Select the Driver: **ODBC Driver 11 for SQL Server**.

4 - Now, you need to define the name of the DSN, the description and the database connection server.

- **Name:** Enter the name that the DSN will have so that you can use it in Scriptcase.
- **Description:** Add a description for the DSN.
- **Server:** inform the server, port and database instance that you will connect to.

4.1 - After informing the data, click on the **Next** button to inform the user name and password required for connection.

- **Login ID:** Inform the user to authenticate with the database.
- **Password:** Enter the corresponding password to authenticate with the informed user.

4.2 - Now, click **Next** to select the default database.

To finish, click **Next** and finally, click **Finish**.

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the Enabled Driver (**MSSQL Server ODBC**) and the Azure MSSQL Server database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database> New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Microsoft Azure** connection.

4 - And choose the **Azure SQL** database.

Connection

Enter the parameters for connecting to your Azure MSSQL Server database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the MSSQL Server Driver to connect. In this example, we use the **MSSQL Server NATIVE SRV PDO** Driver.
- **Server/Host (Name or IP):** Enter the Data Source Name of the Azure server.
- **EX:** mssql
- **Port:** Enter the port to connect to the MSSQL Server. By default, the port defined is **1433**.
- **Database Name:** List and select the database you will connect to.
- **EX:** samples
- **Username:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty .**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.

 - **By default, the . dot is selected as a separator .**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option .**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option.**

Enabling Azure PDO DBLIB

In Scriptcase installed on Linux, we have the following driver available for connection to MSSQL Server: **PDO DBLIB**. If you are using your own pre-configured environment, MSSQL Server extensions must be enabled manually in PHP.

Configuring and enabling Azure PDO DBLIB on Linux

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - On your linux terminal, you only need to run one line to install the PDO DBLIB extension. See below how to proceed.

```
sudo apt-get install php8.1-pdo-dblib
```

- If you are unable to execute the above command because you cannot find packages, install the repository below and update.

```
sudo add-apt-repository ppa:ondrej/php  
sudo apt-get update
```

2 - Restart the Apache service via the terminal.s

```
sudo service apache2 restart
```

Connection to Scriptcase

- **PDO DBLIB:** [Clique aqui](#)

Connection to Azure MSSQL

If you do not have the **MSSQL Server NATIVE SRV, MSSQL Server NATIVE SRV PDO and MSSQL Server ODBC** drivers enabled, check below our documentation on how to enable both in Scriptcase for connection.

- To enable the **PDO DBLIB**: [Click here](#)

ATTENTION: If you do not have an Azure MSSQL Server base created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the Enabled Driver (**MSSQL Server NATIVE SRV or MSSQL Server NATIVE SRV PDO**) and the Azure MSSQL Server database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Microsoft Azure** connection.

4 - And choose the **Azure SQL** database.

Connection

Enter the parameters for connecting to your Azure MSSQL Server database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the MSSQL Server Driver to connect. In this example, we use the **PDO DBLIB** Driver.
- **Server/Host (Name or IP):** Enter the domain of the Azure server where the database is installed.
- **EX:** domain-sql.database.windows.net
- **Port:** Enter the port to connect to the MSSQL Server. By default, the port defined is **1433**.
- **Database Name:** List and select the database you will connect to.
- **EX:** samples
- **Username:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Security tab, where the connection encryption settings are defined.

- **Encrypt**

This property specifies whether communication with the SQL server should be encrypted. To enable encryption, you must set this property to “true”. This ensures that data sent between the client and server is protected by encryption.

- **trustservercertificate**

Set to “true” to specify that the driver does not validate the server’s TLS/SSL certificate.

If “true”, the server’s TLS/SSL certificate is automatically trusted when the communication layer is encrypted using TLS.

- **trustStore**

The path (including the file name) to the certificate’s trustStore file. The trustStore file contains the list of certificates that the client trusts.

When this property is not specified or is set to null, the driver relies on the trust manager factory query rules to determine which certificate store to use.

- **trustStorePassword**

The password used to verify the integrity of trustStore data.

If the trustStore property is set but the trustStorePassword property is not set, the integrity of the trustStore is not checked.

- **hostnameInCertificate**

The hostname to use to validate the SQL Server TLS/SSL certificate.

This property allows you to specify the expected hostname in the SQL server certificate. This is useful to ensure that the connection is only made to the correct server and not to a malicious server that may be using an invalid certificate.

Note: This property is used in combination with the **encrypt**/authentication properties and the **trustServerCertificate** property. This property affects certificate validation if the connection uses **TLS** encryption and **trustServerCertificate** is set to “false”. Ensure that the value passed to **hostnameInCertificate** matches the Common Name (CN) or DNS name in the Subject Alternative Name (SAN) in the server certificate for a **TLS** connection to be successful. For more information about encryption support, see Understanding encryption support.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty .**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above .**
- **View:** Choose whether to display the tables for the informed owner.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **utf8**.
 - **The utf8 charset is set by default.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the . dot is selected as a separator .**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option .**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option.**

Enabling Azure PDO DBLIB

In Scriptcase installed on macOS, we have the following driver available for connection to MSSQL Server: **PDO DBLIB** . If you are using your own pre-configured environment, MSSQL Server extensions must be enabled manually in PHP.

Configuring and enabling the DBLIB PDO on macOS

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

If you have installed PHP 8.1 through our documentation using homebrew, **PDO DBLIB is already enabled in PHP**, requiring only the connection. Check below our documentation for installing PHP 8.1 with homebrew on macOS.

PHP 8.1 on macOS: [Click here](#)

Connection to Scriptcase

Check below which Driver you want to connect to.

- **PDO DBLIB:** [Click here](#)

Connection to Azure MSSQL

If you do not have the **MSSQL Server NATIVE SRV, MSSQL Server NATIVE SRV PDO and MSSQL Server ODBC** drivers enabled, check below our documentation on how to enable both in Scriptcase for connection.

- To enable the **PDO DBLIB**: [Click here](#)

ATTENTION: If you do not have an Azure MSSQL Server base created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the Enabled Driver (**MSSQL Server NATIVE SRV or MSSQL Server NATIVE SRV PDO**) and the Azure MSSQL Server database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Microsoft Azure** connection.

4 - And choose the **Azure SQL** database.

Connection

Enter the parameters for connecting to your Azure MSSQL Server database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the MSSQL Server Driver to connect. In this example, we use the **PDO DBLIB** Driver.
- **Server/Host (Name or IP):** Enter the domain of the Azure server where the database is installed.
- **EX:** domain-sql.database.windows.net
- **Port:** Enter the port to connect to the MSSQL Server. By default, the port defined is **1433**.
- **Database Name:** List and select the database you will connect to.
- **EX:** samples
- **Username:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

 - **By default, Scriptcase enables this option.**

Enabling Azure MariaDB PDO

In the Scriptcase, we have the following driver available for connection to MariaDB: **MariaDB PDO**. If you are using your own pre-configured environment, MariaDB extension must be enabled manually in PHP.

Configuring and enabling the MariaDB PDO

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - In the php.ini file, located in C:\php, look for a line referring to MariaDB extension: **pdo_mysql** and remove the ; from the beginning of the line for the extension to be used by PHP. See the example below:

```
extension=pdo_mysql
```

2 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the ApacheScriptcase9php81 or Apache2.4 service and right click on this service, then **Restart**.

Connection with Scriptcase

Check below which Driver you want to connect to.

- **MariaDB PDO:** [Click here](#)

Connection with Azure MariaDB

If you do not have the **MariaDB PDO** driver enabled, check below our documentation on how to enable both in Scriptcase for connection.

- To enable the **MariaDB PDO**: [Click Here](#)

Attention: If you do not have an Azure MariaDB base created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver (**MariaDB PDO**) and the Azure MariaDB database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection.

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Microsoft Azure** connection.

4 - And choose the database **Azure MariaDB**.

Connection

Enter the parameters for connecting to your Azure MariaDB database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **SGDB Driver:** Select the MariaDB Driver for connection. In this example, we use the **MariaDB PDO** Driver.
- **SGDB Server:** Enter the domain of the Azure server where the database is installed.
- **EX:** serverdomain.mariadb.database.azure.com
- **Port:** Enter the port for connection. By default, the defined port is **3306**.
- **Database:** List and select the database you will connect to.
- **EX:** samples
- **User:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Accessing this tab, you can configure all the security of your Azure MariaDB database.

- **Use SSL:** Choose whether the SSL protocol will be active on the connection.
 - **By default, Scriptcase disables this option.**

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Amazon RDS in Scriptcase

At Scriptcase, we have several banks (**MySQL**, **PostgreSQL**, **MSSQL Server** and **Oracle**) and their respective drivers for connection with Amazon RDS. You must choose the most suitable for your environment and need.

If you do not have an Amazon bank created from the ones available on Scriptcase, check below how to create a database:

- **Creation of Amazon RDS database:** [Click here](#)

You can check your enabled drivers by accessing your diagnosis. See below on how to locate your diagnosis and check if the driver is enabled.

- Accessing the top menu **Help > Diagnosis**, you can easily find it through the interface.

- Or, by accessing your browser url:

`127.0.0.1:8092/scriptcase/diagnosis.php` or `dominio.com/scriptcase/diagnosis.php`

Check below how to enable each database in Scriptcase according to your operating system:

MySQL

Connection to Amazon RDS MySQL

If you do not have the **MySQLi** or **MySQL PDO** drivers enabled, check below our documentation on how to enable both in Scriptcase for connection.

- To enable the **MySQLi**: [Click Here](#)
- To enable the **MySQL PDO**: [Click Here](#)

CAUTION: If you don't have an Amazon RDS database created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver (**MySQLi** or **MySQL PDO**) and the Amazon RDS MySQL database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Amazon RDS** connection.

4 - And choose the **Amazon RDS MySQL** database.

Connection

Enter the parameters for connecting to your Amazon RDS MySQL database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the MySQL Driver for connection. In this example, we use the **MySQL PDO** Driver.
- **Server/Host (Name or IP):** Enter the domain of the Amazon RDS server where the database is installed.
- **EX:** database-mysql.us-east-2.rds.amazonaws.com
- **Port:** Enter the port for connection. By default, the defined port is **3306**.
- **Database name:** List and select the database you will connect to.
- **EX:** samples
- **Username:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Accessing this tab, you can configure all the security of your Amazon RDS MySQL database.

- **Use SSL:** Choose whether the SSL protocol will be active on the connection.
 - **By default, Scriptcase disables this option .**

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above.**
- **View:** Choose whether to display the tables for the informed owner.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **utf8**.
 - **The utf8 charset is set by default .**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the . dot is selected as a separator.**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before the table name:** Define whether the database schema will be displayed

before the table names.

- **By default, Scriptcase enables this option.**

Enabling Amazon RDS MySQLi

At Scriptcase, we have the following drivers available for connection to MySQL: **MySQL PDO, MySQLi**. If you are using your own pre-configured environment, MySQL extensions must be manually enabled in PHP.

Configuring and enabling MySQLi on Linux

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - On your linux terminal, you only need to run one line to install MySQL extensions. See below for how to proceed.

```
sudo apt-get install php8.1-mysql
```

- If you are unable to execute the above command because you cannot find packages, install the repository below and update.

```
sudo add-apt-repository ppa:ondrej/php sudo apt-get update
```

- To enable the **MySQLi**: [Click Here](#)
- To enable the **MySQL PDO**: [Click Here](#)

CAUTION: If you don't have an Amazon RDS database created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver (**MySQLi** or **MySQL PDO**) and the Amazon RDS MySQL database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Amazon RDS** connection.

4 - And choose the **Amazon RDS MySQL** database.

Connection

Enter the parameters for connecting to your Amazon RDS MySQL database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the MySQL Driver for connection. In this example, we use the **MySQL PDO** Driver.
- **Server/Host (Name or IP):** Enter the domain of the Amazon RDS server where the database is installed.
- **EX:** database-mysql.us-east-2.rds.amazonaws.com
- **Port:** Enter the port for connection. By default, the defined port is **3306**.
- **Database name:** List and select the database you will connect to.
- **EX:** samples
- **Username:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Accessing this tab, you can configure all the security of your Amazon RDS MySQL database.

- **Use SSL:** Choose whether the SSL protocol will be active on the connection.
 - **By default, Scriptcase disables this option .**

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above.**
- **View:** Choose whether to display the tables for the informed owner.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **utf8**.
 - **The utf8 charset is set by default .**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the . dot is selected as a separator.**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before the table name:** Define whether the database schema will be displayed

before the table names.

- **By default, Scriptcase enables this option.**

Enabling Amazon RDS MySQLi

At Scriptcase, we have the following drivers available for connection to MySQL: **MySQL PDO, MySQLi**. If you are using your own pre-configured environment, MySQL extensions must be manually enabled in PHP.

Configuring and enabling MySQLi on macOS

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase .**

If you have installed PHP 8.1 through our documentation using homebrew, **MySQL is already enabled in PHP**, requiring only a connection. Check below our documentation for installing PHP 8.1 with homebrew on macOS.

 - **By default, Scriptcase disables this option.**
- **Use the schema before the table name:** Define whether the database schema will be displayed

before the table names.

- **By default, Scriptcase enables this option.**

Enabling Amazon RDS PostgreSQL PDO

In Scriptcase, we have the following drivers available for connection to PostgreSQL: **PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below**. If you are using your own pre-configured environment, PostgreSQL extensions must be enabled manually in PHP.

Configuring and enabling Amazon RDS PostgreSQL PDO on Windows

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - In the php.ini file, located in C:\php, look for lines referring to PostgreSQL extensions: **pgsql** and **pdo_pgsql** and remove the ; from the beginning of the lines for the extension to be used by PHP. See the example below:

```
extension=pgsql  
extension=pdo_pgsql
```

2 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the ApacheScriptcase9php73 or Apache2.4 service and right click on this service, then **Restart**.

Connection to Scriptcase

- **PostgreSQL PDO:** [Click Here](#)

Enabling Amazon RDS PostgreSQL 7 or above

In Scriptcase, we have the following drivers available for connection to PostgreSQL: **PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below**. If you are using your own pre-configured environment, PostgreSQL extensions must be enabled manually in PHP.

Configuring and enabling Amazon RDS PostgreSQL 7 or above on Windows

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - In the php.ini file, located in C:\php, look for lines referring to PostgreSQL extensions: **pgsql** and **pdo_pgsql** and remove the ; from the beginning of the lines for the extension to be used by PHP. See the example below:

```
extension=pgsql  
extension=pdo_pgsql
```

2 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the ApacheScriptcase9php73 or Apache2.4 service and right click on this service, then **Restart**.

Connection to Scriptcase

- **PostgreSQL 7 or above:** [Click Here](#)

Enabling Amazon RDS PostgreSQL 6.4 or above

In Scriptcase, we have the following drivers available for connection to PostgreSQL: **PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below**. If you are using your own pre-configured environment, PostgreSQL extensions must be enabled manually in PHP.

Configuring and enabling Amazon RDS PostgreSQL 6.4 or above on Windows

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - In the php.ini file, located in C:\php, look for lines referring to PostgreSQL extensions: **pgsql** and **pdo_pgsql** and remove the ; from the beginning of the lines for the extension to be used by PHP. See the example below:

```
extension=pgsql  
extension=pdo_pgsql
```

2 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the ApacheScriptcase9php73 or Apache2.4 service and right click on this service, then **Restart**.

Connection to Scriptcase

- **PostgreSQL 6.4 or above:** [Click Here](#)

Enabling Amazon RDS PostgreSQL 6.3 or below

In Scriptcase, we have the following drivers available for connection to PostgreSQL: **PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below**. If you are using your own pre-configured environment, PostgreSQL extensions must be enabled manually in PHP.

Configuring and enabling Amazon RDS PostgreSQL 6.3 or below on Windows

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - In the php.ini file, located in C:\php, look for lines referring to PostgreSQL extensions: **pgsql** and **pdo_pgsql** and remove the ; from the beginning of the lines for the extension to be used by PHP. See the example below:

```
extension=pgsql  
extension=pdo_pgsql
```

2 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the ApacheScriptcase9php73 or Apache2.4 service and right click on this service, then **Restart**.

Connection to Scriptcase

- **PostgreSQL 6.3 or below:** [Click Here](#)

Connection to Amazon RDS PostgreSQL

If you do not have the **PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below** drivers enabled, check below our documentation on how to enable both in Scriptcase for connection.

- To enable the **PostgreSQL PDO**: [Click Here](#)
- To enable the **PostgreSQL 7 or above**: [Click Here](#)
- To enable the **PostgreSQL 6.4 or above**: [Click Here](#)
- To enable the **PostgreSQL 6.3 or below**: [Click Here](#)

ATTENTION: If you don't have an Amazon RDS database created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the Driver enabled (**PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below.**) and the Amazon RDS PostgreSQL database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Amazon RDS** connection.

4 - And choose the **Amazon RDS Postgres** database.

Connection

Enter the parameters for connecting to your Amazon RDS PostgreSQL database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the PostgreSQL Driver for connection. In this example, we use the **PostgreSQL PDO** Driver.
- **Server/Host (Name or IP):** Enter the domain of the Amazon RDS server where the database is installed.
- **EX:** database-postgres.us-east-2.rds.amazonaws.com
- **Port:** Enter the port for connection. By default, the defined port is **5432**.
- **Eschema:** Enter the schema for connection to the database.
- **Database NAME:** List and select the database you will connect to.
- **EX:** samples
- **Username:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.

- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Use SSL

Allows you to define whether the connection will use SSL. Note that the option is disabled by default.

sslmode

sslmode	protection	MITM protection	Statement
disable	No	No	I don't care about security, and I don't want to pay the overhead of encryption.
allow	Maybe	No	I don't care about security, but I will pay the overhead of encryption if the server insists on it.
prefer	Maybe	No	I don't care about encryption, but I wish to pay the overhead of encryption if the server supports it.
require	Yes	No	I want my data to be encrypted, and I accept the overhead.
verify-ca	Yes	Depends on CA policy	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server that I trust.
verify-full	Yes	Yes	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server I trust, and that it's the one I specify.

sslrootcert (SSL Root Certificate):

This parameter refers to the SSL/TLS root certificate used to verify the authenticity of the certificate presented by the server during secure communication. Usage: The value of this parameter must be the full path to the file containing the root certificate.

sslkey (SSL Private Key):

This parameter represents the private key associated with the SSL/TLS certificate used by the server for authentication. Usage: The full path to the file containing the private key must be specified.

sslcert (SSL Certificate):

The sslcert parameter refers to the server's SSL/TLS certificate, which is presented during the security negotiation process for authentication. Usage: The full path to the file containing the server's SSL/TLS certificate must be provided.

Connection to Amazon RDS PostgreSQL

If you do not have the **PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below** drivers enabled, check below our documentation on how to enable both in Scriptcase for connection.

- To enable the **PostgreSQL PDO**: [Click Here](#)
- To enable the **PostgreSQL 7 or above**: [Click Here](#)
- To enable the **PostgreSQL 6.4 or above**: [Click Here](#)
- To enable the **PostgreSQL 6.3 or below**: [Click Here](#)

ATTENTION: If you don't have an Amazon RDS database created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the Driver enabled (**PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below.**) and the Amazon RDS PostgreSQL database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Amazon RDS** connection.

4 - And choose the **Amazon RDS Postgres** database.

Connection

Enter the parameters for connecting to your Amazon RDS PostgreSQL database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the PostgreSQL Driver for connection. In this example, we use the **PostgreSQL PDO** Driver.
- **Server/Host (Name or IP):** Enter the domain of the Amazon RDS server where the database is installed.
- **EX:** database-postgres.us-east-2.rds.amazonaws.com
- **Port:** Enter the port for connection. By default, the defined port is **5432**.
- **Eschema:** Enter the schema for connection to the database.
- **Database NAME:** List and select the database you will connect to.
- **EX:** samples
- **Username:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.

- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Use SSL

Allows you to define whether the connection will use SSL. Note that the option is disabled by default.

sslmode

sslmode	protection	MITM protection	Statement
disable	No	No	I don't care about security, and I don't want to pay the overhead of encryption.
allow	Maybe	No	I don't care about security, but I will pay the overhead of encryption if the server insists on it.
prefer	Maybe	No	I don't care about encryption, but I wish to pay the overhead of encryption if the server supports it.
require	Yes	No	I want my data to be encrypted, and I accept the overhead.
verify-ca	Yes	Depends on CA policy	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server that I trust.
verify-full	Yes	Yes	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server I trust, and that it's the one I specify.

sslrootcert (SSL Root Certificate):

This parameter refers to the SSL/TLS root certificate used to verify the authenticity of the certificate presented by the server during secure communication. Usage: The value of this parameter must be the full path to the file containing the root certificate.

sslkey (SSL Private Key):

This parameter represents the private key associated with the SSL/TLS certificate used by the server for authentication. Usage: The full path to the file containing the private key must be specified.

sslcert (SSL Certificate):

The sslcert parameter refers to the server's SSL/TLS certificate, which is presented during the security negotiation process for authentication. Usage: The full path to the file containing the server's SSL/TLS certificate must be provided.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.

- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above .**
- **View:** Choose whether to display the tables for the informed owner.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **utf8**.
 - **The utf8 charset is set by default.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the . dot is selected as a separator.**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option.**

Enabling Amazon RDS MSSQL Server SRV

At Scriptcase, we have the following drivers available for connection to Azure MSSQL Server: **MSSQL Server NATIVE SRV, MSSQL Server NATIVE SRV PDO and MSSQL Server ODBC** . If you are using your own pre-configured environment, the MSSQL Server extensions must be enabled manually in PHP.

Prerequisites

Before proceeding with this documentation, check your PHP architecture. For drivers to be enabled correctly, **files must be downloaded according to the architecture used.**

- In your Scriptcase, there is the file **info.php**, access it by the URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find the information regarding the architecture in [phpinfo\(\)](#).

NOTE: If you are using Scriptcase's automatic installer, the PHP architecture will be the same as the one you downloaded. **Download Microsoft ODBC Driver 11 For SQL Server according to your PHP architecture .**

- Architecture **x86 = 32 bits**
- Architecture **x64 = 64 bits**

Listed below are the necessary files for the drivers to be enabled.

Required files:

x64

- Microsoft ODBC Driver 11 For SQL Server (**x64**): [Click Here](#)

x86

- Microsoft ODBC Driver 11 For SQL Server (**x86**): [Click Here](#)

Other Files

- PHP extensions (**php_pdo_sqlsrv_73_nts_x64 and php_sqlsrv_73_nts_x64**): [Click Here](#)

Compatibility Table

	Server 2016	Server 2012 /R2	Windows 10	Windows 8 / 8.1	Server 2008 R2 SP1	Server 2008 SP2 / R2 SP1	Windows 7 SP1	Windows Vista SP2
Native SRV PDO	<input type="checkbox"/>							
Native SRV	<input type="checkbox"/>							
ODBC	<input type="checkbox"/>							

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(") instead of the brackets([]) because of the conflict with the of [Global Variables syntax](#) Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

Configuring and enabling Amazon RDS MSSQL Server SRV on Windows

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, requiring only the installation of the client. **Proceed to item 3.**

1 - Extract the .zip file and copy the files from the **php_pdo_sqlsrv_73_nts_x64** and **php_sqlsrv_73_nts_x64** .dll extensions [previously](#) downloaded to your PHP's ext folder.

2 - In the php.ini file, located in c:\php, add the lines referring to the MSSQL Server extensions **php_pdo_sqlsrv_73_nts_x64** and **php_sqlsrv_73_nts_x64**. See the example below:

extension=php_pdo_sqlsrv_73_nts_x64

extension=php_sqlsrv_73_nts_x64

3 - After downloading the Microsoft ODBC Driver 11 For SQL Server file, run the installer and follow the steps below:

4 - Accept the terms of the license agreement and click next.

5 - Check the option "**ODBC Driver for SQL Server SDK**", because the components that we will need are also in this option.

- **In this option, leave the option "Client Components" checked.**

6 - Click Install to start the client installation.

7 - The program features you selected are being installed.

8 - Click finish to exit.

9 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the ApacheScriptcase9php73 or Apache2.4 service and right click on this service, then **Restart**.

- Look for the ApacheScriptcase9php73 or Apache2.4 service and right click on this service, then **Restart**.

Connection to Scriptcase

- **MSSQL Server NATIVE SRV PDO:** [Click here](#)

Connection with Amazon RDS MSSQL

If you do not have the **MSSQL Server NATIVE SRV**, **MSSQL Server NATIVE SRV PDO** and **MSSQL Server ODBC** drivers enabled, check below our documentation on how to enable both in Scriptcase for connection.

- To enable the **MSSQL Server NATIVE SRV**: [Click here](#)
- To enable the **MSSQL Server NATIVE SRV PDO**: [Click here](#)

ATTENTION: If you do not have an Amazon RDS MSSQL Server base created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the Enabled Driver (**MSSQL Server NATIVE SRV** or **MSSQL Server NATIVE SRV PDO**) and the Amazon RDS MSSQL Server database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database> New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Amazon RDS** connection.

4 - And choose the **Amazon RDS MSSQL Server** database.

Connection

Enter the parameters for connecting to your Amazon RDS PostgreSQL database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the PostgreSQL Driver for connection. In this example, we use the **MSSQL Server Native SRV PDO** Driver.
- **Server/Host (Name or IP):** Enter the domain of the Amazon RDS server where the database is installed.
- **EX:** database-mssql.us-east-2.rds.amazonaws.com
- **Port:** Enter the port for connection. By default, the defined port is **1433**.
- **Database Name:** List and select the database you will connect to.
- **EX:** samples
- **Username:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above .**
- **View:** Choose whether to display the tables for the informed owner.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **utf8**.
 - **The utf8 charset is set by default.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the . dot is selected as a separator.**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option.**

Enabling Amazon RDS PDO DBLIB

In Scriptcase installed on Linux, we have the following driver available for connection to MSSQL Server: **PDO DBLIB**. If you are using your own pre-configured environment, MSSQL Server extensions must be enabled manually in PHP.

Configuring and enabling Amazon RDS PDO DBLIB on Linux

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - On your linux terminal, you only need to run one line to install the PDO DBLIB extension. See below how to proceed.

```
sudo apt-get install php8.1-pdo-dblib
```

- If you are unable to execute the above command because you cannot find packages, install the repository below and update.

```
sudo add-apt-repository ppa:ondrej/php  
sudo apt-get update
```

2 - Restart the Apache service via the terminal.

```
sudo service apache2 restart
```

Connection to Scriptcase

- **PDO DBLIB:** [Click here](#)

Connection with Amazon RDS PDO DBLIB

If you do not have the **PDO DBLIB** driver enabled, check below our documentation on how to enable this driver in Scriptcase for connection.

- To enable the **PDO DBLIB**: [Click here](#)

ATTENTION: If you do not have an Amazon RDS MSSQL Server base created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the Enabled Driver (**PDO DBLIB**) and the Amazon RDS MSSQL Server database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database> New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Amazon RDS** connection.

4 - And choose the **Amazon RDS MSSQL Server** database.

Connection

Enter the parameters for connecting to your Amazon RDS PostgreSQL database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the PostgreSQL Driver for connection. In this example, we use the **PDO DBLIB** Driver.
- **Server/Host (Name or IP):** Enter the domain of the Amazon RDS server where the database is installed.
- **EX:** database-mssql.us-east-2.rds.amazonaws.com
- **Port:** Enter the port for connection. By default, the defined port is **1433**.
- **Database Name:** List and select the database you will connect to.
- **EX:** samples
- **Username:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Security tab, where the connection encryption settings are defined.

- **Encrypt**

This property specifies whether communication with the SQL server should be encrypted. To enable encryption, you must set this property to “true”. This ensures that data sent between the client and server is protected by encryption.

- **trustservercertificate**

Set to “true” to specify that the driver does not validate the server’s TLS/SSL certificate.

If “true”, the server’s TLS/SSL certificate is automatically trusted when the communication layer is encrypted using TLS.

- **trustStore**

The path (including the file name) to the certificate’s trustStore file. The trustStore file contains the list of certificates that the client trusts.

When this property is not specified or is set to null, the driver relies on the trust manager factory query rules to determine which certificate store to use.

- **trustStorePassword**

The password used to verify the integrity of trustStore data.

If the trustStore property is set but the trustStorePassword property is not set, the integrity of the trustStore is not checked.

- **hostnameInCertificate**

The hostname to use to validate the SQL Server TLS/SSL certificate.

This property allows you to specify the expected hostname in the SQL server certificate. This is useful to ensure that the connection is only made to the correct server and not to a malicious server that may be using an invalid certificate.

Note: This property is used in combination with the **encrypt**/authentication properties and the **trustServerCertificate** property. This property affects certificate validation if the connection uses **TLS** encryption and **trustServerCertificate** is set to “false”. Ensure that the value passed to **hostnameInCertificate** matches the Common Name (CN) or DNS name in the Subject Alternative Name (SAN) in the server certificate for a **TLS** connection to be successful. For more information about encryption support, see Understanding encryption support.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

 - **By default, Scriptcase disables this option.**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option.**

Enabling Amazon RDS Oracle 8.0.5 or Higher

At Scriptcase, we have the following drivers available for connection to Oracle: **Oracle 8.0.5 or Higher, Oracle PDO, Oracle ODBC and Oracle 8** . If you are using your own pre-configured environment, Oracle extensions must be enabled manually in PHP.

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

Prerequisites

Before proceeding with this documentation, check your PHP architecture. For drivers to be enabled correctly, **files must be downloaded according to the architecture used.**

- In your Scriptcase, there is the file **info.php**, access it by the URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find the information regarding the architecture in [phpinfo\(\)](#).

NOTE: If you are using Scriptcase's automatic installer, the PHP architecture will be the same as the one you downloaded. **Download the Oracle instant client according to your PHP architecture.**

- Architecture **x86 = 32 bits**
- Architecture **x64 = 64 bits**

Below are listed the files required for Oracle drivers to be enabled. If you installed Scriptcase using the installer, it is not necessary to download **Microsoft Visual C ++ 2017** . For manual installations, **you must download and install both versions of Microsoft Visual C ++ 2017** .

Required files:

x64

- Oracle Instant Client **19.6.0.0(x64)**: [Click here](#)
- Microsoft Visual C++ **2017(x64)**: [Click here](#)

x86

- Oracle Instant Client **19.6.0.0(x86)**: [Click here](#)
- Microsoft Visual C++ **2017(x86)**: [Click here](#)

IMPORTANT: PHP 7.3 is compatible with **Oracle Instant Client 11 or higher**.

To download Oracle Instant Client lower than version **19**, you must have an [Oracle Account](#).

Other Files

- Oracle Instant Client **18.5.0.0 or Lower**: [Click here](#)

Compatibility Table

Driver	Oracle database version
Oracle 8.0.5 or Higher	
Instant Client	Oracle database version
19.6.0.0	

ATTENTION: To use the Oracle 11g **Release 1 (11.1)** bank, you must use the **11.1 or 11.2** instant client.

Configuring and enabling Amazon RDS Oracle 8.0.5 on Windows

The automatic installation of Scriptcase comes with pre-configured Oracle drivers, with only **instant_client** to be configured to make the connection. Follow the steps outlined below to enable the connection drivers.

1 - Extract the [previously](#) downloaded Instant Client Basic package to your computer's root.

EX: C:\instantclient_19_6

2 - Paste in Scriptcase's **PHP** folder C:\Program Files\NetMake\v9-php73\components\php the DLLs listed below:

- **oci.dll**
- **oraociei19.dll**
- **oraons.dll**

3 - Add the full path to the instant client in the **Path** parameter of the Environment Variables. Follow the steps below to perform this procedure:

- Go to Control Panel > System > **Advanced system settings**

- Click on the **Advanced > Environment Variables tab** .

- Under **System variables**, select the **Path** item and click **Edit**.

- Click on the **New** button and add the path to the instant client as shown below:

4 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the ApacheScriptcase9php73 service and right click on this service, then **Restart**.

Connection to Scriptcase

- **Oracle 8.0.5 or Higher:** [Click Here](#)

Enabling Amazon RDS Oracle PDO

At Scriptcase, we have the following drivers available for connection to Oracle: **Oracle 8.0.5 or Higher, Oracle PDO, Oracle ODBC and Oracle 8** . If you are using your own pre-configured environment, Oracle extensions must be enabled manually in PHP.

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

Prerequisites

Before proceeding with this documentation, check your PHP architecture. For drivers to be enabled correctly, **files must be downloaded according to the architecture used.**

- In your Scriptcase, there is the file **info.php**, access it by the URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find the information regarding the architecture in [phpinfo\(\)](#).

NOTE: If you are using Scriptcase's automatic installer, the PHP architecture will be the same as the one you downloaded. **Download the Oracle instant client according to your PHP architecture.**

- Architecture **x86 = 32 bits**
- Architecture **x64 = 64 bits**

Below are listed the files required for Oracle drivers to be enabled. If you installed Scriptcase using the installer, it is not necessary to download **Microsoft Visual C ++ 2017** . For manual installations, **you must download and install both versions of Microsoft Visual C ++ 2017** .

Required files:

x64

- Oracle Instant Client **19.6.0.0(x64)**: [Click here](#)
- Microsoft Visual C++ **2017(x64)**: [Click here](#)

x86

- Oracle Instant Client **19.6.0.0(x86)**: [Click here](#)
- Microsoft Visual C++ **2017(x86)**: [Click here](#)

IMPORTANT: PHP 7.3 is compatible with **Oracle Instant Client 11 or higher**.

To download Oracle Instant Client lower than version **19**, you must have an [Oracle Account](#).

Other Files

- Oracle Instant Client **18.5.0.0 or Lower**: [Click here](#)

Compatibility Table

Driver	Oracle database version
Oracle PDO	
Instant Client	Oracle database version
19.6.0.0	

ATTENTION: To use the Oracle 11g **_Release 1 (11.1)** bank, you must use the **11.1 or 11.2** instant client.

Configuring and enabling Amazon RDS Oracle PDO on Windows

The automatic installation of Scriptcase comes with pre-configured Oracle drivers, with only **instant_client** to be configured to make the connection. Follow the steps outlined below to enable the connection drivers.

1 - Extract the [previously](#) downloaded Instant Client Basic package to your computer's root.

EX: C:\instantclient_19_6

2 - Paste in Scriptcase's **PHP** folder C:\Program Files\NetMake\v9-php73\components\php the DLLs listed below:

- **oci.dll**
- **oraociei19.dll**
- **oraons.dll**

3 - Add the full path to the instant client in the **Path** parameter of the Environment Variables. Follow the steps below to perform this procedure:

- Go to Control Panel > System > **Advanced system settings**

- Click on the **Advanced > Environment Variables tab** .

- Under **System variables**, select the **Path** item and click **Edit**.

- Click on the **New** button and add the path to the instant client as shown below:

4 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the ApacheScriptcase9php73 service and right click on this service, then **Restart**.

Connection to Scriptcase

- **Oracle PDO:** [Click Here](#)

Enabling Amazon RDS Oracle ODBC

At Scriptcase, we have the following drivers available for connection to Oracle: **Oracle 8.0.5 or Higher, Oracle PDO, Oracle ODBC and Oracle 8** . If you are using your own pre-configured environment, Oracle extensions must be enabled manually in PHP.

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

Prerequisites

Before proceeding with this documentation, check your PHP architecture. For drivers to be enabled correctly, **files must be downloaded according to the architecture used.**

- In your Scriptcase, there is the file **info.php**, access it by the URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find the information regarding the architecture in [phpinfo\(\)](#).

NOTE: If you are using Scriptcase's automatic installer, the PHP architecture will be the same as the one you downloaded. **Download the Oracle instant client according to your PHP architecture.**

- Architecture **x86 = 32 bits**
- Architecture **x64 = 64 bits**

Below are listed the files required for Oracle drivers to be enabled. If you installed Scriptcase using the installer, it is not necessary to download **Microsoft Visual C ++ 2017** . For manual installations, **you must download and install both versions of Microsoft Visual C ++ 2017** .

Required files:

x64

- Oracle Instant Client **19.6.0.0(x64)**: [Click here](#)
- Microsoft Visual C++ **2017(x64)**: [Click here](#)

x86

- Oracle Instant Client **19.6.0.0(x86)**: [Click here](#)
- Microsoft Visual C++ **2017(x86)**: [Click here](#)

IMPORTANT: PHP 7.3 is compatible with **Oracle Instant Client 11 or higher**.

To download Oracle Instant Client lower than version **19**, you must have an [Oracle Account](#).

Other Files

- Oracle Instant Client **18.5.0.0 or Lower**: [Click here](#)

Compatibility Table

Driver	Oracle database version
Oracle 8	
Instant Client	Oracle database version
19.6.0.0	

ATTENTION: To use the Oracle 11g **_Release 1 (11.1)** bank, you must use the **11.1 or 11.2** instant client.

Configuring and enabling Amazon RDS Oracle 8 on Windows

The automatic installation of Scriptcase comes with pre-configured Oracle drivers, with only **instant_client** to be configured to make the connection. Follow the steps outlined below to enable the connection drivers.

1 - Extract the [previously](#) downloaded Instant Client Basic package to your computer's root.

EX: C:\instantclient_19_6

2 - Paste in Scriptcase's **PHP** folder C:\Program Files\NetMake\v9-php73\components\php the DLLs listed below:

- **oci.dll**
- **oraociei19.dll**
- **oraons.dll**

3 - Add the full path to the instant client in the **Path** parameter of the Environment Variables. Follow the steps below to perform this procedure:

- Go to Control Panel > System > **Advanced system settings**

- Click on the **Advanced > Environment Variables tab** .

- Under **System variables**, select the **Path** item and click **Edit**.

- Click on the **New** button and add the path to the instant client as shown below:

4 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the ApacheScriptcase9php73 service and right click on this service, then **Restart**.

Connection to Scriptcase

- **Oracle 8:** [Click Here](#)

Connection to Amazon RDS Oracle

If you do not have the **Oracle 8.0.5 or Higher, Oracle PDO, and Oracle 8.** drivers enabled, check our documentation below on how to enable both in Scriptcase for connection.

- To enable the **Oracle 8.0.5 or Higher**: [Click here](#)
- To enable the **Oracle PDO**: [Click here](#)
- To enable the **Oracle 8**: [Click here](#)

CAUTION: If you do not have an Amazon RDS database created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver and the Oracle database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Amazon RDS** connection.

4 - And choose the **Amazon RDS Oracle** database.

Connection

Enter the parameters for connecting to your Amazon RDS Oracle database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver to connect. In this example, we use the **Oracle PDO** Driver.
- **Database Name:** Enter the endpoint of the server where the database is installed along with **Service Name** or **Instance**.
 - **EX:** database-oracle.us-east-2.rds.amazonaws.com/ORCL
- **Scheme:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending

on the owner or not.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above.**
- **View:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **Decimal Separator:** Select the separator type of the decimal records, between comma and period.
 - **By default, the . dot is selected as a separator.**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option .**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **EX:**

Connection to Amazon RDS Oracle ODBC

If you do not have the **ODBC**. driver enabled, check our documentation below on how to enable it in Scriptcase for connection.

- To enable the **Oracle ODBC**: [Click here](#)

CAUTION: If you do not have an Amazon RDS database created, check how to create it by clicking [here](#).

Creating a System ODBC Data Source

Check below the entire step by step to create an ODBC data source to connect to Scriptcase.

NOTE: ODBC must be created on the same server where ScriptCase is installed.

1 - Access your **ODBC Data Source Manager** and select according to your architecture. We will select the **x64** version:

2 - When entering the ODBC Data Sources Administrator, select the **DSN System** tab and click on **Add** to create your connection to your Oracle Database.

3 - After that, it is necessary to select the Driver to connect to Oracle. Select Driver: **Oracle in instantclient_19_6**

4 - Now, enter the connection parameters as in the example below:

- **Data Source Name:** Define here the name of the ODBC object that will be used when connecting to Scriptcase.
- **Description:** Write a definition for the Data Source, what is the purpose for example.
- **TNS Service Name:** Enter the endpoint of the server where the database is installed along with **Service Name** or **Instance**.
 - **EX:** database-oracle.us-east-2.rds.amazonaws.com/ORCL
 - For more information about Oracle's **Service Name**, [click here](#).
- **User ID:** Inform the user that will be used in the connection for authentication.

5 - Test the connection to check that all parameters have been filled in correctly.

You will be asked to enter the password for connection.

6 - Click **OK** to complete this process.

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver and the Oracle database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Amazon RDS** connection.

4 - And choose the **Amazon RDS Oracle** database.

Connection

Enter the parameters for connecting to your Amazon RDS Oracle database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver to connect. In this example, we use the **Oracle ODBC** Driver.
- **Database Name:** Inform the Data Source Name configured.
 - **EX:** oracle
- **Scheme:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.

- **By default, Scriptcase leaves this option empty.**
- **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above.**
- **View:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **Decimal Separator:** Select the separator type of the decimal records, between comma and period.
 - **By default, the . dot is selected as a separator.**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option .**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **EX:**

Drive	Oracle Database Version	Oracle database version	Instant Client
19.6.0.0	9i	10g	11g R1
			11g R2(11.2)
			12c
			18c
			19c

It is necessary to enable the Oracle extension in PHP and configure **Instant_Client** to make the connection. Follow the steps described below to enable the connection drivers.

1 - Install the packages below:

UBUNTU\DEBIAN

```
sudo apt-get update
sudo apt-get install libaio1
sudo apt-get install libncurses5
sudo apt-get install alien
sudo apt-get install gcc-multilib g++-multilib
sudo apt-get install libpam0g
sudo apt-get install unixodbc-dev unixodbc
```

CENTOS\RHEL

```
sudo yum update
sudo yum install libaio-devel
sudo yum install libaio
sudo yum install glibc
sudo yum install compat-libstdc++-33
sudo yum install glibc-devel
sudo yum install libstdc++
sudo yum install libstdc++
sudo yum install pam
sudo yum install ncurses-devel
sudo yum install unixODBC
```

2 - Convert and install the [previously downloaded Instant Client Basic](#) packages on your Linux system:

UBUNTU\DEBIAN

```
sudo alien oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
sudo alien oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo dpkg -i oracle-instantclient12.1-basic_12.1.0.2.0-2_amd64.deb
sudo dpkg -i oracle-instantclient12.1-devel_12.1.0.2.0-2_amd64.deb
```

CENTOS\RHEL

```
sudo yum install oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo yum install oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
```

3 - Copy the [previously downloaded oci8.so](#) extension to the PHP extensions directory:

E.g. `sudo cp oci8.so /usr/lib/php/20180731`

Access the **info.php** file and search for the **extension_dir** line. It will tell you the exact path to the directory responsible for PHP extensions.

4 - Edit the **php.ini** file and declare the Oracle extension at the end of the file.

UBUNTU\DEBIAN CENTOS\RHEL

```
/etc/php/8.1/apache2/php.ini    /etc/php.ini
```

E.g. `extension=oci8.so`

5 - Edit the environment variable file and declare the variable responsible for identifying the Oracle library:

Enter the variable **LD_LIBRARY_PATH** and the path to the library in the file responsible for your system's environment variables. Check the path below according to your operating system:

WARNING: The path to the library may depend on your installation, by default the path is this:
`/usr/lib/oracle/12.1/client64/lib/.`

UBUNTU\DEBIAN

```
sudo nano
/etc/apache2/envvars
```

CENTOS\RHEL

```
sudo nano
/etc/sysconfig/httpd
```

- Add this variable at the end of the file with the following syntax:

```
export LD_LIBRARY_PATH=/usr/lib/oracle/12.1/client64/lib/
```

E.g.

NOTE: If you are using CentOS/RHEL, it is not necessary to use 'export' before the variable.

6 - Restart the Scriptcase apache service for the changes to take effect. Use the commands below according to your operating system.

UBUNTU\DEBIAN**CENTOS\RHEL**

```
sudo service apache2 restart sudo systemctl restart httpd
```

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle 8.0.5 or Higher** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed along with **Service Name**.
 - **E.g.** serverdomain.com/XE Or 192.168.254.170/XE
 - For more information about Oracle's **Service Name**, [click here](#).
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
 - **By default, this option is left blank by Scriptcase.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.

- **By default, Scriptcase enables this option.**
- **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Drive	Oracle Database Version	Oracle database version	Instant Client
19.6.0.0	9i	10g	11g R1
			11g R2(11.2)
			12c
			18c
			19c

It is necessary to enable the Oracle extension in PHP and configure **Instant_Client** to make the connection. Follow the steps described below to enable the connection drivers.

1 - Install the packages below:

UBUNTU\DEBIAN

```
sudo apt-get update
sudo apt-get install libaio1
sudo apt-get install libncurses5
sudo apt-get install alien
sudo apt-get install gcc-multilib g++-multilib
sudo apt-get install libpam0g
sudo apt-get install unixodbc-dev unixodbc
```

CENTOS\RHEL

```
sudo yum update
sudo yum install libaio-devel
sudo yum install libaio
sudo yum install glibc
sudo yum install compat-libstdc++-33
sudo yum install glibc-devel
sudo yum install libstdc++
sudo yum install libstdc++
sudo yum install pam
sudo yum install ncurses-devel
sudo yum install unixODBC
```

2 - Convert and install the [previously downloaded](#) **Instant Client Basic** packages on your Linux system:

UBUNTU\DEBIAN

```
sudo alien oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
sudo alien oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo dpkg -i oracle-instantclient12.1-basic_12.1.0.2.0-2_amd64.deb
sudo dpkg -i oracle-instantclient12.1-devel_12.1.0.2.0-2_amd64.deb
```

CENTOS\RHEL

```
sudo yum install oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo yum install oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
```

3 - Copy the [previously downloaded](#) **oci8.so** extension to the PHP extensions directory:

E.g. `sudo cp oci8.so /usr/lib/php/20180731`

Access the **info.php** file and search for the **extension_dir** line. It will tell you the exact path to the directory responsible for PHP extensions.

4 - Edit the **php.ini** file and declare the Oracle extension at the end of the file.

UBUNTU\DEBIAN CENTOS\RHEL

`/etc/php/8.1/apache2/php.ini` `/etc/php.ini`

E.g. `extension=oci8.so`

5 - Edit the environment variable file and declare the variable responsible for identifying the Oracle library:

Enter the variable **LD_LIBRARY_PATH** and the path to the library in the file responsible for your system's environment variables. Check the path below according to your operating system:

WARNING: The path to the library may depend on your installation, by default the path is this:
`/usr/lib/oracle/12.1/client64/lib/.`

UBUNTU\DEBIAN

```
sudo nano
/etc/apache2/envvars
```

CENTOS\RHEL

```
sudo nano
/etc/sysconfig/httpd
```

- Add this variable at the end of the file with the following syntax:

```
export LD_LIBRARY_PATH=/usr/lib/oracle/12.1/client64/lib/
```

E.g.

NOTE: If you are using CentOS/RHEL, it is not necessary to use 'export' before the variable.

6 - Restart the Scriptcase apache service for the changes to take effect. Use the commands below according to your operating system.

UBUNTU\DEBIAN**CENTOS\RHEL**

```
sudo service apache2 restart sudo systemctl restart httpd
```

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed along with **Service Name**.
 - **E.g.** serverdomain.com/XE OR 192.168.254.170/XE
 - For more information about Oracle's **Service Name**, [click here](#).
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
 - **By default, this option is left blank by Scriptcase.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.

- **By default, Scriptcase enables this option.**
- **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Enabling Amazon RDS Oracle ODBC

At Scriptcase, we have the following drivers available for connection to Oracle: **Oracle 8.0.5 or Higher, Oracle PDO, Oracle ODBC and Oracle 8** . If you are using your own pre-configured environment, Oracle extensions must be enabled manually in PHP.

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

Prerequisites

Before proceeding with this documentation, check your PHP architecture. For drivers to be enabled correctly, **files must be downloaded according to the architecture used.**

- In your Scriptcase, there is the file **info.php**, access it by the URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find the information regarding the architecture in [phpinfo\(\)](#).

CAUTION: Download the Oracle instant client according to your PHP architecture.

- Architecture **i386/i686 = 32 bits**
- Architecture **x86_64 = 64 bits**

Below are listed the files required for Oracle drivers to be enabled.

Required files:

- oci8.so** Extension: [Click here](#)

x86_64

- Oracle Instant Client - Basic Package **12.1.0.2(x86_64)**: [Click here](#)
- Oracle Instant Client - Devel Package **12.1.0.2(x86_64)**: [Click here](#)

i386/i686

- Oracle Instant Client - Basic Package **12.1.0.2(i386/i686)**: [Click here](#)
- Oracle Instant Client - Devel Package **12.1.0.2(i386/i686)**: [Click here](#)

IMPORTANT: PHP 7.3 is compatible with **Oracle Instant Client 11.2 or higher**.

To download Oracle Instant Client lower than version **19.5.0.0**, it is necessary to have an [Oracle Account](#).

Other Files

- Oracle Instant Client **12.2.0 ou Higher**: [Click here](#)

Compatibility Table

Driver	Oracle database version
Oracle ODBC	
Instant Client	Oracle database version
12.1.0.2	

Configuring Amazon RDS Oracle ODBC on Linux

It is necessary to enable the Oracle extension in PHP and configure **instant_client** to make the connection. Follow the steps outlined below to enable the connection drivers.

1 - Install the packages below:

UBUNTU\DEBIAN

```
sudo apt-get update
sudo apt-get install libaio1
sudo apt-get install libncurses5
sudo apt-get install alien
sudo apt-get install gcc-multilib g++-multilib
sudo apt-get install libpam0g
sudo apt-get install unixodbc-dev unixodbc
```

CENTOS\RHEL

```
sudo yum update
sudo yum install libaio-devel
sudo yum install libaio
sudo yum install glibc
sudo yum install compat-libstdc++-33
sudo yum install glibc-devel
sudo yum install libstdc++
sudo yum install libstdc++
sudo yum install pam
sudo yum install ncurses-devel
sudo yum install unixODBC
```

2 - Convert and install the [previously](#) downloaded **Instant Client Basic** packages on your Linux system:

UBUNTU\DEBIAN

```
sudo alien oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
sudo alien oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo dpkg -i oracle-instantclient12.1-basic_12.1.0.2.0-2_amd64.deb
sudo dpkg -i oracle-instantclient12.1-devel_12.1.0.2.0-2_amd64.deb
```

CENTOS\RHEL

```
sudo yum install oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo yum install oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
```

3 - Copy the **oci8.so** extension to the PHP extensions directory:

EX: `sudo cp oci8.so /usr/lib/php/20180731`

Access the **info.php** file and look for the **extension_dir** line. It will tell you the exact path to the directory responsible for PHP extensions.

4 - Edit the **php.ini** file and declare the Oracle extension at the end of the file.

UBUNTU\DEBIAN CENTOS\RHEL

```
/etc/php/7.3/apache2/php.ini    /etc/php.ini
```

EX: `extension=oci8.so`

5 - Edit the environment variable file and declare the variable responsible for identifying the Oracle library:

Enter the variable **LD_LIBRARY_PATH** and the path to the library in the file responsible for your system's environment variables. Check the path below according to your operating system:

WARNING: The path to the library may depend on your installation, by default the path is this:
`/usr/lib/oracle/12.1/client64/lib/.`

UBUNTU\DEBIAN

```
sudo nano
/etc/apache2/envvars
```

CENTOS\RHEL

```
sudo nano
/etc/sysconfig/httpd
```

- Add this variable at the end of the file with the following syntax:

```
export LD_LIBRARY_PATH=/usr/lib/oracle/12.1/client64/lib/
```

E.g.

NOTE: If you are using CentOS/RHEL, it is not necessary to use 'export' before the variable.

6 - Restart the Scriptcase apache service for the changes to take effect. Use the commands below according to your operating system.

UBUNTU\DEBIAN **CENTOS\RHEL**

sudo service apache2 restart sudo systemctl restart httpd

Connection to Scriptcase

- Oracle ODBC: [Click here](#)

Drive	Oracle Database Version	Oracle database version						
Instant Client	19.6.0.0	9i	10g	11g R1	11g R2(11.2)	12c	18c	19c

It is necessary to enable the Oracle extension in PHP and configure **Instant_Client** to make the connection. Follow the steps described below to enable the connection drivers.

1 - Install the packages below:

UBUNTU\DEBIAN

```
sudo apt-get update
sudo apt-get install libaio1
sudo apt-get install libncurses5
sudo apt-get install alien
sudo apt-get install gcc-multilib g++-multilib
sudo apt-get install libpam0g
sudo apt-get install unixodbc-dev unixodbc
```

CENTOS\RHEL

```
sudo yum update
sudo yum install libaio-devel
sudo yum install libaio
sudo yum install glibc
sudo yum install compat-libstdc++-33
sudo yum install glibc-devel
sudo yum install libstdc++
sudo yum install libstdc++
sudo yum install pam
sudo yum install ncurses-devel
sudo yum install unixODBC
```

2 - Convert and install the [previously downloaded](#) **Instant Client Basic** packages on your Linux system:

UBUNTU\DEBIAN

```
sudo alien oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
sudo alien oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo dpkg -i oracle-instantclient12.1-basic_12.1.0.2.0-2_amd64.deb
sudo dpkg -i oracle-instantclient12.1-devel_12.1.0.2.0-2_amd64.deb
```

CENTOS\RHEL

```
sudo yum install oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo yum install oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
```

3 - Copy the [previously downloaded](#) **oci8.so** extension to the PHP extensions directory:

E.g. `sudo cp oci8.so /usr/lib/php/20180731`

Access the **info.php** file and search for the **extension_dir** line. It will tell you the exact path to the directory responsible for PHP extensions.

4 - Edit the **php.ini** file and declare the Oracle extension at the end of the file.

UBUNTU\DEBIAN CENTOS\RHEL

`/etc/php/8.1/apache2/php.ini` `/etc/php.ini`

E.g. `extension=oci8.so`

5 - Edit the environment variable file and declare the variable responsible for identifying the Oracle library:

Enter the variable **LD_LIBRARY_PATH** and the path to the library in the file responsible for your system's environment variables. Check the path below according to your operating system:

WARNING: The path to the library may depend on your installation, by default the path is this:
`/usr/lib/oracle/12.1/client64/lib/.`

UBUNTU\DEBIAN

```
sudo nano
/etc/apache2/envvars
```

CENTOS\RHEL

```
sudo nano
/etc/sysconfig/httpd
```

- Add this variable at the end of the file with the following syntax:

```
export LD_LIBRARY_PATH=/usr/lib/oracle/12.1/client64/lib/
```

E.g.

NOTE: If you are using CentOS/RHEL, it is not necessary to use 'export' before the variable.

6 - Restart the Scriptcase apache service for the changes to take effect. Use the commands below according to your operating system.

UBUNTU\DEBIAN**CENTOS\RHEL**

```
sudo service apache2 restart sudo systemctl restart httpd
```

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle 8** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed along with **Service Name**.
 - **E.g.** serverdomain.com/XE OR 192.168.254.170/XE
 - For more information about Oracle's **Service Name**, [click here](#).
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
 - **By default, this option is left blank by Scriptcase.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.

- **By default, Scriptcase enables this option.**
- **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connection to Amazon RDS Oracle

If you do not have the **Oracle 8.0.5 or Higher, Oracle PDO, and Oracle 8.** drivers enabled, check our documentation below on how to enable both in Scriptcase for connection.

- To enable the **Oracle 8.0.5 or Higher**: [Click here](#)
- To enable the **Oracle PDO**: [Click here](#)
- To enable the **Oracle 8**: [Click here](#)

CAUTION: If you do not have an Amazon RDS database created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver and the Oracle database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Amazon RDS** connection.

4 - And choose the **Amazon RDS Oracle** database.

Connection

Enter the parameters for connecting to your Amazon RDS Oracle database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver to connect. In this example, we use the **Oracle PDO** Driver.
- **Database Name:** Enter the endpoint of the server where the database is installed along with **Service Name** or **Instance**.
 - **EX:** database-oracle.us-east-2.rds.amazonaws.com/ORCL
- **Scheme:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending

on the owner or not.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above.**
- **View:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **Decimal Separator:** Select the separator type of the decimal records, between comma and period.
 - **By default, the . dot is selected as a separator.**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option .**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **EX:**

Connection to Amazon RDS Oracle ODBC

If you do not have the **ODBC**. driver enabled, check our documentation below on how to enable it in Scriptcase for connection.

- To enable the **Oracle ODBC**: [Click here](#)

CAUTION: If you do not have an Amazon RDS database created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver and the Oracle database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Amazon RDS** connection.

4 - And choose the **Amazon RDS Oracle** database.

Connection

Enter the parameters for connecting to your Amazon RDS Oracle database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver to connect. In this example, we use the **Oracle ODBC** Driver.
- **Database Name:** Inform the Data Source Name configured.
 - **EX:** oracle
- **Scheme:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above.**
- **View:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **Decimal Separator:** Select the separator type of the decimal records, between comma and period.
 - **By default, the . dot is selected as a separator.**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option .**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **EX:**

Enabling Amazon RDS Oracle 8.0.5 or Above

At Scriptcase, we have the following drivers available for connection to Oracle: **Oracle 8.0.5 or Above, Oracle PDO, Oracle ODBC and Oracle 8** . If you are using your own pre-configured environment, Oracle extensions must be enabled manually in PHP.

Prerequisites

Before proceeding at this documentation, check your PHP architecture. For drivers to be enabled correctly, **the files must be downloaded according to the architecture used.**

- In your Scriptcase, there is the file **info.php**, access it by URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find information regarding architecture in the [phpinfo\(\)](#).

NOTE: Download the Oracle instant client according to your PHP architecture.

- Architecture **i386/i686 = 32 bits**
- Architecture **x86_64 = 64 bits**

Below are listed the files required for Oracle drivers to be enabled.

Required files:

- Extension **oci8.so**: [Clique Aqui](#)

x86_64

- Oracle Instant Client **12.1.0.2(x86_64)**: [Clique Aqui](#)

IMPORTANT: The PHP 7.3 is compatible with **Oracle Instant Client 11.2 or Higher**. To download the Oracle Instant Client below the version **19.5.0.0**, it is necessary to have a [Oracle account](#).

Other Files

- Oracle Instant Client **12.2.0 or Higher**: [Click Here](#)

Compatibility Table

Driver	Oracle database version
Oracle 8.0.5 or Higher	
Instant Client	Oracle database version
12.1.0.2	

Configuring Oracle 8.0.5 or Higher on MacOs

It is necessary to enable the Oracle extension in PHP and configure **Instant_Client** to make the connection. Follow the steps described below to enable the connection drivers.

1 - On your Mac terminal, log in as **root** and create a folder with instant client numbering in `/usr/local/instantclient/12.1.0.2/`.

EX:

- `mkdir -p /usr/local/instantclient/12.1.0.2/`

2 - Extract all content from the **Instant Client** downloaded [previously](#) on your Mac system and copy to the folder created in the previous step:

EX:

- `unzip oci_client_macosx_12.zip`
- `cp -avr __MACOSX/ oci_client_macosx_12/ /usr/local/instantclient/12.1.0.2/`

3 - Copy the [previously downloaded oci8.so](#) extension to the PHP extensions directory:

ATENÇÃO: If you followed our [documentation](#) to install Scriptcase manually on macOS, the extension is already in the extensions directory. You can proceed to item **5**.

EX:

```
sudo cp oci8.so /usr/local/lib/php/pecl/20180731
```

Access the **info.php** file and search for the **extension_dir** line. It will tell you the exact path to the directory responsible for PHP extensions.

4 - Edit the **php.ini** file(`/usr/local/etc/php/7.3/php.ini`) and declare the Oracle extension at the end of the file.

EX:

```
extension=oci8.so
```

5 - Restart the apache service for the changes to be saved. Use the command below for this:

EX:

```
sudo apachectl restart
```

Connection to Scriptcase

- **Oracle 8.0.5 or Higher:** [Click here](#)

Enabling Amazon RDS Oracle PDO

At Scriptcase, we have the following drivers available for connection to Oracle: **Oracle 8.0.5 or Above, Oracle PDO, Oracle ODBC and Oracle 8** . If you are using your own pre-configured environment, Oracle extensions must be enabled manually in PHP.

Prerequisites

Before proceeding at this documentation, check your PHP architecture. For drivers to be enabled correctly, **the files must be downloaded according to the architecture used.**

- In your Scriptcase, there is the file **info.php**, access it by URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find information regarding architecture in the [phpinfo\(\)](#).

NOTE: Download the Oracle instant client according to your PHP architecture.

- Architecture **i386/i686 = 32 bits**
- Architecture **x86_64 = 64 bits**

Below are listed the files required for Oracle drivers to be enabled.

Required files:

- Extension **oci8.so**: [Clique Aqui](#)

x86_64

- Oracle Instant Client **12.1.0.2(x86_64)**: [Clique Aqui](#)

Connection to Scriptcase

- **Oracle 8:** [Click here](#)

Connection to Amazon RDS Oracle

If you do not have the **Oracle 8.0.5 or Higher, Oracle PDO, and Oracle 8.** drivers enabled, check our documentation below on how to enable both in Scriptcase for connection.

- To enable the **Oracle 8.0.5 or Higher**: [Click here](#)
- To enable the **Oracle PDO**: [Click here](#)
- To enable the **Oracle 8**: [Click here](#)

CAUTION: If you do not have an Amazon RDS database created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver and the Oracle database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Amazon RDS** connection.

4 - And choose the **Amazon RDS Oracle** database.

Connection

Enter the parameters for connecting to your Amazon RDS Oracle database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver to connect. In this example, we use the **Oracle PDO** Driver.
- **Database Name:** Enter the endpoint of the server where the database is installed along with **Service Name** or **Instance**.
 - **EX:** database-oracle.us-east-2.rds.amazonaws.com/ORCL
- **Scheme:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending

on the owner or not.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above.**
- **View:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **Decimal Separator:** Select the separator type of the decimal records, between comma and period.
 - **By default, the . dot is selected as a separator.**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option .**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **EX:**

Connection to Amazon RDS Oracle ODBC

If you do not have the **ODBC**. driver enabled, check our documentation below on how to enable it in Scriptcase for connection.

- To enable the **Oracle ODBC**: [Click here](#)

CAUTION: If you do not have an Amazon RDS database created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver and the Oracle database.

1 - Access a project from your Scriptcase.

 - **EX:**

Enabling Amazon RDS MariaDB PDO

At Scriptcase, we have the following driver available for connection MariaDB: **MariaDB PDO**. If you are using your own pre-configured environment MariaDB extension must be manually enabled in PHP.

Configuring and enabling Amazon MariaDB PDO on Windows

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase .**

1 - In the php.ini file, located in C:\php, look for a line referring to MariaDB extension: **pdo_mysql** and remove the ; from the beginning of the line for the extension to be used by PHP. See the example below:

```
extension=pdo_mysql
```

2 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the ApacheScriptcase9php81 or Apache2.4 service and right click on this service, then **Restart**.

Enter the parameters for connecting to your Amazon RDS MariaDB database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the MariaDB Driver for connection. In this example, we use the **MariaDB PDO** Driver.
- **Server/Host (Name or IP):** Enter the domain of the Amazon RDS server where the database is installed.
- **EX:** database-mysql.us-east-2.rds.amazonaws.com
- **Port:** Enter the port for connection. By default, the defined port is **3306**.
- **Database name:** List and select the database you will connect to.
- **EX:** samples
- **Username:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Accessing this tab, you can configure all the security of your Amazon RDS MariaDB database.

- **Use SSL:** Choose whether the SSL protocol will be active on the connection.
 - **By default, Scriptcase disables this option .**

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above.**
- **View:** Choose whether to display the tables for the informed owner.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **utf8**.
 - **The utf8 charset is set by default.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the . dot is selected as a separator.**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before the table name:** Define whether the database schema will be displayed

before the table names.

- **By default, Scriptcase enables this option.**

Google Cloud in Scriptcase

At Scriptcase, we have several databases (**MySQL, MariaDB, PostgreSQL and MSSQL Server**) and their respective drivers for connecting to Google Cloud. You must choose the most suitable for your environment and need.

If you do not have a Google Cloud database created from the ones available on Scriptcase, check below how to create a database:

- **Creation of Google Cloud MySQL database:** [Click here](#)
- **Creation of Google Cloud PostgreSQL database:** [Click here](#)
- **Creation of Google Cloud MSSQL Server database:** [Click here](#)

You can check your enabled drivers by accessing your diagnosis. See below on how to locate your diagnosis and check if the driver is enabled.

- Accessing the top menu **Help > Diagnosis**, you can easily find it through the interface.

- Or, by accessing your browser url:

`127.0.0.1:8092/scriptcase/diagnosis.php` or `dominio.com/scriptcase/diagnosis.php`

Check below how to enable each database in Scriptcase according to your operating system:

MySQL

- **Windows:** [Click here](#)
- **Linux:** [Click here](#)
- **macOS:** [Click here](#)

MariaDB

- **Windows:** [Click here](#)
- **Linux:** [Click here](#)
- **macOS:** [Click here](#)

PostgreSQL

- **Windows:** [Click here](#)
- **Linux:** [Click here](#)
- **macOS:** [Click here](#)

MSSQL Server

- **Windows:** [Click here](#)
- **Linux:** [Click here](#)

- macOS: [Click here](#)

Enabling Google Cloud MySQLi

In Scriptcase, we have the following drivers available for connection to MySQL: **MySQL PDO, MySQLi**. If you are using your own pre-configured environment, MySQL extensions must be manually enabled in PHP.

Configuring and enabling MySQLi on Windows

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - In the `php.ini` file, located in `C:\php`, look for lines referring to MySQL extensions: **mysqli** and **pdo_mysql** and remove the `;` from the beginning of the lines for the extension to be used by PHP. See the example below:

```
extension=mysqli  
extension=pdo_mysql
```

2 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the `ApacheScriptcase9php73` or `Apache2.4` service and right click on this service, then **Restart**.

Connection to Scriptcase

- **MySQLi:** [Click Here](#)

Enabling Google Cloud MySQL PDO

In Scriptcase, we have the following drivers available for connection to MySQL: **MySQL PDO**, **MySQLi**. If you are using your own pre-configured environment, MySQL extensions must be manually enabled in PHP.

Configuring and enabling MySQLi on Windows

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - In the php.ini file, located in C:\php, look for lines referring to MySQL extensions: **mysqli** and **pdo_mysql** and remove the ; from the beginning of the lines for the extension to be used by PHP. See the example below:

```
extension=mysqli  
extension=pdo_mysql
```

2 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the ApacheScriptcase9php73 or Apache2.4 service and right click on this service, then **Restart**.

Connection to Scriptcase

Check below which Driver you want to connect with.

- **MySQL PDO:** [Click here](#)

Connection with Google Cloud MySQL

If you do not have the **MySQLi** or **MySQL PDO** drivers enabled, check below our documentation on how to enable both in Scriptcase for connection.

- To enable the **MySQLi**: [Click Here](#)
- To enable the **MySQL PDO**: [Click Here](#)

CAUTION: If you don't have a Google Cloud database created, check how to create it by clicking [here](#) [link_google]{: target = '_ blank'}.

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver (**MySQLi** or **MySQL PDO**) and the Google Cloud MySQL database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the connection **Google Cloud**.

4 - And choose the database **Google Cloud MySQL**.

Connection

Enter the parameters for connecting to your Google Cloud MySQL database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **SGDB Driver:** Select the MySQL Driver for connection. In this example, we use the **MySQL PDO** Driver.
- **SGDB server:** Enter the IP or domain of the Google Cloud server where the database is installed.
- **EX:** dominioserver.com OU 192.168.254.178
- **Port:** Enter the port for connection. By default, the defined port is **3306**.
- **Database:** List and select the database you will connect to.
- **EX:** samples
- **User:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Accessing this tab, you can configure all the security of your Google Cloud MySQL database.

- **Use SSL:** Choose whether the SSL protocol will be active on the connection.
 - **By default, Scriptcase disables this option.**

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** Selecting this option, the procedures of your database will be displayed.

Filters

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **The user must be in capital letters as in the example above.**
- **View:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **utf8**.
 - **By default, the utf8 charset is set.**
- **Decimal Separator:** Select the separator type of the decimal records, between comma and period.

- **By default, the point . is selected as a separator.**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before the table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**

Enabling Google Cloud MySQLi

In Scriptcase, we have the following drivers available for connection to MySQL: **MySQL PDO, MySQLi** . If you are using your own pre-configured environment, MySQL extensions must be manually enabled in PHP.

Configuring and enabling Google Cloud MySQLi on Linux

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase .**

1 - On your linux terminal, you only need to run one line to install MySQL extensions. See below for how to proceed.

```
sudo apt-get install php8.1-mysql
```

- If you are unable to execute the above command because you cannot find packages, install the repository below and update.

```
sudo add-apt-repository ppa:ondrej/php
```

```
sudo apt-get update
```

2 - Restart the Apache service via the terminal.

```
sudo service apache2 restart
```

Connection with Google Cloud PostgreSQL

If you do not have the **PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below** drivers enabled, check below our documentation on how to enable both in Scriptcase for connection.

- To enable **PostgreSQL PDO**: [Click Here](#)
- To enable **PostgreSQL 7 ou acima**: [Click Here](#)
- To enable **PostgreSQL 6.4 ou acima**: [Click Here](#)
- To enable **PostgreSQL 6.3 ou abaixo**: [Click Here](#)

ATTENTION: If you don't have a Google Cloud database created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver (**PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below.**) and the Google Cloud PostgreSQL database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the connection **Google Cloud**.

4 - And choose the database **Google Cloud Postgres**.

Connection

Enter the parameters for connecting to your Google Cloud PostgreSQL database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **SGDB Driver:** Select the PostgreSQL Driver for connection. In this example, we use the **PostgreSQL PDO** Driver.
- **SGDB server:** Enter the IP or domain of the Google Cloud server where the database is installed.
- **EX:** domain.com OU 192.168.254.178
- **Port:** Enter the port for connection. By default, the defined port is **5432**.
- **Eschema:** Enter the schema for connection to the database.
- **Database:** List and select the database you will connect to.
- **EX:** samples
- **User:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the

parameters entered are correct.

Security

Use SSL

Allows you to define whether the connection will use SSL. Note that the option is disabled by default.

sslmode

sslmode	protection	MITM protection	Statement
disable	No	No	I don't care about security, and I don't want to pay the overhead of encryption.
allow	Maybe	No	I don't care about security, but I will pay the overhead of encryption if the server insists on it.
prefer	Maybe	No	I don't care about encryption, but I wish to pay the overhead of encryption if the server supports it.
require	Yes	No	I want my data to be encrypted, and I accept the overhead.
verify-ca	Yes	Depends on CA policy	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server that I trust.
verify-full	Yes	Yes	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server I trust, and that it's the one I specify.

sslrootcert (SSL Root Certificate):

This parameter refers to the SSL/TLS root certificate used to verify the authenticity of the certificate presented by the server during secure communication. Usage: The value of this parameter must be the full path to the file containing the root certificate.

sslkey (SSL Private Key):

This parameter represents the private key associated with the SSL/TLS certificate used by the server for authentication. Usage: The full path to the file containing the private key must be specified.

sslcert (SSL Certificate):

The sslcert parameter refers to the server's SSL/TLS certificate, which is presented during the security negotiation process for authentication. Usage: The full path to the file containing the server's SSL/TLS certificate must be provided.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

Enabling Google Cloud PostgreSQL PDO

In Scriptcase, we have the following drivers available for connection to PostgreSQL: **PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below**. If you are using your own pre-configured environment, PostgreSQL extensions must be enabled manually in PHP.

Configuring and enabling Google Cloud PostgreSQL PDO on Linux

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase .**

1 - On your linux terminal, you only need to run one line to install PostgreSQL extensions. See below how to proceed.

```
sudo apt-get install php8.1-pgsql
```

- If you are unable to execute the above command because you cannot find packages, install the repository below and update.

```
sudo add-apt-repository ppa:ondrej/php  
sudo apt-get update
```

2 - Restart the Apache service via the terminal.

```
sudo service apache2 restart
```

Connection with Google Cloud PostgreSQL

If you do not have the **PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below** drivers enabled, check below our documentation on how to enable both in Scriptcase for connection.

- To enable **PostgreSQL PDO**: [Click Here](#)
- To enable **PostgreSQL 7 ou acima**: [Click Here](#)
- To enable **PostgreSQL 6.4 ou acima**: [Click Here](#)
- To enable **PostgreSQL 6.3 ou abaixo**: [Click Here](#)

ATTENTION: If you don't have a Google Cloud database created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver (**PostgreSQL PDO, PostgreSQL 7 or above, PostgreSQL 6.4 or above and PostgreSQL 6.3 or below.**) and the Google Cloud PostgreSQL database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the connection **Google Cloud**.

4 - And choose the database **Google Cloud Postgres**.

Connection

Enter the parameters for connecting to your Google Cloud PostgreSQL database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **SGDB Driver:** Select the PostgreSQL Driver for connection. In this example, we use the **PostgreSQL PDO** Driver.
- **SGDB server:** Enter the IP or domain of the Google Cloud server where the database is installed.
- **EX:** domain.com OU 192.168.254.178
- **Port:** Enter the port for connection. By default, the defined port is **5432**.
- **Eschema:** Enter the schema for connection to the database.
- **Database:** List and select the database you will connect to.
- **EX:** samples
- **User:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the

parameters entered are correct.

Security

Use SSL

Allows you to define whether the connection will use SSL. Note that the option is disabled by default.

sslmode

sslmode	protection	MITM protection	Statement
disable	No	No	I don't care about security, and I don't want to pay the overhead of encryption.
allow	Maybe	No	I don't care about security, but I will pay the overhead of encryption if the server insists on it.
prefer	Maybe	No	I don't care about encryption, but I wish to pay the overhead of encryption if the server supports it.
require	Yes	No	I want my data to be encrypted, and I accept the overhead.
verify-ca	Yes	Depends on CA policy	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server that I trust.
verify-full	Yes	Yes	I want my data encrypted, and I accept the overhead. I want to be sure that I connect to a server I trust, and that it's the one I specify.

sslrootcert (SSL Root Certificate):

This parameter refers to the SSL/TLS root certificate used to verify the authenticity of the certificate presented by the server during secure communication. Usage: The value of this parameter must be the full path to the file containing the root certificate.

sslkey (SSL Private Key):

This parameter represents the private key associated with the SSL/TLS certificate used by the server for authentication. Usage: The full path to the file containing the private key must be specified.

sslcert (SSL Certificate):

The sslcert parameter refers to the server's SSL/TLS certificate, which is presented during the security negotiation process for authentication. Usage: The full path to the file containing the server's SSL/TLS certificate must be provided.

Filter

Contact our [support](#) in case of connection problems or questions regarding this database.

Enabling Google Cloud SQL Server SRV

At Scriptcase, we have the following drivers available for connection to Google Cloud MSSQL Server: **MSSQL Server NATIVE SRV, MSSQL Server NATIVE SRV PDO and MSSQL Server ODBC**. If you are using your own pre-configured environment, MSSQL Server extensions must be manually enabled in PHP. Google Cloud MSSQL Server SRV

Prerequisites

Before proceeding with this documentation, check your PHP architecture. For drivers to be enabled correctly, **files must be downloaded according to the architecture used**.

- In your Scriptcase, there is the file **info.php**, access it by the URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find the information regarding the architecture in [phpinfo\(\)](#).

NOTE: If you are using Scriptcase's automatic installer, the PHP architecture will be the same as the one you downloaded. **Download Microsoft ODBC Driver 13 For SQL Server according to your PHP architecture .**

- x86** Architecture = **32 bits**
- x64** Architecture = **64 bits**

File list

Listed below are the necessary files for the drivers to be enabled.

- [Download Microsoft ODBC Driver 13 For SQL Server x64](#)
- [Download Microsoft ODBC Driver 13 For SQL Server x86](#)
- [SQL Server extensions for PHP](#)

Compatibility Table

	Server 2016	Server 2012 /R2	Windows 10	Windows 8 / 8.1	Server 2008 SP2 / R2 SP1	Windows 7 SP1	Windows Vista SP2
Native SRV PDO	<input type="checkbox"/>						
Native SRV	<input type="checkbox"/>						
ODBC	<input type="checkbox"/>						

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(") instead of the brackets([]) because of the conflict with the of [Global Variables syntax](#) Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

Configuring and enabling Google Cloud SQL Server SRV on Windows

If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, requiring only the installation of the client. **Proceed to item 3**

1 - Extract the .zip file and copy the files from the **php_pdo_sqlsrv_81_nts_x64** and **php_sqlsrv_81_nts_x64** .dll extensions [previously](#) downloaded to your PHP's ext folder.

2 - In the php.ini file, located in C:\php, add the lines referring to the MSSQL Server extensions **php_pdo_sqlsrv_81_nts_x64** and **php_sqlsrv_81_nts_x64**. See the example below:

```
extension=pdo_sqlsrv_81_nts_x64
extension=sqlsrv_81_nts_x64
```

3 - After downloading the Microsoft ODBC Driver 13 For SQL Server file, run the installer and follow the steps below:

4 - Accept the terms of the license agreement and click Next.

5 - Check the option **“ODBC Driver for SQL Server SDK”**, because the components that we will need are also in this option.

- **In this option, leave the option “Client Components” checked.**

6 - Click Install to start the client installation.

7 - The program features you selected are being installed.

8 - Click finish to exit.

9 - Restart Apache service through **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the ApacheScriptcase9php81 or Apache2.4 service and right click on that service, then click **Reiniciar**.

Connection to Scriptcase

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(") instead of the brackets([]) because of the conflict with the of [Global Variables syntax](#) Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

Configuring and enabling Google Cloud SQL Server ODBC on Windows

If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, requiring only the installation of the client. **Proceed to item 3**

1 - Extract the .zip file and copy the files from the **php_pdo_sqlsrv_81_nts_x64** and **php_sqlsrv_81_nts_x64** .dll extensions [previously](#) downloaded to your PHP's ext folder.

2 - In the php.ini file, located in C:\php, add the lines referring to the MSSQL Server extensions **php_pdo_sqlsrv_81_nts_x64** and **php_sqlsrv_81_nts_x64**. See the example below:

```
extension=pdo_sqlsrv_81_nts_x64
extension=sqlsrv_81_nts_x64
```

3 - After downloading the Microsoft ODBC Driver 13 For SQL Server file, run the installer and follow the steps below:

4 - Accept the terms of the license agreement and click Next.

5 - Check the option **“ODBC Driver for SQL Server SDK”**, because the components that we will need are also in this option.

- **In this option, leave the option “Client Components” checked.**

6 - Click Install to start the client installation.

7 - The program features you selected are being installed.

8 - Click finish to exit.

9 - Restart Apache service through **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the ApacheScriptcase9php81 or Apache2.4 service and right click on that service, then click **Reiniciar**.

Connection Questions or Problems?

Contact our [support][link_support]{:target='_ blank'} in case of connection problems or questions regarding this database.

Connection with Google Cloud MSSQL

If you do not have the **MSSQL Server NATIVE SRV**, **MSSQL Server NATIVE SRV PDO** and **MSSQL Server ODBC** drivers enabled, check below our documentation on how to enable both in Scriptcase for connection.

- To enable the **MSSQL Server NATIVE SRV**: [click here](#)
- To enable the **MSSQL Server NATIVE SRV PDO**: [click here](#)

ATTENTION: If you don't have a Google Cloud database created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the Enabled Driver (**MSSQL Server NATIVE SRV** or **MSSQL Server NATIVE SRV PDO**) and the Google Cloud MSSQL Server database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the connection **Google Cloud**.

4 - And choose the **Google Cloud SQL Server** database.

Connection

Enter the parameters for connecting to your Amazon RDS MSSQL Server database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **SGDB Driver:** Select the MSSQL Server Driver to connect. In this example, we use the **MSSQL Server NATIVE SRV PDO** Driver.
- **SGDB server:** Enter the domain of the Google Cloud server where the database is installed.
- **EX:** banco-mssql.us-east-2.rds.amazonaws.com
- **Port:** Enter the port for connecting to the MSSQL Server. By default, the defined port is **1433**.
- **Database:** List and select the database you will connect to.
- **EX:** samples
- **User:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Security tab, where the connection encryption settings are defined.

- **Encrypt**

This property specifies whether communication with the SQL server should be encrypted. To enable encryption, you must set this property to “true”. This ensures that data sent between the client and server is protected by encryption.

- **trustservercertificate**

Set to “true” to specify that the driver does not validate the server’s TLS/SSL certificate.

If “true”, the server’s TLS/SSL certificate is automatically trusted when the communication layer is encrypted using TLS.

- **trustStore**

The path (including the file name) to the certificate’s trustStore file. The trustStore file contains the list of certificates that the client trusts.

When this property is not specified or is set to null, the driver relies on the trust manager factory query rules to determine which certificate store to use.

- **trustStorePassword**

The password used to verify the integrity of trustStore data.

If the trustStore property is set but the trustStorePassword property is not set, the integrity of the trustStore is not checked.

- **hostnameInCertificate**

The hostname to use to validate the SQL Server TLS/SSL certificate.

This property allows you to specify the expected hostname in the SQL server certificate. This is useful to ensure that the connection is only made to the correct server and not to a malicious server that may be using an invalid certificate.

Note: This property is used in combination with the **encrypt**/authentication properties and the **trustServerCertificate** property. This property affects certificate validation if the connection uses **TLS** encryption and **trustServerCertificate** is set to “false”. Ensure that the value passed to **hostnameInCertificate** matches the Common Name (CN) or DNS name in the Subject Alternative Name (SAN) in the server certificate for a **TLS** connection to be successful. For more information about encryption support, see Understanding encryption support.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**

System Tables: Selecting this option, the system tables of your database will be displayed.

- **System tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** Selecting this option, the procedures of your database will be displayed.

Filters

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **The user must be in capital letters as in the example above.**
- **View:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **utf8**.
 - **By default, the utf8 charset is set.**
- **Decimal Separator:** Select the separator type of the decimal records, between comma and period.
 - **By default, the point . is selected as a separator.**
- **Persistent Connection:** Define whether connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option.**

Connection Questions or Problems?

Contact our [support][link_support]{:target='_ blank'} in case of connection problems or questions regarding this database.

Connection to Amazon RDS MSSQL ODBC

If you do not have the **MSSQL Server ODBC** driver enabled, check below our documentation on how to enable this driver in Scriptcase for connection.

- To enable **MSSQL Server ODBC**: [click here](#)

ATTENTION: If you don't have a Google Cloud database created, check how to create it by clicking [here](#).

Creating the DSN for connection

To connect to the **MSSQL Server ODBC** Driver, you need to configure a System DSN. Follow the steps described below to perform this configuration.

ATTENTION: ODBC must be created on the same Server where ScriptCase is installed.

1 - Access your **ODBC Data Source Manager** and select according to your architecture. We will select the x64 version:

2 - When entering the ODBC Data Sources Administrator, select the **DSN System** tab and click on **Add** to create your connection to your Database.

3 - After that, it is necessary to select the Driver to connect to the MSSQL Server. Select the Driver: **ODBC Driver 11 for SQL Server**.

4 - Now, you need to define the name of the DSN, the description and the database connection server.

- **Name:** Enter the name that the DSN will have so that you can use it in Scriptcase.
- **Description:** Add a description for the DSN.
- **Server:** inform the server, port and database instance that you will connect to.

4.1 - After entering the data, click on the **Next** button to enter the user name and password required for connection.

- **Login ID:** Inform the user to authenticate with the database.
- **Password:** Enter the corresponding password to authenticate with the informed user.

4.2 - Now, click **Next** to select the default database.

To finish, click **Next** and finally, click **Finish**.

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the Enabled Driver (**MSSQL Server NATIVE SRV** or **MSSQL Server NATIVE SRV PDO**) and the Azure MSSQL Server database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection.

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Google Cloud** connection.

4 - And choose the **Google Cloud SQL Server** database.

Connection

Enter the parameters for connecting to your Azure MSSQL Server database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **SGDB Driver:** Select the MSSQL Server Driver to connect. In this example, we use the **MSSQL Server ODBC** Driver.
- **SGDB server:** Enter the DNS configured in your environment.
- **EX:** mssql
- **Port:** Enter the port to connect to the MSSQL Server. By default, the port defined is **1433**.
- **Database:** List and select the database you will connect to.
- **EX:** samples
- **User:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Security tab, where the connection encryption settings are defined.

- **Encrypt**

This property specifies whether communication with the SQL server should be encrypted. To enable encryption, you must set this property to "true". This ensures that data sent between the client and server is protected by encryption.

- **trustservercertificate**

Set to "true" to specify that the driver does not validate the server's TLS/SSL certificate.

If "true", the server's TLS/SSL certificate is automatically trusted when the communication layer is encrypted using TLS.

- **trustStore**

The path (including the file name) to the certificate's trustStore file. The trustStore file contains the list of certificates that the client trusts.

When this property is not specified or is set to null, the driver relies on the trust manager factory query rules to determine which certificate store to use.

- **trustStorePassword**

The password used to verify the integrity of trustStore data.

If the trustStore property is set but the trustStorePassword property is not set, the integrity of the trustStore is not checked.

- **hostnameInCertificate**

The hostname to use to validate the SQL Server TLS/SSL certificate.

This property allows you to specify the expected hostname in the SQL server certificate. This is useful to ensure that the connection is only made to the correct server and not to a malicious server that may be using an invalid certificate.

Note: This property is used in combination with the **encrypt**/authentication properties and the **trustServerCertificate** property. This property affects certificate validation if the connection uses **TLS** encryption and **trustServerCertificate** is set to "false". Ensure that the value passed to **hostnameInCertificate** matches the Common Name (CN) or DNS name in the Subject Alternative Name (SAN) in the server certificate for a **TLS** connection to be successful. For more information about encryption support, see Understanding encryption support.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Connection Questions or Problems?

Contact our [\[support\]](#)[\[link_support\]{:target='_ blank'}](#) in case of connection problems or questions regarding this database.

Enabling Google Cloud PDO DBLIB

In Scriptcase installed on Linux, we have the following driver available for connection to MSSQL Server: **PDO DBLIB**. If you are using your own pre-configured environment, MSSQL Server extensions must be enabled manually in PHP.

Configuring and enabling Google Cloud PDO DBLIB on Linux

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - On your linux terminal, you only need to run one line to install the PDO DBLIB extension. See below how to proceed.

```
sudo apt-get install php8.1-pdo-dblib
```

- If you are unable to execute the above command because you cannot find packages, install the repository below and update.

```
sudo add-apt-repository ppa:ondrej/php  
sudo apt-get update
```

2 - Restart the Apache service via the terminal.

```
sudo service apache2 restart
```

Connection Questions or Problems?

Contact our [support](#) in case of connection problems or questions regarding this database.

Enabling Google Cloud MariaDB PDO

In Scriptcase, we have the following driver available for connection to MariaDB: **MariaDB PDO**. If you are using your own pre-configured environment, MariaDB extension must be manually enabled in PHP.

Configuring and enabling MariaDB on Windows

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - In the php.ini file, located in C:\php, look for a line referring to MariaDB extension: **pdo_mysql** and remove the ; from the beginning of the line for the extension to be used by PHP. See the example below:

```
extension=pdo_mysql
```

2 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the ApacheScriptcase9php81 or Apache2.4 service and right click on this service, then **Restart**.

Connection to Scriptcase

Check below which Driver you want to connect with.

- **MariaDB PDO:** [Click here](#)

Connection with Google Cloud MariaDB

If you do not have the **MariaDB PDO** driver enabled, check below our documentation on how to enable in Scriptcase for connection.

- To enable the **MariaDB PDO**: [Click Here](#)

Warning: If you don't have a Google Cloud database created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver (**MariaDB PDO**) and the Google Cloud MariaDB database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the connection **Google Cloud**.

4 - And choose the database **Google Cloud MariaDB**.

Connection

Enter the parameters for connecting to your Google Cloud MariaDB database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **SGDB Driver:** Select the MariaDB Driver for connection. In this example, we use the **MariaDB PDO** Driver.
- **SGDB server:** Enter the IP or domain of the Google Cloud server where the database is installed.
- **EX:** dominioserver.com OU 192.168.254.178
- **Port:** Enter the port for connection. By default, the defined port is **3306**.
- **Database:** List and select the database you will connect to.
- **EX:** samples
- **User:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Accessing this tab, you can configure all the security of your Google Cloud MariaDB database.

- **Use SSL:** Choose whether the SSL protocol will be active on the connection.
 - **By default, Scriptcase disables this option.**

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Enabling Google Cloud MariaDB PDO

At Scriptcase, we have the following driver available for connection to MariaDB: **MariaDB PDO**. If you are using your own pre-configured environment, MariaDB extension must be manually enabled in PHP.

Configuring and enabling Google Cloud MariaDB PDO on Linux

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

1 - On your linux terminal, you only need to run one line to install MariaDB extensions. See below for how to proceed.

```
sudo apt-get install php8.1-mysql
```

- If you are unable to execute the above command because you cannot find packages, install the repository below and update.

```
sudo add-apt-repository ppa:ondrej/php
```

```
sudo apt-get update
```

2 - Restart the Apache service via the terminal.

```
sudo service apache2 restart
```

Connection to Scriptcase

- **MariaDB PDO:** [Click Here](#)

Connection with Google Cloud MariaDB

If you do not have the **MariaDB PDO** driver enabled, check below our documentation on how to enable both in Scriptcase for connection.

- To enable the **MariaDB PDO**: [Click Here](#)

CAUTION: If you don't have a Google Cloud database created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver (**MariaDB PDO**) and the Google Cloud MariaDB database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the connection **Google Cloud**.

4 - And choose the database **Google Cloud MariaDB**.

Connection

Enter the parameters for connecting to your Google Cloud MariaDB database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **SGDB Driver:** Select the MariaDB Driver for connection. In this example, we use the **MariaDB PDO** Driver.
- **SGDB server:** Enter the IP or domain of the Google Cloud server where the database is installed.
- **EX:** dominioserver.com OU 192.168.254.178
- **Port:** Enter the port for connection. By default, the defined port is **3306**.
- **Database:** List and select the database you will connect to.
- **EX:** samples
- **User:** Inform the user to authenticate the connection to your database.
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Security

Accessing this tab, you can configure all the security of your Google Cloud MariaDB database.

- **Use SSL:** Choose whether the SSL protocol will be active on the connection.
 - **By default, Scriptcase disables this option.**

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** Selecting this option, the procedures of your database will be displayed.

Filters

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **The user must be in capital letters as in the example above.**
- **View:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **utf8**.
 - **By default, the utf8 charset is set.**
- **Decimal Separator:** Select the separator type of the decimal records, between comma and period.

- **By default, the point . is selected as a separator.**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before the table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**

Enabling Google Cloud MariaDB PDO

In Scriptcase, we have the following driver available for connection to MariaDB: **MariaDB PDO**. If you are using your own pre-configured environment, MariaDB extension must be manually enabled in PHP.

Configuring and enabling MariaDB on macOS

If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

If you have PHP 8.1 installed through our documentation using homebrew, or **MariaDB**, PHP is not enabled, it is only necessary to connect. Check our documentation below for installing PHP 8.1 with homebrew on macOS.

 - **By default, Scriptcase enables this option.**

Oracle Cloud in Scriptcase

In Scriptcase, the **Oracle** database and its drivers are available for connection to Oracle Cloud. You must choose the most suitable driver for your environment and need.

If you do not have an Oracle Cloud database created from the ones available in Scriptcase, check below how to create a database:

- **Oracle Cloud database creation:** [Click here](#)

You can check your enabled drivers by accessing your diagnosis. See below on how to locate your diagnosis and check if the driver is enabled.

- Accessing the top menu **Help > Diagnosis**, you can easily find it through the interface.

- Or, by accessing your browser url:

`127.0.0.1:8092/scriptcase/diagnosis.php` or `dominio.com/scriptcase/diagnosis.php`

Check below how to enable each database in Scriptcase according to your operating system:

Oracle

- **Windows:** [Click here](#)
- **Linux:** [Click here](#)
- **macOS:** [Click here](#)

Enabling Oracle Cloud 8.0.5 or Higher

At Scriptcase, we have the following drivers available for connection to Oracle: **Oracle 8.0.5 or Higher, Oracle PDO, Oracle ODBC and Oracle 8** . If you are using your own pre-configured environment, Oracle extensions must be enabled manually in PHP.

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

Prerequisites

Before proceeding with this documentation, check your PHP architecture. For drivers to be enabled correctly, **files must be downloaded according to the architecture used.**

- In your Scriptcase, there is the file **info.php**, access it by the URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find the information regarding the architecture in [phpinfo\(\)](#).

NOTE: If you are using Scriptcase's automatic installer, the PHP architecture will be the same as the one you downloaded. **Download the Oracle instant client according to your PHP architecture.**

- Architecture **x86 = 32 bits**
- Architecture **x64 = 64 bits**

Below are listed the files required for Oracle drivers to be enabled. If you installed Scriptcase using the installer, it is not necessary to download **Microsoft Visual C ++ 2017** . For manual installations, **you must download and install both versions of Microsoft Visual C ++ 2017** .

Required files:

x64

- Oracle Instant Client **19.6.0.0(x64)**: [Click here](#)
- Microsoft Visual C++ **2017(x64)**: [Click here](#)

x86

- Oracle Instant Client **19.6.0.0(x86)**: [Click here](#)
- Microsoft Visual C++ **2017(x86)**: [Click here](#)

IMPORTANT: PHP 7.3 is compatible with **Oracle Instant Client 11 or higher**.
To download Oracle Instant Client lower than version **19**, you must have an [Oracle Account](#).

Other Files

- Oracle Instant Client **18.5.0.0 or Lower**: [Click here](#)

Compatibility Table

Driver	Oracle database version
Oracle 8.0.5 or Higher	
Instant Client	Oracle database version
19.6.0.0	

ATTENTION: To use the Oracle 11g **_Release 1 (11.1)** bank, you must use the **11.1 or 11.2** instant client.

Configuring and enabling Oracle Cloud 8.0.5 on Windows

The automatic installation of Scriptcase comes with pre-configured Oracle drivers, with only **instant_client** to be configured to make the connection. Follow the steps outlined below to enable the connection drivers.

1 - Extract the [previously](#) downloaded Instant Client Basic package to your computer's root.

EX: C:\instantclient_19_6

2 - Paste in Scriptcase's **PHP** folder C:\Program Files\NetMake\v9-php73\components\php the DLLs listed below:

- **oci.dll**
- **oraociei19.dll**
- **oraons.dll**

3 - Add the full path to the instant client in the **Path** parameter of the Environment Variables. Follow the steps below to perform this procedure:

- Go to Control Panel > System > **Advanced system settings**

- Click on the **Advanced > Environment Variables tab** .

- Under **System variables**, select the **Path** item and click **Edit**.

- Click on the **New** button and add the path to the instant client as shown below:

4 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the ApacheScriptcase9php73 service and right click on this service, then **Restart**.

Connection to Scriptcase

- **Oracle 8.0.5 or Higher:** [Click Here](#)

Enabling Oracle Cloud PDO

At Scriptcase, we have the following drivers available for connection to Oracle: **Oracle 8.0.5 or Higher, Oracle PDO, Oracle ODBC and Oracle 8** . If you are using your own pre-configured environment, Oracle extensions must be enabled manually in PHP.

IMPORTANT: If you are using Scriptcase's automatic installer, **the extensions are already enabled in PHP**, ready for connection. **The procedure below is only for manual installations of Scriptcase.**

Prerequisites

Before proceeding with this documentation, check your PHP architecture. For drivers to be enabled correctly, **files must be downloaded according to the architecture used.**

- In your Scriptcase, there is the file **info.php**, access it by the URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find the information regarding the architecture in [phpinfo\(\)](#).

NOTE: If you are using Scriptcase's automatic installer, the PHP architecture will be the same as the one you downloaded. **Download the Oracle instant client according to your PHP architecture.**

- Architecture **x86 = 32 bits**
- Architecture **x64 = 64 bits**

Below are listed the files required for Oracle drivers to be enabled. If you installed Scriptcase using the installer, it is not necessary to download **Microsoft Visual C ++ 2017** . For manual installations, **you must download and install both versions of Microsoft Visual C ++ 2017** .

Required files:

x64

- Click on the **New** button and add the path to the instant client as shown below:

4 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Look for the ApacheScriptcase9php73 service and right click on this service, then **Restart**.

Connection to Scriptcase

- **Oracle 8:** [Click Here](#)

Connection to Oracle Cloud

If you do not have the **Oracle 8.0.5 or Higher, Oracle PDO, and Oracle 8.** drivers enabled, check our documentation below on how to enable both in Scriptcase for connection.

- To enable the **Oracle 8.0.5 or Higher**: [Click here](#)
- To enable the **Oracle PDO**: [Click here](#)
- To enable the **Oracle 8**: [Click here](#)

CAUTION: If you do not have an Oracle Cloud database created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver and the Oracle database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Oracle Cloud** connection.

Connection

Enter the parameters for connecting to your Oracle Cloud database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver to connect. In this example, we use the **Oracle PDO** Driver.
- **Database Name:** Enter the IP or domain of the server where the database is installed together with the **Service Name (Endpoint)** which is right after the IP in the image below. **EX:**
192.168.254.189/DB.oracle.com

Check which endpoint to use for the connection:

- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above.**
- **View:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **Decimal Separator:** Select the separator type of the decimal records, between comma and period.
 - **By default, the . dot is selected as a separator.**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option .**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **EX:**

Connection to Oracle Cloud ODBC

If you do not have the **Oracle ODBC** driver enabled, check our documentation below on how to enable it in Scriptcase for connection.

- To enable the **Oracle ODBC**: [Click here](#)

CAUTION: If you do not have an Oracle Cloud database created, check how to create it by clicking [here](#).

Creating a System ODBC Data Source

Check below the entire step by step to create an ODBC data source to connect to Scriptcase.

NOTE: ODBC must be created on the same server where ScriptCase is installed.

1 - Access your **ODBC Data Source Manager** and select according to your architecture. We will select the **x64** version:

2 - When entering the ODBC Data Sources Administrator, select the **DSN System** tab and click on **Add** to create your connection to your Oracle Database.

3 - After that, it is necessary to select the Driver to connect to Oracle. Select Driver: **Oracle in instantclient_19_6**

4 - Now, enter the connection parameters as in the example below:

- **Data Source Name:** Define here the name of the ODBC object that will be used when connecting to Scriptcase.
- **Description:** Write a definition for the Data Source, what is the purpose for example.
- **TNS Service Name:** It is the item is right after the IP on your Oracle Cloud console, as in the image below. **EX:** 192.168.254.189/DB.oracle.com

Check which endpoint to use for the connection:

- **User ID:** Inform the user that will be used in the connection for authentication.

5 - Test the connection to check that all parameters have been filled in correctly.

You will be asked to enter the password for connection.

6 - Click **OK** to complete this process.

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver and the Oracle database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Oracle Cloud** connection.

Connection

Enter the parameters for connecting to your Oracle Cloud database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver to connect. In this example, we use the **Oracle PDO** Driver.
- **Database Name:** Enter the Data Source Name created.
 - **EX:** oracle
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above.**
- **View:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

- **Decimal Separator:** Select the separator type of the decimal records, between comma and period.
 - **By default, the . dot is selected as a separator.**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option .**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **EX:**

Drive	Oracle Database Version	Oracle database version	Instant Client
19.6.0.0	9i	10g	11g R1
			11g R2(11.2)
			12c
			18c
			19c

It is necessary to enable the Oracle extension in PHP and configure **Instant_Client** to make the connection. Follow the steps described below to enable the connection drivers.

1 - Install the packages below:

UBUNTU\DEBIAN

```
sudo apt-get update
sudo apt-get install libaio1
sudo apt-get install libncurses5
sudo apt-get install alien
sudo apt-get install gcc-multilib g++-multilib
sudo apt-get install libpam0g
sudo apt-get install unixodbc-dev unixodbc
```

CENTOS\RHEL

```
sudo yum update
sudo yum install libaio-devel
sudo yum install libaio
sudo yum install glibc
sudo yum install compat-libstdc++-33
sudo yum install glibc-devel
sudo yum install libstdc++
sudo yum install libstdc++
sudo yum install pam
sudo yum install ncurses-devel
sudo yum install unixODBC
```

2 - Convert and install the [previously downloaded](#) **Instant Client Basic** packages on your Linux system:

UBUNTU\DEBIAN

```
sudo alien oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
sudo alien oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo dpkg -i oracle-instantclient12.1-basic_12.1.0.2.0-2_amd64.deb
sudo dpkg -i oracle-instantclient12.1-devel_12.1.0.2.0-2_amd64.deb
```

CENTOS\RHEL

```
sudo yum install oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo yum install oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
```

3 - Copy the [previously downloaded](#) **oci8.so** extension to the PHP extensions directory:

E.g. `sudo cp oci8.so /usr/lib/php/20180731`

Access the **info.php** file and search for the **extension_dir** line. It will tell you the exact path to the directory responsible for PHP extensions.

4 - Edit the **php.ini** file and declare the Oracle extension at the end of the file.

UBUNTU\DEBIAN CENTOS\RHEL

`/etc/php/8.1/apache2/php.ini` `/etc/php.ini`

E.g. `extension=oci8.so`

5 - Edit the environment variable file and declare the variable responsible for identifying the Oracle library:

Enter the variable **LD_LIBRARY_PATH** and the path to the library in the file responsible for your system's environment variables. Check the path below according to your operating system:

WARNING: The path to the library may depend on your installation, by default the path is this:
`/usr/lib/oracle/12.1/client64/lib/.`

UBUNTU\DEBIAN

```
sudo nano
/etc/apache2/envvars
```

CENTOS\RHEL

```
sudo nano
/etc/sysconfig/httpd
```

- Add this variable at the end of the file with the following syntax:

```
export LD_LIBRARY_PATH=/usr/lib/oracle/12.1/client64/lib/
```

E.g.

NOTE: If you are using CentOS/RHEL, it is not necessary to use 'export' before the variable.

6 - Restart the Scriptcase apache service for the changes to take effect. Use the commands below according to your operating system.

UBUNTU\DEBIAN**CENTOS\RHEL**

```
sudo service apache2 restart sudo systemctl restart httpd
```

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle 8.0.5 or Higher** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed along with **Service Name**.
 - **E.g.** serverdomain.com/XE Or 192.168.254.170/XE
 - For more information about Oracle's **Service Name**, [click here](#).
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
 - **By default, this option is left blank by Scriptcase.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.

- **By default, Scriptcase enables this option.**
- **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Enabling Oracle Cloud PDO

In Scriptcase, we have the following drivers available for connections with Oracle: **Oracle PDO, Oracle 8.0.5 or Higher, Oracle ODBC and Oracle 8**. If you are using your own pre-configured environment, Oracle extensions must be manually enabled in PHP.

IMPORTANT: If you are using the automatic installer, **the extensions are already configured in PHP**, ready to connect if you have enabled them in the installation process. If you have not enabled them, see below how to enable them.

Configuring Oracle Cloud PDO on Linux (Automatic installation)

The automatic installation of Scriptcase already comes with the Oracle drivers pre-configured, with only the **instant_client** to be configured to make the connection. Follow the steps described below to enable connection drivers.

1 - Download the Oracle Instant Client **12.1.0.2** by [clicking here](#).

2 - After downloading, extract the file and copy the folder **instantclient** into the directory: **/opt/Scriptcase/v9-php81/components/drivers/**

3 - Restart the Apache

```
sudo service apachesc9php81 restart
```

Configuring Oracle Cloud PDO on Linux (Manual installation)

Oracle PDO Driver Compatibility Table

Drive	Oracle Database Version	10g	11g R1	11g R2(11.2)	12c	18c	19c
Oracle PDO	9i <input type="text"/>	<input type="text"/>					
Instant Client	Oracle database version						

Drive	Oracle Database Version	10g	11g R1	11g R2(11.2)	12c	18c	19c
19.6.0.0	9i <input type="text"/>	<input type="text"/>					

It is necessary to enable the Oracle extension in PHP and configure **Instant_Client** to make the connection. Follow the steps described below to enable the connection drivers.

1 - Install the packages below:

UBUNTU\DEBIAN

```
sudo apt-get update
sudo apt-get install libaio1
sudo apt-get install libncurses5
sudo apt-get install alien
sudo apt-get install gcc-multilib g++-multilib
sudo apt-get install libpam0g
sudo apt-get install unixodbc-dev unixodbc
```

CENTOS\RHEL

```
sudo yum update
sudo yum install libaio-devel
sudo yum install libaio
sudo yum install glibc
sudo yum install compat-libstdc++-33
sudo yum install glibc-devel
sudo yum install libstdc++
sudo yum install libstdc++
sudo yum install pam
sudo yum install ncurses-devel
sudo yum install unixODBC
```

2 - Convert and install the [previously downloaded](#) **Instant Client Basic** packages on your Linux system:

UBUNTU\DEBIAN

```
sudo alien oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
sudo alien oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo dpkg -i oracle-instantclient12.1-basic_12.1.0.2.0-2_amd64.deb
sudo dpkg -i oracle-instantclient12.1-devel_12.1.0.2.0-2_amd64.deb
```

CENTOS\RHEL

```
sudo yum install oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo yum install oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
```

3 - Copy the [previously downloaded](#) **oci8.so** extension to the PHP extensions directory:

E.g. `sudo cp oci8.so /usr/lib/php/20180731`

Access the **info.php** file and search for the **extension_dir** line. It will tell you the exact path to the directory responsible for PHP extensions.

4 - Edit the **php.ini** file and declare the Oracle extension at the end of the file.

UBUNTU\DEBIAN CENTOS\RHEL

```
/etc/php/8.1/apache2/php.ini    /etc/php.ini
```

E.g. `extension=oci8.so`

5 - Edit the environment variable file and declare the variable responsible for identifying the Oracle library:

Enter the variable **LD_LIBRARY_PATH** and the path to the library in the file responsible for your system's environment variables. Check the path below according to your operating system:

WARNING: The path to the library may depend on your installation, by default the path is this:
`/usr/lib/oracle/12.1/client64/lib/.`

UBUNTU\DEBIAN

CENTOS\RHEL

UBUNTU\DEBIAN

```
sudo nano
/etc/apache2/envvars
```

CENTOS\RHEL

```
sudo nano
/etc/sysconfig/httpd
```

- Add this variable at the end of the file with the following syntax:

```
export LD_LIBRARY_PATH=/usr/lib/oracle/12.1/client64/lib/
```

E.g.

NOTE: If you are using CentOS/RHEL, it is not necessary to use 'export' before the variable.

6 - Restart the Scriptcase apache service for the changes to take effect. Use the commands below according to your operating system.

UBUNTU\DEBIAN**CENTOS\RHEL**

```
sudo service apache2 restart sudo systemctl restart httpd
```

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed along with **Service Name**.
 - **E.g.** serverdomain.com/XE OR 192.168.254.170/XE
 - For more information about Oracle's **Service Name**, [click here](#).
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the

parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

 - **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Drive	Oracle Database Version	Instant Client	Oracle database version											
19.6.0.0	9i	<input type="text"/>	10g	<input type="text"/>	11g R1	<input type="text"/>	11g R2(11.2)	<input type="text"/>	12c	<input type="text"/>	18c	<input type="text"/>	19c	<input type="text"/>

Configuring Oracle Cloud ODBC on Linux

It is necessary to enable the Oracle extension in PHP and configure **instant_client** to make the connection. Follow the steps outlined below to enable the connection drivers.

1 - Install the packages below:

UBUNTU\DEBIAN

```
sudo apt-get update
sudo apt-get install libaio1
sudo apt-get install libncurses5
sudo apt-get install alien
sudo apt-get install gcc-multilib g++-multilib
sudo apt-get install libpam0g
sudo apt-get install unixodbc-dev unixodbc
```

CENTOS\RHEL

```
sudo yum update
sudo yum install libaio-devel
sudo yum install libaio
sudo yum install glibc
sudo yum install compat-libstdc++-33
sudo yum install glibc-devel
sudo yum install libstdc++
sudo yum install libstdc++
sudo yum install pam
sudo yum install ncurses-devel
sudo yum install unixODBC
```

2 - Convert and install the [previously](#) downloaded **Instant Client Basic** packages on your Linux system:

UBUNTU\DEBIAN

```
sudo alien oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
sudo alien oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo dpkg -i oracle-instantclient12.1-basic_12.1.0.2.0-2_amd64.deb
sudo dpkg -i oracle-instantclient12.1-devel_12.1.0.2.0-2_amd64.deb
```

CENTOS\RHEL

```
sudo yum install oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo yum install oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
```

3 - Copy the **oci8.so** extension to the PHP extensions directory:

EX: `sudo cp oci8.so /usr/lib/php/20180731`

Access the **info.php** file and look for the **extension_dir** line. It will tell you the exact path to the directory responsible for PHP extensions.

4 - Edit the **php.ini** file and declare the Oracle extension at the end of the file.

UBUNTU\DEBIAN CENTOS\RHEL

`/etc/php/8.1/apache2/php.ini` `/etc/php.ini`

EX: `extension=oci8.so`

5 - Edit the environment variable file and declare the variable responsible for identifying the Oracle library:

Enter the variable **LD_LIBRARY_PATH** and the path to the library in the file responsible for your system's environment variables. Check the path below according to your operating system:

WARNING: The path to the library may depend on your installation, by default the path is this:
`/usr/lib/oracle/12.1/client64/lib/`.

UBUNTU\DEBIAN

```
sudo nano  
/etc/apache2/envvars
```

CENTOS\RHEL

```
sudo nano  
/etc/sysconfig/httpd
```

- Add this variable at the end of the file with the following syntax:

```
export LD_LIBRARY_PATH=/usr/lib/oracle/12.1/client64/lib/
```

E.g.

NOTE: If you are using CentOS/RHEL, it is not necessary to use 'export' before the variable.

6 - Restart the Scriptcase apache service for the changes to take effect. Use the commands below according to your operating system.

UBUNTU\DEBIAN**CENTOS\RHEL**

```
sudo service apache2 restart sudo systemctl restart httpd
```

Connection to Scriptcase

- **Oracle ODBC:** [Click here](#)

Drive	Oracle Database Version	Oracle database version	Instant Client
19.6.0.0	9i	10g	11g R1
			11g R2(11.2)
			12c
			18c
			19c

It is necessary to enable the Oracle extension in PHP and configure **Instant_Client** to make the connection. Follow the steps described below to enable the connection drivers.

1 - Install the packages below:

UBUNTU\DEBIAN

```
sudo apt-get update
sudo apt-get install libaio1
sudo apt-get install libncurses5
sudo apt-get install alien
sudo apt-get install gcc-multilib g++-multilib
sudo apt-get install libpam0g
sudo apt-get install unixodbc-dev unixodbc
```

CENTOS\RHEL

```
sudo yum update
sudo yum install libaio-devel
sudo yum install libaio
sudo yum install glibc
sudo yum install compat-libstdc++-33
sudo yum install glibc-devel
sudo yum install libstdc++
sudo yum install libstdc++
sudo yum install pam
sudo yum install ncurses-devel
sudo yum install unixODBC
```

2 - Convert and install the [previously downloaded](#) **Instant Client Basic** packages on your Linux system:

UBUNTU\DEBIAN

```
sudo alien oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
sudo alien oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo dpkg -i oracle-instantclient12.1-basic_12.1.0.2.0-2_amd64.deb
sudo dpkg -i oracle-instantclient12.1-devel_12.1.0.2.0-2_amd64.deb
```

CENTOS\RHEL

```
sudo yum install oracle-instantclient12.1-basic-12.1.0.2.0-1.x86_64.rpm
sudo yum install oracle-instantclient12.1-devel-12.1.0.2.0-1.x86_64.rpm
```

3 - Copy the [previously downloaded](#) **oci8.so** extension to the PHP extensions directory:

E.g. `sudo cp oci8.so /usr/lib/php/20180731`

Access the **info.php** file and search for the **extension_dir** line. It will tell you the exact path to the directory responsible for PHP extensions.

4 - Edit the **php.ini** file and declare the Oracle extension at the end of the file.

UBUNTU\DEBIAN CENTOS\RHEL

`/etc/php/8.1/apache2/php.ini` `/etc/php.ini`

E.g. `extension=oci8.so`

5 - Edit the environment variable file and declare the variable responsible for identifying the Oracle library:

Enter the variable **LD_LIBRARY_PATH** and the path to the library in the file responsible for your system's environment variables. Check the path below according to your operating system:

WARNING: The path to the library may depend on your installation, by default the path is this:
`/usr/lib/oracle/12.1/client64/lib/.`

UBUNTU\DEBIAN

```
sudo nano
/etc/apache2/envvars
```

CENTOS\RHEL

```
sudo nano
/etc/sysconfig/httpd
```

- Add this variable at the end of the file with the following syntax:

```
export LD_LIBRARY_PATH=/usr/lib/oracle/12.1/client64/lib/
```

E.g.

NOTE: If you are using CentOS/RHEL, it is not necessary to use 'export' before the variable.

6 - Restart the Scriptcase apache service for the changes to take effect. Use the commands below according to your operating system.

UBUNTU\DEBIAN**CENTOS\RHEL**

```
sudo service apache2 restart sudo systemctl restart httpd
```

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project, using the [previously](#) enabled Driver and the Oracle database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **Oracle** connection.

Connection

Enter the parameters for connecting to your Oracle database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver used to connect. In this example, we use the **Oracle 8** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed along with **Service Name**.
 - **E.g.** serverdomain.com/XE OR 192.168.254.170/XE
 - For more information about Oracle's **Service Name**, [click here](#).
- **Schema:** Inform the Scheme of specific tables created for the use of the informed user.
 - **This item is optional if you do not have a schema configured in your database.**
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
 - **By default, this option is left blank by Scriptcase.**
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.

- **By default, Scriptcase enables this option.**
- **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connection to Oracle Cloud

If you do not have the **Oracle 8.0.5 or Higher, Oracle PDO, and Oracle 8.** drivers enabled, check our documentation below on how to enable both in Scriptcase for connection.

- To enable the **Oracle 8.0.5 or Higher**: [Click here](#)
- To enable the **Oracle PDO**: [Click here](#)
- To enable the **Oracle 8**: [Click here](#)

CAUTION: If you do not have an Oracle Cloud database created, check how to create it by clicking [here](#).

Creating a connection to Scriptcase

See below how to create a connection in your Scriptcase project, using the enabled Driver and the Oracle database.

1 - Access a project from your Scriptcase.

2 - Click the **New Connection** icon to create a connection

or access the **Database > New connection** menu.

After that, a screen will appear with all database connections.

3 - Select the **Oracle Cloud** connection.

Connection

Enter the parameters for connecting to your Oracle Cloud database as follows:

- **Connection name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the Oracle Driver to connect. In this example, we use the **Oracle PDO** Driver.
- **Database Name:** Enter the server IP or domain where the database is installed along with **Service Name** or **Instance**.
 - **EX:** 192.168.254.189/DB.oracle.com
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Enabling Oracle Cloud 8.0.5 or Higher

At Scriptcase, we have the following drivers available for connection to Oracle: **Oracle 8.0.5 or Above, Oracle PDO, Oracle ODBC and Oracle 8** . If you are using your own pre-configured environment, Oracle extensions must be enabled manually in PHP.

Prerequisites

Before proceeding at this documentation, check your PHP architecture. For drivers to be enabled correctly, **the files must be downloaded according to the architecture used.**

- In your Scriptcase, there is the file **info.php**, access it by URL: <http://127.0.0.1:8092/scriptcase/info.php>, where you will find information regarding architecture in the [phpinfo\(\)](#).

NOTE: Download the Oracle instant client according to your PHP architecture.

- Architecture **i386/i686 = 32 bits**
- Architecture **x86_64 = 64 bits**

Below are listed the files required for Oracle drivers to be enabled.

Required files:

- Extension **oci8.so**: [Clique Aqui](#)

x86_64

- Oracle Instant Client **12.1.0.2(x86_64)**: [Clique Aqui](#)

IMPORTANT: The PHP 7.3 is compatible with **Oracle Instant Client 11.2 or Higher**. To download the Oracle Instant Client below the version **19.5.0.0**, it is necessary to have a [Oracle account](#).

Other Files

- Oracle Instant Client **12.2.0 or Higher**: [Click Here](#)

Compatibility Table

Drive	Versão do banco de dados Oracle	10g	11g R1	11g R2(11.2)	12c	18c	19c
Oracle PDO	9i <input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Instant Client	Versão de base de dados Oracle	10g	11g R1	11g R2(11.2)	12c	18c	19c
19.6.0.0	9i <input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

Configuring Oracle 8.0.5 or Higher on MacOs

It is necessary to enable the Oracle extension in PHP and configure **Instant_Client** to make the connection. Follow the steps described below to enable the connection drivers.

1 - On your Mac terminal, log in as **root** and create a folder with instant client numbering in `/usr/local/instantclient/12.1.0.2/`.

EX:

- `mkdir -p /usr/local/instantclient/12.1.0.2/`

2 - Extract all content from the **Instant Client** downloaded [previously](#) on your Mac system and copy to the folder created in the previous step:

EX:

- unzip oci_client_macosx_12.zip
- cp -avr __MACOSX/ oci_client_macosx_12/ /usr/local/instantclient/12.1.0.2/

3 - Copy the [previously downloaded oci8.so](#) extension to the PHP extensions directory:

ATENÇÃO: If you followed our [documentation](#) to install Scriptcase manually on macOS, the extension is already in the extensions directory. You can proceed to item **5**.

EX:

```
sudo cp oci8.so /usr/local/lib/php/pecl/20180731
```

Access the **info.php** file and search for the **extension_dir** line. It will tell you the exact path to the directory responsible for PHP extensions.

4 - Edit the **php.ini** file(/usr/local/etc/php/8.1/php.ini) and declare the Oracle extension at the end of the file.

EX:

```
extension=oci8.so
```

5 - Restart the apache service for the changes to be saved. Use the command below for this:

EX:

```
sudo apachectl restart
```

Connection to Scriptcase

 - **EX:** oracle
- **Username:** Inform the user to authenticate the connection to your Oracle database.
 - **For Oracle connections, the user must be capitalized, as in the example .**
- **Password:** Enter the password to complete the authentication process.
- **Test connection:** Click this button to get a response to the Scriptcase request to find out if the parameters entered are correct.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending on the owner or not.

Show

It allows the Oracle connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** Selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option .**
- **System Tables:** Selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX%% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **EX:**

- **Owner:** Inform the user who sees the tables informed for display.
 - **User must be capitalized as in the example above.**
- **View:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your Oracle database connection.

Advanced

In this tab, you have access to specific settings for the connection. The settings made in this session impact the data display and application performance.

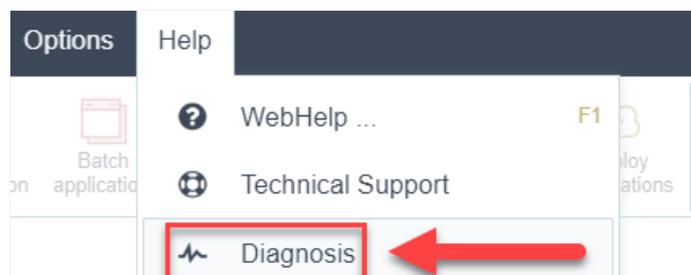

- **Decimal Separator:** Select the separator type of the decimal records, between comma and period.
 - **By default, the . dot is selected as a separator.**
- **Persistent Connection:** Define whether connections will be terminated after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option .**
- **Use the schema before the table name:** Define whether the database schema will be displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **EX:**

MariaDB with Scriptcase

In Scriptcase, we have one driver to connect with MariaDB. **If you are using your own pre-configured environment, MariaDB extensions must be manually enabled in PHP.**

You can check your enabled drivers by accessing your Scriptcase diagnosis. See below on how to locate your diagnosis and check if the driver is enabled.

- Accessing the top menu **Help > Diagnosis**, you can easily find it through the interface.

- Or, by accessing your browser url:

127.0.0.1:8092/scriptcase/diagnosis.php or domain.com/scriptcase/diagnosis.php

If the desired driver is already enabled and you just want to know how to connect with Scriptcase, click on the link below according to the driver that will be used.

Environment	MariaDB PDO
Windows	See how to connect
Linux	See how to connect
macOS	See how to connect

Connecting with MariaDB PDO

In Scriptcase, we have the following driver available for connection with MariaDB: **MariaDB PDO**. If you are using your own pre-configured environment, MariaDB extension must be manually enabled in PHP.

Prerequisites

If you are using a manual installation on Windows, you'll need to enable the MariaDB extension on **php.ini** file. Check below how to do it.

1 - In the `php.ini` file, located in `C:\php`, uncomment the line referring to the MariaDB extension **php_pdo_mysql** removing the `;` from the beginning of the line. See the example below:

2 - Restart the Apache service using the **Task Manager**.

- Open the Task Manager and click on the **Services** tab.
- Search for the `Apache2.4` or `ApacheScriptcase9php81` service and right click on this service, then **Restart**.

Creating a Connection in Scriptcase

See below how to create a connection in your Scriptcase project using the MariaDB database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **MariaDB** connection.

Connection

Enter the parameters for connecting to your MariaDB database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the MariaDB Driver used to connect. In this example, we use the **MariaDB PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
 - **E.g.** `serverdomain.com` OR `192.168.254.170`
- **Port:** Inform the number port for your database server.
- **Username:** Inform the user to authenticate the connection to your MariaDB database.
- **Password:** Enter the password to complete the authentication process.
- **Database Name:** Type your database name to connect with him. Or, if you want to choose one different database, click on the button **List Database** to show all databases available for your user.
 - **Create Database:** Clicking on this button, you will create a new MariaDB database for use.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the

parameters entered are correct.

Security

On this tab you can set your SSL encryption for your database connection. Check below how to do this.

Use SSL

Activates or deactivates the use of secure connections with MariaDB.

Client Key

Path to the client's private identification key in the format PEM.

Client Certificate

Path to the client's public certificate key.

CA Path

Path to the directory that contains the Certificate of Authority (CA) in the format PEM, if used, it should specify the same certificate used by the server.

CA Certificate

Path to the Certificate of Authority (AC) in the format PEM. This option, if used, should specify the same certificate as the server.

Specific Chipper

A list of permitted numbers to use with the cryptography of the connection. If one of the numbers is not supported, the SSL connection won't work.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

It allows the MariaDB connection to see tables, views, system tables and procedures depending on the items selected by the user. By default, the items **Tables** and **Views** are already selected by Scriptcase.

- **Tables:** By selecting this option, the tables in your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **Views:** By selecting this option, the views of your database will be displayed.
 - **By default, Scriptcase enables this option.**
- **System Tables:** By selecting this option, the system tables of your database will be displayed.
- **Procedures:** By selecting this option, the procedures of your database will be displayed.

Searches

Allows you to define which tables and owners are displayed.

- **Tables:** You can define in this option which tables will be displayed. The configuration can contain a PREFIX% or name of the tables to display.
 - **By default, Scriptcase leaves this option empty.**
 - **E.g.**

- **Owner:** Inform the user who sees the tables entered for display.
 - **The user must be in capital letters as in the example above.**
- **Show:** Choose whether tables for the informed owner are displayed.

NOTE: By using table filtering, you eliminate unnecessary tables for your project and **improves the performance** of your database connection.

Advanced

In this tab, you have access to specific settings for the connection. The changes made in this session impact the data display and application performance.

- **client_encoding:** Select the encoding used in your database. In the example above, we use the client_encoding **UTF-8**.
- **Decimal Separator:** Select the type of separator for decimal records, between comma and period.
 - **By default, the period . is selected as a separator.**
- **Persistent Connection:** Define whether the connections will be closed after the execution of your scripts in Scriptcase applications.
 - **By default, Scriptcase disables this option.**
- **Use the schema before table name:** Define whether the database schema is displayed before the table names.
 - **By default, Scriptcase enables this option.**
 - **E.g.**

Connecting with MariaDB PDO

In Scriptcase, we have the following driver available for connection with MariaDB: **MariaDB PDO**. If you are using your own pre-configured environment, MariaDB extension must be manually enabled in PHP.

Prerequisites

If you are using a manual installation on Linux, you'll need to install the MariaDB php extension. Check below how to do it.

1 - Access your **Linux** terminal and type this line below according to your OS to install MariaDB PDO driver.

Ubuntu

```
sudo apt-get install php8.1-mysql
```

CentOS

```
sudo yum install php-  
mysql
```

2 - Check if the MariaDB driver is enabled in your Scriptcase diagnosis. See below on how to locate your diagnosis and check if the driver is enabled.

- Accessing the top menu **Help > Diagnosis**, you can easily find it through the interface.

- Or, by accessing your Scriptcase installation path:

127.0.0.1/scriptcase/diagnosis.php OR domain.com/scriptcase/diagnosis.php

Creating a Connection with ScriptCase

See below how to create a connection in your Scriptcase project using the MariaDB database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **MariaDB** connection.

Connection

Enter the parameters for connecting to your MariaDB database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the MariaDB Driver used to connect. In this example, we use the **MariaDB PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
 - **E.g.** serverdomain.com OR 192.168.254.170
- **Port:** Inform the number port for your database server.
- **Username:** Inform the user to authenticate the connection to your MariaDB database.
- **Password:** Enter the password to complete the authentication process.

- **Database Name:** Type your database name to connect with him. Or, if you want to choose one different database, click on the button **List Database** to show all databases available for your user.
 - **Create Database:** Clicking on this button, you will create a new MariaDB database for use.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Security

On this tab you can set your SSL encryption for your database connection. Check below how to do this.

Use SSL

Activates or deactivates the use of secure connections with MariaDB.

Client Key

Path to the client's private identification key in the format PEM.

Client Certificate

Path to the client's public certificate key.

CA Path

Path to the directory that contains the Certificate of Authority (CA) in the format PEM, if used, it should specify the same certificate used by the server.

CA Certificate

Path to the Certificate of Authority (AC) in the format PEM. This option, if used, should specify the same certificate as the server.

Specific Chipper

A list of permitted numbers to use with the cryptography of the connection. If one of the numbers is not supported, the SSL connection won't work.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

 - **E.g.**

SSH

Here are the SSH options available in the image and their descriptions regarding database connection:

Use SSH

Enables or disables the SSH tunnel for database connection. When enabled, the database connection will be routed through the SSH server.

SSH Server

The IP address or hostname of the SSH server that will be used for tunneling. This is the machine that will act as a bridge to access the database securely.

SSH Port

The port used to connect to the SSH server.

SSH User

The username used to authenticate with the SSH server. This user must have permissions to establish an SSH connection.

Private cert. file

The private key file used for authentication if the SSH server requires key-based authentication instead of a password.

Local port for port forwarding

The local port on the client machine that will be used for forwarding database traffic through the SSH tunnel. This port acts as a bridge between the database client and the remote database.

Database server from SSH

The hostname or IP address of the database server as seen from the SSH server. This is necessary when the database is only accessible within the SSH server's network.

Database port from SSH

The port of the database server that will be accessed through the SSH tunnel. This should match the database service's listening port.

Connecting with MariaDB PDO

In Scriptcase, we have the following driver available for connections with MariaDB: **MariaDB PDO**. If you are using your own pre-configured environment, MariaDB extensions must be manually installed with PHP.

Prerequisites

If you are using a manual installation on MacOS, you'll need to install the PHP and the MariaDB driver will be enabled. Click [here](#) to see how to do it.

1 - Check if the MariaDB driver is enabled in your Scriptcase diagnosis. See below on how to locate your diagnosis and check if the driver is enabled.

- Accessing the top menu **Help > Diagnosis**, you can easily find it through the interface.

- Or, by accessing your Scriptcase installation path:

127.0.0.1/scriptcase/diagnosis.php OR domain.com/scriptcase/diagnosis.php

Creating a Connection with ScriptCase

See below how to create a connection in your Scriptcase project using the MariaDB database.

1 - Access any project from your Scriptcase.

2 - Click on the **New Connection** icon to create a connection.

or access the **Database > New Connection** menu tab.

After that, a new page will appear with all database connections.

3 - Select the **MariaDB** connection.

Connection

Enter the parameters for connecting to your MariaDB database as follows:

- **Connection Name:** Define the name of your new connection. By default, Scriptcase adds the prefix **conn** along with the database name.
- **DBMS Driver:** Select the MariaDB Driver used to connect. In this example, we use the **MariaDB PDO** Driver.
- **Server/Host (Name or IP):** Enter the IP or domain of the server where the database is installed.
 - **E.g.** serverdomain.com OR 192.168.254.170
- **Port:** Inform the number port for your database server.
- **Username:** Inform the user to authenticate the connection to your MariaDB database.
- **Password:** Enter the password to complete the authentication process.
- **Database Name:** Type your database name to connect with him. Or, if you want to choose one different database, click on the button **List Database** to show all databases availables for your user.
 - **Create Database:** Clicking on this button, you will create a new MariaDB database for use.
- **Test Connection:** Click on this button to get a response from the Scriptcase request to find out if the parameters entered are correct.

Security

On this tab you can set your SSL encryption for your database connection. Check below how to do this.

Use SSL

Activates or deactivates the use of secure connections with MariaDB.

Client Key

Path to the client's private identification key in the format PEM.

Client Certificate

Path to the client's public certificate key.

CA Path

Path to the directory that contains the Certificate of Authority (CA) in the format PEM, if used, it should specify the same certificate used by the server.

CA Certificate

Path to the Certificate of Authority (AC) in the format PEM. This option, if used, should specify the same certificate as the server.

Specific Chipper

A list of permitted numbers to use with the cryptography of the connection. If one of the numbers is not supported, the SSL connection won't work.

Filter

Accessing this tab, you can configure which Database items will be displayed on the connection, depending or not on the owner.

Show

Scriptcase Applications Overview

Scriptcase Applications

The Scriptcase offers a wide range of applications that allows the developer to create a complete system. The Scriptcase also allows the integration of the applications with external libraries, boosting its power in the systems development.

See below the available types of applications.

Grid

Application used to display data, this application serves as a report where we can do exports to PDF, XLS, XML, and other formats.

Procedure

Similar to the grid application, this application is available for few databases (MSSQL Server, Oracle and Db2) when selecting the connection, in case the user have a procedure that returns information it will be displayed in this special application.

Form

Application used to insert and update data, there are four different types of orientations.

Tabs

This application allows the creation of tabs where we can put up other applications like grids and forms.

Control

This application is used to create controls in a system, it is not linked to a table, and it needs the creation of one or more fields to its operation. A example of using is in the creation of a login screen.

Menu

It is used to create a hierarchical structure to navigate through the system's applications. There are two types of menu available in Scriptcase, Horizontal Menu and Tree Menu, that differs only in the preview of its items.

Responsive Menu

It is used to create a hierarchical structure to navigate through the system's applications.

Search

Application used to create search exclusively to forms.

Report PDF

Application used to generate reports using pre set formats, where we can position the data in the report.

Dashboard

Allows the developer to display applications inserted in widgets.

Blank

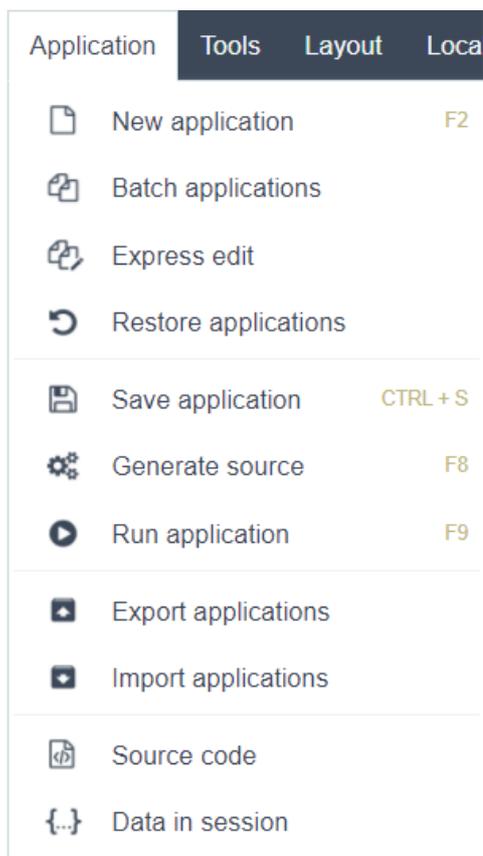

This application allows the insert of PHP code / HTML and displays the result of its processing. The advantage of using this application is the possibility of using macros and the native integrations with the other applications.

Calendar

Application where we can maintain an event schedule that can be synchronized to the google calendar.

Application Options Overview

The applications menu adds all features unique to applications like batch creation, express editing and application recovery.

Below is a brief explanation of each option.

New Application

Opens the application creation screen. Despite being extremely simple, each application has different options, to better untangle the creation of each of the applications, the articles were separated.

Below are the links to the documentation for creating each of the applications. **Click on the application you want to create**

- [Grid](#)
- [Chart](#)
- [Form](#)
- [Control](#)
- [Filter](#)
- [Menu](#)
- [Tree Menu](#)
- [Calendar](#)
- [Tabs](#)
- [Report PDF](#)
- [Dashboard](#)
- [Blank](#)
- [Procedure](#)

Create Batch application

Exclusive for creating Queries and Forms, it allows the creation of multiple applications with the editing link already configured.

[Click here for more details.](#)

Express Edition

Allows you to edit the project's applications simultaneously, allowing the definition of common values between them.

[Click here for more details.](#)

Restore Applications

This feature allows you to restore project applications that have undergone some recent change. Restore points are automatically set by the tool whenever a change is saved.

[Click here for more details.](#)

Save Applications

This option saves the application that is open in edit mode at the time of saving.

[Click here for more details.](#)

Generate Font

Generates the source code only for the application opened in editing mode.

[Click here for more details.](#)

Run Application

Saves and runs the application that is open in edit mode.

[Click here for more details.](#)

Export Applications

Export one or more applications from the project. In this type of export, all the files necessary for the selected applications to work are sent.

[Click here for more details.](#)

Import Applications

Allows you to import applications generated from the **Export Applications** option.

It is necessary that the export of the applications has been carried out in an equal or lower version for the project export to work. Thus, it is not possible to export an application from Scriptcase 9.7.002 and import an installation 9.7.001.

[Click here for more details.](#)

Source code

In this option it is possible to view the source code of the application that is open in editing mode.

For this feature to be available, the application's source code must have been previously generated.

[Click here for more details.](#)

Session data

In this option, you can see all the session variables available in the development environment, that is, it is the session tree stored by Scriptcase.

[Click here for more details.](#)

Batch Applications

Batch Applications

With this tool, it is possible to create multiple applications (Form and Grid).

When creating grids and forms using the same table, the applications are created with an application link between them, allowing to edit the record from the Grid application.

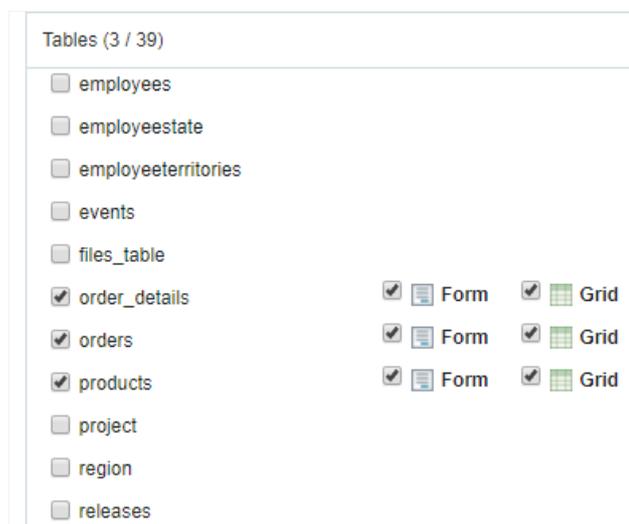

To start the process of creating the application, you need to select a connection so that the tables can be listed.

Applications Express creation

Connection

Next, you need to select the tables that are going to be used to create the applications. When selecting the tables, you can define which applications (Forms and Grids) are going to be created.

Tables (3 / 39)

<input type="checkbox"/> employees		
<input type="checkbox"/> employeestate		
<input type="checkbox"/> employeeterritories		
<input type="checkbox"/> events		
<input type="checkbox"/> files_table		
<input checked="" type="checkbox"/> order_details	<input checked="" type="checkbox"/> Form	<input checked="" type="checkbox"/> Grid
<input checked="" type="checkbox"/> orders	<input checked="" type="checkbox"/> Form	<input checked="" type="checkbox"/> Grid
<input checked="" type="checkbox"/> products	<input checked="" type="checkbox"/> Form	<input checked="" type="checkbox"/> Grid
<input type="checkbox"/> project		
<input type="checkbox"/> region		
<input type="checkbox"/> releases		

For last, you need to define the name, description and type, in case for the Forms.

Applications Description

Table: order_details (Form)	
Name	form_order_details_1
Description	

Table: order_details (Grid)	
Name	grid_order_details
Description	

Table: orders (Form)	
Name	form_orders_1
Description	

Table: orders (Grid)	
Name	grid_orders_1
Description	

Table: products (Form)	
Name	form_products
Description	

Table: products (Grid)	
Name	grid_products
Description	

Generate Source To edit

- **Name** - Name of the application that is going to be created.
- **Description** - Application Description.
- **Type** - This option is only available for Forms, defines the type of form that is going to be created (Single Record, Multiple Rows, Editable Grid and Editable Grid "View").
- **Generate Source** - Selecting this option all the applications to be created will have their source code generated.
- **To edit** - Selecting this option all the applications created will be open for modifications right after creation.

Express Edit

In this article, you learn how to edit various application at the same time. Using the Express Edit tool, you can define values for various common attributes for these applications. It is useful specially to add updates to your applications.

Only some settings are available within the Express Edit tool.

Select Application

Firstly, You need to inform which applications You want to edit.

Express Editing

All
 Select Applications

All

You edit all the applications in the project, with no exceptions.

Select Applications

All the applications existing in the project are listed so that you can select the applications that you want to edit.

Applications		
Visualization	<input checked="" type="radio"/> Per Type	<input type="radio"/> Per Folder

Properties

This page show all attributes enabled in the Express Edit, separated by categories.

These settings can be to apply to all applications simultaneously just select **Apply to all applications** or apply individually when selecting **Apply individually**.

If you use the **Apply individually** option, will be necessary to define to how many applications will be showed in the page. *Use 0 all application will be showed.*

Apply to all applications

This option allows applying the same configurations, to all the selected applications, automatically.

Apply individually

This option allows you to apply the modifications individually for each application selected. This option contains not only the previous attributes, but also three exclusive attributes.

Categories - Layout/Theme

Header Image

Define the image for the header of the applications.

SweetAlert

It allows using the alerts messages with SweetAlert components.

SweetAlert position using Toast

This option define the position that Sweet Alert message using Toast will be shown.

Theme

It applies the desired Theme (Only the ones included in the Project properties) to all the applications.

Button

Allows you to define a Button Theme for selected applications

Template

Change the Header and Footer template of the applications.

Table Width

Defines the width of the table according to the unit of measure selected in the **Table Unit** option

Value is applied when selecting pixel or percentage

Table Unit

Sets the unit of measure for the Table Width option:

- Pixel - Fixed width of the application with its minimum value limited by the options available in the application.
- Percentage - adaptable width according to defined screen percentage. It has the limitation of application items.
- Automatic - Automatically fits the screen.

Fixed columns

Allows the choice of grid columns that will be fixed in the left corner of the screen if there is horizontal scrolling.

Fixed column hover

Display pinned column icon only on field label cell hover. Hover works only when the application is running as desktop, if it is running mobile the icon will always be displayed.

Fixed options' column

Pin the options column icons displayed in the row of the record regardless of having fixed columns selected.

Fixed group by

Allows the information of a grid's group by line to be fixed on the screen when scrolling horizontally.

Header Title

Define a title to the application.

This option will be enabled if you use the Apply individually option.

Toolbar buttons

Defines how the toolbar buttons will open. If it will open in modal or in a DIV below the toolbar.

Categories - SQL

Distinguish uppercase/loYourcase

It allows the Scriptcase to distinguish the letters uppercase and loYourcase.

Debug Mode

Define if the application is run will be with the debug mode enable. This option allows showing all SQL statements the application is executing.

Connection

It applies the desired connection (Connections created in the "New Connection" module) for the applications.

Connection for fields

It applies the desired connection (Connections created in the "New Connection" module) for the fields in the applications.

Categories - Mobile

Enable mobile optimization

Enables mobile optimization for adapting to mobile devices.

Enable scroll up button

It enables the displaying of the button back to top button in the Grid, Filter, Detail and Summary modules.

Scroll up button position

Defines the position of the back to the top button:

The options are:

- **Right** - Position the button in the bottom right corner;
- **Left** - Position the button in the bottom left corner;

Simplified toolbar

Defines the display format of the application's bottom toolbar, alternating between simplified when the option is enabled and traditional when these options are disabled.

To define the buttons that should compose your application's toolbar on mobile, access the Toolbar menu, then the Mobile tab.

Pin bottom toolbar

Defines the behavior of the lower toolbar when running the application on mobile devices with the Simplified toolbar option disabled.

When enabling these options, the lower toolbar will behave similarly to the upper toolbar, remaining fixed on the screen and thus facilitating access to the configured resources.

Categories - Security

Use Security

Define the use of security on the applications of the project.

Enable CSRF

It enables "Cross-Site Request Forgery" protection. (This option only applies for the Control and Form applications)

HttpOnly

Defines the use or not of the resource.

This option tells the browser that cookies should only be accessed via the HTTP protocol, preventing its access to scripting languages such as Javascript.

Session ID

Determines that the session ID must be stored in cookies on the client side and cannot be passed through URLs.

Cookie Secure

Determines that cookies should only be transmitted over secure connections.

Disable XSS Auditor

Determines whether or not to use the XSS Auditor option

Strict-Transport-Security

Determines that the application's pages can only be accessed through the HTTPS protocol.

X-Frame-Options

Determines the rule for including the application in iframes.

- SAMEORIGIN - allows only pages on the same site to include your application in iframes.
- DENY does - not allow your applications to be opened in iframes.

X-Content-Type-Options

Determines that the MIME types of the requested files must be respected by the browser.

Referrer-Policy

Determines how much reference information should be included in requests.

Feature-Policy

Determines which resources can be loaded by the browser. Add the rule on the same line being separated by semicolon(;)

Example: Feature-Policy: unsized-media 'none'; geolocation 'self' https://example.com; camera *;

Content-Security-Policy

Determines the behavior of certain browser APIs and functionality. Add the rule on the same line separated by semicolons(;)

Example: Content-Security-Policy: default-src https: 'unsafe-eval' 'unsafe-inline'; object-src 'none'

Permissions-policy

Determines the behavior of certain browser characteristics. Add the rule on the same line separated by a comma(,) **Example:**

fullscreen=(), geolocation=()

Enable direct call by URL

Allow the applications to be called directly by the URL.

Export with Password

It allows defining a password in the Applications exportation.

Categories - Fields

Run content in JavaScript

Defines if the JavaScript code stored in the database runs on the browser.

Remove the HTML tags

Defines if the HTML code stored in the database will have the HTML tags removed for display.

Save HTML tags

Stores the HTML tags informed within the Application field to the database. (This option only applies for the Form application)

Fixed Label

It allows you to transform the Fields labels in static labels when you scroll down the page.

Use Select2

It allows you to apply the Select2 as default in the applications.

Display date format

Display the Field Format

Date display position

Position for the date format, on the right or bottom of the field.

Display message

Custom message for required fields.

Icon type

Choose whether the sort icons next to the field label will be the images defined in the application's theme or Font Awesome icons. This setting together with the selected icons for alphanumeric and numeric fields are used both in the grid and in the summary.

Alphanumeric fields

Choose the Font Awesome icon set to use for sorting alphanumeric fields.

Numeric fields

Choose the Font Awesome icon set to use when sorting numeric fields.

Text input in JavaScript

Stores the JavaScript informed within the Application field to the database. (This option only applies for the Form application)

Show HTML content

Defines if the HTML code stored in the database is interpreted or not by the browser. (This option only applies for the Grid application)

Categories - General

Documents Path

Absolute path where the application documents are stored.

Notify discarded changes

Notifies the user of changes that will be discarded when reloading the data.

Grid export modules

It allows you to select the Grid Modules in the exportation.

Description

You can define a description to the applications.

This option will be enabled if you use the Apply individually option.

Friendly URL

Define a friendly URL to application.

This option will be enabled if you use the Apply individually option.

Select columns of Export

It allows selecting the desired application columns in the exportation.

Display field error in a modal

Display the field error inside a message box opening in modal.

Field error position

Position where the field error will be displayed.

Timeout Error

Screen error message display time.

Highlight Results

Defines whether search results will be highlighted.

Image Directory

Base directory for the application images.

Language

It applies the selected language for all the selected applications in the project.

Hotkey Templates

it allows configuring the hotkey template for all applications.

Image Viewer

Defines whether the image viewer will be available.

Edit Properties

After selecting the modifications individually for all the select applications, It displays a list with all the selected attributes listed for modification.

Edit Properties											
APPLICATION DESCRIPTION	THEME		MODEL FOR HEADER		MODEL FOR BODY		MODEL FOR FOOTER				
tab01_1	Used on example tab01 *	ScriptCase ▼	Sc4_Cherry ▼	Show header <input checked="" type="radio"/> Yes <input type="radio"/> No		ScriptCase ▼	Default ▼	ScriptCase ▼	Default ▼	Show Footer <input type="radio"/> Yes <input checked="" type="radio"/> No	

After selecting the modifications that you want set, you see a list with all the selected attributes.

Edit Properties			
Theme	ScriptCase ▼	Sc6_Blue ▼	Color themes and fonts
Model for Header	Show header <input checked="" type="radio"/> Yes <input type="radio"/> No		Name of the model used to compose the header of the application
Model for Body	ScriptCase ▼	▼	Name of the used model to compose the body of the application
Model for Footer	Show Footer <input checked="" type="radio"/> Yes <input type="radio"/> No		Name of the used model to compose the footer of the application
Header Image		<input type="text"/> Clean	Change the image of the header

Modified Applications

When you apply the modifications, It displays a list of the applications that Youre modified.

Modified Applications		
tab01_1	tab02	tab03
tabs_v9		

Restore Applications

Restore Applications

This feature allows to restore the project's applications that has been modified recently. When saving the application, ScriptCase stores automatically a limited number (defined in Settings > System Settings on the option Number of automatic application copies) of copies of the application, so that they can be restored. First, we need to select the application that you want to restore.

Choose the application

grid_new ▼

Next » ?

Previously, you need to select the restore point that you desire and also define a name for the restored application.

Choose the restoration point and the application name

Save Applications

Save Applications

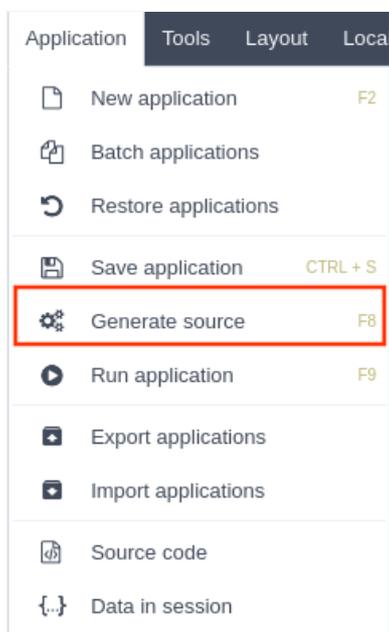

This option saves the application opened in the edition mode. This option can be found inside the applications menu or in the default toolbar, also being possible to use the shortcut CTRL+S.

Generate Source

Generate Source

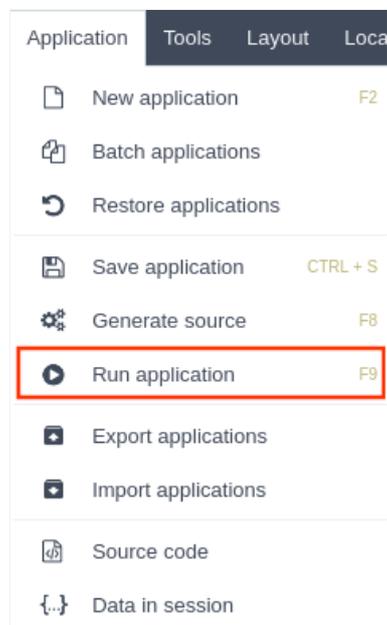

Different from the generate source code found in Project, this option saves and only generate the source code of the opened application in edition mode. This option can be found inside the menu Applications or in the default toolbar, and it is also possible to use the shortcut F8.

Execute Application

Execute Application

Saves and execute the application that is opened in the edition mode. This option can be found inside the Application menu of in the default toolbar, and it is also possible use the shortcut F9.

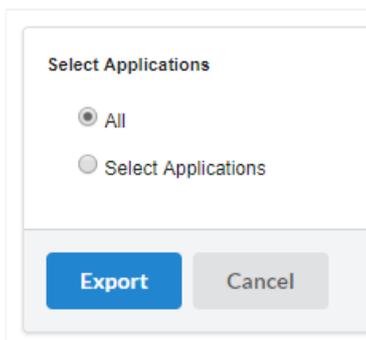

Export Applications

Export Applications

Every application of a project or some applications can be exported. In this export, not only the application but also the needed archives to its operation of the selected applications are exported.

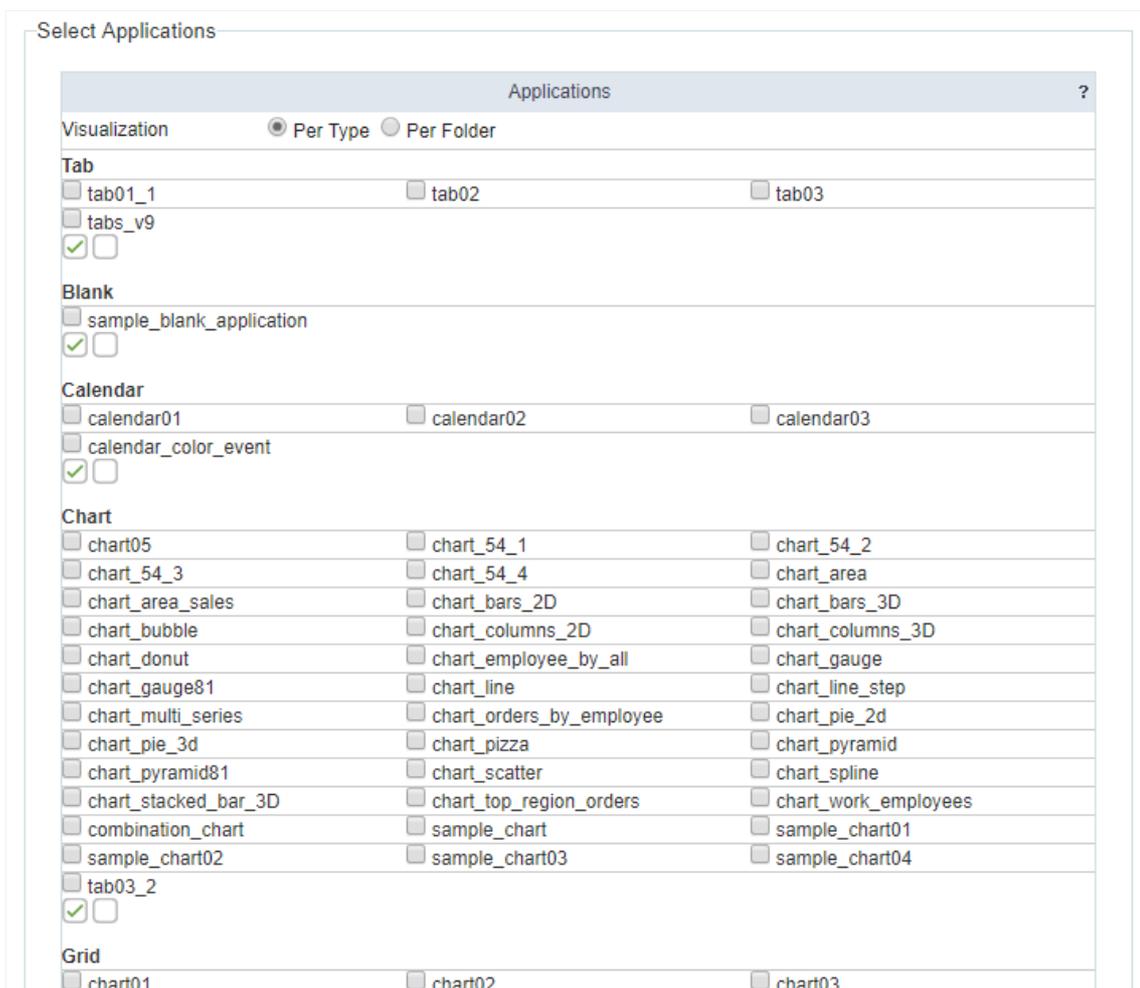

This option can be found inside the menu **Application**.

Firstly you need to select if you want to export all applications or if you want to select some applications.

When select all applications, it will be displayed with the export log and the link to download the generated file.

In this example, we choose to **"Select Applications"**, in this case the applications are listed according to the type or folder.

To proceed, select the desired applications and click in export. After this it will be displayed a log of the exported files and a link

to download the generated file.

Import Applications

Import Applications

Allows the developer to import applications created in the same version of Scriptcase. This option can be found inside the menu **Application**.

After the import application screen is displayed, select the file you want to import.

Backup File ?

Escolher arquivo Test.zip

Continue

The options are:

Applications >>

Connections <<

conn_example

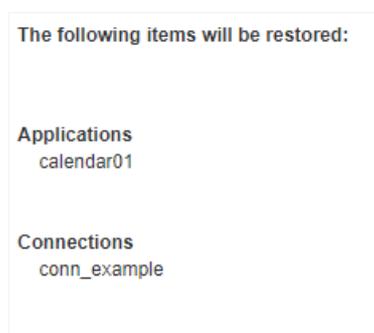

Project languages >>

Rename ▼ conn_example2

Continue

Overwrite - Overwrites the project's files by the files that are being imported. **Don't overwrite** - Keeps the project's files, ignoring the files that are being imported. **Rename** - Keep the project's and import the files selected with the defined names.

In the next step, show a summary that will be restored.

The following items will be restored:

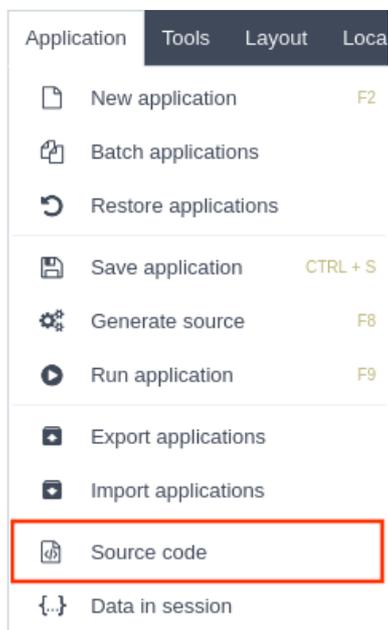

Applications
calendar01

Connections
conn_example

Source code

Source code

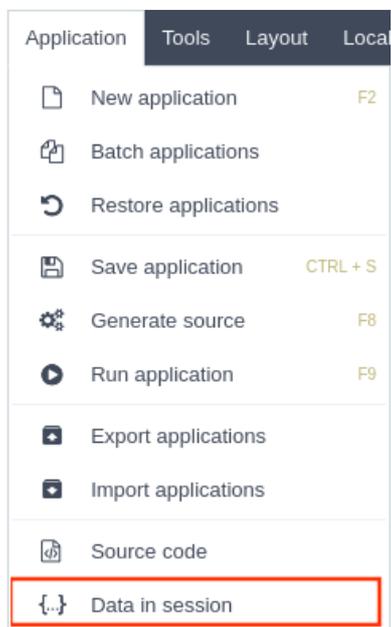

In this option is possible to see the application's source code after it generates.

Session data

Session data

In this option, it is possible to see every session variable available in the development environment, it is the session tree that Scriptcase stores.

Grid Modules Settings

Initial Module

Allows you to set in which mode the application will start when executed.

INITIAL MODULE

Select the Grid module that will be displayed when running the application:

- Search
- Grid
- Summary
- Chart
- Print
- PDF
- Word
- Excel
- RTF
- XML
- CSV

Grid Application Modules

- **Search** : The application will start with the Advanced Search module, so you can filter the records before the next application, that can be a Grid, PDF, Summary, Chart, Print, PDF, Word, Excel, RTF, XML or CSV. You can configure these options within the Filter's settings.
- **Grid** : The application will start with the Grid module itself, this is the default option.
- **Summary** : The application will start with the Summary module. To use the Summary as initial application it's mandatory to create at least one Group, using the Static Group By settings.
- **Chart** : The application will start with the Chart module. To use the Chart as initial application it's mandatory to create at least one Group, using the Static Group By settings.
- **Print** : The application will start with the print mode, according to the select command.
- **PDF** : Application will be started with the option to view or download a PDF file.
- **Word** : Application will be started with the option to view or download a Word file(.doc or .docx).
- **Excel** : Application will be started with the option to view or download an Excel file (.xls or .xls).
- **RTF** : Application will be started with the option to view or download a RTF file (.tft).
- **XML** : Application will be started with the option to view or download a XML file.
- **CSV** : Application will be started with the option to view or download a CSV file.

Search

APPLICATION MODULES

Select the modules that will be part of the Grid and set its parameters:

 <input checked="" type="checkbox"/> Search	 <input checked="" type="checkbox"/> Grid	 <input checked="" type="checkbox"/> Detail	 <input checked="" type="checkbox"/> Summary	 <input checked="" type="checkbox"/> Chart
Filter module	<input type="text" value="Grid"/>	Application module where search is applied.		
Use Iframe	<input type="text" value="No"/>	Use iframes to display the Search and the Grid on the same page.		
Show Results	<input type="text" value="Yes"/>	Display the search results on the same page when loading the application for the first time using iframes.		
Iframe Height	<input type="text" value="1500"/>	Iframe height in pixels where the grid will be displayed.		
Search Modal	<input type="text" value="No"/>	Display the search in a modal window.		
Search Modal Height	<input type="text" value="0"/>	Height search modal.		
Search Modal Width	<input type="text" value="0"/>	Search modal width.		
Table Width	<input type="text" value="0"/>	Width value for the application table.		
Table Width Unit	<input type="text" value="Automatic"/>	Measure unit for the width.		
Advanced Settings				

Grid

Search Settings

- **Filter Module** : This option configures which application will be called after the Search.
- **Use Iframe** : This option configures the Search to be displayed within an iframe (displaying the Filter itself and the search results on the same page). *This option is available only when the initial module is set to be the Search .*
- **Hide Grid Header** : Hide the Grid's header when using the Search in the iframe.
- **Show Results** : Display the search results on the same page when loading the application for the first time when the "Use Iframe" option is set as "Yes", otherwise, the results will be displayed only after the search.
- **Iframe Height** : Iframe height, in pixels, used to display the search results.
- **Search Modal** : This option configures the Filter Application to open in a modal window.
- **Search Modal Height** : Search Modal box height (in pixels). Option available only when the Search Modal box is enabled.
- **Search Modal Width** : Search Modal box Width (in pixels). Option available only when the Search Modal box is enabled
- **Table Width** : Filter application table width. This value can be in percent, pixel or automatic (set by Scriptcase). If you change the value you will also need to set the "Table Width Unit"
- **Table Width Unit** : This option configures the unit for the table width (percent, pixel or automatic). The value itself must to be set within the option "Table Width".

Grid

APPLICATION MODULES

Select the modules that will be part of the Grid and set its parameters:

Search

Grid

Detail

Orientation	<input type="text" value="Horizontal"/>	Grid records' orientation (Horizontal, Vertical, Slide or User Defined).
Fixed label	<input type="text" value="Yes"/>	This option will freeze the column labels on top of the grid.
Fixed columns	<input type="text" value="Yes"/>	Allows the choice of grid columns that will be fixed in the grid.
Fixed column hover	<input type="text" value="Yes"/>	Display pinned column icon only on field label cell hover.
Fixed options' column	<input type="text" value="Yes"/>	Pin the options column icons displayed in the row of the grid.
Fixed group by	<input type="text" value="Yes"/>	Allows the information of a grid's group by line to be fixed.
Pagination	<input type="text" value="Partial"/>	Pagination method for the grid records.
Lines Per Page	<input type="text" value="10"/>	Number of record lines per page.
Infinite Scroll Increment	<input type="text" value="5"/>	Number of rows to load when loading new records.
Open windows using modal	<input type="text" value="Yes"/>	For Grids apps with the Infinite Scroll pagination enabled, open using a modal instead.
Maintain records	<input type="text" value="Yes"/>	When you navigate to another window and go back, it maintains the records.
Grid height	<input type="text"/>	It defines the height of the Grid in pixels, for when "Infinite Scroll" is enabled.
Table Width	<input type="text" value="0"/>	Set the application width.
Table Width Unit	<input type="text" value="Automatic"/>	Measure unit used for the application width.

Grid Settings

Orientation

This option configures the Grid records' orientation (Horizontal, Vertical, Slide or User Defined). When using the "User Defined" option you can design the HTML manually inside the option "Layout » HTML templates" and select within the Layout settings.

Fixed Label

This option will fix the columns' label at the top of the page (it is only available when the Grid records' orientation is set as Horizontal).

Fixed columns

Enables the option of fixing one or more columns of the query application during its execution. The resource will be represented by the icon  positioned on the right side of the label.

Icon color is defined by application theme.

When fixing a column, all others positioned on the left side will also be fixed.

For example, when fixing the column **Contact** the columns **Customer Code** and **Company** were also fixed.

In order for only the Contact field to be fixed, it is necessary to move it to the left corner using the **Columns** button.

See [how](#) configure the option of columns in the grid.

Fixed column hover

Defines if the fixed column button will always be visible in the application or only when the field hovers.

This hover option works only in applications running on the desktop, if the application is opened on a mobile device, the pin column icons will always be visible.

When checking yes the icon will be displayed when hovering the mouse over the column.

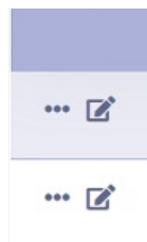

When checking no the icon to fix the column will always be visible.

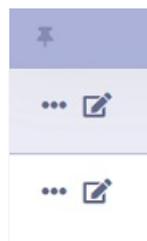

Pin options column

Allows you to fix the options column displayed in rows of records.

If the developer chooses to **mark yes** the column will remain fixed without the possibility for the application user to change its behavior, as in the image below.

When checking no the option to fix the column is at the discretion of the application user and the fix icon will be displayed, following the behavior defined in the configuration previous **Hover of fixed columns**.

Fixed breaks

This option fixes the line with the break information when there is a horizontal scroll.

When checking yes if the application has a horizontal scroll, the break information will always be visible.

Country => ARGENTINA			
City => Buenos Aires			
any Name	Contact Name	Contact Title	
...  lo Moreno tilla	Antonio Moreno	Owner	
...  Comidas para	Patricio Simpson	Sales Agent	

When checking **no** when scrolling horizontally, the break information is no longer displayed, as in the example below.

Name	Contact Name	Contact Title	
...  loreno	Antonio Moreno	Owner	
...  midas para	Patricio Simpson	Sales Agent	

Pagination

This option sets the Grid paging type: Partial (pagination according to the amount of records set per page), Total (displays all records) or Infinite Scroll (automatic scrolling according to the increment)

Lines Per Page

This option sets the amount of records per page for the Grid

Infinite Scroll Increment

This option sets the number of rows displayed on each increment of new records. It is available only when paging is configured with Infinite Scroll.

Open windows using modal

For Grids application with the Infinite Scroll paging enabled, this option will set the links between applications and details of the Grid, that are configured to open in iframe, to open using a modal instead.

Maintain records

It configures if the amount of records displayed will be preserved when the application navigates to another window and go back.

Grid height

It sets the height of the query in pixels. If it is empty

Table Width

Grid application table width. This value can be in percent, pixel or automatic (set by Scriptcase). If you change the value you will

also need to set the "Table Width Unit"

Table Width Unit

This option configures the unit for the Grid table width (percent, pixel or automatic). The value itself must to be set within the option "Table Width".

Detail

APPLICATION MODULES

Select the modules that will be part of the Grid and set its parameters:

 <input checked="" type="checkbox"/> Search	 <input checked="" type="checkbox"/> Grid	 <input checked="" type="checkbox"/> Detail	 <input checked="" type="checkbox"/> Summary	 <input checked="" type="checkbox"/> Chart
--	---	---	---	--

Display Detail	<input type="text" value="In another page"/>	Detail record display mode
Alignment	<input type="text" value="Left"/>	Field alignment for detail page.
Detail Width	<input type="text" value="0"/>	Width value for the application detail
Width of the modal	<input type="text"/>	Width of the modal window in pixels.
Height of the modal	<input type="text"/>	Height of the modal window in pixel
Detail Width Unit	<input type="text" value="Automatic"/>	Measure unit used in the width.

[Advanced Settings](#)

Grid

Detail settings

- **Display Detail** : Allows you to set where the detail will open within the Grid Application * **Beside the Grid** : Displays the Grid Details to the right of the record, in the same window where Grid is being displayed. * **Below the Grid** : Displays the Grid Details below the Grid records, in the same window where Grid is being displayed. * **In another page** : Displays the Grid Details in another page, replacing the Grid view. * **In another window** : Displays the Grid Details in a separated browser window. * **Modal** : Opens a pop-up window to the display of the Grid Detail.
 - **Alignment** : Using this option you can set an alignment (center, right or left) for the Grid Detail when it's using the "Display Detail" setting as "Beside the Grid" or "Below the Grid".
 - **Detail Width** : This option sets the Grid Detail width when it's using the "Display Detail" setting as "Beside the Grid", "Below the Grid", "In another page" or "In another window".
 - **Width of the modal** : Allows you to customize the Grid Detail width when it's using the "Display Detail" option as "Modal".
 - **Height of the modal** : Allows you to customize the Grid Detail height when it's using the "Display Detail" option as "Modal".
 - **Detail Width Unit** : This option configures the unit for the "Detail Width" (percent, pixel or automatic).

Summary

APPLICATION MODULES

Select the modules that will be part of the Grid and set its parameters:

 <input checked="" type="checkbox"/> Search	 <input checked="" type="checkbox"/> Grid	 <input checked="" type="checkbox"/> Detail	 <input checked="" type="checkbox"/> Summary	 <input checked="" type="checkbox"/> Chart

Table Columns	Automatic ▾
Refresh Interval	<input type="text" value="0"/>

Friendly URL

This attribute defines the application's friendly URL.

Friendly URL	<input type="text" value="order-clients"/>
--------------	--

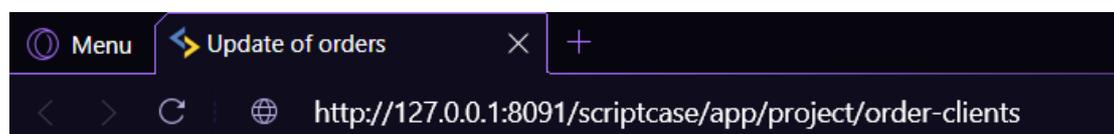

Alphanumeric characters and some special characters are allowed, such as: **hyphen** (-), **underscore** (_), **comma** (,), and **dot** (.).

The use of accents or spaces is not allowed.

Some recommendations for definition are:

- Use keywords for identification.
- Use hyphens to separate words.
- Use only lowercase letters.
- Avoid using dates.

Example of an application using a Friendly URL

The friendly URL can also be defined in the application list on the project's initial screen.

See the example below

APPLICATION ▲	FRIENDLY URL ▲	DESCRIPTION ▲	CREATOR
grid_dbo_vwTarrafa	vwTask		

Display Line Number

This attribute defines whether or not the line counter is displayed in the application. The row counter will be positioned next to the options column.

This feature is only available for forms configured in the formats: **Grid Editable** and **Grid Editable (View)**

Example with display line number enabled

1	 
2	 

Example with display line number disabled

 	ALFKI
 	ANAT

- **Display Titles** : Allows you to set if the titles of fields will be displayed or not.

Line break in title

This attribute defines whether or not the line break in the field label will be allowed.

This attribute is only available in horizontal forms (Multiple Records, Editable Grid and Editable Grid (View)) configured to use **partial pagination**.

When enabled, does not allow line breaks in the field label. In this way, even if the field occupies a smaller space than the label, as in the Customer Code field in the image below, the line will not be broken.

Example of line break in title enabled

When disabled, allows a line break in the field label. When using this option, the space destined to the label will be defined by the size of the field, in this way, if the label is larger than the space destined to the field, there will be a break in the line.

Example of line break in title disabled

Customer identification	Employeeid
ALFKI	1
ALFKI	1

Horizontal Alignment

Defines the horizontal alignment of the application and can be defined as: **Centered**, **Left** or **Right**.

The attribute's default setting is **Centered**

Centered

Positions the application in the center of the page, respecting the margin definitions defined in the theme or in the **margin** attribute.

Application example with centered alignment

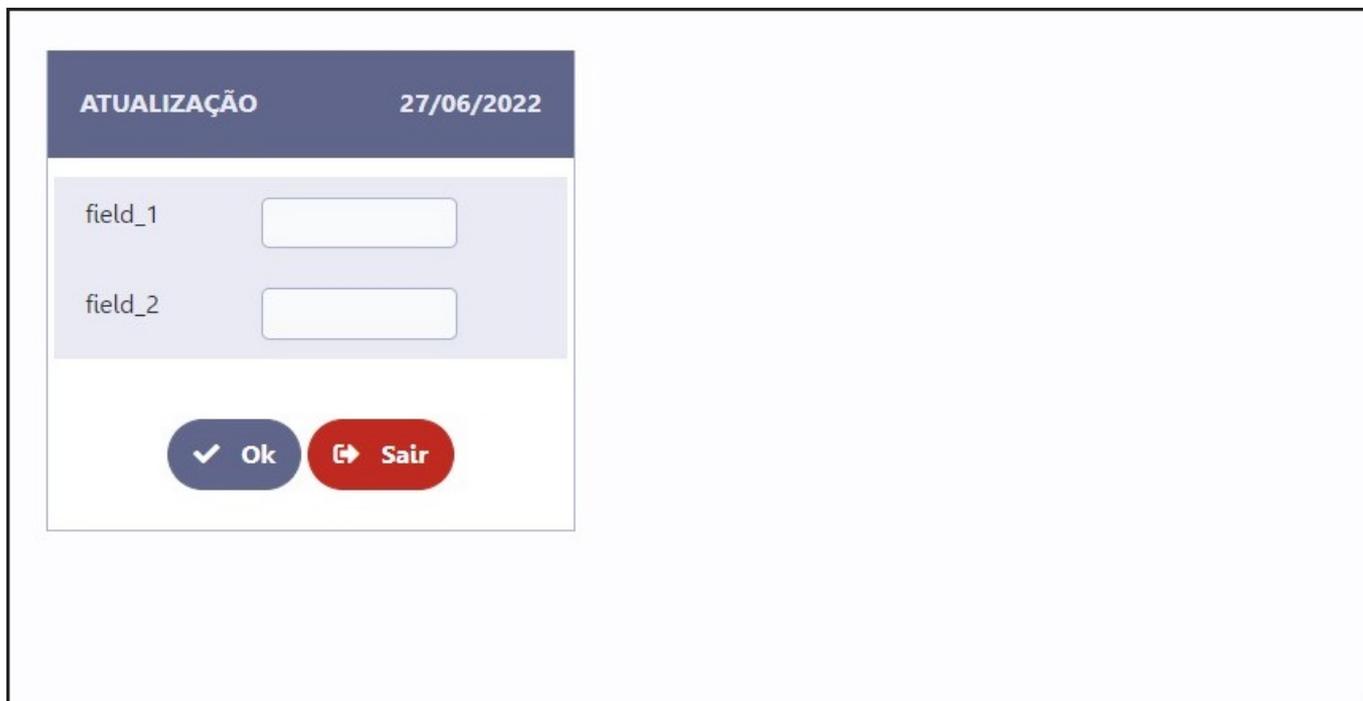

The screenshot shows a centered application window with a dark blue header containing the text "ATUALIZAÇÃO" and "27/06/2022". Below the header, there are two input fields labeled "field_1" and "field_2". At the bottom of the window, there are two buttons: a blue button with a checkmark and the text "Ok", and a red button with a door icon and the text "Sair".

Left

Positions the application in the left corner of the screen, respecting the definitions of the margins defined in the theme or in the **margin** attribute.

Left-aligned application example

Right

Positions the application in the right corner of the screen, respecting the definitions of the margins defined in the theme or in the **margin** attribute.

Right-aligned application example

Vertical Alignment

This attribute defines the vertical alignment of the application and can be configured with the following options: [No Value](#), [Top](#), [Center](#) ou [Bottom](#).

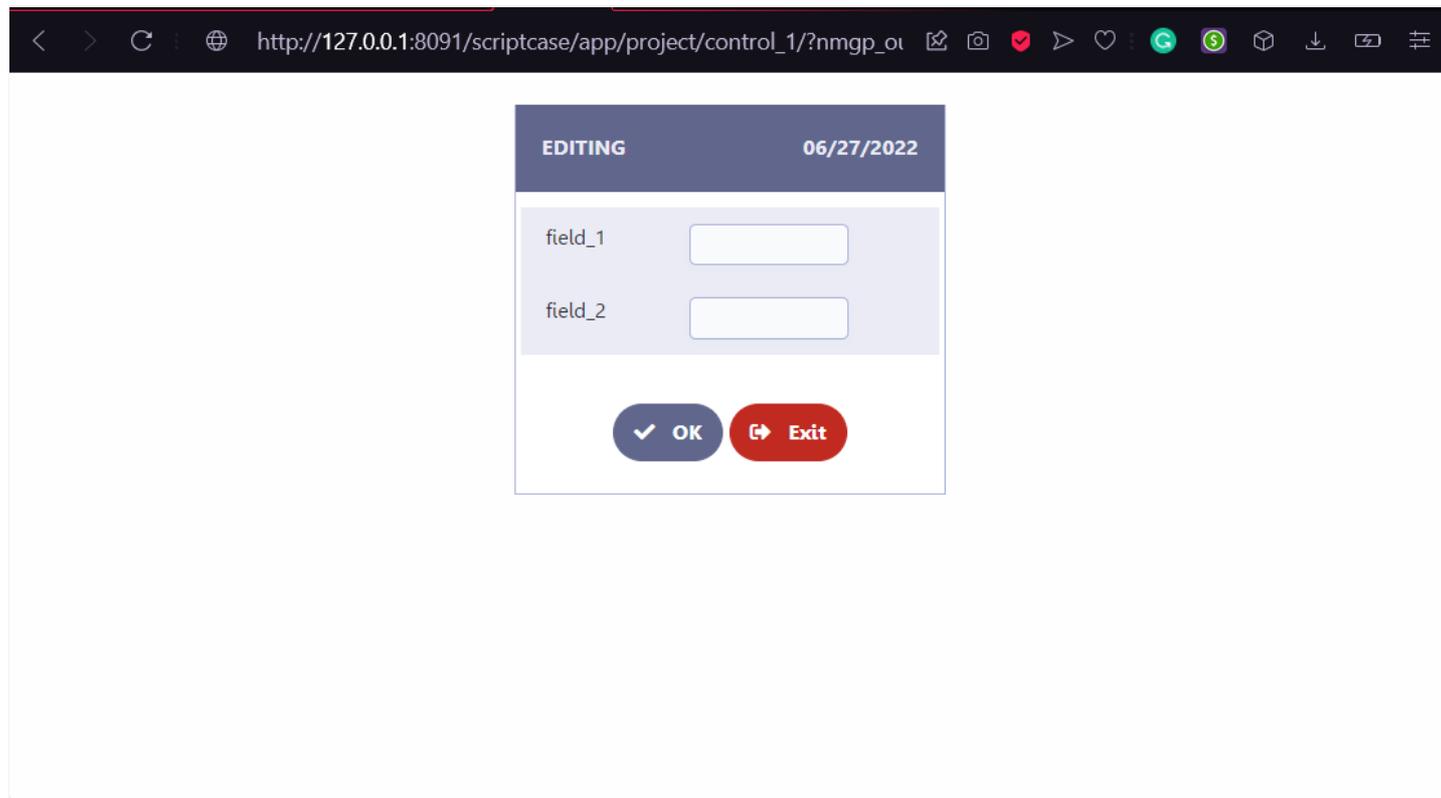

When using **Top**, **Center** or **Bottom** alignments, the margin attribute is disregarded.

See below for details on each of the alignment options.

No Value

Standard vertical alignment for new applications. In this configuration, the application is positioned at the top of the screen respecting the margins defined in the **margin** attribute or in the definition of the theme used in the application.

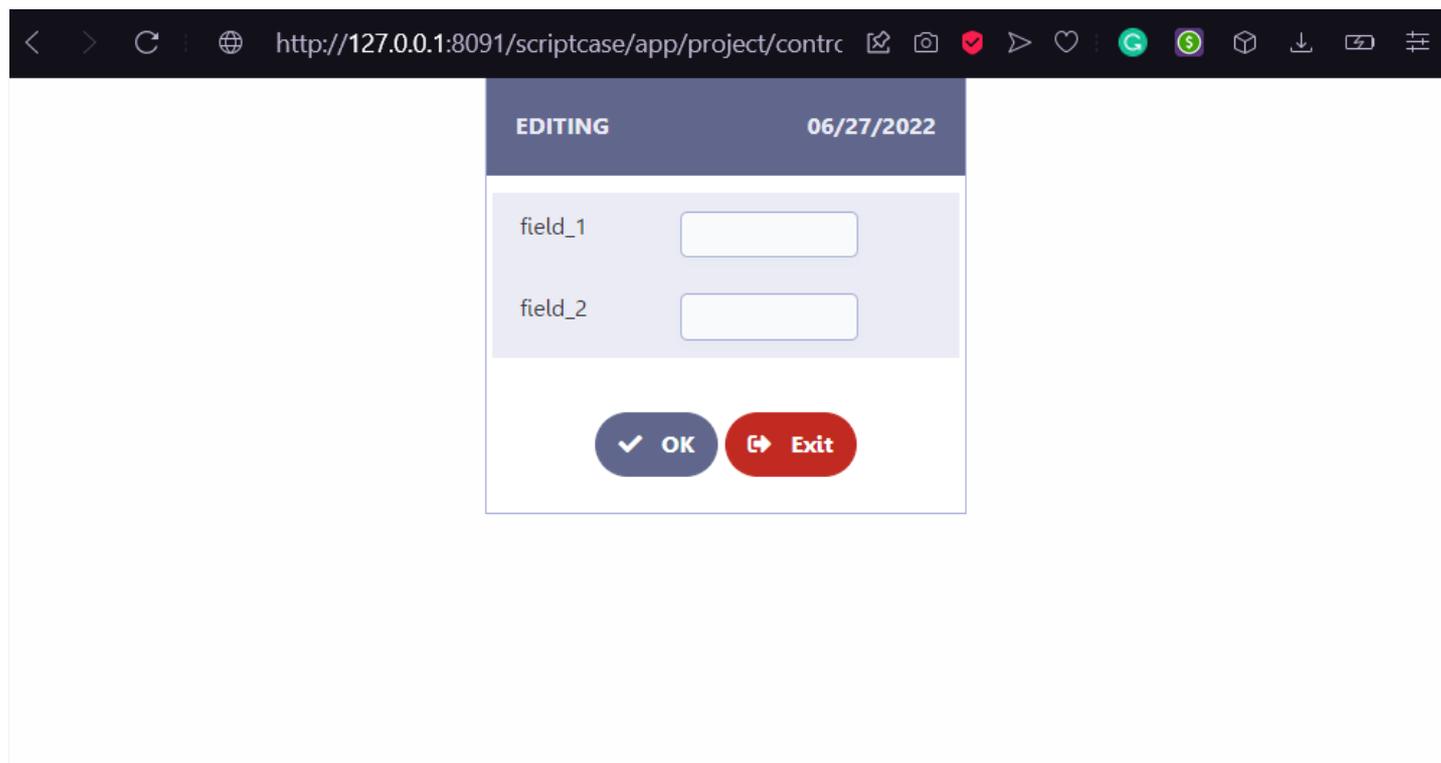

Application example with standard alignment

Top

Places the application at the top of the screen, disregarding the definitions of margins defined in the application theme or in the **margin** attribute.

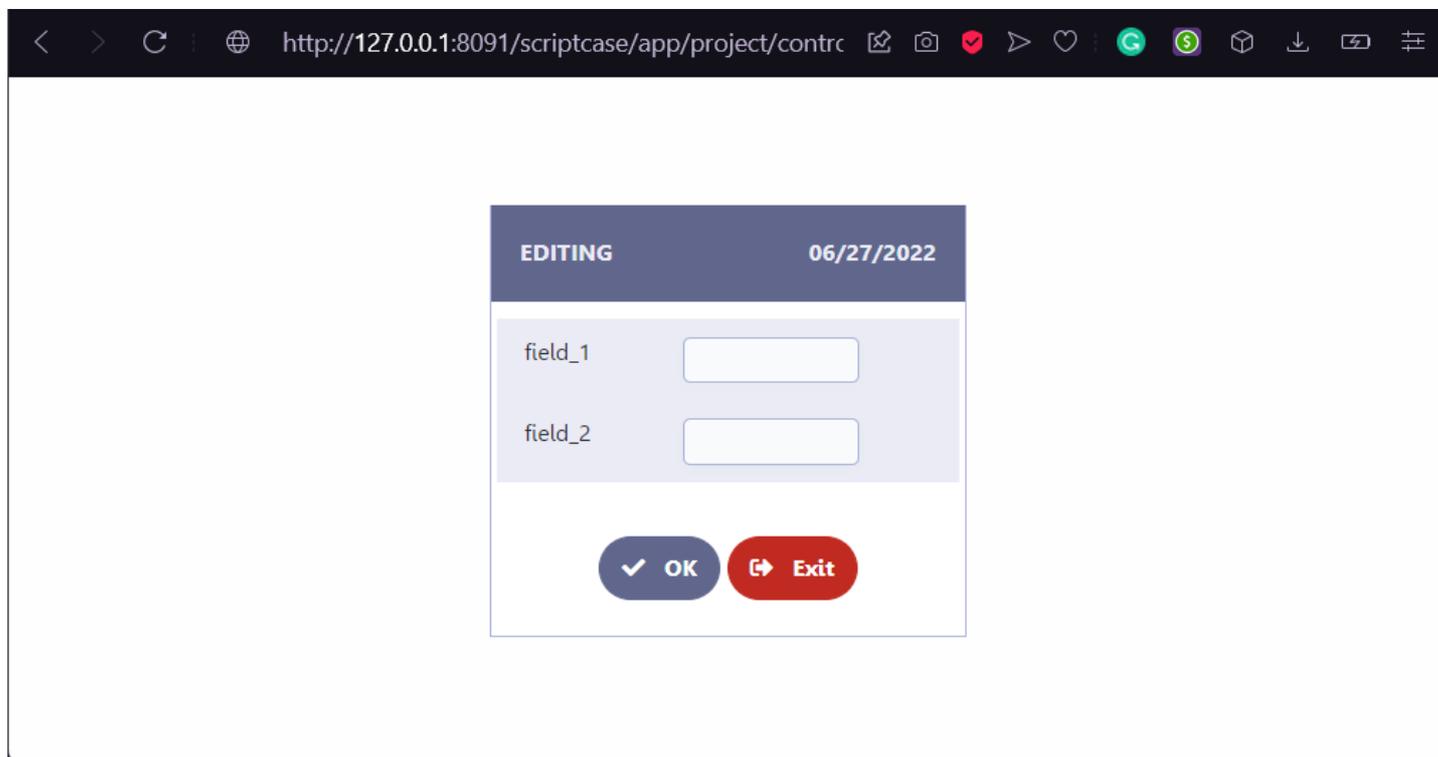

Application example with alignment on the top

Center

Positions the application in the center of the screen, disregarding the definitions of the margins defined in the application theme or in the **margin** attribute.

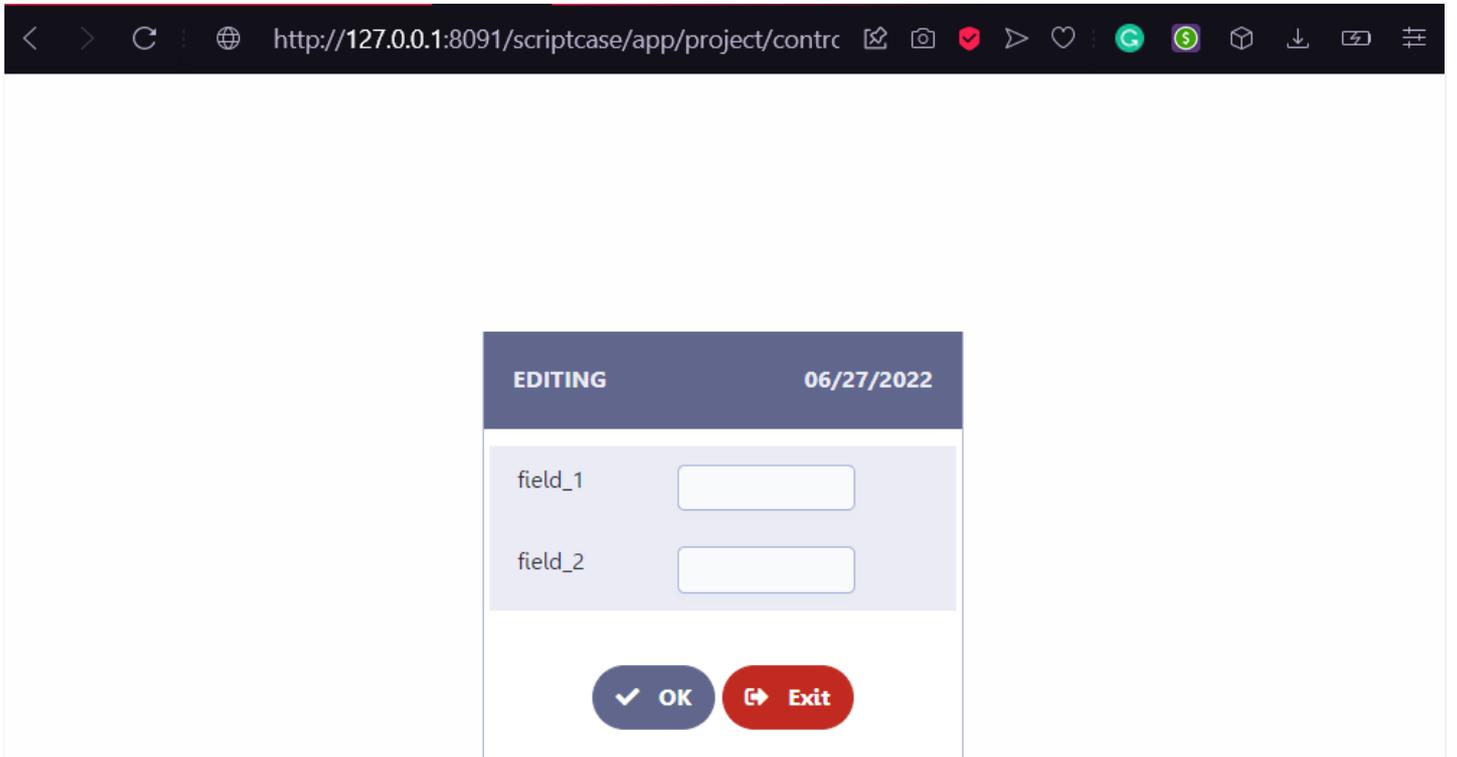

Application example with Center alignment

Bottom

Places the application at the bottom of the screen, disregarding the definitions of margins defined in the application theme or in the **margin** attribute.

Application example with alignment on the bottom

Margins

Allows the developer to set the application's margin values in pixels. If no value is specified, the application will use the default values from the configured theme.

Attention:

When configuring the **Vertical Alignment** attribute, the defined margin values will be ignored.

Example of how to use the attribute

Margins	<input type="text" value="100"/>	Top
	<input type="text"/>	Bottom
	<input type="text"/>	Right
	<input type="text"/>	Left

Field alignment

Defines the alignment of field values when the grid uses **Vertical** or **Slide** orientations.

This attribute is only considered in grids configured as Slide or Vertical

It allows defining the alignment of fields when the query orientation is configured as Vertical or Slide.

Table columns

This parameter defines the width of the application fields. The available options are: **Informed**, **Calculated** e **Automatic**.

Table Columns	Automatic ▾
Refresh Interval	Provided
	Calculated
	Automatic

Informed

This property defines that the width of the fields will be defined individually, at the field level, through the **Width** attribute.

Using this property, it is mandatory that the width attribute in the field configuration has a value, otherwise, the field will assume the behavior of the **Automatic** property.

Calculated

The field width is calculated by our generator according to its field type and size.

Automatic

In this case the field width will be defined using browser criteria. No specific width for the fields will be informed.

Table Columns	Automatic ▾
Refresh Interval	Provided
	Calculated
	Automatic

Refresh interval

This attribute defines the page refresh time. This time is defined in seconds and only numbers must be informed.

By default the attribute is defined with **0**. With this value there will be no page reload.

Refresh Interval	<input type="text" value="5"/>

Grid Edit Fields

This interface is useful for editing the field settings and their position to display.

Fields	Label	Datatype	Line Break	Line Break PDF	Title Horizontal Alignment	Text Alignment	Font Color
PAGE: PAG1							
BLOCK: GRID_ORDERS							
 orderid	<input type="text" value="Orderid"/>	Integer ▼	<input type="checkbox"/>	<input type="checkbox"/>	Right ▼	Right ▼	<input type="text"/>
 customerid	<input type="text" value="Customer Name"/>	Text ▼	<input checked="" type="checkbox"/>	<input type="checkbox"/>	Left ▼	Left ▼	<input type="text"/>
 employeedid	<input type="text" value="Employeedid"/>	Integer ▼	<input type="checkbox"/>	<input type="checkbox"/>	Right ▼	Right ▼	<input type="text"/>
 orderdate	<input type="text" value="Orderdate"/>	Date ▼	<input type="checkbox"/>	<input type="checkbox"/>	Center ▼	Center ▼	<input type="text"/>
 requireddate	<input type="text" value="Requireddate"/>	Date ▼	<input type="checkbox"/>	<input type="checkbox"/>	Center ▼	Center ▼	<input type="text"/>
 shippeddate	<input type="text" value="Shippeddate"/>	Date ▼	<input type="checkbox"/>	<input type="checkbox"/>	Center ▼	Center ▼	<input type="text"/>

Fields

Allows accessing the field settings (pencil icon on the left). You can change the field position by dragging them to the desired position. Drag a field to “fields not displayed” if you don’t want it in the app.

Label

Defines the title of a field in the app. For example: if the field name in the database is fld_txt_customer_name, you can display the label “Customer Name”.

Data Type

It informs the data type of the field.

Line Break

Allows the Line Break in the records when the field text is greater than the column width.

Line Break PDF

Allows the Line Break when the user exports the app as a PDF.

Title Horizontal Alignment

Defines the horizontal alignment of the field label.

Text Alignment

Defines the horizontal alignment of the field text.

Font Color

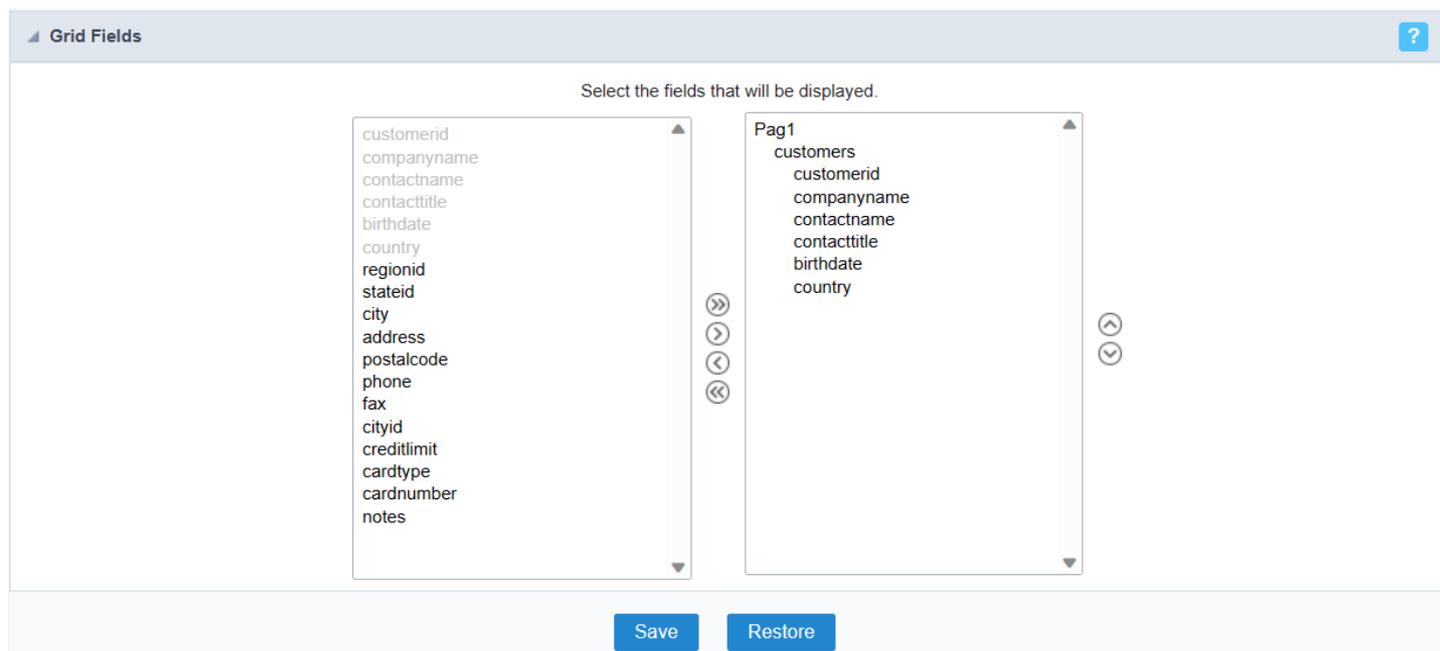

Configure the text color for the field.

Grid Fields Positioning

In this configuration screen we have a list of all the fields available in the application, whether they are fields mapped from the table or virtual fields (Created only in the Scriptcase interface).

It is also possible to allow the end user to manipulate the application's fields in the way they prefer, for that we must add the **columns button** in the application's toolbar.

In the **left column**, we have a list with all the fields available for use and in the **right column** we have a list of the fields that were selected to be displayed in the running application.

Adding and Removing Application Fields

The fields must be configured using the selection buttons, located between the columns.

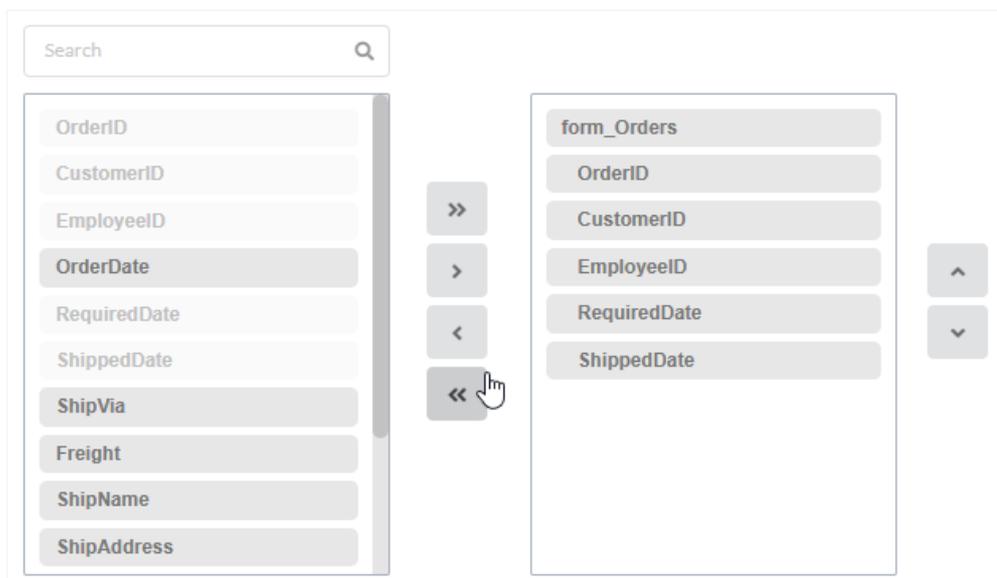

- **>>** - Move all fields to the right.
- **>** - Moves only selected fields to the right
- **<** - Moves only the selected fields to the left.
- **<<** - Move all fields to the left.

In the left column, there are the application fields that are not in use in the filter, while the right column shows all the selected fields and the order in which they will be displayed.

To add fields to the filter, select the fields you want in the filter and click the **>** button.

To select fields in sequence, simply click on a field and drag. Pressing control (Ctrl) allows you to select multiple alternate fields.

Search and positioning

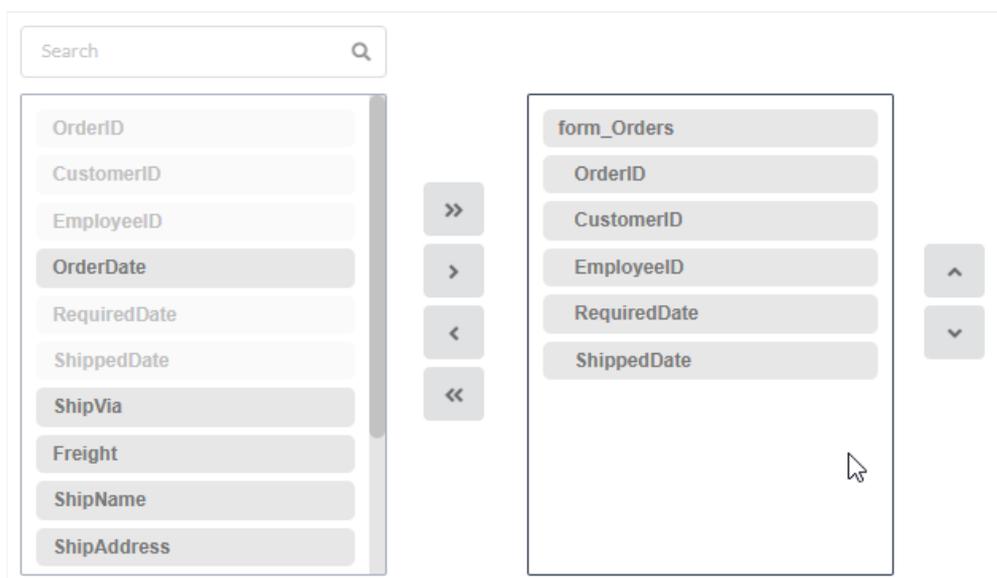

Field display order

The fields will be displayed in the application respecting the order defined in the right column.

The display order must be defined using the sort buttons  and  which will move the selected fields in the column.

Remembering that the fields must be positioned inside a block (**customers**) which must be inside a page (**Pag1**).

Check below the use of the buttons to order the fields

Save and Restore

Below the columns are two buttons:

- **Save** which records the current placement of fields in columns.
- **Restore** which reorganizes the fields returning to the last position saved.

Restoring the positioning of the fields to the last saved definition.

Search

OrderID		form_Orders	
CustomerID		OrderID	
EmployeeID	>>	CustomerID	
OrderDate	>	EmployeeID	^
RequiredDate	<	RequiredDate	v
ShippedDate	<<	ShippedDate	
ShipVia			
Freight			
ShipName			
ShipAddress			

Restore Save

Grid Toolbar

The application toolbar has two segments: Top and Bottom, in a way that is possible to define to display buttons into both areas. Those areas work independently, allowing them to display the same button, for example.

It's also possible to select the buttons and their position if the application is running on a mobile device.

Toolbar

Desktop

Here we must inform the toolbar settings for the "Classic Web Version" mode and which buttons are available in the application when accessed from a **Desktop** environment.

Mobile

Here we must inform the toolbar settings for the "Mobile Version" mode. That is which buttons are available in the application when accessed from a **Mobile** dispositive.

Configure the toolbar below for a "classic web version " and also for a "mobile version".

Group of buttons

Add Edit Delete

Navigation:

Buttons relative to the navigation of the application.

Next	Move to the next page that can be a single record or a list of records.
Previous	Returns to displays the previous page records or a single record.
First	Move to the First page or record
Last	Move to the Last page or record
Exit	Close the application
Navigation by page	Displays a "page-number" navigation bar. Example: 1 2 3 4 5
Reload	Displays a button to reload the query data

Export:

Groups the options relative to the generated exports. Scriptcase generates the following export formats:

PDF	Generates a complete Report with all the data of the application in a PDF format.
WORD	Generates a complete Report with all the data of the application in a WORD format.
XLS	Generates a complete Report with all the data of the application in an EXCEL format.
XML	Generates a complete Report with all the data of the application in an XML format.
CSV	Generates a complete Report with all the data of the application in a CSV format.
RTF	Generates a complete Report with all the data of the application in an RTF format.
Print	Creates an HTML with the records ready for printing.

Export by Email:

Groups the options relative to the emails exports. Scriptcase generates the following export formats:

PDF (Email)	Sends by Email a complete report with all the data of the application in a PDF format.
WORD (Email)	Sends by Email a complete report with all the data of the application in a WORD format.
XLS (Email)	Sends by Email a complete report with all the data of the application in an EXCEL format.
XML (Email)	Sends by Email a complete report with all the data of the application in an XML format.
CSV (Email)	Sends by Email a complete report with all the data of the application in a CSV format.
RTF (Email)	Sends by Email a complete report with all the data of the application in an RTF format.

Others:

Other options available in the Grid application.

Jump to	Move to the informed page.
Rows Limit	It is a Combobox that defines the number of rows per page.
Search	Goes to the Search Form to filter the records.
Dynamic Search	It displays the fields of the search to filter the records.
Columns	Allows to include or remove columns of the Grid on the fly.
Sorting Options	Allows selecting the order of the records based on the field.
Group By	Allows to select or change a Group By rule on the Grid.
Save Grid	Allows saving the current state of the application. For example, in the advanced search, you can save the search data for further use.
Quick Search	Allows to perform a quick search in the records of the application.
Gantt	It displays a Gantt chart, if it was previously set.
Summary	It displays a summary with the synthetical data of the records.
Form Buttons	It displays the Form Buttons when there's an Application Link from the Grid to a Form.
Languages	It displays a Combobox with the names available, defined in the project properties.
Themes	It displays a Combobox with the themes available, defined in the project properties.
Rows Counter	It displays the number of records retrieved by the application.
HelpCase	Displays a button to open the help page.

Separator:

-----	Displays a line separating the buttons, when used the Group Buttons.
-------	--

Toolbar Mobile

1515557700	\$1,071.70

Dropdown List Theme

Allows defining the Dropdown theme selecting between **Application theme** and **Button theme**.

Name

Allows defining a name for the button group.

Label

It is the displayed name for the button group in the application.

Hint\Title

Displays a hint to the end-user when the mouse is on the group of buttons.

Button Type

Allows displaying the button group as a Button, Image, or Link.

Image

Allows selecting an image for the button.

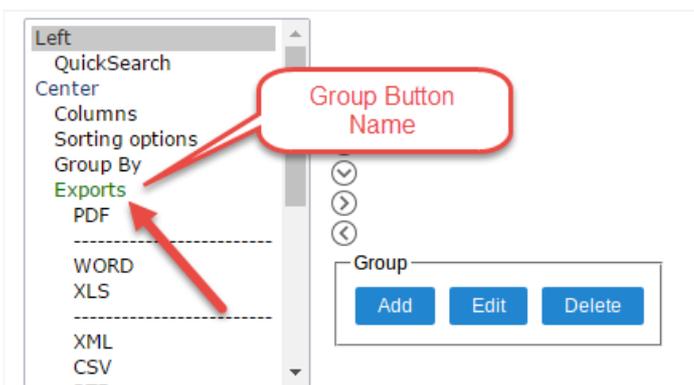

Display

Defines if the button displays only Text, only image, or both.

Display Position

Defines the position of the Text or Image (Text to the right, Image to the right).

After creating a button group, you need to move the grouped buttons below of the Button Group and then move them to the right. Like the image below:

Allows defining the label of the buttons to display for the users.

Hint:

Allows defining the buttons hint to display for the users.

Application Hotkeys

Scriptcase allows creating shortcut keys to your applications. You can select a predefined template or create specific actions for an application.

▲ Application Hotkeys ?

ATTRIBUTE	VALUE	DESCRIPTION
Use hotkeys	<input checked="" type="checkbox"/>	Define if the application will use hotkeys
Hotkeys template	<div style="border: 1px solid #ccc; padding: 2px; display: inline-block;"> SC_DefaultHotkeys ▼ ↻ ✎ </div>	Select the hotkey template from previously created schemas

Clean
+

ACTION	KEYBINDING
No hotkeys configured	

Clean
+

Use hotkeys

Defines if the application uses hotkeys. When you enable this option, the default shortcut keys settings are disabled.

Hotkeys templat

Select the [hotkey template](#) previously created.

Action

Selects the triggered action when pressing the selected key.

Keybinding

Selects the keys responsible for executing the chosen action.

Add “+”

Adds a new action on the keys list.

Clear

It clears the selected hotkeys preference.

Options

Options			
ATTRIBUTE	VALUE	DESCRIPTION	
Fix top toolbar NEW	<input type="checkbox"/>	Affixates the top toolbar	
Fix bottom toolbar NEW	<input type="checkbox"/>	Affixates the bottom toolbar	
Display Summary	<input type="checkbox"/>	Display summary	
Format Row Counter	<input type="text" value="{lang_othr_smry_info}"/>	Format of the row counter	
The number of links displayed	<input type="text" value="5"/>	The amount of pages displayed	
Jump to	<input type="text" value="Page"/> ▼	Jump to page, or search	
Records per page	<input type="text" value="10,20,50"/>	Number of records per page	
Toolbar buttons	<input type="text" value="A DIV below the toolbar."/> ▼	Defines how the toolbar buttons are displayed	

Fix top toolbar:

Affixates the top toolbar to the top of the window

Fix bottom toolbar:

Affixates the bottom toolbar to the bottom of the window

Display Summary:

Allows to display the summary button or not.

Row Counter:

Allows to display the Row Counter or not.

Example: (1 to 10 of 200)

The Number of Links Displayed:

Defines the number of links per page, when the navigation option is disabled.

Jump To:

Move to the informed record page.

Records by page:

Allows defining the number of records to be exhibited for each page. To show all records use the option "all".

Example: 10,20,30, all

Toolbar Buttons:

The type of view for the Toolbar buttons (A DIV below the toolbar, Modal).

Grid Export Overview

The Export menu allows the configuration of the various types of export present in the grid application.

The files generated in the export can only be viewed in the browser, downloaded to the client's machine or [sent by email](#) using the sending APIs (SMTP, Chuck or Amazon SES) built into the tool.

Each type of export has its own configuration that can be previously defined by the developer or passed on to the end user through the configurable export option, thus making the report generation more dynamic.

Grid Export Type List

PDF	XML
WORD	JSON
CSV	Impressão HTML
Excel	RTF

- [JSON exportation for grids and charts](#)

Grid Export Email

In this menu, the service used to send emails will be defined in the **Sending Settings** block, as well as the body of the emails that will be sent in the **Export Settings** block.

To use this resource, it is necessary that the fields for exporting by e-mail are enabled in the application's toolbar.

Sending settings

In this block we must define the sending service that will be used in the application. This service must be defined in the **API** attribute by selecting a [Pre-configured API](#) or selecting the **Custom** option that must be configured in the application.

This option allows you to select only one delivery service for the application. For the dynamic definition of the service it is necessary to use the macro [sc_send_mail_api](#).

API

This attribute defines the service that will be used by the application to send emails.

The developer chooses between selecting one of the listed [Email sending APIs](#) or the **Custom** option that allows configuring a sending service in the application itself.

Pre-configured APIs

If there are one or more email APIs configured and active, they will be listed and categorized according to the **access level** at which they were created.

Access Levels

- **Public:** Available to all users on all projects.
- **Project:** Only available in the project in which it was created.
- **User:** Only available to the user who performed the API configuration.

It is also possible to configure a new API or edit an existing one by clicking on the icon , that opens [API configuration screen](#).

The icon is responsible for updating the list of APIs in the attribute by refreshing the field, allowing the new configured APIs to be displayed without the need to reload the page.

Custom

When selecting this option, the configuration fields will be displayed below the API Attribute, in this case, it is not necessary that there is an API configured in the **Tools > API** menu.

The developer must configure the sending service using the displayed fields according to the selected **Gateway**.

Scriptcase connects to three different APIs for sending emails: SMTP, Mandrill, and Amazon SES.

SMTP Configuration

SMTP is the standard protocol for sending e-mails over the Internet, and each provider has its SMTP.

For more information about SMTP settings [click here](#)

API

It allows you to select an API already configured in **Tools > API** or set a new one here by selecting - **custom** -. In this case, you see some options according to the selected Gateway.

To use an API in a published project, it is necessary to perform the [Configuration of this API in the production environment](#), in the API menu.

Gateway

Select the way to send the email. The SMTP is the default protocol for sending e-mails over the Internet, and each provider has its SMTP.

SMTP Server

SMTP server address for the provider.

Port SMTP

Port used by the mail server. Use port 465 for security with SSL, port 587 for security with TLS, or port 25 as port without security. By omitting the value, Scriptcase defaults to 25.

User SMTP

SMTP server user.

Enter SMTP

SMTP server user password.

Protocol SMTP

Defines the security protocol. By omitting the value, Scriptcase uses the default value.

E-mail

Enter the origin email, that is the email sender.

Name

The sender's name displayed in the email.

Mandrill Configurations

[Mandrill](#) is a transactional email API for MailChimp users, ideal for sending data-driven emails.

API

It allows you to select an API already configured in **Tools > API** or set a new one here by selecting - **custom** -. In this case, you see some options according to the selected Gateway.

To use an API in a published project, it is necessary to perform the [Configuration of this API in the production environment](#), in the API menu.

Gateway

Select the way to send the email. [Mandrill](#) is a transactional email API for MailChimp users, ideal for sending data-driven emails.

API KEY

Enter the key obtained from the origin site of your API.

E-mail

Enter the origin email, that is the email sender.

Name

The sender's name displayed in the email.

For more information about [mandrill](#)

Amazon SES Configurations

Amazon Simple Email Service [Amazon SES](#) is an email sending service designed to assist in sending marketing emails, notifications, and transactional messages.

To use an API in a published project, it is necessary to perform the [Configuration of this API in the production environment](#), in the API menu.

API KEY

Enter the key obtained from the origin site of your API.

API Secret

Enter the secret access key of your account.

Region

Amazon SES has endpoints in many countries, to reduce network latency, inform the region of the endpoint closest to your application. [See the regions](#).

E-mail

Enter the origin email, that is the email sender.

Name

The sender's name displayed in the email.

For more information about [Amazon SES](#)

Export Settings

It allows the definition of the default values of the interface for sending e-mails used by the end user of the application.

To

Set the default value for the field in the application's end-user email sending interface.

Whether or not to inform a default value for the field is the choice of the developer, who can choose to activate the **empty attribute**, use a **global variable** or inform a **fixed text**.

Whether using the variable or fixed text in the field, if you choose to inform more than two e-mails, they must be separated by **,** or **;**

Empty attribute

When choosing not to inform a value, the developer forces the user to inform one or more destination e-mails.

Global variable

In this case, just add the variable to the value of the attribute containing the field's default email list.

fixed text

The developer can define one or more default emails directly in the attribute without using a variable.

Example of displaying the (To) field in the email sending user interface

Below is an example of how the emails defined by the developer will be displayed on the sending screen to the application user. In this screen the user can remove the default values previously defined by the developer by clicking on **X** or can add new emails to the field.

It has copy

Defines the behavior of the **Copy (cc)** attribute in the submission screen used by the end user.

It has three possible configurations:

No

In this case the **Copy (cc)** attribute will not be available in the application, making it impossible to send emails with Copy(cc).

Yes

Neste caso o atributo **Cópia (cc)** estará disponível na aplicação para a configuração do desenvolvedor e na interface de envio de e-mail do usuário.

Hidden

In this case the **Copy (cc)** attribute will be available **only** for the developer configuration. The **Copy (cc)** field will not be displayed on the user's email sending interface screen, thus making it impossible to change the default values defined by the developer.

In this case, the email will always be sent with a copy to the emails configured by the developer.

Copy (CC)

Set the default value for the field in the application's end-user email sending interface.

Whether or not to inform a default value for the field is the choice of the developer, who can choose to activate the **empty attribute**, use a **global variable** or inform a **fixed text**.

Whether using the variable or fixed text in the field, if you choose to inform more than two e-mails, they must be separated by **,** or **;**.

Empty attribute

When choosing not to inform a value, the developer forces the user to inform one or more destination e-mails.

Global variable

In this case, just add the variable to the value of the attribute containing the field's default email list.

fixed text

The developer can define one or more default emails directly in the attribute without using a variable.

It has blind carbon copy (bcc)

Defines the behavior of the **Copy (cc)** attribute in the submission screen used by the end user.

It has three possible configurations:

No

In this case the **Copy (cc)** attribute will not be available in the application, making it impossible to send emails with Copy(cc).

Yes

Neste caso o atributo **Cópia (cc)** estará disponível na aplicação para a configuração do desenvolvedor e na interface de envio de e-mail do usuário.

Hidden

In this case the **Copy (cc)** attribute will be available **only** for the developer configuration. The **Copy (cc)** field will not be displayed on the user's email sending interface screen, thus making it impossible to change the default values defined by the developer.

In this case, the email will always be sent with a copy to the emails configured by the developer.

Blind carbon copy (BCC)

Set the default value for the field in the application's end-user email sending interface.

Whether or not to inform a default value for the field is the choice of the developer, who can choose to activate the **empty attribute**, use a **global variable** or inform a **fixed text**.

Whether using the variable or fixed text in the field, if you choose to inform more than two e-mails, they must be separated by **,** or **;**.

Empty attribute

When choosing not to inform a value, the developer forces the user to inform one or more destination e-mails.

Global variable

In this case, just add the variable to the value of the attribute containing the field's default email list.

fixed text

The developer can define one or more default emails directly in the attribute without using a variable.

Subject

Sets the default value for the field in the application's end-user email sending interface.

The developer can choose to define a default value using **global variable**, **lang variable**, informing a **fixed text** or can choose not to define a default text leaving the **attribute empty**.

The default value defined by the developer can be changed by the application user.

Subject attribute configuration example

Subject field example in User interface

Body

Sets the default value for the field in the application's end-user email sending interface.

The developer can choose to define a default value using **global variable**, **lang variable**, informing a **fixed text** or can choose not to define a default text leaving the **attribute empty**.

The default value defined by the developer can be changed by the application user.

Subject attribute configuration example

Subject field example in User interface

- [Export Setting](#)

Grid Export PDF

Check the settings available in the grid's PDF Export.

General settings

Export with password

This option defines the password used to open the exported file.

If this **option is disabled** the file can be opened by anyone who has access, if this option is enabled, a password must be defined that must be informed when trying to open the file.

This option does not prevent the exported file from downloading.

Example of the password request screen:

Password

When enabling the option **Export with password** this attribute will be displayed for the definition of the password to access the file, which can contain between 1 and 255 alphanumeric characters.

If no password is informed, the file will be generated without a password to access the file.

The file password can be set in two ways:

Entering the password directly

In this way, the exported files will always have the same access password.

Using a global variable

In this way the file password can be dynamically generated.

Select Columns

This attribute controls the display of the **Select Columns** tab in the generated application, which allows the user to define the fields that must be included in the export.

The fields positioned **to the right** in blue will be present in the export, whereas the fields **to the left** in red are outside the exported file.

PDF chart level selection

This attribute controls the display of the level selection option for the graph that will be generated in the PDF export.

When enabled, on the PDF export configuration screen, a list of fields that make up the current application break will be displayed.

Example of the Select level option

In the above image, the application has a grouping with three fields (levels).

- The **Level 1** would be the **Country**.
- The **Level 2** would be the **Creditlimit**.
- The **Level 3** would be the **Year of Birthdate**.

The selected level defines the amount of graphics that will be generated in the file, so when selecting level 3 of the grouping, as in the image, the PDF will be generated with 3 graphics, one for each level/field.

Selecting page break per level

This attribute enables the Fields for page break option, in the end-user export configuration screen, which defines the fields that will jump from page in the generated PDF.

Example:

Assuming that the user selects the **Year of Birthdate** field.

The PDF will be generated with each year of birth occupying its own page.

Year of Birthdate All records with the same year will be displayed on the page.

Open PDF Directly

This attribute defines whether or not the file access buttons are displayed after exporting.

If Disabled

The export screen will be displayed on the same application tab where the progress bar will be displayed with the file access buttons, allowing the user to choose between viewing the file, downloading it or returning to the source application.

The screen displayed will be as follows:

- **Preview** - Opens the generated file in a browser tab.
- **Download** - Download the generated file.
- **Back** - Returns to the source application.

When enabling the option to generate the PDF directly, the **Display progress bar** attribute will be available.

Show progress bar

Only available when the attribute **Generate PDF Directly** is enabled, this flag controls the display of the progress bar when performing an export.

If enabled, a progress bar like this will be displayed where it is possible to follow the file generation process.

When not used, the progress bar will not be displayed when performing the export, in which case the user will not have any feedback on the progress of the process, which can be time consuming depending on the application used.

We recommend using the **display progress bar** when the amount of data processed is high or if using graphing.

Progress bar example

Default values settings and items to end-user export interface

Configurable PDF

Defines whether or not to display the export configuration screen for the application's end user.

When enabled, this feature enables the **PDF Configuration** screen, allowing the application user to configure the file in the best way, according to the options provided by the developer in the **PDF configurations available to the end user** field.

The developer must set the default values for the fields available for user editing.

If disabled, the user will not be able to configure the PDF, the file will be generated according to the settings defined by the developer.

User setup screen example

Grid Export modules

Defines the query modules that will be added to the exported file.

If the **Grid export modules** field is added for user editing, the values defined by the developer will be the default value of the field in the user configuration interface.

The **Graph** and **Summary** options are only available when there is one or more [grouping](#) configured in the application and when their respective modules are enabled in the menu [Grid Modules](#) { :target='_blank'}.

Example

Grid export module configuration:

Example of the Export modules field in the application's user configuration interface:

Summary export modules

This option allows the developer to choose which modules will be available in the summary export. The options will be marked to be exported, however the user can change the modules at runtime.o.

If the field **Summary export modules** is added for user editing, the values defined by the developer will be the default value of the field in the user configuration interface.

The **Graph** and **Summary** options are only available when there are one or more [Breaks](#) configured in the application and when their respective modules are enabled in the [Grid Modules](#) { link: target='_blank'}.

Example

Summary Export Modules Configuration:

On execution, the Summary option will be disabled:

Print Type

Allows you to set the print mode of the file (Economic, Color).

Economical: Black and white printing Color: Color Printing

PDF Format

This option allows you to define the format of the report pages (letter, A4, etc).

PDF Orientation

Allows you to define whether the print will be in Portrait or Landscape orientation.

Generate bookmarks

This option creates bookmarks, which facilitate navigation between pdf records.

If the option to generate bookmarks is enabled when exporting the PDF, bookmarks will be generated in the upper left corner of the screen, as shown in the image below:

Bookmarkers will only be generated if a group by is defined in the application.

Information that appears if the bookmarkers option is enabled:

- Breakage information
- Information about the query totalization
- Information about the query summary

Display header in all pages

Allows the header to be displayed even if it is not available in the query.

This option, by default, is disabled in the pdf configuration interface, causing the header to be displayed. To enable this option in the pdf configuration interface, uncheck the **Display title on all pages** option box.

Display the title on all pages

This option will display the column headings on all pages of the PDF. If this option is unchecked, the title will only be displayed on the first page.

Display title below each Group By

When this option is enabled, it will display a box already checked by default in the PDF configuration, where you can uncheck it if desired. If the box is checked, it will display the column headings in the PDF in all available groupings.

Compressed PDF

It generates the .PDF file compressed in .zip format, allowing the reduction of the generated file.

This option makes PDF generation a little more time consuming.

PDF Settings

Records per Page

Allows you to define the number of lines per page of the query that will be displayed in the file.

Records per page in the summary

Allows you to define the number of lines per page of the summary that will be displayed in the file.

Complete lines to footer

Complete with (empty) lines to the footer.

Page numbering format

Page Numbering Format whether it will be simple(1,2,3,4,5,...), Full(1/n, 2/n, 3/n,...) or not use numbering.

Height of page numbering

Allows you to align the numbering vertically, at the top or bottom of the page.

Horizontal position of page numbering

Allows you to horizontally align the page numbering (Left, Center, Right).

Margin

The value in millimeters to be applied to the PDF margins must be filled in (Top, Bottom, Right, Left). Mais sobre o texto original

The filling of the value in millimeters applies to the margin (up, down, right and left).

print background

Allows you to print background on the PDF file.

JS execution time

Maximum time (in seconds) the server waits when running JS.

Timeout for chart's image creation

Allows you to define whether the application's graphics will be displayed in the PDF.

Word

General Settings

Export with password

This option defines the password used to open the exported file.

If this **option is disabled** the file can be opened by anyone who has access, if this option is enabled, a password must be defined that must be informed when trying to open the file.

This option does not prevent the exported file from downloading.

Example of the password request screen:

Password

When enabling the option **Export with password** this attribute will be displayed for the definition of the password to access the file, which can contain between 1 and 255 alphanumeric characters.

If no password is informed, the file will be generated without a password to access the file.

The file password can be set in two ways:

Entering the password directly

In this way, the exported files will always have the same access password.

Using a global variable

In this way the file password can be dynamically generated.

Select Columns

This attribute controls the display of the **Select Columns** tab in the generated application, which allows the user to define the fields that must be included in the export.

The fields positioned **to the right** in blue will be present in the export, whereas the fields **to the left** in red are outside the exported file.

Open WORD Directly

This attribute defines whether or not the file access buttons are displayed after exporting.

If Disabled

The export screen will be displayed on the same application tab where the progress bar will be displayed with the file access buttons, allowing the user to choose between viewing the file, downloading it or returning to the source application.

The screen displayed will be as follows:

- **Preview** - Opens the generated file in a browser tab.
- **Download** - Download the generated file.

- **Back** - Returns to the source application.

Default values settings and itens to end-user export interface

Word configurable

Defines whether or not to display the export configuration screen at runtime.

If Enabled

A screen with configuration options for the exported file will be displayed, allowing the end user to configure the export the best way.

Configuration options must be defined by the developer in the **WORD settings available to the end user** field.

In this case, the settings defined by the developer will serve as default values for the user configuration screen.

Setup screen example

If Disabled

In this case, the settings defined by the developer will be applied to the file generated in the export.

Grid Export modules

This option allows the developer to choose which modules will be available when exporting the grid. The options will be marked to be exported, however the user can change the modules at runtime.

Example:

Disabling the Summary option:

On execution, the Summary option will be disabled:

Summary export modules

This option allows the developer to choose which modules will be available in the summary export. The options will be checked to be exported, however the user can change the modules at runtime.

Exemple:

No option disabled in Summary export:

On execution, the Summary option will be disabled:

Word settings

Lines per page in grid

Allows you to define the number of lines per page of the grid that will be displayed in the file.

Lines per page in summary

Allows you to define the number of lines per page of the summary that will be displayed in the file.

CSV

General Settings

Export with password

This option defines the password used to open the exported file.

If this **option is disabled** the file can be opened by anyone who has access, if this option is enabled, a password must be defined that must be informed when trying to open the file.

This option does not prevent the exported file from downloading.

Example of the password request screen:

Password

When enabling the option **Export with password** this attribute will be displayed for the definition of the password to access the file, which can contain between 1 and 255 alphanumeric characters.

If no password is informed, the file will be generated without a password to access the file.

The file password can be set in two ways:

Entering the password directly

In this way, the exported files will always have the same access password.

Using a global variable

In this way the file password can be dynamically generated.

Select Columns

This attribute controls the display of the **Select Columns** tab in the generated application, which allows the user to define the fields that must be included in the export.

The fields positioned **to the right** in blue will be present in the export, whereas the fields **to the left** in red are outside the exported file.

Open CSV Directly

This attribute defines whether or not the file access buttons are displayed after exporting.

If Disabled

The export screen will be displayed on the same application tab where the progress bar will be displayed with the file access buttons, allowing the user to choose between viewing the file, downloading it or returning to the source application.

The screen displayed will be as follows:

- **Preview** - Opens the generated file in a browser tab.
- **Download** - Download the generated file.

- **Back** - Returns to the source application.

Default values settings and itens to end-user export interface

Configurable CSV

Sets whether or not to display it on the export configuration screen at runtime

If Enabled

A screen with configuration options for the exported file will be displayed, allowing the end user to configure the export the best way.

Configuration options must be defined by the developer in the **WORD settings available to the end user** field.

In this case, the settings defined by the developer will serve as default values for the user configuration screen.

Setup screen example

If Disabled

In this case, the settings defined by the developer will be applied to the file generated in the export.

Grid Export modules

This option allows the developer to choose which modules will be available when exporting the grid. The options will be marked to be exported, however the user can change the modules at runtime.

Example:

Disabling the Summary option:

On execution, the Summary option will be disabled:

Summary export modules

This option allows the developer to choose which modules will be available in the summary export. The options will be checked to be exported, however the user can change the modules at runtime.

Exemple:

No option disabled in Summary export:

On execution, the Summary option will be disabled:

Line separator

Allows you to set the line separator character.

Column separator

Allows you to define the separator character of columns and records.

Text delimiter

Allows you to define the character used to delimit the text of the columns.

Add label

Allows you to define whether the column label will be added to the file.

Excel

General Settings

Export with password

This option defines the password used to open the exported file.

If this **option is disabled** the file can be opened by anyone who has access, if this option is enabled, a password must be defined that must be informed when trying to open the file.

This option does not prevent the exported file from downloading.

Example of the password request screen:

Password

When enabling the option **Export with password** this attribute will be displayed for the definition of the password to access the file, which can contain between 1 and 255 alphanumeric characters.

If no password is informed, the file will be generated without a password to access the file.

The file password can be set in two ways:

Entering the password directly

In this way, the exported files will always have the same access password.

Using a global variable

In this way the file password can be dynamically generated.

Select Columns

This attribute controls the display of the **Select Columns** tab in the generated application, which allows the user to define the fields that must be included in the export.

The fields positioned **to the right** in blue will be present in the export, whereas the fields **to the left** in red are outside the exported file.

Open Excel Directly

This attribute defines whether or not the file access buttons are displayed after exporting.

If Disabled

The export screen will be displayed on the same application tab where the progress bar will be displayed with the file access buttons, allowing the user to choose between viewing the file, downloading it or returning to the source application.

The screen displayed will be as follows:

- **Preview** - Opens the generated file in a browser tab.
- **Download** - Download the generated file.

- **Back** - Returns to the source application.

Default values settings and itens to end-user export interface

Excel Configurable

Defines whether or not to display the export configuration screen at runtime.

If Enabled

A screen with configuration options for the exported file will be displayed, allowing the end user to configure the export the best way.

The configuration options must be defined by the developer in the field **Excel settings available to the end user.**

In this case, the settings defined by the developer will serve as default values for the user configuration screen.

Setup screen example

If Disabled

In this case, the settings defined by the developer will be applied to the file generated in the export.

Grid Export modules

This option allows the developer to choose which modules will be available when exporting the grid. The options will be marked to be exported, however the user can change the modules at runtime.

Example:

Disabling the Summary option:

On execution, the Summary option will be disabled:

Summary export modules

This option allows the developer to choose which modules will be available in the summary export. The options will be marked to be exported, however the user can change the modules at runtime.

Example:

No option disabled in Summary export:

On execution, the Summary option will be disabled:

Format

Allows you to define the format of the generated document (xls or xlsx).

Export with totals

Allows the display of the total when exporting to Excel.

XML

General settings

![Configuração de exportação Word da consulta][img_conf_geral_exportar_xml]

Export with password

This option defines the password used to open the exported file.

If this **option is disabled** the file can be opened by anyone who has access, if this option is enabled, a password must be defined that must be informed when trying to open the file.

This option does not prevent the exported file from downloading.

Example of the password request screen:

Password

When enabling the option **Export with password** this attribute will be displayed for the definition of the password to access the file, which can contain between 1 and 255 alphanumeric characters.

If no password is informed, the file will be generated without a password to access the file.

The file password can be set in two ways:

Entering the password directly

In this way, the exported files will always have the same access password.

Using a global variable

In this way the file password can be dynamically generated.

Select Columns

This attribute controls the display of the **Select Columns** tab in the generated application, which allows the user to define the fields that must be included in the export.

The fields positioned **to the right** in blue will be present in the export, whereas the fields **to the left** in red are outside the exported file.

Open XML Directly

This attribute defines whether or not the file access buttons are displayed after exporting.

If Disabled

The export screen will be displayed on the same application tab where the progress bar will be displayed with the file access buttons, allowing the user to choose between viewing the file, downloading it or returning to the source application.

The screen displayed will be as follows:

- **Preview** - Opens the generated file in a browser tab.
- **Download** - Download the generated file.

- **Back** - Returns to the source application.

Default values settings and itens to end-user export interface

Configurable XML

Defines whether or not to display the export configuration screen at runtime.

If Enabled

A screen with configuration options for the exported file will be displayed, allowing the end user to configure the export the best way.

The configuration options must be defined by the developer in the field **Excel settings available to the end user.**

In this case, the settings defined by the developer will serve as default values for the user configuration screen.

Setup screen example

If Disabled

In this case, the settings defined by the developer will be applied to the file generated in the export.

Grid Export modules

This option allows the developer to choose which modules will be available when exporting the grid.

The options will be marked to be exported, however the user can change the modules at runtime.

Example:

Disabling the Summary option:

On execution, the Summary option will be disabled:

Summary export modules

This option allows the developer to choose which modules will be available in the summary export. The options will be marked to be exported, however the user can change the modules at runtime.

Example:

No option disabled in Summary export:

On execution, the Summary option will be disabled:

Format

Allows you to define the format of the generated document (xls or xls).

Export with totals

Allows the display of the total when exporting to Excel. [img_conf_geral_exportar_xml]:

/assets/images/docs/app/comum/exportacao/conf_valores_padrao_usr/xml/conf_geral_exportar_xml.png

JSON

General settings

Export with password

This option defines the password used to open the exported file.

If this **option is disabled** the file can be opened by anyone who has access, if this option is enabled, a password must be defined that must be informed when trying to open the file.

This option does not prevent the exported file from downloading.

Example of the password request screen:

Password

When enabling the option **Export with password** this attribute will be displayed for the definition of the password to access the file, which can contain between 1 and 255 alphanumeric characters.

If no password is informed, the file will be generated without a password to access the file.

The file password can be set in two ways:

Entering the password directly

In this way, the exported files will always have the same access password.

Using a global variable

In this way the file password can be dynamically generated.

Select Columns

This attribute controls the display of the **Select Columns** tab in the generated application, which allows the user to define the fields that must be included in the export.

The fields positioned **to the right** in blue will be present in the export, whereas the fields **to the left** in red are outside the exported file.

Generate JSON directly

This attribute defines whether or not the file access buttons are displayed after exporting.

If Disabled

The export screen will be displayed on the same application tab where the progress bar will be displayed with the file access buttons, allowing the user to choose between viewing the file, downloading it or returning to the source application.

The screen displayed will be as follows:

- **Preview** - Opens the generated file in a browser tab.
- **Download** - Download the generated file.

- **Back** - Returns to the source application.

Default values settings and itens to end-user export interface

Configurable JSON

Defines whether or not to display the export configuration screen at runtime.

If Enabled

A screen with configuration options for the exported file will be displayed, allowing the end user to configure the export the best way.

Configuration options must be defined by the developer in the **JSON settings available to the end user.** field.

In this case, the settings defined by the developer will serve as the default values for the user configuration screen.

Setup screen example

If Disabled

In this case, the settings defined by the developer will be applied to the file generated in the export

Grid Export modules

This option allows the developer to choose which modules will be available when exporting the grid.

The options will be marked to be exported, however the user can change the modules at runtime.

Example:

Disabling the Summary option:

On execution, the Summary option will be disabled:

Módulos de exportação do resumo

Summary export modules This option allows the developer to choose which modules will be available in the summary export.

The options will be marked to be exported, however the user can change the modules at runtime.

Example:

No option disabled in Summary export:

On execution, the Summary option will be disabled:

Use Label

Allows the label used in the application field to be sent in the JSON attribute.

Formatted Value

Allows you to display the formatted numeric value or the displayed value in the database.

Impressão HTML

General settings

Export with password

This option defines the password used to open the exported file.

If this **option is disabled** the file can be opened by anyone who has access, if this option is enabled, a password must be defined that must be informed when trying to open the file.

This option does not prevent the exported file from downloading.

Example of the password request screen:

Password

When enabling the option **Export with password** this attribute will be displayed for the definition of the password to access the file, which can contain between 1 and 255 alphanumeric characters.

If no password is informed, the file will be generated without a password to access the file.

The file password can be set in two ways:

Entering the password directly

In this way, the exported files will always have the same access password.

Using a global variable

In this way the file password can be dynamically generated.

Select Columns

This attribute controls the display of the **Select Columns** tab in the generated application, which allows the user to define the fields that must be included in the export.

The fields positioned **to the right** in blue will be present in the export, whereas the fields **to the left** in red are outside the exported file.

Open directly

This attribute defines whether or not the file access buttons are displayed after exporting.

If Disabled

The export screen will be displayed on the same application tab where the progress bar will be displayed with the file access buttons, allowing the user to choose between viewing the file, downloading it or returning to the source application.

The screen displayed will be as follows:

- **Preview** - Opens the generated file in a browser tab.
- **Download** - Download the generated file.

- **Back** - Returns to the source application.

Default values settings and itens to end-user export interface

Configurable Print HTML

Defines whether or not to display the export configuration screen at runtime.

If Enabled

A screen with configuration options for the exported file will be displayed, allowing the end user to configure the export the way the best way.

The configuration options must be defined by the developer in the field **HTML print settings available to the end user**.

In this case, the settings defined by the developer will serve as the default values for the user configuration screen.

Setup screen example

If Disabled

In this case, the settings defined by the developer will be applied to the file generated in the export

Grid Export modules

This option allows the developer to choose which modules will be available when exporting the grid.

The options will be marked to be exported, however the user can change the modules at runtime.

Defines the modules of the grid that will be added to the exported file.

The **Graph** and **Summary** options are only available when there are one or more [Group By](#) configured and when their modules are enabled in the menu [Grid Modules](#).

Exemplo:

Disabling the Summary option:

On execution, the Summary option will be disabled:

Summary export modules

This option allows the developer to choose which modules will be available in the summary export. The options will be marked to be exported, however the user can change the modules at runtime.

Example:

Disabling the Summary option:

On execution, the Summary option will be disabled:

Print mode

Allows you to define the print content of the file (Both, Current page, Full report).

Print Type

Permite definir o tipo de impressão do arquivo. (Ambos, Preto e Branco , Colorido).

Print settings

Records per page

Allows you to define the number of lines per page of the query that will be displayed in the file.

Records per page in the summary

Allows you to define the number of lines per page of the summary that will be displayed in the file.

Print background

Allows you to define whether the background will be displayed when printing.

RTF

General settings

Select Columns

This attribute controls the display of the **Select Columns** tab in the generated application, which allows the user to define the fields that must be included in the export.

The fields positioned **to the right** in blue will be present in the export, whereas the fields **to the left** in red are outside the exported file.

Open RTF Directly

This attribute defines whether or not the file access buttons are displayed after exporting.

If Disabled

The export screen will be displayed on the same application tab where the progress bar will be displayed with the file access buttons, allowing the user to choose between viewing the file, downloading it or returning to the source application.

The screen displayed will be as follows:

- **Preview** - Opens the generated file in a browser tab.
- **Download** - Download the generated file.
- **Back** - Returns to the source application.

Grid SQL Settings

SQL Settings

This interface allows configuring the related database settings, such as the SQL statement, the used database connection, case sensitive, and others.

ATTRIBUTE	VALUE	DESCRIPTION
SQL Select Statement	<pre>SELECT customerid, companyname, contactname, contacttitle, birthdate, country, regionid, stateid, city,</pre>	
Limit	<input type="text"/>	It sets the number of records to be retrieved from the SQL statement.
SQL Preparation	<input type="text"/>	
Connection	<input type="text" value="conn_example"/>	Connection name to access the database.
Use Customized Message	<input type="checkbox"/>	Use a customized error message when the application has no records.
No Records Message	<input type="text"/>	When the application has no records, it will display this customized text.
Font	<input type="text"/> Aa	Font face of the error message.
Font Size	<input type="text" value="12"/>	Font size of the error message.
Font Color	<input type="text" value="#000000"/>	Font color of the error message.
Variable for Table	<input type="text"/>	Variable name used for replacing the table name. Please indicate the name of the table that will be replaced by the variable value.
Fields Variables	<div style="border: 1px solid black; padding: 5px;"> <p>Variable</p> <input type="text"/> <p>customerid</p> </div>	Variables for substitution of the field names on the application. For each dynamically determined field, inform the name of the variable and the field that will be substituted.
Case Sensitive	<input checked="" type="checkbox"/>	Use case sensitive.

Grid

SQL configuration

SQL Select Statement

It allows you to define the primary SQL of the application. You can edit this SQL to add or delete fields.

Limit

Lets you limit the display in the number of records retrieved by SQL query.

SQL Preparation

You can enter SQL commands or procedure names to execute them before the primary SQL of the application.

Connection

It allows defining the database connection of the application. You can change the connection to another one that has the same table.

Use Customized Message

Lets you define to display the “no records” message or not.

No Records Message

Lets you set the message when the application has no records.

Font

This option is available when using the “Use Customized Message” option. It lets you set the font for the message.

Font Size

This option is available when using the “Use Customized Message” option. It lets you to set the font size.

Font Color

This option is available when using the “Use Customized Message” option. It lets you to set the font color.

Variable for Table

It allows to use a variable to change a part of the string containing the table name.

Fill the first input with the name of the variable (replace to). The second input you should fill with the part of the name of the table you want to replace (replace from).

Fields Variables

It allows to use a variable to change a part of the string containing the field name.

Fill the first input with the name of the variable (replace to). The second input you should fill with the part of the name of the field you want to replace (replace from).

Case sensitive

It defines if the database connection uses case sensitive or not.

Creating Parameters for Applications Links

Parameters are used to pass values between applications. When the target application is a query, we recommend adding a global variable in the WHERE clause to filter the records that meet a specific condition.

To configure the parameter, in the destination application, access the SQL option in the left side menu.

We must edit the SQL of the grid application, adding the WHERE clause and the field that receive the value through a global

variable(as shown in the image below).

SQL Settings	
ATTRIBUTE	VALUE
SQL Select Statement	<pre>SELECT orderid, customerid, employeeid, orderdate, requireddate, shippeddate, shipvia, freight, priceorder, shipcountry, shipregion, shipstate, shipcity, shipname, shipaddress, shippostalcode FROM orders WHERE orderid = [orders]</pre>

after edition, we must generate the source code of the application clicking on the button -

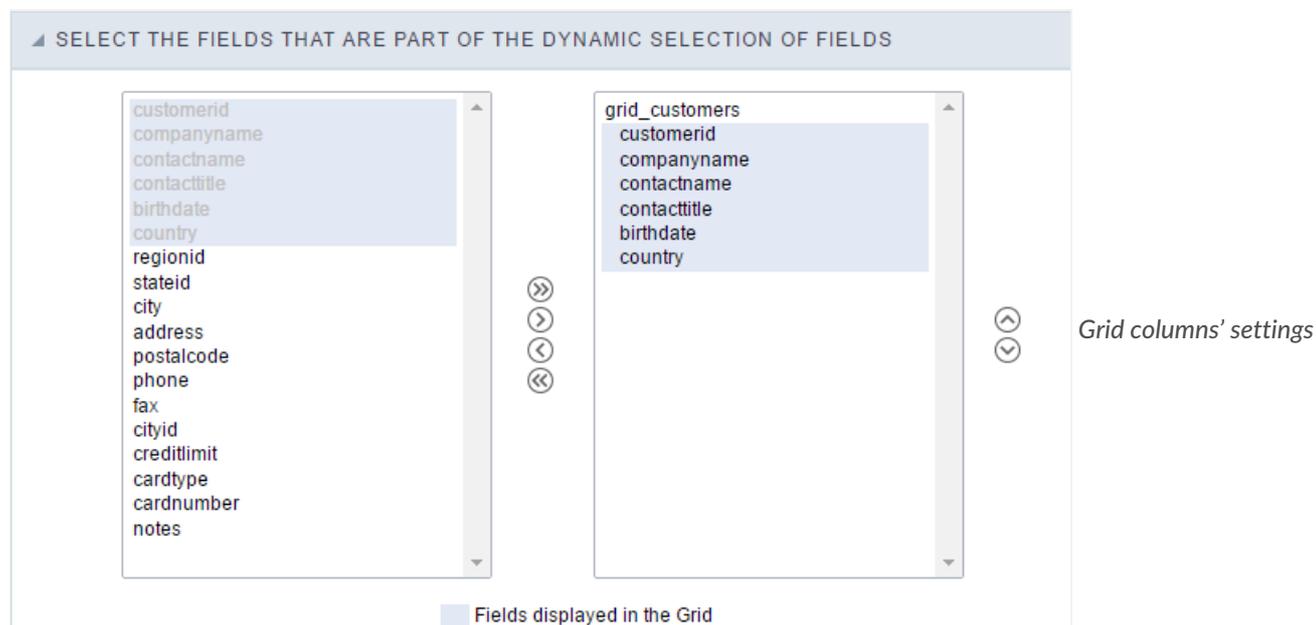

- or using the hotkey **F8**.

[Related Videos >](#)

Columns

You can display or hide fields dynamically inside the Grid application using the button “Columns”. This option is used to select the fields/columns that will be part of this dynamic fields selection.

The box in the left represents the fields that are NOT being displayed within the dynamic fields selection.

The box in the right represents the fields that are being displayed within the dynamic fields selection.

Sorting Settings

They define the fields available for sorting options in the runtime application and their behavior.

To configure the application's initial ordering, it is necessary to add a **order by** in the query query in the **SQL** menu.

Sort Fields
?

Select the fields that allow sorting.

On/Off

birthdate	Descendant	country	Ascendant
regionid	Descendant	stateid	Ascendant
city	Ascendant	address	Ascendant
postalcode	Ascendant	phone	Ascendant
fax	Ascendant	cityid	Descendant
creditlimit	Descendant	cardtype	Ascendant
cardnumber	Ascendant	notes	Ascendant

Advanced sorting
?

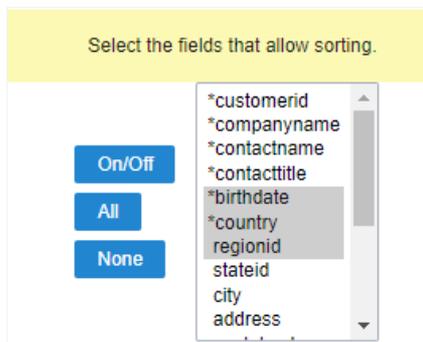

ATTRIBUTE	VALUE	DESCRIPTION
Sorting fields	<input checked="" type="radio"/> Use fields displayed in the application <input type="radio"/> Use columns <input type="radio"/> Define fields manually	Default for fields that will be displayed in the advanced sorting
Display icon only on mouseover	<input checked="" type="checkbox"/>	Displays the sorting icon only when the mouse is on the label of the field.
Icon type	Defined by the theme	Choose whether the sort icons next to the field label will be the images defined in the application's theme or Font Awesome icons.

The settings in the **Fields with Sorting** block refer to the application fields, whereas the **Advanced Sorting** options refer to the button on the toolbar.

Fields with Ordering

This definition is made using the **On/Off** button which, when activated, inverts the current definition of the selected fields.

By default, the first six fields of the application are enabled to be available for sorting

The active fields for sorting in the application are represented by the asterisk next to the name. In the example below the **birthdate** and **address** fields will be available for sorting while the **stateid** field will not be.

In the application, the fields available for sorting can be identified by the sort icon displayed on the hover (when passing the mouse over) of the columns.

So that the icons are always displayed we must change the option **Display icon only on mouseover** in the advanced settings below.

Address	↕	Region	State
Obere Str. 57		East South Central	Salta

Classify Fields

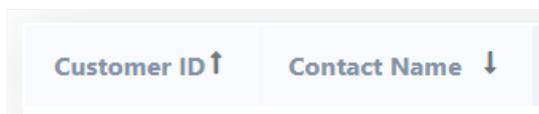

Sort Fields			
customerid	Ascendant ▼	companyname	Ascendant ▼
contactname	Ascendant ▼	contacttitle	Ascendant ▼
birthdate	Descendant ▼	country	Ascendant ▼
regionid	Descendant ▼	stateid	Ascendant ▼
city	Ascendant ▼	address	Ascendant ▼
postalcode	Ascendant ▼	phone	Ascendant ▼

In this option all fields of the application will be displayed, it defines the initial behavior of the field when clicked to perform the ordination.

For example, the **customerid** field is selected to perform an **Ascending** sort on the first click, whereas the **contactname** field is set to start **Descending** sorting.

customerid	Ascendant ▼
contactname	Descendant ▼

This configuration can also be identified in the application according to the icon displayed on the hover of the field

This In this way, when clicking on the **contactname** field, a descending order will be performed at first.

Advanced Sorting

Sorting These options define the fields available in the sort button on the toolbar, as well as the behavior and icons of the fields available for sorting in the application.

Advanced sorting	
ATTRIBUTE	VALUE
Sorting fields	<input checked="" type="radio"/> Use fields displayed in the application <input type="radio"/> Use columns <input type="radio"/> Define fields manually
Display icon only on mouseover	<input checked="" type="checkbox"/>

Numeric fields	<input type="radio"/> <input checked="" type="radio"/>

Sorting fields

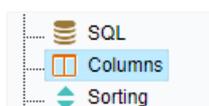

In this attribute we define the fields available for sorting in the **sort** field of the toolbar.

Use fields displayed in the application

The fields defined for display in the application in the **field placement** menu will be available for sorting.

Use columns

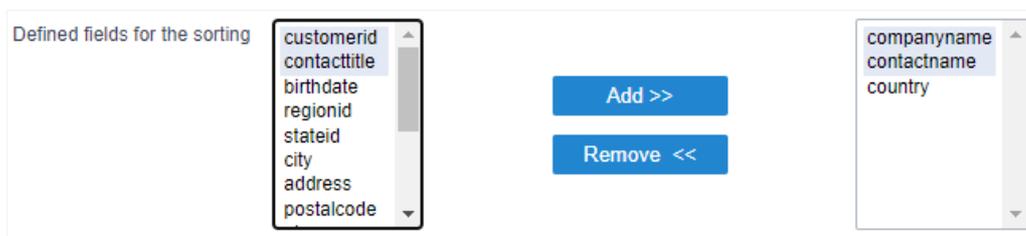

In this option, the **order** button inherits all the fields selected to integrate the columns button. These fields are defined in the **Columns** menu.

Manually define fields

When selecting this option a new attribute, **Fields defined for sorting** will be displayed to define the available fields in the sort button.

The highlighted fields, for example **customerid** and **address**, are the fields that are currently being displayed in the application.

Display icon only on mouseover

This attribute defines if the sort icon will always be visible or if it will only be available on mouseover of the field.

Show icon on mouseover only option disabled

Customer ID ↓↕	Contact Name ↓↕	Company Name ↓↕
ALFKI	Maria Anders s	Alfreds Futterkiste
ANATR	Ana Trujillo	Ana Trujillo Emparedados y helados

Display icon on mouseover only option enabled

Customer ID	Contact Name ↓↕	Company Name
ALFKI	Maria Anders s	Alfreds Futterkiste
ANATR	Ana Trujillo	Ana Trujillo Emparedados y helados

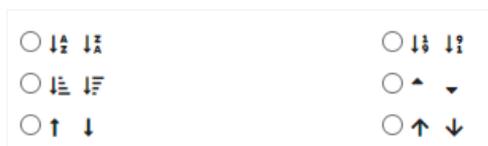

Icon Type

Defines if the icon will be inherited by the theme when selecting **Defined by theme** or if it will use **font Awesome** which enables two other attributes: **Alphanumeric Fields** and **Numeric Fields**.

In the project theme it is not possible to select the **font Awesome** option to define the sorting icons.

Alphanumeric Fields

Defines the sort icon for all alphanumeric fields in the application.

Numerical Fields

Defines the sort icon for all numeric fields in the application.

<input type="radio"/> 1/2 1/3	<input type="radio"/> 1/2 1/3
<input type="radio"/> 1/3 1/4	<input type="radio"/> ^ v
<input type="radio"/> ↑ ↓	<input type="radio"/> ↑ ↓

Grid Group Label

With this option, you can insert one or more titles for the columns in the application, allowing to modify its size, color, font, and position.

The Group Label doesn't work with a dynamic display of fields.

The screenshot displays the 'Group Label' configuration interface. At the top, there is a header bar with a left arrow and the text 'Group Label', and a question mark icon on the right. Below this is a grid with a header row containing 'Group name' and a trash icon, and three data columns labeled 'Title_Summary', 'Count_Reg', and 'rule1'. Below the grid are two blue buttons: 'Add Row' and 'Save'. A 'Cell Properties' dialog box is open in the foreground, showing the following settings for the 'Group name' cell: Title (Group name), Font (Aa), Font size (dropdown), Horizontal alignment (Center), Vertical Alignment (Middle), Font Color (color picker), and Background Color (color picker). At the bottom of the dialog are 'Update' and 'Cancel' buttons. The text 'Editing Group' is visible on the right side of the dialog.

Label cell properties

Title

It allows you to define a Title for the Group Label.

Font

Set the font family for the group label title.

Font Size

Set the font size for the group label title.

Horizontal Alignment

Define the horizontal alignment of the group label title. Left, Center, or Right.

Vertical Alignment

Define the vertical alignment of the group label title. Middle, Bottom, or Top.

Font Color

Set the font color for the group label title.

Background Color

Define a background color for the group label title.

Configuring Security in Grid

Use security

With this option enabled, when accessing the application, an “unauthorized user” message will be displayed, preventing access to the application.

When enabled, application access is only possible through the macro **sc_apl_status** or through **security module**.

[Click here](#) to access the macro documentation sc_apl_status.

In the development environment, the use of the above options for testing purposes may be suppressed, preventing the password being requested or access being blocked at each execution of the applications. To do this, disable the options “Enable security usage” and “Enable password usage” in the menu **Configuration > My Scriptcase**.

Security exit url

Defines which application the user will be redirected to after the “unauthorized user” warning.

Use password

When enabling the option, you will be asked to define a password for accessing the application.

When running the application using the active password, you will be asked for the password before accessing the application.

The password will be requested regardless of the “use security” setting or the use of the security module.

Request password only once

This option defines the behavior of the use password option.

When this option is enabled, the password will be requested only once per session.

When disabling, the password will be requested every time the application will be accessed.

Allow direct calling by URL

Allows an application to be called by typing the URL directly into browsers.

When disabled, when accessing the application by typing the URL directly, the invalid data error will be displayed. With this configuration, the application can only be accessed through a menu application, for example.

Configuring Security Cookies in Grid

HttpOnly

These are cookies that can be set by the server or by javascript but cannot be accessed in any way by javascript.

With the HTTPOnly parameter enabled, it is very difficult to steal a session through XSS because the javascript cannot read the content of these cookies.

A widely exploited attack in XSS is the theft of user session cookies. Theft of cookies is carried out through a javascript command that sends cookies to an external URL where the attacking user has control.

This option is enabled by default in all applications.

Session ID

Enables the session id that will be stored in cookies on the client side. This option embeds the session id directly in the URLs

This option is enabled by default in all applications.

Cookie Secure

With this option enabled, cookies are protected and can only be transmitted via secure communication. Therefore, they cannot be accessed through Javascript.

The HttpOnly option must also be enabled.

Configuring Security Headers in Grid

Disabling Auditor XSS

XSS is short for Cross-Site Scripting, which is an attack that consists of sending HTML with malicious JavaScript to a website.

It is a security attack that consists of sending HTML with malicious JavaScript to a website. If the website displays this HTML with JavaScript without filtering the malicious JavaScript code, the cookies sent by the website can be stolen and sent to an attacking website, so that it can be used to forge user sessions and access the website's user account without permissions.

Strict-Transport-Security

HSTS forces browsers to use HTTPS in the domain where it is enabled, instead of using HTTP.

When enabled, the default value is "max-age = 31536000".

The HSTS policy is set for one year (31536000 seconds). This period specifies the time the browser will access the server via HTTP

X-Frame-Options

The HTTP X-Frame-Options response header can be used to indicate whether or not the browser should render the page in a `<frame>`, `<iframe>`, `<embed>` " or '". This header provides protection against clickjacking, known as 'click swipe' - this vulnerability can steal relevant information and data from the user.

X-Frame-Options does not allow the rendering of a page in a frame, ensuring that the content of your page is not embedded in other sites

- **SAMEORIGIN:** The SAMEORIGIN directive allows the page to be loaded in a frame from the same source as the page itself. This option must be used so that the application with clickjacking protection can be used in the menu application.
- **DENY:** This directive completely disables page loading in a frame.

If no option is selected, the application can be used on any `<frame>`, `<iframe>`,

or `<object>`, allowing the application to be incorporated into another website.

X-Content-Type-Options

X-Content-Type-Options is used to protect against MIME detection vulnerabilities. With this option enabled, it prevents browsers from interpreting the page content (sniffing) and executing the data as code / tag. These vulnerabilities can occur when uploading a text file with a javascript code and the browser reading the content that is in the file and executing, even though it is just text and not part of the code.

With this enabled, the HTTP X-Content-Type-Options header is defined, by default, as "no detection".

Referrer-Policy

no-referrer.

The Referer header will be omitted completely. No reference information will be sent with requests.

no-referrer-when-downgrade.

This is the default behavior when no policy is specified, or if the value provided is invalid.

origin.

Only send the origin of the document as a reference. For example, a document at `https://example.com/page.html` will send the reference `https://example.com/`.

origin-when-cross-origin.

Sends the origin, path and query string when performing a same-origin request, but only sends the origin of the document in other cases.

same-origin.

The reference will be sent to sources on the same site, but requests between sources will not send reference information.

strict-origin.

Only send the document source as a reference when the security protocol level remains the same (HTTPS → HTTPS), but do not send it to a less secure recipient (HTTPS → HTTP).

strict-origin-when-cross-origin.

Sends the source, path and query string when performing a request from the same source, only sends the source when the security protocol level remains the same during an inter-source request (HTTPS → HTTPS), and sends no header to recipients less secure (HTTPS → HTTP)

unsafe-url.

Sends the source, path and query chain when performing any request, regardless of security.

Feature-Policy

The value of this header is a policy or set of policies that you want the browser to respect for a particular source.

The source whitelist can take on several different values:

- ``*:`` The feature is allowed in top-level navigation contexts and in nested navigation contexts (iframes).
- ``self:`` The feature is allowed in top-level navigation contexts and nested navigation contexts from the same source. It is not allowed in documents of cross origin in nested browsing contexts.
- ``none:`` The feature is not allowed in top-level browsing contexts and is not allowed in nested browsing contexts.
- ``<origin (s)>:`` specific sources for which to enable the policy (for example `https://example.com`).

Example 1 - Using only one directive Let's say you want to prevent all content from using the geolocation API on your site. You can do this by submitting a restricted 'none' whitelist to the geolocation resource:

Feature-Policy: ``geolocation 'none'``

Example 2 - Using more than one directive Functionalities within a policy are separated by semicolons.

Feature-Policy: `unsized-media 'none'; geolocation 'self' https://example.com; camera *;``

Directives

accelerometer

Controls whether the current document is allowed to collect information about the acceleration of the device

via the Accelerometer interface.

ambient-light-sensor

Controls whether the current document is allowed to collect information about the amount of light in the environment around the device through the AmbientLightSensor interface.

autoplay

Controls whether the current document is allowed to play the requested media automatically via the HTMLMediaElement interface. When this policy is disabled and there is no user action, the Promise returned by HTMLMediaElement.play () will reject it with a DOMException. The autoplay attribute on <audio> " and " elements will be ignored.

battery

Controls whether the use of the Battery Status API is allowed. When this policy is disabled, the Promise returned by Navigator.getBattery () will reject it with a NotAllowedError DOMException.

camera

Controls whether the current document is allowed to use inputs from video devices. When this policy is disabled, the Promise returned by getUserMedia () will reject it with a NotAllowedError DOMException.

display-capture

Controls whether or not the current document is allowed to use the getDisplayMedia () method to capture screen content. When this policy is disabled, the Promise returned by getDisplayMedia () will reject it with a NotAllowedError if permission is not obtained to capture the contents of the screen.

document-domain

Control whether the current document is allowed to place document.domain. When this policy is disabled, attempts to place document.domain will fail and cause a SecurityError DOMException to be thrown.

encrypted-media

Controls whether the current document is allowed to use the Encrypted Media Extensions (EME) API. When this policy is disabled, the Promise returned by Navigator.requestMediaKeySystemAccess () will reject it with a DOMException.

execution-while-not-rendered

Controls whether tasks should be performed in frames while they are not rendered (e.g. whether a frame is hidden or display: none).

execution-while-out-of-viewport

Controls whether tasks should be performed in frames while they are outside the visible viewing window.

fullscreen

Controls whether the current document is allowed to use Element.requestFullscreen (). When this policy is disabled, the returned Promise rejects it with a TypeError DOMException.

geolocation

Controls whether the current document is allowed to use the Geolocation interface. When the policy is disabled, calls to getCurrentPosition () and watchPosition () will cause function callbacks to be invoked with a PositionError of PERMISSION_DENIED.

gyroscope

Controls whether the current document is allowed to collect information about the orientation of the device through the Gyroscope interface.

layout-animations

Controls whether the current document is allowed to show layout animations.

legacy-image-formats

Controls whether the current document is allowed to show images in legacy formats.

magnetometer

Controls whether the current document is allowed to collect information about the orientation of the device through the Magnetometer interface.

microphone

Controls whether the current document is allowed to use inputs from audio devices. When this policy is disabled, the Promise returned by `MediaDevices.getUserMedia ()` will reject it with a `NotAllowedError`.

midi

Controls whether the current document is allowed to use the Web MIDI API. When this policy is disabled, the Promise returned by `Navigator.requestMIDIAccess ()` will reject it with a `DOMException`.

navigation-override

Controls the availability of mechanisms that enable the author of the page to take control over the behavior of spatial navigation, or to cancel completely.

oversized-images

Controls whether the current document is allowed to download and display large images.

payment

Controls whether the current document allows the use of the Payment Request API. When this policy is disabled, the `PaymentRequest ()` constructor will throw a `SecurityError DOMException`.

picture-in-picture

Controls whether the current document allows a video to be allowed to play in Picture-in-Picture mode via the corresponding API.

publickey-credentials-get

Controls whether the current document is allowed to use the Web Authentication API to retrieve already stored public key credentials, i.e. via `navigator.credentials.get ({publicKey: ..., ...})`.

sync-xhr

Controls whether the current document is allowed to make synchronous XMLHttpRequest requests.

usb

Controls whether the current document is allowed to use the WebUSB API.

vr

Controls whether the current document is allowed to use the WebVR API. When this policy is disabled, the Promise returned by `Navigator.getVRDisplays ()` will reject it with a `DOMException`. Keep in mind that the WebVR standard is in the process of being replaced by WebXR.

wake-lock

Controls whether the current document is allowed to use the Wake Lock API to indicate that the device should not go into a power saving mode.

screen-wake-lock

Controls whether the current document is allowed to use the Screen Wake Lock API to indicate whether or not the device should darken the screen.

xr-spatial-tracking

Controls whether or not the current document is allowed to use the WebXR Device API to interact with the WebXR session.

Content-Security-Policy

Content-Security-Policy is the name of an HTTP response header that modern browsers use to increase the security of the document (or web page).

The Content-Security-Policy header allows you to restrict resources such as JavaScript, CSS or just about anything the browser loads.

Directives**default-src**

The default-src directive defines the standard policy for fetching features such as JavaScript, Images, CSS, Fonts, AJAX requests, Frames, HTML5 Media. Not all directives go back to default-src. Refer to the Source List Reference for possible values.

DEFAULT-SRC Policy Example `default-src 'self' cdn.example.com;`

script-src

Defines valid JavaScript sources.

SCRIPT-SRC Policy Example `script-src 'self' js.example.com;`

style-src

Defines valid fonts for style sheets or CSS.

EXAMPLE__ STYLE-SRC POLICY `style-src 'self' css.example.com;`

img-src

Defines valid image sources.

Example of IMG-SRC Policy `img-src 'self' img.example.com;`

connect-src

Applies to XMLHttpRequest (AJAX), WebSocket, fetch (), `<a ping>` or EventSource. If not allowed, the browser emulates a 400 HTTP status code. `__Connect-SRC Policy Example__ connect-src 'self';``

font-src

Defines valid fonts for font resources (loaded via @ font-face).

FONT-SRC Policy Example `font-src font.example.com;``

object-src

Defines valid plug-in sources, for example `<object>` or `<applet>`.

Example OBJECT-SRC Policy `object-src 'self';`

media-src

Defines valid audio and video sources, for example `<audio>`, HTML5, `<video>` elements.

Example of MEDIA-SRC Policy `media-src media.example.com;`

frame-src

Defines valid fonts for loading frames. In CSP, Level 2 `frame-src` has been deprecated in favor of the `child-src` directive. CSP Level 3, has not been replaced with `frame-src` and will continue to postpone `child-src` if not present.

Example FRAME-SRC `frame-src 'self';`

sandbox

Enables a sandbox for the requested resource similar to the `iframe` `sandbox` attribute. The sandbox applies a policy of the same origin, avoids pop-ups, plug-ins and blocks the execution of scripts. You can keep the `sandbox` value empty to keep all restrictions in place, or add values: `allow-forms allow-same-origin allow-scripts allow-popups allow-modals allow-orientation-lock allow-pointer-lock allow-presentation allow-popups-to-escape-sandbox allow-top-navigation`

Example of SANDBOX policy `sandbox allow-forms allow-scripts;`

report-uri

Instructs the browser to POST policy crash reports to this URI. You can also use `Content-Security-Policy-Report-Only` as the HTTP header name to instruct the browser to send reports only (does not block anything). This directive was discontinued at CSP Level 3 in favor of the `report-to` directive.

Example REPORT-URI `report-uri / some-report-uri;`

child-src

Defines valid fonts for web workers and nested browsing contexts loaded using elements such as `<frame>` and `<iframe>`.

Example of FILHO-SRC Policy `child-src 'self'`

form-action

Defines valid fonts that can be used as an `<form>` HTML action.

Example action policy example `form-action 'self';`

frame-ancestors

Defines valid fonts for embedding the resource using `<frame>` `<iframe>` `<object>` `<embed>` `<applet>`. Setting this directive to `'none'` should be roughly equivalent to `X-Frame-Options: DENY FRAME-ANCESTORS`.
EXAMPLE POLICY `frame-ancestors 'none';`

plugin-types

Defines valid MIME types for plug-ins called via `<object>` and `<embed>`. To load one, `<applet>` you must specify `application / x-java-applet`.

PLUG-IN TYPES Policy Example ``plugin-types application / pdf;``

base-uri

Defines a set of allowed URLs that can be used in the attribute of an HTML basetag.

URI-BASE Policy Example ``` base-uri 'self'; ```

report-to

Defines a report group name defined by an HTTP Response Report-Header. See the reporting API for more information.

Example Report for Policy `report-to groupName;`

worker-src

Restricts URLs that can be loaded as Worker, SharedWorker or ServiceWorker.

WORKER-SRC Policy Example `worker-src 'none';``

manifest-src

Restricts URLs where application manifests can be loaded.

Example of MANIFEST-SRC Policy `manifest-src 'none';``

prefetch-src

Defines valid sources for pre-fetching and pre-rendering of requests, for example, through the linktag with `rel = "prefetch"` or `rel = "prerender"`:

`__ PREFETCH-SRC Policy Example__ prefetch-src 'none'``

navigate-to

Restricts the URLs to which the document can navigate by any means. For example, when a link is clicked, a form is submitted or `window.location` is called. If `form-action` is present, this directive will be ignored for submitting forms. Implementation status

Navigation Policy Example ``navigate-to example.com``

Grid Log Configurations

This interface allows you to define a Log schema to the app. The Log schema tracks what the end-users are doing in the app. Those are the events it can tracks: Access, Insert, Update, and delete.

To learn how to create a Log schema [see here](#).

LOG	
ATTRIBUTE	VALUE
Schema	log <input type="button" value="⋮"/>
Events	<div style="display: flex; align-items: center; gap: 10px;"><div style="border: 1px solid #ccc; width: 100px; height: 40px; position: relative;"><div style="position: absolute; top: -10px; right: -10px;">▲</div><div style="position: absolute; bottom: -10px; right: -10px;">▼</div></div><div style="text-align: center;"><input type="button" value="Add >>"/> <input type="button" value="Remove <<"/></div><div style="border: 1px solid #ccc; width: 100px; height: 40px; position: relative;"><div style="position: absolute; top: -10px; right: -10px;">▲</div><div style="position: absolute; bottom: -10px; right: -10px;">▼</div></div></div>

Application Log configuration

Schema Select an existing log schema for the application.

Events You can select just specific events to save in the log.

Gantt Chart settings

A Gantt chart is a type of bar chart that illustrates a project schedule. Gantt charts illustrate the start and end dates of the terminal elements and summary elements of a project. Terminal elements and summary elements comprise the work breakdown structure of the project.

Attribute	Description
Chart Title	Defines the title for the chart.
Chart Theme	Sets the theme used in the chart.
Chart Position	Defines the display position of the chart.
Output Format	Output format, you can choose of HTML or HTML5 (the default option is HTML5)
Field label	Field containing the record label of the Gantt chart. You can choose which field will appear within the left column to describe the tasks.
Width	Gantt chart width. The default unit for this width is pixels, however you can also apply it in percent by adding the “%” sign after the number (i.e: 100%).
Height	Gantt chart height. The default unit for this width is pixels, however you can also apply it in percent by adding the “%” sign after the number (i.e: 100%).
Months	Allows you to set the number of months that will be displayed in the Gantt chart.
Start Date	Using this combo box you can choose the field that stores the start date, you need to have this record within the connected table.
End Date	Using this combo box you can choose field that stores the end date, you need to have this record within the connected table.
Display format	Allows you to set the display format of the fields date type.
Percent Completed	Using this combo box you can choose the field that stores the information regarding the task completion (percentage), you need to have this record within the connected table.
Resource	Field containing the name of the resource allocated to the task.

[Related Link](#) 

Save Grid

This option allows the user to configure a layout for the consultation and summary application, and save this configuration for later use.

For example, the customer can change the layout and display of fields and change the order of the application, saving this layout. Then, when performing a filter, he can apply the saved layout so that the application is displayed in the way he configured it later.

Settings	
ATTRIBUTE	VALUE
Data to be stored	<input checked="" type="checkbox"/> Filter <input checked="" type="checkbox"/> Columns Select <input checked="" type="checkbox"/> Group By <input checked="" type="checkbox"/> Order By <input checked="" type="checkbox"/> Theme <input type="checkbox"/> Language <input type="checkbox"/> Rows Counter <input type="checkbox"/> Current Page
Save Grid state	
ATTRIBUTE	VALUE
Select level	<input checked="" type="checkbox"/> Public Title: <input type="text" value="{lang_srch_public}"/> <input type="checkbox"/> Use Rules
Layout	<input checked="" type="radio"/> Extended <input type="radio"/> Simplified
Save Grid state in session	
ATTRIBUTE	VALUE
Save in session	<input checked="" type="checkbox"/>
Save mode	<input type="text" value="Manual"/> ▼
Load the last saved session when starting the application	<input type="checkbox"/>

The definition of the data that will be stored by the option Save Grid is defined by the developer.

The Save Grid option can be used in two ways, **Save Grid** and **Persist Status**, the difference between them is the way they are saved.

Save Grid - Saves the current grid state to a profile created at the time of saving. Allowing more than one layout to be saved.

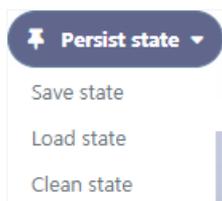

Save current application state

Level: Name:

List of the saved states

Name	Level	
Profile 01	Public	Save Apply Delete

Persist Status - Saves the grid state in the session. It is not necessary to create a profile and only stores the last status.

To activate the options, we must add the buttons on the toolbar.

Configuration

Settings	
ATTRIBUTE	VALUE
Data to be stored	<input checked="" type="checkbox"/> Filter <input checked="" type="checkbox"/> Columns Select <input checked="" type="checkbox"/> Group By <input checked="" type="checkbox"/> Order By <input checked="" type="checkbox"/> Theme <input type="checkbox"/> Language <input type="checkbox"/> Rows Counter <input type="checkbox"/> Current Page

This configuration is related to the two options, **Save Grid** and **Persist Status**, defining the data that will be stored when the option is used.

Below is the list of data that can be stored.

- **Filter**
- **Select Columns**
- **Group By**
- **Order by**
- **Theme**
- **Language**
- **Row Counter**
- **Current page**

The filter option covers all filters in the grid application: Quicksearch, Advanced Filter, Dynamic Filter or Refined Filter.

Save Grid State

ATTRIBUTE	VALUE
Select level	<input checked="" type="checkbox"/> Public Title <input type="text" value="{lang_srch_public}"/> <input checked="" type="checkbox"/> Use Rules Rule 01 <input type="text"/> <input type="button" value="New rule"/> <input type="button" value="Edit"/> <input type="button" value="Delete"/>
Layout	<input checked="" type="radio"/> Extended <input type="radio"/> Simplified

These settings refer only to the **Save Grid** option

Set Level

Public - Profiles saved at this level will be visible to everyone who accesses the application.

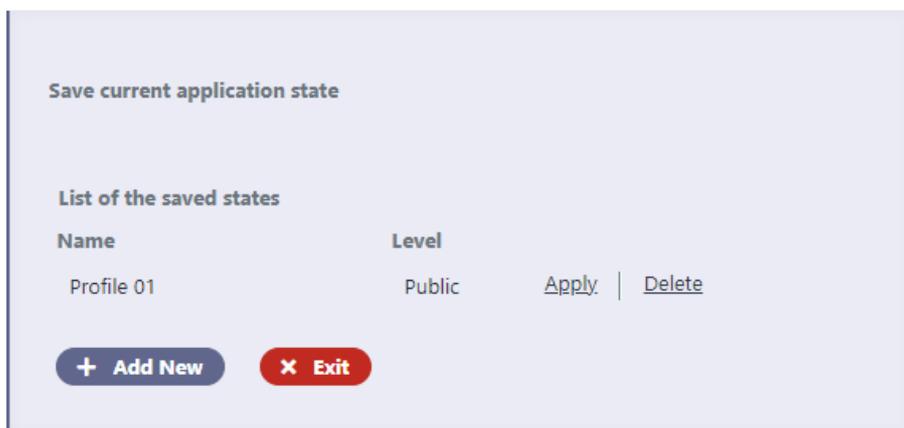

Use Rules - Creation of rules for profile creation with access restriction. [\[Click here\]](#) to see how to create a rule.

Layout

Defines how to display the **Save Grid** option

Extended - Displays the Save Grid options in a modal below the button.

Simplified - Displays the Save Grid options in a div below the toolbar.

Save Grid state in session

Save Grid state in session	
ATTRIBUTE	VALUE
Save in session	<input checked="" type="checkbox"/>
Save mode	Manual ▾
Load the last saved session when starting the application	<input type="checkbox"/>

Save in session

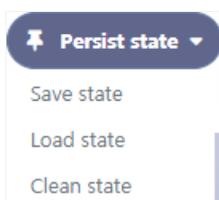

Activates the Persist state option, allowing the saving of the query state in the session, without the need to create a profile.

It will be necessary to add the button **Persistent State** in the application toolbar.

Save mode

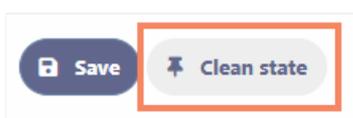

Defines whether saving the state in the session will be carried out automatically or manually. The layout of the **Persistent state** option changes according to the selected option.

Manual - When selected, the option **Persistent State** displays 3 options on the interface.

- Save State - Saves the current grid state in the session
- Load State - Load the last grid state saved in the session
- Clear - Clear the grid state saved in the session

Automatic - When selected, the option **Persistent state** displays only the button **Clear**, as the options **Load State** and **Save State** will no longer be displayed.

Load the last saved session when starting the application

When active, this option causes the application to start with the last state saved in the session. If there is no stored data, the query will start with the configuration defined in its development.

This option is only available when selecting **manual** in the option **Save way**

[Related Video](#) 

Grid - Fields Overview

The applications can have two types of fields.

Table Fields

Columns of the table connected to the application and their data types.

Example:

In a table with the following structure:

```
CREATE TABLE `orders` (
  `orderid` int(11) NOT NULL,
  `customerid` varchar(5) NULL DEFAULT NULL,
  `employeeid` int(11) NULL DEFAULT NULL,
  `orderdate` date NULL DEFAULT NULL,
  `requireddate` date NULL DEFAULT NULL,
  PRIMARY KEY (`orderid`) USING BTREE
);
```

These are the listed fields on left menu **Fields**:

Virtual Fields

Fields created inside application to assist in the development process.

How to create a virtual field

1. Inside an application, access the left menu **Fields** and click on **New Field** option.
2. Choose how many fields do you want to create:

1. Create the fields and define type, name and label for each one:

- **Type**: Data type of the field.
- **Name**: Internal name of the field. Used to identify the field on events and Scriptcase interface.
- **Label**: Title of the field displayed on the application.

Scriptcase **doesn't insert** virtual fields on the table after its creation.

Types of fields by applications

Application Table Fields Virtual Fields

Grid	<input type="text"/>	<input type="text"/>
Procedure	<input type="text"/>	<input type="text"/>
Chart	<input type="text"/>	<input type="text"/>
Form	<input type="text"/>	<input type="text"/>
Control	<input type="text"/>	<input type="text"/>
Calendar	<input type="text"/>	<input type="text"/>
Search	<input type="text"/>	<input type="text"/>
PDF Report	<input type="text"/>	<input type="text"/>

The applications **Menu**, **Tree Menu**, **Dashboard** and **Blank** were not listed because they haven't manage fields.

Grid - Text Field

General Settings

This type of field allows the developer to create quickly fields to display data from the database, where the final user can see the data in the way it was set by the developer.

Type of Data

Defines the type of the field in the application. In this case we should select **Text**.

Label

Defines the title that will be displayed in the field when the application is executed. The terminology used in the interface is fundamental to the system have a good usability, whe should use names and familiar terms to the final user of the application, instead of using terms from the system.

For example, this text field that has the name **customerid**, the client would have a much better understanding of the functionality of the field when we define the label as **Customer Name**.

Not only a fixed text, the **Label** attribute allows the use of langs to define the field's title, making it possible to use your application in a multi language project.

Case Settings

This option allows the developer to inform how the text will be displayed in runtime.

The options available are:

Lower Case: Every letter in the text will be converted to lower case.

Upper Case: Every letter of the text will be converted to upper case.

Capitalize first word: The first letter of the first world will be converted to upper case.

Capitalize all words: The first letter of every words will be converted to upper case.

Show HTML Content

When this option is active every HTML, CSS and JavaScript content that are in the database will be displayed with the main value.

Field Mask

Defines the field mask. There are two types of mask described in the table below:

Character Description

X	It is overridden by any characters returned by the database. Filled is required and the value will be completed with leading zeros when there are fewer characters than the size of the mask.
Z	It is overridden by any characters returned by the database. Its filling is optional and when there are fewer characters than the mask size, nothing will be done about the characters that are missing. In addition the leading zeros will be suppressed. When used in conjunction with the X necessarily the use of this character is to the left of the mask.
9	It represents any numeric character (from 0-9)
A	It represents an alpha numeric character (A-Z,a-z)
*	It represents any alpha-numeric character (A-Z,a-z,0-9)entered by the user.

For example, it is possible to set the mast to display a telephone number:

It will be show with this format on runtime:

It is also possible to set the field mask like those examples:

Field mask examples:

Telephone number

Field	Mask Input	Typed Value	Formatted Value
Phone Number	+99 99 9999 - 9999	123456789012	+12 34 5678 - 9012
Phone Number	(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
Phone Number	(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
Phone Number	(zz) xxxx - xxxx	12345678	() 1234 - 5678
Software Key (Letters only)	AAAA-AAAA-AAAA-AAAA	QWERTYUIASDFGHJK	QWER-TYUI-ASDF-GHJK
Software Key (Letters and numbers)	xxxx-xxxx-xxxx-xxxx	Q1W2E3R4T5Y6U7I8	Q1W2-E3R4-T5Y6-U7I8
License Plate	AAA - 9999	QWE1234	QWE - 1234
Scriptcase Serial Key	A999A999A999-**	D111H111G111DG2P	D111H111G111-DG2P
Multiple masks (Phone Number)	9999-9999;(99)9999-9999;	9999 999 9999	+99 99 9999-9999

Repeat Value:

When this option is active the value of the field will be repeated if the previous database register is the same.

Example:

SQL Type

Informs the type of the field in the database.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter than (;).
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML, CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).

- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Martial Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man, Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.

- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the “Separated by” field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**
 - **Text Font** : Allows choosing the font type, which will be applied in the application field.
 - **Font Size** : Allows choosing the font size, which will be applied to the application object.
 - **Italic Text** : Allows to apply the italic type in the font.
 - **Bold Text** : Allows you to apply bold type to the font.
 - **Number of characters** : Number of characters to display.
 - **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
 - **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
 - **Background Image** : Allows you to add a background image to the field.
 - **Line Break** : Enables the possibility of a line break for the field.
 - **Content color** : Changes the content color of the query field and the grouped field, when available.
 - **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
 - **Width** : To define the width of the field.
 - **Height** : To set the height of the field.
 - **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
 - **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
 - **Title color** : Allows you to choose a color for the field title using a color palette.
 - **Title background color** : Allows choosing a color for the background of the field title using a color palette.
 - **Bold** : Displays the field title in bold

PDF Configuration

Line Break

This option allows breaking the line in the PDF file when exported.

Chart Settings

By using this option, you will see an icon on the Field Title, this icon displays a chart relating to the field.

On this type option you need to choose two columns to build the chart. The first one is the field its self that you are working with, and the second one is the you chose and is called “Column for Label”.

Bar Chart Interface.

- **Group by Label** : Groups the values of the column by the label. Similar to the effect of the group by of the a Select.
- **Summary Function** : Function that summarizes the data applied to the column. The functions that can be used on the field are the following: Count, Sum, Max, Min and Avg.
- **Configurable Chart** : Allows the user to setup the parameters of the chart creation when the

application is running.

- **Display Values** : Displays the values of the generated chart.
- **Column for Label** : Selecting the column that will be the label for the field.
- **Chart Width** : Width of the chart, in pixels.
- **Chart Height** : Height of the chart, in pixels.

Chart Layout

Chart layout settings interface.

Grid - Multiple Lines Text Field

General Settings

Multiple Lines Text field Configuration Interface.

- **Data Type** : Define the type of field for the application. When it is defined as a Multiple Lines Text, it accepts letters, numbers and special characters in multiple lines.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Case Settings** : Convert the letter from the field when losing focus. The options are:
 - **Upper case** : All in Upper Case
 - **Lower case** : All in Lower case
 - **Capitalize first word** : Capitalizes the first letter of the first word
 - **Capitalize all words** : Capitalizes the first letter of all the the words
- **Show HTML content** : Determines if the HTML contained in the field will be displayed or not. If enabled, the HTML will be displayed, otherwise the HTML will be interpreted by the browser.
- **Grid Mask** : Defines the mask for the field display. There are two typed of masks described below:

Character	Description
X	Placeholder to any character. Replaced by any character. If number of characters entered are less then the mask size, the field value is completed with zeros (Filling full size field entry is required).
Z	Replaced by any character retrieved from database. Suppress zeros at field left (Complete field filling is optional). When used combined with the mask character X it should be placed at the mask left.

Mask Examples

Mask	Field Value	Formatted Value
(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
(zz) xxxx - xxxx	1234567890	(12) 3456 - 7890
(zz) xxxx - xxxx	12345678	() 1234 - 5678
(zz) xxxx - xxxx	0012345678	() 1234 - 5678

- **Do Not Repeat Value** : Do not repeat the value of the field in case it is the same as the previous record.

- **Run content in JavaScript** : If enabled, the JavaScript will be interpreted by the browser, otherwise the JavaScript will be displayed.
- **SQL Type** : Informs the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**
 - **Text Font** : Allows choosing the font type, which will be applied in the application field.
 - **Font Size** : Allows choosing the font size, which will be applied to the application object.
 - **Italic Text** : Allows to apply the italic type in the font.
 - **Bold Text** : Allows you to apply bold type to the font.
 - **Number of characters** : Number of characters to display.
 - **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
 - **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or

bottom).

- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Grid - Integer Field

On this page, you will learn how you can configure settings related to the Number field. From the use of specific symbols display to the mode in which they are displayed. And thus, boost the application.

Data type:

It sets the application field type. When the field is set as Number, it is permissible to define formatting rules of integers.

Label:

It sets the title that will be displayed in the field when you run the application. The terminology used in the interface is fundamental for your system has a good usability. In this case, we recommend you to use names and terms familiar to the end user of the application, instead of using terms originated in the system.

Field Mask Input:

It sets the mask input for the field. There are two types of mask as described in the table below:

Character Description

X	It is overridden by any characters returned by the database. Filled is required and the value will be completed with leading zeros when there are fewer characters than the size of the mask.
Z	It is overridden by any characters returned by the database. Its filling is optional and when there are fewer characters than the mask size, nothing will be done about the characters that are missing. In addition the leading zeros will be suppressed. When used in conjunction with the X necessarily the use of this character is to the left of the mask.
9	It represents any numeric character (from 0-9)
A	It represents an alpha numeric character (A-Z,a-z)
*	It represents any alpha-numeric character (A-Z,a-z,0-9)entered by the user.

Mask Input Examples:

Field	Mask Input	Typed Value	Formatted Value
Phone Number	+99 99 9999 - 9999	123456789012	+12 34 5678 - 9012
Phone Number	(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
Phone Number	(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
Phone Number	(zz) xxxx - xxxx	12345678	() 1234 - 5678
Software Key (Letters only)	AAAA-AAAA-AAAA-AAAA	QWERTYUIASDFGHJK	QWER-TYUI-ASDF-GHJK
Software Key (Letters and numbers)	xxxx-xxxx-xxxx-xxxx	Q1W2E3R4T5Y6U7I8	Q1W2-E3R4-T5Y6-U7I8
License Plate	AAA - 9999	QWE1234	QWE - 1234
Scriptcase Serial Key	A999A999A999- **	D111H111G111DG2P	D111H111G111-DG2P
Multiple masks (Phone Number)	9999-9999;(99)9999-9999;	9999 999 9999	+99 99 9999-9999

Repeat value:

This option when enabled will allows you to repeat the field value if it is equal to the value of the previous record in the database.

Example:

Tipo SQL:

Reports the SQL type of the field as it is configured in the database.

Use regional settings:

It allows you to apply regional settings to the number fields formatting. When this option is not selected it will be displayed the attributes group, minus sign and negative number format.

Grouping:

It allows you to define which character is used to separate thousands. This option is only available when the option to use regional settings is disabled.

Negative sign:

It allows you to define which character will be used for the display of negative numbers. This option is only available when the option to use regional settings is disabled.

Negative number format:

It allows you to define the placement of the negative sign in relation to value. This option is only available when the option to use regional settings is disabled.

Color for the negative values:

It allows you to define a color when the value is negative, improving the understanding of the end user about that kind of value.

Example:

c

Display the value in words:

The value of the field will be displayed in full on application. This feature can facilitate the comprehension and understanding of the user.

Example:

Line size:

Maximum size in characters to be displayed in the value cell, in full. When this value is exceeded the line will break within the cell.

Lookup Settings

The Lookup is a way used to provide the end user a list of values description/name where the items can be selected and used in the application. For example, for a field sex that in the database is represented with M or F values can be presented as male or female dynamically with the lookup. So you will be able to retrieve these values from a database table or manually, if the reference table does not exist.

Example:

Lookup Methods

There are two lookup methods available:

Manual: To use this method it is necessary to inform the selection conditions manually to the Lookup.

Automatic: To use this method it is necessary to use a lookup query from the database to access the reference table.

Editing-automatic lookup:

Select Command:

It sets the SQL command that will retrieve the value to display inside the Grid field. The command must have the following format

```
SELECT field_to_be_displayed FROM table WHERE key_field = {grid_field}
```

The Grid field must be always referenced between curly braces {}, So at run time, the field braces will be replaced by its value in the table.

Multiple Options:

When the Select command informed return multiple values, the option must be selected.

Delimiter:

It sets the tab of values returned by the Select command, this option should be filled when the “Yes” option is checked in the multiple attribute options.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

Use a specific connection:

This option allows you to select another existing connection in the project, other than the current connection, to select the values for the lookup.

Edit Lookup - Manual:

Lookup used to modify the display of the field with predefined values.

Lookup Types

It sets the operating mode of the lookup can be: single value, multiple values (delimiter), multiple values (position) and multiple values (binary).

Single value: it will be displayed only one value for the field. There is a direct replacement of the value stored in the Bank for a label defined in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value of “M” will be replaced by “Male”.

Multiple Values (Delimiter):

By using this option it will be displayed multiple values for the selected field. The values must be separated by a delimiter to be informed. A replacement of parts from a string stored in the field, separated by a delimiter for values contained in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value S;M will be replaced by Sports and Movies.

Delimiter: Character used to separate the values within the same string.

Multiple Values (Position)

Allows you to recover information stored in a single string of the selected field. In order for this information to be retrieved must be informed, in addition to the label, the starting position and the number of bytes that each information occupies within the string.

As an example we will use a string to store Sex, Marital status and Hobby respectively. Sex occupies one byte, Status one byte and Hobby two bytes .

For this purpose we define the list as:

Label	Value	Start	Size
Male	M	1	1
Female	F	1	1
Married	M	2	1
Single	S	2	1
Study	ST	3	2
Sportes	SP	3	2
Reading	LE	3	2

Example: the string MMST would be presented in the query as: Male Married Study

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value M will be replaced by Male.

Start: : Starting position in the string where the information is recorded. The first position is always 1.

Size : Number of bytes that the information occupies in the string.

Multiple values (binary):

It allows you to retrieve several information stored in decimal form of the selected field.

As examples we will use the following list (although not informed in the interface of inclusion of values in the list, each item has a value assigned automatically according to the order):

Assigned value	Description in Lookup
1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

To display the data, a decomposition of the decimal number stored in the bank is performed. For example, numbers 11 and 12 (written in the database) would be decomposed as follows:

11 = 1 + 2 + 8 = (Sports - Culture - Reading)

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

12 = 4 + 8 = (Leisure - Reading)

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

Label:

Text that will be displayed in the Grid.

Include Button:

Includes in the list the values populated in the Label and value fields.

Alter Button:

It changes the attributes of the selected item.

Delete Button:

Deletes the selected item.

Clean Button:

It cleans the fields

Save Button:

Allows the user to save the entire list, for later use using the Load Lookup definition option.

Load Lookup definition:

Allows you to load a predefined value list for use as a lookup.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set

in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.
- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Line Chart

Using this guide, you can define ac chart for each line.

- **Line Chart Type** : There are two types of charts that can be used. Below you can see their description:
- **Bar Chart** : This option allows to display a bar chart relating to the column that you are working with. The size of the bars is done by math relating to the Grand Total of the column. The value informed in the width of the chart defines the size of the images that will be displayed.

In the example shown above, the width of the Chart is 200 pixels.

- **Line Chart** : This option allows to display a Line Chart relating to the column that you are working with . The amount of lines are done by dividing the value of a column by the value informed to the number of icons.

In the example above, the field Number of Icons, it was informed the value 1000, so the number of stars besides, it determined by dividing the displayed value by 1000.

- **Display Value** : It will display the value and the chart at the same time, the value being on the left or right side of the bar or lines.
- **Number of Icons** : Determines the amount of icons (figures) that will appear for each value on this field. This value will be presented by the dividing the value of the column by the Number of Icons.
- **Chart width** : Width of the chart in pixels. This field is used by the option Bar Chart. In case it is not informed, the value used is 200 pixels.
- **Chart height** : Height of the chart in pixels. This field is used by the option Bar Chart.
- **Margin** : Charts margin. This option is only used by the bar chart.
- **Image / Positive Color** : The way that it is informed will variate depending on the options below:
 - **Bar Chart** : Inform a color for the field that will be used to form the chart image. Click the icon beside to choose the color.
 - **Line Chart** : Inform an image name for the field that will be used like an icon. Click the icon beside to choose the image "Icon".
- **Image / Negative Color** : The information passed to this field follows the same criteria as the Image / Positive Color field. This parameter will be used in the case the value is negative.

PDF Configuration

Line Break

This option allows breaking the line in the PDF file when exported.

Charts Settings

By using this option, you will see an icon on the Field Title, this icon displays a chart relating to the field.

On this type option you need to choose two columns to build the chart. The first one is the field its self that you are working with, and the second one is the you chose and is called "Column for Label".

Bar Chart Interface.

- **Group by Label** : Groups the values of the column by the label. Similar to the effect of the group by of the a Select.
- **Summary Function** : Function that summarizes the data applied to the column. The functions that can be used on the field are the following: Count, Sum, Max, Min and Avg.
- **Configurable Chart** : Allows the user to setup the parameters of the chart creation when the application is running.
- **Display Values** : Displays the values of the generated chart.
- **Column for Label** : Selecting the column that will be the label for the field.
- **Chart Width** : Width of the chart, in pixels.
- **Chart Height** : Height of the chart, in pixels.

Chart Layout

Chart layout settings interface.

Grid - Decimal Field

General Settings

Decimal field Configuration Interface.

Data Type

Define the field type to Decimal. It allows defining the Decimal number format.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Accumulated

It defines the field to accumulate values of another field. This option is only available for virtual fields.

Accumulator field

It is available when the option "Accumulated" is enabled. This configuration defines which field will accumulate the values. The field should be Integer, Currency, or Decimal.

Grid Mask

It defines a mask for the field value. There is two types of masks:

Character	Description
X	It sets the placeholder to any character for replacing. If the entered number of characters is less than the mask size, It completes the field value with zeros (Filling full-size field entry is required).
Z	It sets the placeholder to any character for replacing, but it suppresses zeros at field left (Complete field filling is optional). Use it on the left when combined with the X mask.

Mask Examples

Mask	Field Value	Formatted Value
(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
(zz) xxxx - xxxx	1234567890	(12) 3456 - 7890
(zz) xxxx - xxxx	12345678	() 1234 - 5678
(zz) xxxx - xxxx	0012345678	() 1234 - 5678

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Values format

Format of Values with Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the attributes Grouping, Negative Symbol and negative number format.

Digit Grouping Separator

It defines the character to separate the thousands.

Decimal Separator

It defines the decimal separator.

Negative sign

It defines the character to represent negative numbers.

Negative number format

It defines the position of the Negative sign.

Color of Negative

It defines a color for the field when the value is negative.

Decimal Precision

It defines the number of decimal places for the field.

Complete with zeros

Defines the decimal places that will or not be completed zeros to the right. Example: The value is 125,50, but the decimal precision is 3. If the option is enabled, then the value will 125,500.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the

select command separated by the character in the “Separated by” field.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Martial Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.

- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML, CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
 - **Default value** : Defines the default value, used in the cases where the select command does not return any values.
 - **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**
 - **Text Font** : Allows choosing the font type, which will be applied in the application field.
 - **Font Size** : Allows choosing the font size, which will be applied to the application object.
 - **Italic Text** : Allows to apply the italic type in the font.
 - **Bold Text** : Allows you to apply bold type to the font.
 - **Number of characters** : Number of characters to display.
 - **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
 - **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
 - **Background Image** : Allows you to add a background image to the field.
 - **Line Break** : Enables the possibility of a line break for the field.
 - **Content color** : Changes the content color of the query field and the grouped field, when available.
 - **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
 - **Width** : To define the width of the field.
 - **Height** : To set the height of the field.
 - **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
 - **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
 - **Title color** : Allows you to choose a color for the field title using a color palette.
 - **Title background color** : Allows choosing a color for the background of the field title using a color palette.
 - **Bold** : Displays the field title in bold

Line Chart

Using this guide, you can define a chart for each line.

- **Line Chart Type** : There are two types of charts that can be used. Below you can see their description:
- **Bar Chart** : This option allows to display a bar chart relating to the column that you are working with. The size of the bars is done by math relating to the Grand Total of the column. The value informed in the width of the chart defines the size of the images that will be displayed.

In the example shown above, the width of the Chart is 200 pixels.

- **Line Chart** : This option allows to display a Line Chart relating to the column that you are working with. The amount of lines are done by dividing the value of a column by the value informed to the number of icons.

In the example above, the field Number of Icons, it was informed the value 1000, so the number of stars besides, it determined by dividing the displayed value by 1000.

- **Display Value** : It will display the value and the chart at the same time, the value being on the left or right side of the bar or lines.
- **Number of Icons** : Determines the amount of icons (figures) that will appear for each value on this

field. This value will be presented by the dividing the value of the column by the Number of Icons.

- **Chart width** : Width of the chart in pixels. This field is used by the option Bar Chart. In case it is not informed, the value used is 200 pixels.
- **Chart height** : Height of the chart in pixels. This field is used by the option Bar Chart.
- **Margin** : Charts margin. This option is only used by the bar chart.
- **Image / Positive Color** : The way that it is informed will variate depending on the options below:
 - **Bar Chart** : Inform a color for the field that will be used to form the chart image. Click the icon beside to choose the color.
 - **Line Chart** : Inform an image name for the field that will be used like an icon. Click the icon beside to choose the image "Icon".
- **Image / Negative Color** : The information passed to this field follows the same criteria as the Image / Positive Color field. This parameter will be used in the case the value is negative.

PDF Configuration

Line Break

This option allows breaking the line in the PDF file when exported.

Chart Settings

By using this option, you will see an icon on the Field Title, this icon displays a chart relating to the field.

On this type option you need to choose two columns to build the chart. The first one is the field its self that you are working with, and the second one is the you chose and is called "Column for Label".

Bar Chart Interface.

- **Group by Label** : Groups the values of the column by the label. Similar to the effect of the group by of the a Select.
- **Summary Function** : Function that summarizes the data applied to the column. The functions that can be used on the field are the following: Count, Sum, Max, Min and Avg.
- **Configurable Chart** : Allows the user to setup the parameters of the chart creation when the application is running.
- **Display Values** : Displays the values of the generated chart.
- **Column for Label** : Selecting the column that will be the label for the field.
- **Chart Width** : Width of the chart, in pixels.
- **Chart Height** : Height of the chart, in pixels.

Chart Layout

Chart layout settings interface.

Grid - Percent Field

General Settings

Percentage field Configuration Interface.

Data Type

Define the field type to Percentage.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Accumulated

It defines the field to accumulate values of another field. This option is only available for virtual fields.

Accumulator field

It is available when the option "Accumulated" is enabled. This configuration defines which field will accumulate the values. The field should be Integer, Currency, or Decimal.

Grid Mask

It defines a mask for the field value. There is two types of masks:

Character	Description
X	It sets the placeholder to any character for replacing. If the entered number of characters is less than the mask size, It completes the field value with zeros (Filling full-size field entry is required).
Z	It sets the placeholder to any character for replacing, but it suppresses zeros at field left (Complete field filling is optional). Use it on the left when combined with the X mask.

Mask Examples

Mask	Field Value	Formatted Value
(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
(zz) xxxx - xxxx	1234567890	(12) 3456 - 7890
(zz) xxxx - xxxx	12345678	() 1234 - 5678
(zz) xxxx - xxxx	0012345678	() 1234 - 5678

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the attributes Grouping, Negative Symbol and negative number format.

Digit Grouping Separator

It defines the character to separate the thousands.

Decimal Separator

It defines the decimal separator.

Negative sign

It defines the character to represent negative numbers.

Negative number format

It defines the position of the Negative sign.

Color of Negative

It defines a color for the field when the value is negative.

Decimal Precision

It defines the number of decimal places for the field.

Complete with zeros

Defines the decimal places that will or not be completed zeros to the right. Example: The value is 125,50, but the decimal precision is 3. If the option is enabled, then the value will 125,500.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value

returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.

- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
 - **Default value** : Defines the default value, used in the cases where the select command does not return any values.
 - **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
 - **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and

lookup value is enabled.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.
- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Line Chart

Using this guide, you can define ac chart for each line.

- **Line Chart Type** : There are two types of charts that can be used. Below you can see their description:
- **Bar Chart** : This option allows to display a bar chart relating to the column that you are working with. The size of the bars is done by math relating to the Grand Total of the column. The value informed in the width of the chart defines the size of the images that will be displayed.

In the example shown above, the width of the Chart is 200 pixels.

- **Line Chart** : This option allows to display a Line Chart relating to the column that you are working with . The amount of lines are done by dividing the value of a column by the value informed to the number of icons.

In the example above, the field Number of Icons, it was informed the value 1000, so the number of stars besides, it determined by dividing the displayed value by 1000.

- **Display Value** : It will display the value and the chart at the same time, the value being on the left or right side of the bar or lines.
- **Number of Icons** : Determines the amount of icons (figures) that will appear for each value on this field. This value will be presented by the dividing the value of the column by the Number of Icons.
- **Chart width** : Width of the chart in pixels. This field is used by the option Bar Chart. In case it is not

informed, the value used is 200 pixels.

- **Chart height** : Height of the chart in pixels. This field is used by the option Bar Chart.
- **Margin** : Charts margin. This option is only used by the bar chart.
- **Image / Positive Color** : The way that it is informed will variate depending on the options below:
 - **Bar Chart** : Inform a color for the field that will be used to form the chart image. Click the icon beside to choose the color.
 - **Line Chart** : Inform an image name for the field that will be used like an icon. Click the icon beside to choose the image "Icon".
- **Image / Negative Color** : The information passed to this field follows the same criteria as the Image / Positive Color field. This parameter will be used in the case the value is negative.

PDF Configuration

Line Break

This option allows breaking the line in the PDF file when exported.

Chart Settings

By using this option, you will see an icon on the Field Title, this icon displays a chart relating to the field.

On this type option you need to choose two columns to build the chart. The first one is the field its self that you are working with, and the second one is the you chose and is called "Column for Label".

Bar Chart Interface.

- **Group by Label** : Groups the values of the column by the label. Similar to the effect of the group by of the a Select.
- **Summary Function** : Function that summarizes the data applied to the column. The functions that can be used on the field are the following: Count, Sum, Max, Min and Avg.
- **Configurable Chart** : Allows the user to setup the parameters of the chart creation when the application is running.
- **Display Values** : Displays the values of the generated chart.
- **Column for Label** : Selecting the column that will be the label for the field.
- **Chart Width** : Width of the chart, in pixels.
- **Chart Height** : Height of the chart, in pixels.

Chart Layout

Chart layout settings interface.

Grid - Currency Field

General Settings

Currency field Configuration Interface.

Data Type

Define the field type to Currency. It allows defining the currency number format.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Accumulated

It defines the field to accumulate values of another field. This option is only available for virtual fields.

Accumulator field

It is available when the option "Accumulated" is enabled. This configuration defines which field will accumulate the values. The field should be Integer, Currency, or Decimal.

Grid Mask

It defines a mask for the field value. There is two types of masks:

Character	Description
X	Placeholder to any character. Replaced by any character. If number of characters entered are less then the mask size, the field value is completed with zeros (Filling full size field entry is required).
Z	Replaced by any character retrieved from database. Suppress zeros at field left (Complete field filling is optional). When used combined with the mask character X it should be placed at the mask left.

Mask Examples

Mask	Field Value	Formatted Value
(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
(zz) xxxx - xxxx	1234567890	(12) 3456 - 7890
(zz) xxxx - xxxx	12345678	() 1234 - 5678
(zz) xxxx - xxxx	0012345678	() 1234 - 5678

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

![Displaying repeated values.][cons_configuracao_geral_texto_nao_repetir_valor]

SQL Type

It informs the data type of field in the database.

Values Format

Interface of Values Format.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the attributes Grouping, Negative Symbol and negative number format.

Currency Format

It defines if the field displays the Currency Symbol of the Regional Settings.

Currency Symbol

It allows setting the character that represents the Currency Symbol.

Digit Grouping Separator

It defines the character to separate the thousands.

Decimal Separator

It defines the decimal separator.

Negative sign

It defines the character to represent negative numbers.

Negative number format

It defines the position of the Negative sign.

Color of Negative

It defines a color for the field when the value is negative.

Decimal Precision

It defines the number of decimal places for the field.

Complete with zeros

Defines the decimal places that will or not be completed zeros to the right. Example: The value is 125,50, but the decimal precision is 3. If the option is enabled, then the value will 125,500.

Display full value

It displays the full value. Example: 2018(Two thousand eighteen).

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter than (;).
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.

- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
 - **Default value** : Defines the default value, used in the cases where the select command does not return any values.
 - **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
 - **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**
 - **Text Font** : Allows choosing the font type, which will be applied in the application field.
 - **Font Size** : Allows choosing the font size, which will be applied to the application object.
 - **Italic Text** : Allows to apply the italic type in the font.
 - **Bold Text** : Allows you to apply bold type to the font.
 - **Number of characters** : Number of characters to display.
 - **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
 - **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
 - **Background Image** : Allows you to add a background image to the field.
 - **Line Break** : Enables the possibility of a line break for the field.
 - **Content color** : Changes the content color of the query field and the grouped field, when available.
 - **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
 - **Width** : To define the width of the field.
 - **Height** : To set the height of the field.
 - **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
 - **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
 - **Title color** : Allows you to choose a color for the field title using a color palette.
 - **Title background color** : Allows choosing a color for the background of the field title using a color palette.
 - **Bold** : Displays the field title in bold

Line Chart

Using this guide, you can define a chart for each line.

- **Line Chart Type** : There are two types of charts that can be used. Below you can see their description:
- **Bar Chart** : This option allows to display a bar chart relating to the column that you are working with. The size of the bars is done by math relating to the Grand Total of the column. The value informed in the width of the chart defines the size of the images that will be displayed.

In the example shown above, the width of the Chart is 200 pixels.

- **Line Chart** : This option allows to display a Line Chart relating to the column that you are working with . The amount of lines are done by dividing the value of a column by the value informed to the number of icons.

In the example above, the field Number of Icons, it was informed the value 1000, so the number of stars besides, it determined by dividing the displayed value by 1000.

- **Display Value** : It will display the value and the chart at the same time, the value being on the left or right side of the bar or lines.
- **Number of Icons** : Determines the amount of icons (figures) that will appear for each value on this field. This value will be presented by the dividing the value of the column by the Number of Icons.
- **Chart width** : Width of the chart in pixels. This field is used by the option Bar Chart. In case it is not informed, the value used is 200 pixels.
- **Chart height** : Height of the chart in pixels. This field is used by the option Bar Chart.
- **Margin** : Charts margin. This option is only used by the bar chart.
- **Image / Positive Color** : The way that it is informed will variate depending on the options below:
 - **Bar Chart** : Inform a color for the field that will be used to form the chart image. Click the icon beside to choose the color.
 - **Line Chart** : Inform an image name for the field that will be used like an icon. Click the icon beside to choose the image "Icon".
- **Image / Negative Color** : The information passed to this field follows the same criteria as the Image / Positive Color field. This parameter will be used in the case the value is negative.

PDF Configuration

Line Break

This option allows breaking the line in the PDF file when exported.

Chart Settings

By using this option, you will see an icon on the Field Title, this icon displays a chart relating to the field.

On this type option you need to choose two columns to build the chart. The first one is the field its self that you are working with, and the second one is the you chose and is called "Column for Label".

Bar Chart Interface.

- **Group by Label** : Groups the values of the column by the label. Similar to the effect of the group by of the a Select.
- **Summary Function** : Function that summarizes the data applied to the column. The functions that can be used on the field are the following: Count, Sum, Max, Min and Avg.
- **Configurable Chart** : Allows the user to setup the parameters of the chart creation when the application is running.
- **Display Values** : Displays the values of the generated chart.
- **Column for Label** : Selecting the column that will be the label for the field.
- **Chart Width** : Width of the chart, in pixels.
- **Chart Height** : Height of the chart, in pixels.

Chart Layout

Grid - Percent (Calculated) Field

General Settings

Percentage field Configuration Interface.

Data Type

Define the field type to Percentage.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Accumulated

It defines the field to accumulate values of another field. This option is only available for virtual fields.

Accumulator field

It is available when the option "Accumulated" is enabled. This configuration defines which field will accumulate the values. The field should be Integer, Currency, or Decimal.

Grid Mask

It defines a mask for the field value. There is two types of masks:

Character	Description
X	It sets the placeholder to any character for replacing. If the entered number of characters is less than the mask size, It completes the field value with zeros (Filling full-size field entry is required).
Z	It sets the placeholder to any character for replacing, but it suppresses zeros at field left (Complete field filling is optional). Use it on the left when combined with the X mask.

Mask Examples

Mask	Field Value	Formatted Value
(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
(zz) xxxx - xxxx	1234567890	(12) 3456 - 7890
(zz) xxxx - xxxx	12345678	() 1234 - 5678
(zz) xxxx - xxxx	0012345678	() 1234 - 5678

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the attributes Grouping, Negative Symbol and negative number format.

Digit Grouping Separator

It defines the character to separate the thousands.

Decimal Separator

It defines the decimal separator.

Negative sign

It defines the character to represent negative numbers.

Negative number format

It defines the position of the Negative sign.

Color of Negative

It defines a color for the field when the value is negative.

Decimal Precision

It defines the number of decimal places for the field.

Complete with zeros

Defines the decimal places that will or not be completed zeros to the right. Example: The value is 125,50, but the decimal precision is 3. If the option is enabled, then the value will 125,500.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value

returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.

- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
 - **Default value** : Defines the default value, used in the cases where the select command does not return any values.
 - **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
 - **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and

lookup value is enabled.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.
- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Line Chart

Using this guide, you can define ac chart for each line.

- **Line Chart Type** : There are two types of charts that can be used. Below you can see their description:
- **Bar Chart** : This option allows to display a bar chart relating to the column that you are working with. The size of the bars is done by math relating to the Grand Total of the column. The value informed in the width of the chart defines the size of the images that will be displayed.

In the example shown above, the width of the Chart is 200 pixels.

- **Line Chart** : This option allows to display a Line Chart relating to the column that you are working with . The amount of lines are done by dividing the value of a column by the value informed to the number of icons.

In the example above, the field Number of Icons, it was informed the value 1000, so the number of stars besides, it determined by dividing the displayed value by 1000.

- **Display Value** : It will display the value and the chart at the same time, the value being on the left or right side of the bar or lines.
- **Number of Icons** : Determines the amount of icons (figures) that will appear for each value on this field. This value will be presented by the dividing the value of the column by the Number of Icons.
- **Chart width** : Width of the chart in pixels. This field is used by the option Bar Chart. In case it is not

informed, the value used is 200 pixels.

- **Chart height** : Height of the chart in pixels. This field is used by the option Bar Chart.
- **Margin** : Charts margin. This option is only used by the bar chart.
- **Image / Positive Color** : The way that it is informed will variate depending on the options below:
 - **Bar Chart** : Inform a color for the field that will be used to form the chart image. Click the icon beside to choose the color.
 - **Line Chart** : Inform an image name for the field that will be used like an icon. Click the icon beside to choose the image "Icon".
- **Image / Negative Color** : The information passed to this field follows the same criteria as the Image / Positive Color field. This parameter will be used in the case the value is negative.

PDF Configuration

Line Break

This option allows breaking the line in the PDF file when exported.

Chart Settings

By using this option, you will see an icon on the Field Title, this icon displays a chart relating to the field.

On this type option you need to choose two columns to build the chart. The first one is the field its self that you are working with, and the second one is the you chose and is called "Column for Label".

Bar Chart Interface.

- **Group by Label** : Groups the values of the column by the label. Similar to the effect of the group by of the a Select.
- **Summary Function** : Function that summarizes the data applied to the column. The functions that can be used on the field are the following: Count, Sum, Max, Min and Avg.
- **Configurable Chart** : Allows the user to setup the parameters of the chart creation when the application is running.
- **Display Values** : Displays the values of the generated chart.
- **Column for Label** : Selecting the column that will be the label for the field.
- **Chart Width** : Width of the chart, in pixels.
- **Chart Height** : Height of the chart, in pixels.

Grid - HTML Image Field

General Settings

 *HTML Image field Configuration Interface.*

Data Type

Define the type of field. When setting it to HTML Image, it allows to display an image into the field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Image

Define an image to be displayed. The icon "Select Image" lists all images from Scriptcase and your uploaded images. The "Upload an image" option allows you to send a copy to the Scriptcase server.

New Link

This button allows the creation of a field link with some other application..

This way, it is possible, for example, to create a link with a blank to delete a record from the grid, passing the record ID as a parameter.

See more information about field binding by [clicking here](#).

Border

Define the width of the Image border in Pixels.

Width

Define the image width size in Pixels.

Height

Define the image height size in Pixels.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.
- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the

- background of the application field.
- **Width** : To define the width of the field.
 - **Height** : To set the height of the field.
 - **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
 - **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
 - **Title color** : Allows you to choose a color for the field title using a color palette.
 - **Title background color** : Allows choosing a color for the background of the field title using a color palette.
 - **Bold** : Displays the field title in bold

Grid - Credit Card Number Field

General Settings

Credit Card Number Configuration Interface.

- **Data Type** : Select the type of field for the application. When it is defined as a Credit Card Number, you can define some rules for the display format of the Credit Card.
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name would be "Client Name".
- **Do Not Repeat Value** : Do not repeat the value of the field in the case it is the same as the previous record.

- **SQL Type** : Informs the data type of the field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**
 - **Text Font** : Allows choosing the font type, which will be applied in the application field.
 - **Font Size** : Allows choosing the font size, which will be applied to the application object.
 - **Italic Text** : Allows to apply the italic type in the font.
 - **Bold Text** : Allows you to apply bold type to the font.
 - **Number of characters** : Number of characters to display.
 - **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
 - **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
 - **Background Image** : Allows you to add a background image to the field.
 - **Line Break** : Enables the possibility of a line break for the field.
 - **Content color** : Changes the content color of the query field and the grouped field, when available.
 - **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
 - **Width** : To define the width of the field.
 - **Height** : To set the height of the field.
 - **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
 - **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
 - **Title color** : Allows you to choose a color for the field title using a color palette.
 - **Title background color** : Allows choosing a color for the background of the field title using a color palette.
 - **Bold** : Displays the field title in bold

PDF Configuration

Line Break

This option allows breaking the line in the PDF file when exported.

Chart Settings

By using this option, you will see an icon on the Field Title, this icon displays a chart relating to the field.

On this type option you need to choose two columns to build the chart. The first one is the field its self that you are working with, and the second one is the you chose and is called "Column for Label".

 *Bar Chart Interface.*

- **Group by Label** : Groups the values of the column by the label. Similar to the effect of the group by of the a Select.
- **Summary Function** : Function that summarizes the data applied to the column. The functions that can be used on the field are the following: Count, Sum, Max, Min and Avg.
- **Configurable Chart** : Allows the user to setup the parameters of the chart creation when the application is running.
- **Display Values** : Displays the values of the generated chart.
- **Column for Label** : Selecting the column that will be the label for the field.
- **Chart Width** : Width of the chart, in pixels.
- **Chart Height** : Height of the chart, in pixels.

Chart Layout

Chart Layout

Chart layout settings interface.

Grid - YouTube Field

General Settings

YouTube field Configuration Interface.

Data Type

Define the type of field. When setting it to YouTube, it allows displaying an Youtube video on the field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Display Mode

Define the mode to display the video in the application.

Width

Video Width in pixels.

Height

Video Height in pixels.

Link Type

The display settings of the link, if it is going to be a Text or a Button.

Link text

It displays a text to mask the video URL.

SQL Type

It informs the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

• Display Settings

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.
- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.

- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Grid - Google Maps Field

General Settings

Google Maps field Configuration Interface.

- **Data Type** : Define the type of field for the application. When it is defined as Google Maps, it will use the Google Maps API to display the map in the Grid Applications
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name is "Client Name".
- **Home** : Defines what type of parameters will be used in the API.

Home Configuration Interface.

- **Display Mode** : Indicates the display mode of the map. It can be opened in a Modal or in a new Window.
- **Width** : Defines the width of the map that is going to be displayed.
- **Height** : Defines the height of the map that is going to be displayed.
- **Zoom** : Defines the initial Zoom (available from the Google API) of the Map location.
- **API Key** : API Key for authorization to use Google Maps in the Application. (Required only for the versions 2 or earlier of the Google API.)

The API Key is a unique key, composed by a string(text) alphanumeric, which is the license to use the service. When you subscribe to use the service, the key is tied to the domain and the directory of the server. All the pages that use the API needs to be in the same directory that was used for the subscription. In case you have a web server on your local machine, you just need to possess a key for testing, and to do this you only need to set `http://localhost` in the domain of the subscription.

To get your API Key access the site by [clicking here](#)

- **Link Type** : Defines how the link will be displayed.
- **Text Link** : Text to call the Map.
- **Marker Description** : Displays the description for each marker displayed on the map.
- **SQL Type** : Informs the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**
 - **Text Font** : Allows choosing the font type, which will be applied in the application field.
 - **Font Size** : Allows choosing the font size, which will be applied to the application object.
 - **Italic Text** : Allows to apply the italic type in the font.
 - **Bold Text** : Allows you to apply bold type to the font.
 - **Number of characters** : Number of characters to display.
 - **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
 - **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
 - **Background Image** : Allows you to add a background image to the field.
 - **Line Break** : Enables the possibility of a line break for the field.
 - **Content color** : Changes the content color of the query field and the grouped field, when available.
 - **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
 - **Width** : To define the width of the field.
 - **Height** : To set the height of the field.
 - **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
 - **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top,

middle or bottom).

- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Grid - Date Field

General Settings

Date field Configuration Interface.

Data Type

Define the type of field. When setting it to Date, you can inform its format into this field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Format of Values without Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the date separator attribute (Check the Regional Settings).

Display

It offers predefined formats for displaying dates.

Detail Mask

Define the format of the field in the Grid. It uses the patterns of PHP function Date.

d-m-Y	25-09-2009
F/Y	September/2009
j/n/Y \a\s g:i:s A	25/9/2001 as 14:30:11 PM
l, d \d\e F \d\e Y	Thursday, 25 of January of 2009
h:i:s	11:33:20
#h:i:s	123:43:27 (accumulating the hours)

Internal Format

It allows defining the field format when the SQL type is different from **Date**. You must use the characters **Y**, **M** and **D** that correspond to **Year**, **Month** and **Day**.

- **Example 1** : If the field is storing the Date value in a **char(8)** where the positions **1** to **4** represents the year, the positions **5** and **6** is the month and the position **7** and **8** is the day, you must define the internal format as: **YYYYMMDD**
- **Example 2** : If the field is storing the Date value in a **char(6)** where the positions **1** and **2** represents the month and the positions **3** to **6** is the year, you must define the internal format as: **MMYYYY**

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**
 - **Text Font** : Allows choosing the font type, which will be applied in the application field.
 - **Font Size** : Allows choosing the font size, which will be applied to the application object.
 - **Italic Text** : Allows to apply the italic type in the font.
 - **Bold Text** : Allows you to apply bold type to the font.
 - **Number of characters** : Number of characters to display.
 - **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
 - **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
 - **Background Image** : Allows you to add a background image to the field.
 - **Line Break** : Enables the possibility of a line break for the field.
 - **Content color** : Changes the content color of the query field and the grouped field, when available.
 - **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
 - **Width** : To define the width of the field.
 - **Height** : To set the height of the field.
 - **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
 - **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
 - **Title color** : Allows you to choose a color for the field title using a color palette.
 - **Title background color** : Allows choosing a color for the background of the field title using a color palette.
 - **Bold** : Displays the field title in bold

PDF Configuration

Line Break

This option allows breaking the line in the PDF file when exported.

Chart Settings

By using this option, you will see an icon on the Field Title, this icon displays a chart relating to the field.

On this type option you need to choose two columns to build the chart. The first one is the field its self that you are working with, and the second one is the you chose and is called "Column for Label".

Bar Chart Interface.

- **Group by Label** : Groups the values of the column by the label. Similar to the effect of the group by of the a Select.
- **Summary Function** : Function that summarizes the data applied to the column. The functions that can be used on the field are the following: Count, Sum, Max, Min and Avg.
- **Configurable Chart** : Allows the user to setup the parameters of the chart creation when the application is running.
- **Display Values** : Displays the values of the generated chart.
- **Column for Label** : Selecting the column that will be the label for the field.
- **Chart Width** : Width of the chart, in pixels.
- **Chart Height** : Height of the chart, in pixels.

Chart Layout

Chart layout settings interface.

Grid - Time Field

General Settings

Time field Configuration Interface.

Data Type

Define the type of field. When setting it to Time, you can inform a time format into this field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Format of Values without Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the Time. When not enabled, it displays the Time separator attribute (Check the Regional Settings).

Display

It offers predefined formats for displaying Time.

Detail Mask

Define the format of the field in the Grid. It uses the patterns of PHP function Date.

h:i:s 11:33:20

#h:i:s 123:43:27 (accumulating the hours)

Internal Format

It allows defining the field format when the SQL type is different from **TIME**. You must use the characters **HH**, **II**, and **SS** that correspond to **Day**, **Hour**, **Minutes** and **Seconds**.

- **Example 1:** If the field is storing the Date value in a **char(8)** where the positions **1** to **4** represents the year, the positions **5** and **6** is the month and the position **7** and **8** is the day, you must define the internal format as **YYYYMMDD**
- **Example 2:** If the field is storing the Date value in a **char(6)** where the positions **1** and **2** represents the month and the positions **3** to **6** is the year, you must define the internal format as **MMYYYY**

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of

scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**
 - **Text Font** : Allows choosing the font type, which will be applied in the application field.
 - **Font Size** : Allows choosing the font size, which will be applied to the application object.
 - **Italic Text** : Allows to apply the italic type in the font.
 - **Bold Text** : Allows you to apply bold type to the font.
 - **Number of characters** : Number of characters to display.
 - **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
 - **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
 - **Background Image** : Allows you to add a background image to the field.
 - **Line Break** : Enables the possibility of a line break for the field.
 - **Content color** : Changes the content color of the query field and the grouped field, when available.
 - **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
 - **Width** : To define the width of the field.
 - **Height** : To set the height of the field.
 - **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
 - **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
 - **Title color** : Allows you to choose a color for the field title using a color palette.
 - **Title background color** : Allows choosing a color for the background of the field title using a color palette.
 - **Bold** : Displays the field title in bold

PDF Configuration

- **Summary Function** : Function that summarizes the data applied to the column. The functions that can be used on the field are the following: Count, Sum, Max, Min and Avg.
- **Configurable Chart** : Allows the user to setup the parameters of the chart creation when the application is running.
- **Display Values** : Displays the values of the generated chart.
- **Column for Label** : Selecting the column that will be the label for the field.
- **Chart Width** : Width of the chart, in pixels.
- **Chart Height** : Height of the chart, in pixels.

Chart Layout

Chart layout settings interface.

Grid - Image (Database) Field

General Settings

Upload field Configuration Interface.

Data Type

Define the type of field. When setting it to Image (Database), all the Images files are stored and loaded directly from the Database.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Image Border

Width of the Image border in Pixels.

Image Height

Image height size in Pixels.

Image Width

Image width size in Pixels.

Maintain Aspect

It maintains the original aspect ratio of the image when resizing it.

Open in Another Window

Allows to open the image in another window.

SQL Type

It informs the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.
- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.

- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Grid - Image (File Name) Field

General Settings

Upload field Configuration Interface.

Data Type

Define the type of field. When setting it to Image (File Name), all the Images files are stored and loaded directly from the Database.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Image Border

Width of the Image border in Pixels.

Image Height

Image height size in Pixels.

Image Width

Image width size in Pixels.

Maintain Aspect

It maintains the original aspect ratio of the image when resizing it.

Cloud storage API

Profile with the API information (Dropbox, Google Drive or Amazon S3) used to upload the file to the cloud created in Tools > API.

Storage API directory

Directory name for upload to the Cloud Storage API. Eg.: files/docs/{id}. The file will be saved in the root folder if this field is empty.

Storage API cache directory

Local directory for caching files sent to the cloud via the storage API.

Open in Another Window

Allows to open the image in another window.

Subdirectory for local storage

Local subdirectory or on the server where the files are stored. eg: {CustomerId} , [glo_var_seq]

Image Caching

Time in minutes the image cache will be kept in the server before being deleted.

Repeat value

Repeat the field value if it is equal to the previous record.

SQL Type

It informs the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.
- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Grid - Document (Database) Field

General Settings

Upload field Configuration Interface.

Data Type

Define the type of field. When setting it to Document (Database), all the document files are stored and loaded directly from the Database.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Icon

Displays an icon beside the field to identify the type of document.

File Name

It allows defining the field to store the name of the document in the database.

SQL Type

It informs the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.
- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Grid - Document (File Name) Field

General Settings

Upload field Configuration Interface.

Data Type

Define the type of field. When setting it to Document (File Name), all the document files are stored and loaded directly from the Database.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Sub-folder

Sub-folder name that the files are stored.

Icon

Displays an icon beside the field to identify the type of document.

File Name

It allows defining the field to store the name of the document in the database.

Cloud storage API

Profile with the API information (Dropbox, Google Drive or Amazon S3) used to upload the file to the cloud created in Tools > API.

Storage API directory

Directory name for upload to the Cloud Storage API. Eg.: files/docs/{id}. The file will be saved in the root folder if this field is empty.

Storage API cache directory

Local directory for caching files sent to the cloud via the storage API.

SQL Type

It informs the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.
- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or

bottom).

- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Grid - Bar code Field

General Settings

 Configuration Interface of the Barcode Field.

- **Data Type** : DataType of the field for the application.
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name would be "Client Name".
- **SQL Type** : Database field type.

Watch below a video showing an example about the Barcode field:

Values Format

 Configuration Interface of the Barcode Field.

- **Type** : Type of Barcode.
- **Text** : Barcode Text for illustration purposes.
- There are **18 types of barcodes**, that are listed below:

 Barcode configuration interface.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**
 - **Text Font** : Allows choosing the font type, which will be applied in the application field.
 - **Font Size** : Allows choosing the font size, which will be applied to the application object.
 - **Italic Text** : Allows to apply the italic type in the font.
 - **Bold Text** : Allows you to apply bold type to the font.
 - **Number of characters** : Number of characters to display.
 - **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
 - **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
 - **Background Image** : Allows you to add a background image to the field.
 - **Line Break** : Enables the possibility of a line break for the field.
 - **Content color** : Changes the content color of the query field and the grouped field, when available.
 - **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
 - **Width** : To define the width of the field.
 - **Height** : To set the height of the field.
 - **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
 - **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
 - **Title color** : Allows you to choose a color for the field title using a color palette.

- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Grid - QRCode Field

General Settings

 *QRCode field Configuration Interface.*

Data Type

Define the type of field. When setting it to QRCODE, it allows you to transform values into a QRCODE.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

SQL Type

It informs the data type of field in the database.

Watch below a video showing an example with QRCODE

Values Format

 *Interface of Values Format.*

Level of error correction

The Codewords are 8 bits long and use the Reed-Solomon error correction algorithm with four error correction levels. The higher the error correction level, the less storage capacity.

Image Size

Set the size of the QRCODE image.

Margin

Set the margins of the QRCODE.

 *Interface of Values Format.*

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.

- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Grid - Signature Field

General Settings

Configuration Interface of the Signature Field.

The signature field will help you creating more sophisticated forms and making it possible to store signatures in your database. Inside our development environment we have specific settings that will help you to customize your field, those options are:

- **Data Type** : You can define the type of field for the application. When it is defined as a text, it accepts letters, numbers and special characters.
- **Label** : Lets you define a label to the field in the application. For example: if the field is defined in the database as cmp_name_client, it will be easier to the user understand if the name is "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Background color** : Defines a color to the field background by using a valid hexadecimal color value or by choosing a color from the color palette.
- **Pen color**: Set a color to the pen by using a valid hexadecimal color value or by choosing a color from the color palette.
- **Width** : Lets you define a width to the field.
- **Height** : Set a height to the field.
- **Subtitle** : Defines the subtitle that will be displayed beside the field.
- **Initial Value** : Lets you define the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
- **Save Variable** : Save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Set the name for the session variable that will receive the field value.
- **Disabled Field** : Define if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : Displays the HTML Object that will be used to display the field in the form.
- **SQL Type** : Displays the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of ScriptCase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **CSS of the Title**
 - **Font** : Select the font type, that will be applied to the application field title.
 - **Font Size** : Defines the font size, that will be applied to the application field title.
 - **Font Color** : Choose a color to the font by using a valid hexadecimal color value or from the color picker.
 - **Background Color** : You can define the color for the field by using a valid hexadecimal color value or from the color picker.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Set the underline style to the font.
 - **Border style** : Choose a style for the border.
 - **Collapse** : Defines the collapse for the border.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Choose a color for the border, using a color palette to apply to the title.
 - **Horizontal Alignment** : Position the label of the field in the wanted position (left,right,center and justify).
 - **Vertical Alignment** : Position the label of the field in the wanted position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : Defines a width for the title of the field.
 - **Height** : Set a height for the title of the field.

Grid - Rating Field

This field allows the developer to create a field to display the data previously added using stars (or any other image).

Attribute descriptions

Data Type

Define the field type to **Rating**.

Label

The Label option lets you define the title of a field. Example: If the database field name is "**Stars**", You can display a different name for the user, like "**Stars**".

Besides use a fixed text, the **Label** attribute allows the use of **Langs** to define the field title, allowing the [internationalization of your application](#).

Subtitle

Define the subtitle of the field, below the ratings. **Example:** "Thank you for your feedback!".

As in the **Label**, the **subtitle** attribute also allows the use of **Langs** for the [internationalization of your application](#).

Amount of icons

It defines how many icons it will display in the field. The value set in this attribute must be according to the evaluation rules.

Use in Group by and Sums

Allows the field to be used instead of the value when the field is selected in the **(static or dynamic)** group by or in the totalization of the summary. To do this, just add the fields in the dynamic or static group by column to be able to visualize the grouping performed in the query.

Example of the **Rating** field in the summary.

In the summary, when hovering the mouse over the field, a small window detailing the ratings that were carried out both in each record and in total will be displayed, as shown in the image below.

Display absolute value

Allows the exact number of ratings that each star received to be displayed in the detailing window, next to the percentage, when summing up the summary.

With this flag turned off, the grouping will only display the voting percentage, leaving out the exact number of ratings.

In the case of the result of the ratings, this result is calculated through the weighted average **(Sum/Total of Evaluations)** as in the example below:

For example: in the image above, we have a total of 4 ratings carried out, where:

0 rating for 5 stars
2 ratings for 4 stars

0 rating for 3 stars
 1 rating for 2 stars
 1 rating for 1 star

Considering that the number of stars refers to the weight each one has, we have the following:

5 stars = 0 rating x 5 (weight) = 0
 4 stars = 2 ratings x 4 (weight) = 8
 3 stars = 0 rating x 3 (weight) = 0
 2 stars = 1 rating x 2 (weight) = 2
 1 star = 1 rating x 1 (weight) = 1

Sum = 11

We took the result of the sum and divided it by the total number of evaluations, which was 4.

Sum/Total of Evaluations = 11/4 = 2.75 ≈ 2.8.

As only 1 value after the comma will always be displayed in the detail window, rounding will occur upwards when the values after the comma are above the central value, and downwards when it is less than the central value.

Ex.: 2.75 ≈ 2.8.

Use Font Awesome

Allows you to use Font Awesome icons to represent stars instead of images.

Rating Star Hints

Defines the hint for each star

Icon size

Sets the pixel size of star icons.

Rating Padding

Defines the padding value in pixels for separating each star.

Icons Color

Allows you to define the color of the stars; the color is passed in hexadecimal.

SQL Type

It informs the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position

(left,right,center and justify).

- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon ? beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Grid - Rating Smile Field

General settings

This field type allows the developer to show data as an evaluation with emoji that goes from **Very Bad** to **Excellent**, where the final user could see the last evaluation.

Data type

Defines the data type of the field in the application. In this case we should select **Rating Smile**.

Label

Defines the title that will be shown in the field when the application is running. The used terms in the interface are essential to the system has good usability, we should use common name and terms for the final user, instead of the default values of the system.

For example, for the rating smile field, the client would have a better understanding of the field function when the label is **Product evaluation**.

Besides a fixed text, the **Label** allow to use of lang to define the field title, this way is possible to use the [application internationalization](#).

Subtitle

Define a subtitle that will be shown beside the field. Ex.: Thank you for the feedback!

Below is one example of an application subtitle:

Use in Group by and Sums

Allows the field to be used instead of the value when the field is selected in the **(static or dynamic)** group by or in the totalization of the summary. To do this, just add the fields in the dynamic or static group by column to be able to visualize the grouping performed in the query.

Example of the **Rating Smile** field in the summary.

In the summary, when hovering the mouse over the field, a small window detailing the evaluations that were carried out both in each record and in total will be displayed, as shown in the image below.

Display absolute value

Allows the exact number of evaluations that each icon received to be displayed in the detailing window, next to the percentage, when summing up the summary.

With this flag turned off, the grouping will only display the voting percentage, leaving out the exact number of ratings.

In the case of the result of the evaluations, this result is calculated through the weighted average **(Sum/Total of Evaluations)** as in the example below:

Excellent: 5 ratings - 16.7%
Good: 7 ratings - 23.3%
Regular: 11 ratings - 36.7%
Bad: 3 ratings - 10%

Very bad: 4 reviews - 13.3%

Considering that the weight of each smile always varies from 1 to 5 (Very bad to Excellent), we have:

5 ratings x 5 (weight) + 7 ratings x 4 (weight) + 11 ratings x 3 (weight) + 3 rating x 2 (weight) + 4 ratings x 1 (weight)

Sum = 96 → Result = 96 / 30 (total evaluations) = 3.2

As the result taken into account in the **Rating Smile** field is always an integer, and the value after the decimal point is below the central value (in this example, the central value would be 3.2), so we rounded DOWN, and we got the same result a 3, which corresponds precisely to the **“Regular”** smile, and that is why this is the one that is most lit at the top of the detailing window, as shown in the image above.

Values and hints

Allows to the developer to define the values to each emoji taht will be saved at the data base and allow to define a hint (**It is show passing the mouse above the emoji**)

Display format

Allows the developer to define the format that the emojis will be shown.

In case the first option is defined, the emojis will be shown like this:

In case the second option is defined, the emojis will be shown like this:

Icon size

Allows defining the icon size in pixels.

Rating padding

Allows for defining the padding value between the emojis.

Icon colors

Allows the icon colors to be defined in each emoji.

SQL type

Infomrs the field type at the data base.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.
- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).

- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Grid - Rating Thumbs Field

General settings

This field type allows the developer to show data as an evaluation with icons “like” and “dislike”.

Data type

Defines the data type of the field in the application. In this case we should select **Rating Thumbs**.

Label

Defines the title that will be shown in the field when the application is running. The used terms in the interface are essential to the system has good usability, we should use common name and terms for the final user, instead of the default values of the system.

For example, for the rating thumbs field, the client would have a better understanding of the field function when the label is **Product evaluation**.

Besides a fixed text, the **Label** allow to use of lang to define the field title, this way is possible to use the [application internationalization](#).

Subtitle

Define a subtitle that will be shown beside the field. Ex.: Thank you for the feedback!

Below is one example of an application subtitle:

Use in Group by and Sums

Allows the field to be used instead of the value when the field is selected in the **(static or dynamic)** group by or in the totalization of the summary. To do this, just add the fields in the dynamic or static group by column to be able to visualize the grouping performed in the query.

Example of the **Rating Thumbs** field in the summary.

In the summary, when hovering the mouse over the field, a small window detailing the evaluations that were carried out both in each record and in total will be displayed, as shown in the image below.

Display absolute value

Allows the exact number of evaluations that each thumb received to be displayed in the detailing window, next to the percentage, when summing up the summary.

With this flag turned off, the grouping will only display the voting percentage, leaving out the exact number of ratings.

As there are only two possible options to choose from, only records are counted to define the percentage of times each thumb was selected.

For the scenario in which both thumbs have the same number of ratings, with a percentage of 50% x 50%, the thumb that will be more lit at the top of the detailing window will always be the “Like”.

Values and hints

Allows to the developer to define the values to each icon taht will be saved at the data base and allow to define a hint (**It is shown passing the mouse above the icon**)

Display format

Allows the developer to define the format that the emojis will be shown.

In case the first option is defined, the emojis will be shown like this:

In case the second option is defined, the emojis will be shown like this:

Icon size

Allows defining the icon size in pixels.

Rating padding

Allows for defining the padding value between the emojis.

Icon colors

Allows the icon colors to be defined in each emoji.

SQL type

Informs the field type at the data base.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.
- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.

- **Bold** : Displays the field title in bold

Grid - Fields Grouping

This feature allows to group two or more fields into a virtual field of the special type **Field Grouping**.

See [how you can create a Field Grouping](#).

Fields Grouping example

General Settings

See below the option's general configuration for fields grouping.

Data Type

Informs the data type of the field in the application.

Label

Defines the *title* displayed in the application column.

The text definition has no character restriction and can be done with a **fixed text** or using a **lang**, to create systems with multiple languages.

[See more details](#) about langs and about our [Data dictionary](#).

Grouping fields

In this attribute we define the fields that will be grouped, moving them to the right, and the order in which these fields will be displayed on the grouping fields.

Display options

Defines how grouped field values will be display in the field.

When selecting the option *Label and Value* (Default value) defines that both the **label** and the **field value** will be displayed, see the example below.

When selecting the *Value* option, only the field value will be displayed, see the example below.

Label positioning

- **Above** - Default value, positions the label of the grouped fields above the values.
- **Beside** - Positions the label of the grouped fields beside the values.

This attribute is only available when selecting the *field value* option in the **Display Options** attribute.

Example of above label

Example of beside label**Spacing between fields**

Sets the spacing between grouped fields. This attribute is applied in pixels, for this definition we must inform only the numerical value.

Examples of fields with and without spacing**Title for sorting grouped fields**

This attribute defines the title of the grouping sort box.

By default, Scriptcase defines the lang `{lang_field_grouping_choose_column_sorting}` as the title. The lang text can be changed in the tool [Application Language](#).

Example of sorting grouped fields**SQL type**

Defines the SQL type of the field.

Display Settings

See below the options to display settings of the field grouping.

Title horizontal Alignment

In this attribute you can set the horizontal alignment of the field grouping title as: **Left**, **Right** or **Centered**

When leaving this value unchanged, the alignment assumes the configuration of the application's theme.

Examples of horizontal alignments: Left - Right - Centered**Title vertical alignment**

In this attribute you can set the vertical alignment of the field grouping title as: **Top**, **Middle** or **Bottom**

Examples of vertical alignments: Top - Middle - Bottom**Background color**

Defines the background color of the entire column of the grouping of fields.

The configuration of grouped fields must be carried out individually in the field.

Title color

Set a color to field grouping title overriding theme settings.

Example of label text color

Field title background color

Set a background color to field grouping title overriding theme settings.

Example of the background color of the label

Bold

Defines whether or not the button group title will be in bold.

Grid Layout Setting

This module lets you editing display options for the application. You can apply visualization themes, organize blocks, define values, and the display format of the Header and Footer.

Blocks

Blocks are “containers” where you can position the application fieldSlides of Forms, Controls, or Grids.

Scriptcase creates applications with one block by default. You can add more blocks as you wish, to organize it in the best way.

See below, the Columns Organization, and where you can define the position of the next block: beside or below the current one.

Op		Block	Title	Label		Fields		Organization				
Name	Label	Display	Display	Position	Columns	Position	Next	Width	Collapse			
Pag1												
			form_orders	form_orders	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Pag2												
			Block 2	Block 2	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Blocks not shown												

Application Block configuration

On the left side of each block, there are two icons, the first one to edit the information of the block and the second one to delete the block.

Organizing the position of the Blocks

See below how to modify the display order of the Blocks in one Page.

Click and drag the block that you desire to modify to its new position.

Op		Block	Title	Label		Fields		Organization				
Name	Label	Display	Display	Position	Columns	Position	Next	Width	Collapse			
Pag1												
			form_orders	form_orders	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Pag2												
			Block 2	Block 2	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Blocks not shown												

Application Block Display configuration

- See how to remove a block from the display

Click on the block desired and drag it to the item “Blocks not Shown”. This way, you can also drag the block to another page if desired. See the images below.

Block		Title		Label		Fields		Organization				
Op	Name	Label	Display	Display	Position	Columns	Position	Next	Width	Collapse		
Pag1												
			form_orders	form_orders	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼

Application Block Display configuration

Block

- **Name:** The name that identifier the Block.
- **Label:** Title of the block to display in the application.

Title

- **Display:** It controls the display of the block title.

Label

- **Display:** It controls the display of the field labels of the block.
- **Position:** Options to display label :
 1. **Above:** Display the label above the field.
 2. **Beside:** Display the label beside the field.
 3. **Below:** Display the label below the field.

Fields

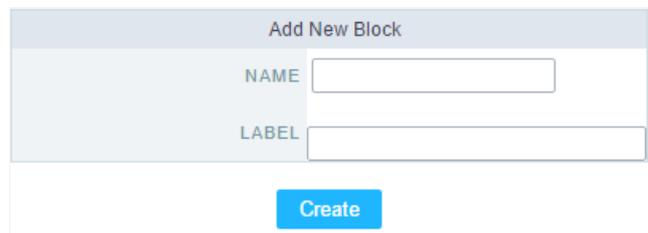

- **Columns:** Amount of columns side by side in the block.
- **Position:** The way to display the fields in the block:
 1. **Below:** Display the fields one below the other respecting the number of columns.
 2. **Beside:** Display the fields one beside the other respecting the number of columns.
 3. **Line:** Display the fields one beside the other with no tabulation.

Organization

- **Next:** The way to display the blocks in the page:
 1. **Below:** Set to show the following block below the current one.
 2. **Beside:** Set to show the following block beside the current one.
 3. **Tab:** Set to show the following block in a different tab then the current one.
- **Width:** Set the block width in pixels or percentages. Use the symbol “%” to indicates the value in percentage.
- **Collapse:** Enables the option to close the block.

Create a New Block

To include new blocks in an Application, click on the button **Create New Block**. Then, enter the name and label of the block in the following interface and finish by click on Create.

The screenshot shows a form titled "Add New Block". It contains two input fields: "NAME" and "LABEL". Below the fields is a blue "Create" button. The form is set against a light gray background.

Creating application blocks configuration

Name

Name of the Block.

Label

Title of the block to display in the application.

Edit Blocks

To edit a block, click on the icon , that is on the left side of the block. Then you can see the following interface to define the parameters of the blocks. Click on Save to finish.

EDIT BLOCKS	
ATTRIBUTE	VALUE
Name	<input type="text" value="form_orders"/>
Title	<input type="text" value="form_orders"/>
Display Title	<input type="radio"/> Yes <input checked="" type="radio"/> No

Label Position	<input type="text" value="Beside"/>
Next Block	<input type="text" value="Below"/>
Border Color	<input type="text"/>
Border Width	<input type="text" value="0"/> pixels
Block Width	<input type="text" value="100%"/>
Block Height	<input type="text" value=""/>
Cell Spacing	<input type="text" value=""/> pixels
Collapse	<input type="text" value="Start open"/>

Application Block editing interface

Name

Name of the block. ##### Title

Block title for display. ##### Display Title

This option, when active, allows displaying the block title. ##### Title Font

Set the font family of the block title. ##### Font Size

Set the font size of the block title. ##### Font Color

Set the font color of the block title. ##### Background Color

Set the Background Color of the block title. ##### Background image

Set a Background image for the block title. ##### Title Height

Height in pixels of the block title line. ##### Horizontal Alignment

Horizontal Alignment of the block title (Left, Center, and Right). ##### Vertical Alignment

Vertical Alignment of the block title (Top, Middle, and Bottom). ##### Display Label

Display the labels of the fields in the block. ##### Columns

Amount of field columns in a block. ##### Columns Width

Set the field column width of the block. ##### Label Color

Color of the field labels. ##### Fields Organization

The way to display the fields in the block. ##### Label Position

Set the position of the field labels of the block.

The options are:

- **Beside** - This option positions the label on the right side of the field.

User

- **Above** - This option places the label above the field.
- **Below** - This option places the label below the field.

Next Block

Set the position of the following block relating to the current one. ##### Border Color
 The border Color for the block. ##### Border Width
 The border Width for the block. ##### Block Width
 The width for the block. ##### Block Height
 The Height for the block. ##### Cell Spacing
 The Cell Spacing in the block. ##### Collapse
 It enables the option to close the block.

Layout Settings

ScriptCase creates an app by using default values defined per project, but you can change those values for a specific application on this interface.

▲ LAYOUT SETTINGS

Header Template	<input type="text" value="Flat"/>	Template name used for the application header.
Footer Template	<input type="text" value="Default"/>	Template name used for the application footer.
Button	<input type="text"/>	Use different buttons than what was defined in the color scheme.
Themes	<input type="text" value="Sc9_Rhino"/>	Use different themes from the one defined for the color scheme

Application Layout

Header Template

Allows choosing the look of the application Header.

Footer Template

Allows choosing the look of the application Footer.

Button

Allows choosing the button theme for the application.

Themes

Choose one of the selected themes in the project properties. It defines the look of the application, like colors, fonts, and others.

Header

Here we can define if we want to display the header or not, the application title, and fill the header variables. The header looks according to the selected template in the Layout settings interface.

▲ HEADER	
ATTRIBUTE	VALUE
Display Header	<input checked="" type="checkbox"/>
Insertion Title	<input type="text" value="{lang_othr_frmi_tit} - orders"/>
Update Title	<input type="text" value="{lang_othr_frmu_tit} - orders"/>
Header Variables	
SC_HEADER	<input type="text" value="Title"/>
SC_VALUE	<input type="text" value="Date"/> ?

Application Header Configuration

Display Header

This option determines if we want to display the header or not.

Title

Allows informing the title of the application.

Header Variables

We must fill the variable fields with one of the types available in the Combobox. Depending on the type, you need to associate content with it. Those are the types:

- **Field:** When you choose the option "**Field**", it opens a Combobox to choose a field to associate the field value with the header. This option will be enabled in the applications that you can crate a fields
- **Title:** It displays the value of "**Application Title**" in the header.
- **Date:** It displays the system's date in "yyyy/mm/dd" format in the header. There are several display formats available, and you can change it by using the text field beside it. To access existing formats, click on the hint to see an explanation.
- **Image:** It displays a field to inform the name of an existing image in the server. You can select an image by clicking on the

icon “**Choose Image**”, and you still can upload new images by using the button “**Upload**”. .

- **Value:** It displays the content of the text input. You can inform static texts and “**Global Variables**”. e.g. “Employee Name: [v_name]”.

Depending on the Application, you may have more than one title option.

Footer

FOOTER	
ATTRIBUTE	VALUE
Display Footer	<input type="checkbox"/>
Footer Variables	
NM_FOOTER_DATA	<input type="text"/>
NM_FOOTER_LOGO	<input type="text"/>
NM_FOOTER_TITLE	<input type="text"/>

Application Footer Settings

This page may change depending on the footer template chosen in the Layout Settings.

Display Footer

This option determines if we want to display the footer or not.

Footer Variables

We must fill the variable fields with one of the types available in the Combobox. Depending on the type, you need to associate content with it. Those are the types:

- **Field:** When you choose the option “**Field**”, it opens a Combobox to choose a field to associate the field value with the header. This option will be enabled in the applications that you can crate a fields
- **Date:** It displays the system’s date in “yyyy/mm/dd” format in the header. There are several display formats available, and you can change it by using the text field beside it. To access existing formats, click on the hint to see an explanation.
- **Image:** It displays a field to inform the name of an existing image in the server. You can select an image by clicking on the icon “**Choose Image**”, and you still can upload new images by using the button “**Upload**”. .
- **Value:** It displays the content of the text input. You can inform static texts and “**Global Variables**”. e.g. “Employee Name: [v_name]”.

Grid Events Overview

Most Scriptcase applications, with the exception of Tabs and Dashboard applications, have events that can be used to create business rules, validations and changes to the application's CSS, among other things.

When events are executed?

Each event is executed at a certain moment in the application and has an execution order, for this reason, they have different functions within the creation of a business rule and validations.

They can be triggered automatically, as in the case of the **onApplicationInit** and **onScriptInit** events, where they are executed when the application starts. Also, they can be triggered through user interaction, as with the **onNavigate** and **onValidate** events, which are executed when browsing the application or submitting a form, respectively.

For information about the timing of events execution or other information, access the documentation of the desired event.

how they work?

By default, the events already have handle for opening `<?php` and closing `?>` of PHP tags, so they are ready to receive PHP code and macros from Scriptcase.

However, it is possible to use other languages in the event, such as **JQuery**, **JavaScript**, **CSS** and **HTML**. For this, it is necessary to close the PHP tag `?>` of the event, so that the code can be added.

Remembering that it is necessary to reopen the event's PHP tag `<?php`, otherwise the application will not run correctly.

When closing the PHP tag in a Scriptcase event, the executed language is HTML.

Example of using other languages:

onApplicationInit - Grid

It is the first event executed in the application, being fired even before the SQL and HTML assembly.

It works as a preparation for the application, where it is possible, among other things, to manipulate variables, perform validations and change the connection with the `sc_change_connection` macro, for example.

In the example below, access to the edit form (`form_orders`) linked to the query will be limited, depending on the user who is accessing the application.

If the variable `[usr_login]` is equal to **admin**, the user will have access to the form with the possibility of inserting and deleting a record.

If the variable has some other value, the user will still have access to the form, but only with the possibility of changing a record.

Samples Code

```
if ( [usr_login] == 'admin' ) {  
  
    sc_apl_conf("form_orders", "insert", "on");  
    sc_apl_conf("form_orders", "delete", "on");  
  
} else {  
  
    sc_apl_conf("form_orders", "insert", "off");  
    sc_apl_conf("form_orders", "delete", "off");  
  
}
```

onNavigate - Grid

In the query application, this event runs in two situations:

- When configured with partial paging, the event is executed when navigating between pages using the **navigation buttons**, **navigation by page** or the **Jump to** option.
- When configuring the application with **Infinite Scroll**, it is executed every time records are loaded.

Unlike other events, this one depends on user interaction to be triggered, allowing, for example, that any validation or layout change is performed only after this interaction.

Note

The query navigation is performed by ajax, thus, it is not possible to use Javascript codes (jQuery, Ajax).

When using full paging in the application, the event is not executed.

onScriptInit - Grid

Second event to be executed, before the execution of the main select, it is triggered whenever the application is loaded. For example, after using the advanced filter.

In it, all application variables and libraries are available for use.

The manipulation of connections with `sc_connection_edit` and `sc_connection_new` macros, manipulation of the main select with `sc_select_order` and `sc_select_where(add)` macros and inclusion of libraries already incorporated into Scriptcase such as JQuery with `sc_include_lib` macro are some of the examples of using the event.

In the example below, access to the sales report will be limited to the user who performed them.

Access is limited if the user is not the admin.

Sample Code

```
if ( [usr_login] != 'admin' ) {  
    if ( empty({sc_where_atual})) {  
        sc_select_where(add) = "WHERE employeeid > [usr_login]";  
    } else {  
        sc_select_where(add) = "AND employeeid > [usr_login]";  
    }  
}
```

onRecord - Grid

This event is executed immediately before the display of each record displayed in the query, regardless of user interaction.

Thus, it is commonly used for data manipulation and validation, creating links with the `sc_link` macro or changing the layout with the `sc_field_style` macro, based on the displayed information.

In the example below, the style of the text in the `{priceorder}` field will change according to the value.

For values below 500 reais, the text will have a different color from values above 500 reais,

Samples Code

```
if ( {priceorder} < 500 ) {  
    sc_field_style({priceorder}, "Background-Color", "15", "#228B22", "", "bold");  
} else {  
    sc_field_style({priceorder}, "Background-Color", "15", "#006400", "", "bold");  
}
```

onHeader - Grid

The third event generated in the query occurs immediately before the application's header display, during the loading of the page's display HTML elements.

The onHeader is only obtained when the option to display the header is enabled in the application's layout settings.

In this event, it is possible to perform queries in the database, allowing you to read information about the application and the values of the Query's fields.

It is used, among other things, to change the application's CSS, javascript codes and display information linked to fields, such as a sales total or a legend for a line graph.

onFooter - Grid

This event occurs after the processing of the grid lines, during the display of the HTML elements of the page footer.

onFooter is used when we want to display some information in the footer, such as a sales total or a legend for a line graph.

onFooter runs only when the option to show footer is enabled in the application's layout settings.

E.g: We want at the bottom of the application to display the total value of orders displayed in the grid of an invoice, with a 10% discount:

```
sc_lookup(ret," select sum( valueitem ) from sales_item where sale_id={sale_id} ");
```

```
[v_footnote] = {ret[0][0]} * 0.1;
```

Code Editor

Scriptcase has Events to allow the developers to customize the application code. By using the events, the developers can program custom actions at a specific execution time (e.g. After a record is inserted, when it is loaded, upon submitting a Form, ...) and for a specific application type. In the events area you can use global and local variables, JavaScript, CSS, HTML, PHP codes and also Scriptcase macros.

Scriptcase code editor is used within events and has a series of shortcuts to help in the applications development.

At the top section of the editor, there are some options that allows us to change the editor theme or expand it, for example. These options can also be activated using the hotkeys.

- - Increases the area occupied by your code editor.
- - Expand the sides of the code editor.
- - Activates the search in the code editor.
- - Enables replace in the code editor.
- - Defines the code editor theme.

The hotkeys are available in all browsers compatible with Scriptcase.

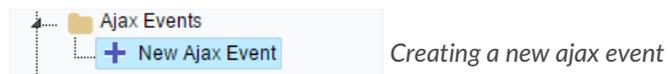

[Click Here](#) to view the Scriptcase hotkeys documentation.

Grid Ajax Events

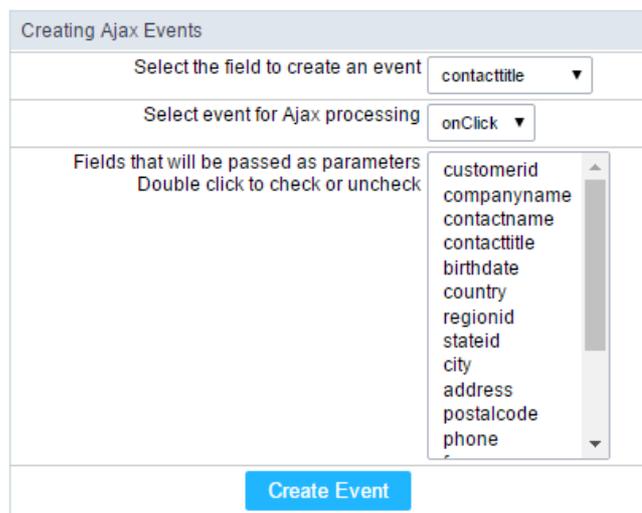

OnClick

The ajax event OnClick is executed when the field that it's based on is clicked.

- Creating a new ajax event

- Selecting a field

A screenshot of a dialog box titled 'Creating Ajax Events'. The dialog has three main sections. The first section is 'Select the field to create an event' with a dropdown menu showing 'contacttitle'. The second section is 'Select event for Ajax processing' with a dropdown menu showing 'onClick'. The third section is 'Fields that will be passed as parameters' with a list of fields: 'customerid', 'companyname', 'contactname', 'contacttitle', 'birthdate', 'country', 'regionid', 'stateid', 'city', 'address', 'postalcode', and 'phone'. A blue 'Create Event' button is at the bottom. To the right of the dialog, the text 'Selecting a field of the ajax event' is written in a light blue font.

Choose a field to create an event To define in which field the event will be add to.

Choose an event that run the ajax Defines which event will be added to the field.

Grid Buttons Settings

In addition to the buttons that comes automatically with the applications, you can also create your own buttons. All the buttons are displayed within the application toolbar.

New buttons creation settings

Creating a new button

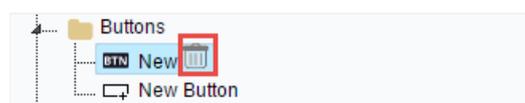

To create a new button, click on the “New Button” option and enter a name and a button type.

The button Types are: JavaScript, PHP, Link and Run.

Grid buttons type

Deleting a button

To delete a button click on Delete icon (represented by a recycle bin image) in the right of the button name, at the application menu under the Buttons option.

Deleting a button

JavaScript

Display Mode

You can configure the display mode of the javascript button in Image, Button or Link.

Detail Module

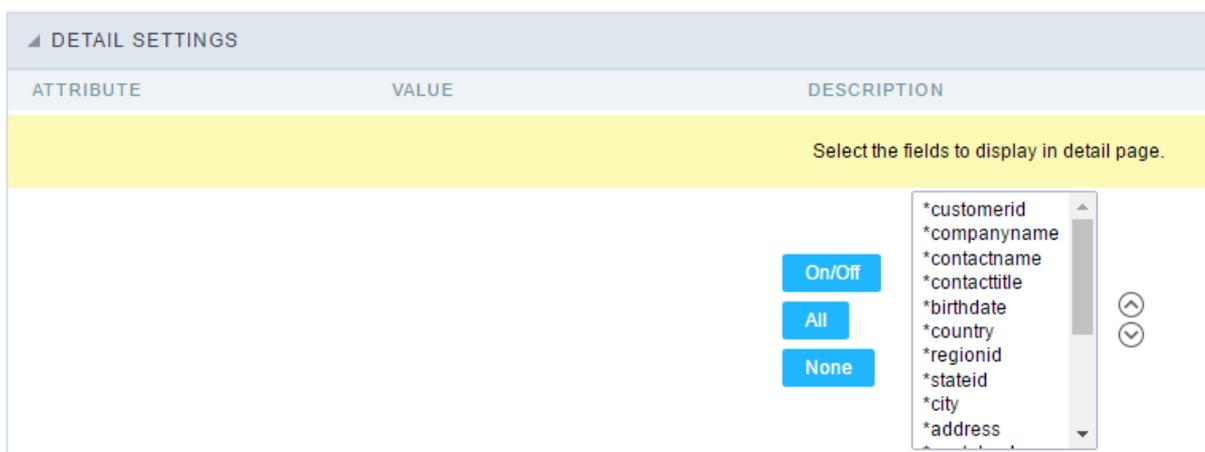

The Grid Detail Module allows you to organize the information displayed according to its significance. It's a complementary application that displays the data in a detailed Form. In order to see the Grid Detail within the Grid the final user needs to click on

 that is displayed for each record.

To enable the Grid Detail Module, access the "Grid Modules" and enable the check box, it uses to come enabled by default:

Detail Settings

In this section, the user can define how the detail of a particular record should be displayed when it's selected and which registry information should be displayed in this detail.

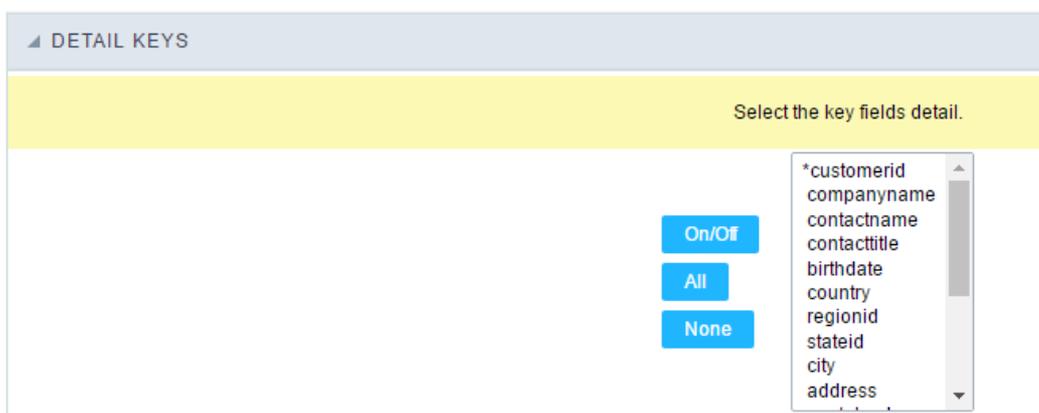

- **Attributes**

- **Fields selection for the detail page.** : Allows you to select the desired fields. Just click the field and then click the "On/Off" button to enable/disable the fields.

Detail Keys

Through this interface you can chose the fields that will be part of the "WHERE" clause, it will return the corrected information according to the selected record. ScriptCase uses to identifies the table primary keys, that is being used within the application SQL, automatically. However, sometimes it is necessary to set the primary key manually, especially in cases where the application has a SQL JOIN, involving more than one table.

Select here the fields that are keys to the Detail. The application will execute another select command, and you can configure which fields will be passed for this "WHERE" clause:

- **On/Off** : Select the field to be displayed in detail. The selected field (On) gets an asterisk.
- **All** : Check "On" to all fields.
- **None** : Check "Off" to all fields.

Desktop Toolbar

The application toolbar is divided in two parts: superior and inferior. It is possible to select the buttons for each part independently. A button can even be part of both parts simultaneously.

DETAIL TOOLBAR		
ATTRIBUTE	VALUE	DESCRIPTION
Configure the toolbar below for a "classic web version " and also for a "mobile version".		
<div style="display: flex; border-bottom: 1px solid gray; padding-bottom: 5px;"> Desktop Mobile </div> <div style="border: 1px solid gray; padding: 10px;"> <div style="display: flex; justify-content: space-between; align-items: flex-start;"> <div style="width: 20%;"> <p>Top Toolbar</p> </div> <div style="width: 60%;"> <div style="display: flex; justify-content: space-between;"> <div style="width: 45%;"> <div style="border: 1px solid gray; padding: 5px; margin-bottom: 5px;"> Export PDF Print Navigation Exit Separator ----- </div> </div> <div style="width: 10%; text-align: center;"> >>> > < <<< </div> <div style="width: 45%;"> <div style="border: 1px solid gray; padding: 5px; margin-bottom: 5px;"> Left Center PDF Print Exit Right </div> </div> <div style="width: 10%; text-align: center;"> ^ v v v v v </div> </div> </div> <div style="border: 1px solid gray; padding: 5px; margin-top: 5px; display: flex; justify-content: flex-end; gap: 5px;"> Group Add Edit Delete </div> </div> </div> <div style="border: 1px solid gray; padding: 10px; margin-top: 10px;"> <div style="display: flex; justify-content: space-between; align-items: flex-start;"> <div style="width: 20%;"> <p>Bottom Toolbar</p> </div> <div style="width: 60%;"> <div style="display: flex; justify-content: space-between;"> <div style="width: 45%;"> <div style="border: 1px solid gray; padding: 5px; margin-bottom: 5px;"> Export PDF Print Navigation Exit Separator ----- </div> </div> <div style="width: 10%; text-align: center;"> >>> > < <<< </div> <div style="width: 45%;"> <div style="border: 1px solid gray; padding: 5px; margin-bottom: 5px;"> Left Center Right </div> </div> <div style="width: 10%; text-align: center;"> ^ v v v v v </div> </div> </div> <div style="border: 1px solid gray; padding: 5px; margin-top: 5px; display: flex; justify-content: flex-end; gap: 5px;"> Group Add Edit Delete </div> </div> </div>		

- **Attributes**

- **Navigation** : Navigation Buttons
 - **Exit** : Ends or return to the previous application depending on how the "Display Detail" is configured. You can change the label within the "Button Settings".
- **Exports** : Sets the formats for printing generation:
 - **Print** : Creates a complete report with all Grid Detail data within a HTML printable page.
 - **PDF** : Creates a complete report with all Grid Detail data within a PDF file type.
- **Othes**
 - **Separator** : Creates a separation line between the buttons for better display, specially for grouped buttons.

Mobile Toolbar

DETAIL TOOLBAR

ATTRIBUTE	VALUE	DESCRIPTION
Configure the toolbar below for a "classic web version " and also for a "mobile version".		
Desktop Mobile		Copy from desktop
Top Mobile toolbar	Export PDF Print Navigation Exit Separator -----	Left Center PDF Print Exit Right
Bottom Mobile toolbar	Export PDF Print Navigation Exit Separator -----	Left Center Right

Group: Add Edit Delete

Group: Add Edit Delete

It has the same options of **Desktop** version, by adding only the item "copy of the desktop", in which, when clicked, performs a copy of toolbar items from **Desktop** to **Mobile**.

Button Settings

HEADER	
ATTRIBUTE	VALUE
Display Header	<input checked="" type="checkbox"/>
Detail Title	{lang_othr_detl_titl} - customers
Header Variables	
SC_HEADER	
SC_VALUE	

Button Displays the buttons available in the application.

Label Allows you to customize the buttons name from current application. You can also use the option "Application Language" (placed within the main menu "Locales") to change the button labels for the whole project.

Hint Allows you to set a hint for the buttons. The hint will help the user to understand the button's action.

Shortcut key Allows you to set a shortcut key to run the button action. Important note: Each browser has its own shortcut combinations and reserved words, you need to check it before implementing this option.

Application Hotkeys

Scriptcase allows creating shortcut keys to your applications. You can select a predefined template or create specific actions for an application.

Application Hotkeys
?

ATTRIBUTE	VALUE	DESCRIPTION
Use hotkeys	<input checked="" type="checkbox"/>	Define if the application will use hotkeys
Hotkeys template	<div style="border: 1px solid #ccc; padding: 2px; display: flex; align-items: center;"> SC_DefaultHotkeys v ↻ ✎ </div>	Select the hotkey template from previously created schemas

Clean
+

ACTION	KEYBINDING
No hotkeys configured	

Clean
+

Use hotkeys

Defines if the application uses hotkeys. When you enable this option, the default shortcut keys settings are disabled.

Hotkeys templat

Select the [hotkey template](#) previously created.

Action

Selects the triggered action when pressing the selected key.

Keybinding

Selects the keys responsible for executing the chosen action.

Add “+”

Adds a new action on the keys list.

Clear

It clears the selected hotkeys preference.

Header

In this section is where the content variables that will be part of the header is set.

▲ HEADER	
ATTRIBUTE	VALUE
Display Header	<input checked="" type="checkbox"/>
Detail Title	<input type="text" value="{lang_othr_detl_tit} - customers"/>
Header Variables	
SC_HEADER	<input type="text"/>
SC_VALUE	<input type="text"/>

This screen will change depending on the format chosen header within.

- **Display Header** : This flag determines whether the header is displayed.
- **Detail Title** : Using this option you can set a title for the application, it uses bring a value from the Grid application as default. However it can be customized.
- **Header Variables** : Variable fields can be filled with any of the types displayed in the Combo box. Depending on the type, you must associate a content. Below we describe the existing types:
 - **Field** : When the “__Category” type option is chosen, it will open a combo box next to the fields that are part of the “Select”. By choosing one of these fields, you are associating the value of the field to display in the header.
 - **Title** : When this option is selected, it will display the value filled in “**Detail Title**” to the header.
 - **Date** : When you select the “**Date**” type, the system date in the format mm/dd/yyyy will be displayed in the header. There are several display formats using server date and time. The format can be reported in the text field that appears next. Click in the question mark to check out the available formats.
 - **Image** : When the image type field is selected, a field for filling in the image name on the server will appear. To locate the existing images and select one, click on the “**Choose Image**” icon and to make new images available on the server click on “**Download an image**” .
 - **Value** : When “**Value**” type is selected, the content filled in the text field next to that will be displayed in the header, texts and “__ Global variables__” can be entered. Ex: “Name of the Employee: [v_name]”.

Nested Grid Overview

The *Nested Grid* functions as a link between query applications and is used to display and maintain supplemental data from the parent application, such as customer order information about a.

Example of application with Grid nested in Iframe

In the example, the nested Grid is set to display below the record, with options to edit and add new items to the order.

Check configuration options

- [General Settings](#)
- [Creating a nested Grid](#)
- [Individual Nested Grid Settings](#)

Nested Grid Settings

On this screen we must define the display configuration of the nested Grids in the main application.

We can define the general behavior of the nested Grids or use the **Define Individually** in the attributes and define the appearance and behavior individually, in each nested Grid created.

Configuration

This configuration block defines how the nested Grid will be displayed in the main application.

iframe mode

This attribute defines whether or not the iframe is used to display the called application.

This implies the full use of the functionality of the query configured as nested Grid, such as: Pagination, filters, export, breaks, columns and ordering.

Title on the same line

This attribute defines whether the nested Grid column titles will be displayed on the same line as the main Application Title.

This attribute is available when the **iframe mode** and **Enable TreeView** options are set to *No* or *Individually Defined*.

The configuration options are:

- **Yes** - In this option, the title of the nested Grid columns will be embedded in the title of the main application, as in the example below.
- **No** - In this case the **Positioning** will be displayed so that we can define the positioning of the nested Grid.
- **Define individually** - Enables setting the Title on the same line in the configuration of each nested Grid created, so that the behavior can be defined individually.

Example of nested Grids displayed on the same row

Enable TreeView

This option adds a feature to hide/show the nested Grid in the query.

The display of the nested Grid will be defined by the **Positioning**.

Choosing Yes will disable the Same Line Title option.

Example of Nested Grid with TreeView

Positioning

Defines the location of the nested Grid within the main application.

This attribute will be displayed when setting *Yes* in the **Title option on the same line**.

The options are:

- **In a column** - A column will be added after the last field of the main application
- **Below a record** - The nested Grid will be displayed below the record line.
- **Define Individually** - Enables the Positioning configuration attribute in the configurations of each nested Grid created, so that the behavior can be defined individually.

Example of nested Grid In a Column with TreeView

Example of nested Grids Under a Record with TreeView

Nested Grid Positioning

This attribute is available if the main application has two or more nested Grids and if they are configured to display **below the record**.

In this case, we can define whether to display **next to each other** or **below each other**.

Example nested grid shown side by side

Sample nested grid shown one below the other

Alignment

Allows you to configure the alignment of the nested Grid in relation to the main query when the Positioning option is Below a Record.

The options are: **Left**, **Right** and **Center**.

This option is available only if the Location attribute is set to *Below Record*

Remove application padding and margins

Remove margins and padding from the called app to make it fit better on the screen.

Remove

border Removes the borders of the called application's main table to better fit the display

iframe configuration

These settings are only available if the **iframe mode** attribute in the Settings block is set to *Yes*

Iframe Hight

Allows you to set the iframe height in pixels.

Iframe Width

Allows you to set the iframe width in pixels.

Inicial Module

Defines the application's initial module on the first load: (Grid, Filter or empty)

Number of Lines

Defines the number of lines to be displayed.

Number of Columns

Defines the number of columns to be displayed.

Pagin

Defines if the records will be shown partially with pagination (navigation), or if it will be total with all records on the same page.

Fix top toolbar

Allows you to pin the toolbar on top.

Fix bottom toolbar

Allows you to pin the toolbar on bottom.

Buttons

Defines which buttons will be available on the nestedgrid toolbar.

Nested Grid Configuration

This configuration block defines whether or not the nested Grid will be exported with the main application.

The **NestedGrid** can be added in the following export types: [PDF](#), [Excel][[link_export_excel](#), [XML](#) {target="_blank"} and [JSON](#)

This setting is only available if the **iframe mode** attribute in the Settings block is set to *No* or *Set Individually*

Each type of export can be defined as follows:

- **Yes** - This option will include the nested Grid when exporting.
- **No** - This option will not include the nested Grid when performing the export.
- **Define individually**: enables the export field in the nested Grids created, so that the display definition in the export is defined individually.

New link

To create a new link with a Nested Grid, click the New Link item in the Links within Nested Grid folder.

Add a new Nested Grid

Enter the name and label of the link to be created.

- **Name** - Defines the name of the Nested Grid. The name field only allows numbers, unaccented letters, and underscores.
- **Label**: defines the display text of the Nested Grid column.
- **Advanced Nested Grid** - defines the use of the iframe to open the Nested Grid, allowing the use of various features of the query

The **Label** attribute has no character restriction and allows the use of lang.

Application List

All project applications available for the link will be listed. In this step, the developer must select the destination application that will be used in the connection.

Finding Applications

To assist in locating the application, you can use the **grouping buttons** or the **Search** field.

Search field

The search is performed by application name.

Grouping Buttons

In this grouping there are three visualization options:

All

Lists all applications in the project alphabetically **a-z**.

Example of applications without clustering

By folder

Lists applications grouped by their folder, according to the organization of applications in the [Explorer Project](#).

Example of applications grouped by Folder

- **Item 1** - List of folders created in [Explorer Project](#). Select the folder and all applications in the folder will be displayed on the **item 2**.
- **Item 2** - List of applications in the folder selected in the __Item 1__.

By type

Lists applications grouped by their respective type.

Example of applications grouped by type

Item 1 - Types of existing applications in Scriptcase. Select the type of application you want to list, the applications corresponding to the selected type will be listed in **item 2**. **Item 2** - List of applications referring to the type selected in **item 1**.

When selecting the destination application, click on **Next** ».

Definition of parameters

In this step, the developer must inform the values that will be passed to the parameters of the destination application.

These parameters can be:

- [Global Variables](#) - Which can be defined in the events or in the target application's SQL.
- Primary Key - For connections created with applications of the types: [Form](#) and [Calendar](#).

Parameters

Lists all parameters defined in the target application.

Type

Defines the source type of the value that will be sent to the parameter defined in the destination application.

The options are:

- **Fields** - It uses the value of a field from the source application as a parameter.
- **Variable** - It uses the value of a global variable, defined in the source application, as a parameter. **This option will only be listed if a global variable is defined in an event in the source application.**
- **Fixed value** - It uses a fixed value, defined in the value column, as a parameter. **In this option only alphanumeric values are allowed.**
- **No value** - Using this option no value is passed. When using this option as a parameter for a primary key, the target application will be displayed in include mode.

Value

Defines the value that will be sent as a parameter. The options in this column change according to the selected **Type**.

- When selecting **Campo** - The value column will list all the fields of the source application, which will send the value.
- When selecting **Variable** - All global variables defined in the source application will be listed.
- When selecting **Fixed value** - A field will be displayed for the value to be informed. The use of variables is not allowed in this option and we must use only alphanumeric values.
- When selecting **No Value** - In this case, no value will be sent to the parameter.

Refresh Button

This button enables ajax reloading of the list of parameters, in this way it is possible to change or add a parameter in the destination application without the need to restart the creation of the connection in progress.

Application without Parameter

To show only the records that meet a certain condition, it is necessary to define parameters, for this the query application must have a WHERE clause with a global variable configured in its SQL.

WHERE grid definition example

Editing nested grid

In the application menu inside the Subqueries folder there is a links folder that contains all the subqueries called by this application. Clicking on a Nested grid will bring up a screen for editing.

General Settings

In this settings block we can define the Label of the Nested grid and change the Connection settings, such as adding or removing parameters. It is also possible to change some attributes defined as **Define Individually** in the general configuration, in the **Subqueries > Configuration** menu.

[Click here][link_conf_ligacao_subquery]{:target="_blank"} to see more details about the link configuration in the Nested grid.

- **Label** - defines the display text of the Nested grid column. This attribute has no character restriction and allows the use of lang.
- **Ligação** : This attribute shows data about the current link with the Nested grid, showing the application and the parameters used. To change any attribute of the link, click the Edit Link button.
- **Iframe Mode**: Defines whether or not to use the iframe to display the Nested grid. This attribute is displayed in the Nested grid configuration if it has been configured as **Define Individually** in the general configuration in the **Subqueries > Configuration** menu.
- **Positioning** - Defines the positioning of the current Nested grid. This attribute is displayed in the Nested grid configuration if it has been configured as **Define Individually** in the general configuration in the **Subqueries > Configuration** menu.
- **Enable TreeView** - This option adds a function to hide/show the Nested grid in the query. This attribute is displayed in the Nested grid configuration if it has been configured as **Define Individually** in the general configuration in the **Subqueries > Configuration** menu.

iframe setup

This configuration block is displayed only when the **iframe_mode** attribute is enabled.

- **Display** : This attribute allows you to define which elements of the Nested grid, if the Nested grid uses any of these resources, will be displayed in the main query.

The **IframeMode**, **Positioning** and **Enable TreeView** attributes are displayed in the

The **Label** attribute has no character restriction and allows the use of lang.

Edit view

This block displays the attributes defined as **Define Individually** in the *Subquery Configuration* configuration block in the **Subqueries > Configuration** menu.

- **Display** - Defines if the *Label of the field*,* the number of lines* and the *total* of the Nested grid will be displayed.
- **PDF** - defines if the Nested grid will be displayed in the PDF export.
- **Excel** - Defines if the Nested grid will be displayed in the Excel export.
- **XML** - defines if the Nested grid will be shown in the XML export.
- **JSON** - Defines if the Nested grid will be displayed in the JSON export.
- **Theme**: When checked, forces the display schema of the Nested grid to be the same as the main query.

Display options in Nested grid

- **1** : Display field label.
- **2**: Sequential display (Line number).
- **3** : Show total.

See configuration

This configuration block is displayed with the following configuration:

Attribute	Value
Title on the same line	Not
Enable tree view	Not
Positioning	in a column

- **Horizontal Alignment:** Defines the horizontal alignment of the Nested grid. It can be left, right, or center aligned.
- **Vertical Alignment:** Defines the vertical alignment of the Nested grid. It can be aligned at the top, middle or bottom.
- **Background Color:** You can set the background color. If not completed, the current display scheme query applications background color will be used.
- **Horizontal Alignment of the Title :** Defines the horizontal alignment of the Label of the Nested grid. It can be left, right, or center aligned.
- **Title vertical alignment:** Defines the vertical alignment of the Nested grid label. It can be aligned at the top, middle or bottom.
- **Bold :** Sets the title (label) of the Nested grid to be bold.

Sorting Rules

▲ SORTING RULES CONFIGURATION

ATTRIBUTE	VALUE
Sorting rules sort	<div style="border: 1px solid #ccc; padding: 5px; display: inline-block;"> Order ▲ <div style="position: absolute; right: -10px; top: 50%; transform: translateY(-50%);"> ▲ ▼ </div> </div>

Integrate sorting options

Sorting Fields/Rules ▼

- **Attributes**

- **Sorting rules sorting** : Allows you to change the sort display of the sorting rules. To configure this option, an icon is displayed (set up ordering) that when clicked, allows to select the field and your display order ascending (ASC) or descending (DESC) .
- **Integrate sorting rules** : This option allows you to set whether to use the sorting rules together with the regular sorting options or not. You can choose the display options between:
- **Sorting Fields/Rules(default)** : This option allows you to apply the rules that have been created together with the regular fields sorting (descending or ascending)
- **Sorting Fields** : This option allows you to apply the fields sorting only, discarding the sorting rules (descending or ascending)
- **Sorting Rules** : This option allows you to apply the sorting only according to the rules that have been created, discarding the fields sorting.

Creating a Sorting Rule

New Sorting Rule

Name	Order
Label	Order

Create

- **Attribute**

- **Name** : Field to inform the new rule name.
- **Label** : Field to inform the name that will be displayed in the application.

Setting up a sorting Rule

New Sorting Rule

Name	Order
Label	Order

Create

- **Attributes**

- **Label** : This option allows you to enter a name that will be displayed when the application is executed.
- **Select the fields for a sorting rule** : Allows you to select through the selection bar which fields will be displayed (fields that are in the frame at the right side) and the fields will not be displayed (fields that are in the left side frame). To sort the fields the way you want, use the sort bar located on the right side of the frame. To apply the sorting type to the field, simply select the straight side frame field and select the Ascending mode, where displays a "+" or a "-" by the field side to indicate if the sort order is Descending.

Refined Search

The refined search is a feature where you can integrate a search interface, next to the Grid, limiting values according to a universe that exists in the connected database.

Settings

▲ Refined search settings	
ATTRIBUTE	VALUE
Move searched above	<input checked="" type="checkbox"/>
Show quantity	<input checked="" type="checkbox"/>
Start mode	Open ▾
Minimum width	280px
Maximum width	
Minimum height	
Maximum height	
Enable collapse/expand icon	<input checked="" type="checkbox"/>
Start as	Expandido ▾
Use search modal	<input checked="" type="checkbox"/>
Number of modal columns	3
Modal height	600
Modal width	850
Display tags	<input checked="" type="checkbox"/>
Display multiselect as checkbox	<input checked="" type="checkbox"/>
Submit on click	<input checked="" type="checkbox"/>
Start with checked checkboxes	<input checked="" type="checkbox"/>

Move searched above

When you filter by a field, this field will be moved to the top of the refined search stack.

Show quantity

Alongside the values of the fields, you will see the existing amount. Ex.: Brazil (1547)

Start mode

This option sets whether the fields select options will start open or closed.

Minimum width

This option sets the minimum width for the refined search fields, value in pixels.

Maximum width

This option sets the maximum width for the refined search fields, value in pixels.

Minimum height

This option sets the minimum height for the refined search fields results, value in pixels.

Maximum height

This option sets the maximum height for the refined search fields results, value in pixels.

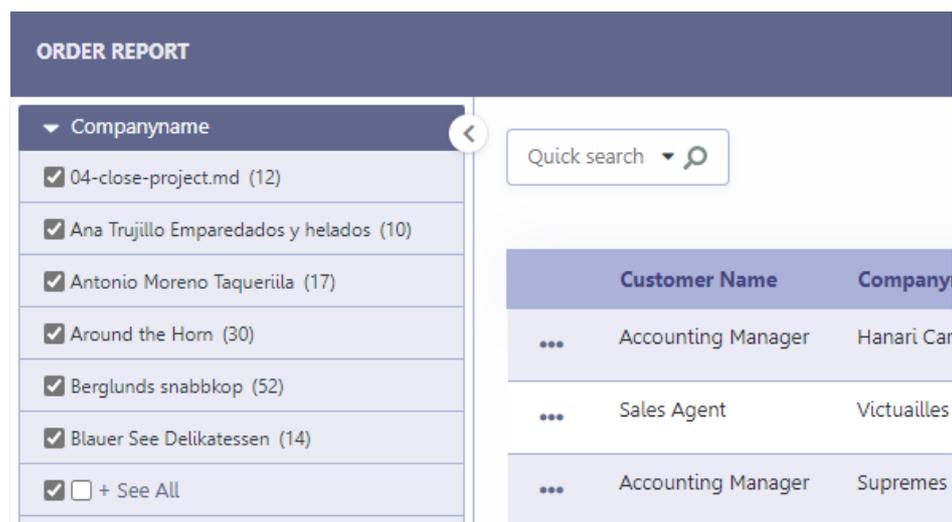

Collected/Expanded

Enables the option collapse or expand the **refined filter** options panel to improve the Grid visualization.

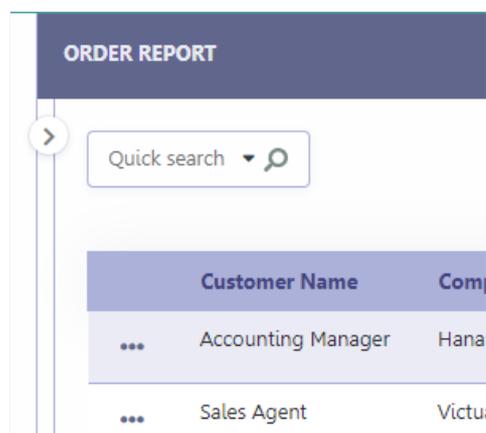

Start as Collapsed/Expanded

Available only when **Collapsed/Expanded** option is active, defines whether the refined filter will start open or closed.

These are the options:

Start open

Start closed

By default, for new applications, this option will come with the value

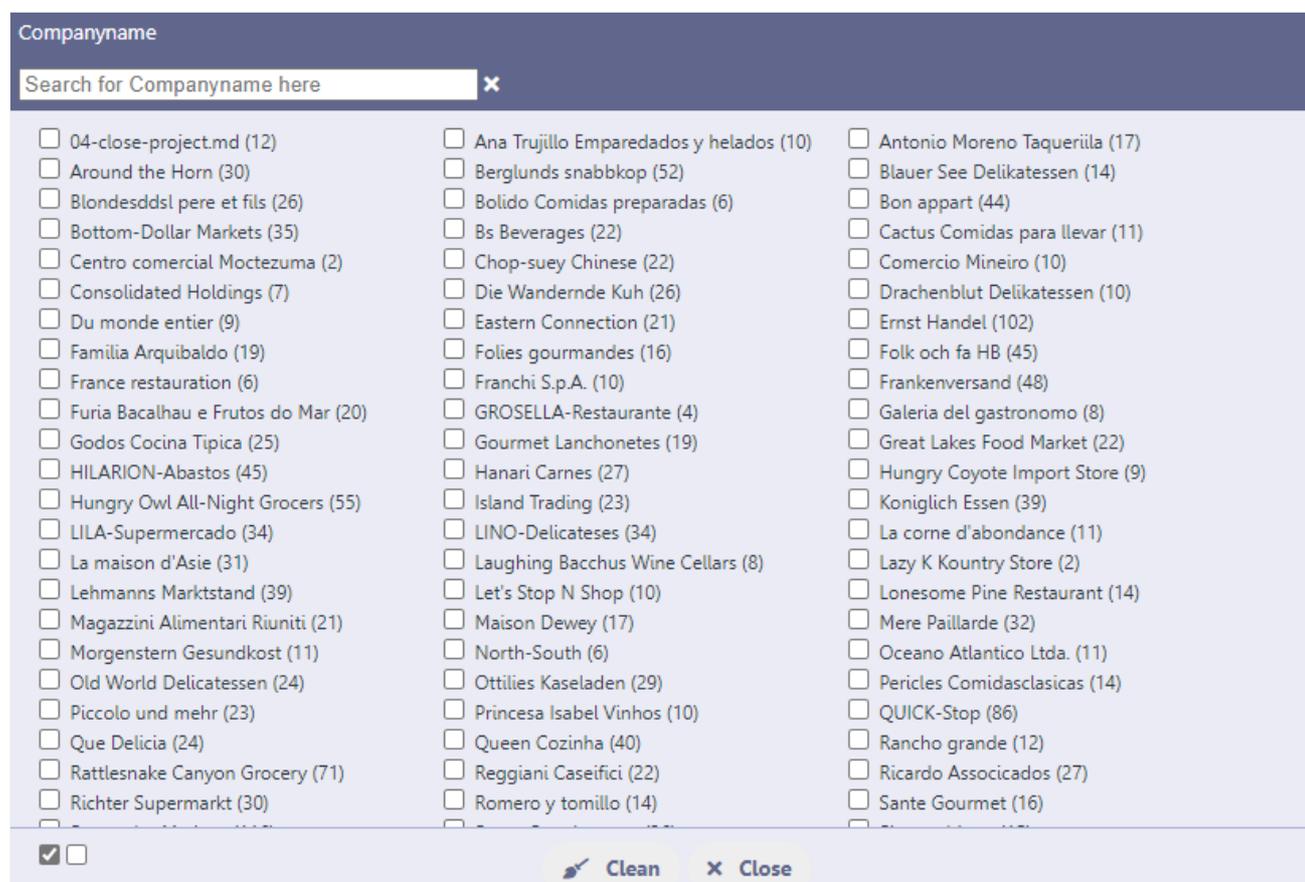

Start Open

Use modal

When enabled, sets the modal opening when clicking the **View All** option.

The button **+ View All** is defined in the filter fields settings, by limiting the amount of records displayed in the field. For more details [Click Here](#).

Example of modal screen

Number of modal columns

Defines the number of columns for displaying records in the modal.

Only the number must be informed, without measurement unit, otherwise the value will not be considered.

Modal width

Defines the pixel width of the modal that will be displayed.

Only the number must be informed, without measurement unit, otherwise the value will not be considered.

Showing tags

Defines whether or not to display tags with selected filter values.

When active the tags are displayed, as in the image below.

Display as checkbox

Defines whether filter values will be displayed with checkboxes or as links.

Example of display with checkbox

When enabled, the values will have a checkbox indicating your selection whether they are selected or not.

Product Name
<input type="checkbox"/> Chai (38)
<input type="checkbox"/> Chang 555 (44)
<input type="checkbox"/> Aniseed Syrup (12)
<input type="checkbox"/> Chef Anton's Cajun Seasoning (20)
<input type="checkbox"/> Chef Anton's Gumbo Mix (10)
<input type="checkbox"/> Grandma's Boysenberry Spread (12)
<input checked="" type="checkbox"/> + See All

Display example without the checkbox

When disabled, filter values are displayed as a link, and the select button is shown so that more than one value can be selected.

Product Name
Chai (38)
Chang 555 (44)
Aniseed Syrup (12)
Chef Anton's Cajun Seasoning (20)
Chef Anton's Gumbo Mix (10)
Grandma's Boysenberry Spread (12)
+ See All
Multiselect

Submit when scoring

When active, the filter is applied instantly after selecting the desired value.

By activating this option, the application is reloaded with each selection of filter values.*

Show marked checkbox

Defines the initial format of the filter values checkbox.

When active, when accessing the application, the filter checkbox is already marked, representing the application's data universe. This way, the user will have to uncheck the options that he does not want to see.

When disabled, when accessing the application the filter checkbox will be unchecked. This way, the user will have to check the options he wants to filter.

Example of enabled option

Product Name
<input checked="" type="checkbox"/> Chai (38)
<input checked="" type="checkbox"/> Chang 555 (44)
<input checked="" type="checkbox"/> Aniseed Syrup (12)
<input checked="" type="checkbox"/> Chef Anton's Cajun Seasoning (20)
<input checked="" type="checkbox"/> Chef Anton's Gumbo Mix (10)
<input checked="" type="checkbox"/> Grandma's Boysenberry Spread (12)
<input checked="" type="checkbox"/> <input type="checkbox"/> + See All

Example of disabled option

Product Name
<input type="checkbox"/> Chai (38)
<input type="checkbox"/> Chang 555 (44)
<input type="checkbox"/> Aniseed Syrup (12)
<input type="checkbox"/> Chef Anton's Cajun Seasoning (20)
<input type="checkbox"/> Chef Anton's Gumbo Mix (10)
<input type="checkbox"/> Grandma's Boysenberry Spread (12)
<input checked="" type="checkbox"/> <input type="checkbox"/> + See All

Select fields

Refined Search fields

The refined search is automatically added to the Grid application when one or more Grid fields are selected in the tab "select fields".

▲ REFINED SEARCH FIELDS

Select Fields Edit Fields

Select the fields that will part of the refined search. Use the tab "Edit Fields" to configure the settings.

<input checked="" type="checkbox"/> birthdate	<input checked="" type="checkbox"/> creditlimit	<input checked="" type="checkbox"/> country	<input type="checkbox"/> customerid	<input type="checkbox"/> companyname	<input type="checkbox"/> contactname
<input type="checkbox"/> contacttitle	<input type="checkbox"/> regionid	<input type="checkbox"/> stateid	<input type="checkbox"/> city	<input type="checkbox"/> address	<input type="checkbox"/> postalcode
<input type="checkbox"/> phone	<input type="checkbox"/> fax	<input type="checkbox"/> cityid	<input type="checkbox"/> cardtype	<input type="checkbox"/> cardnumber	<input type="checkbox"/> notes

Selecting

fields of refined search

Edit fields

In the tab “Edit fields”, you can configure each field according to what you need to display within the application.

REFINED SEARCH FIELDS										
Select Fields Edit Fields										
Range				See more						
Fields	Range	Increment	Show value	Multiselect	Start opened	See more	Quantity	Date	Sorting	Message for empty fields
birthdate				<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>		ddmmyyyy	ASC	{lang_refine_search_empty}
creditlimit	<input checked="" type="checkbox"/>	5	<input checked="" type="checkbox"/>		<input type="checkbox"/>	<input type="checkbox"/>			ASC	{lang_refine_search_empty}
country				<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	10		ASC	{lang_refine_search_empty}

Fields

Listing of selected fields in the tab “select fields”.

RangeThis

option activate a slider with intervals between the smallest and largest value.

Increment

When using the range this option will set an integer value to increase the range.

Show value

When checked, displays the range values in the slider.

Multi select

Enables multiple selection values to perform the filter.

Start opened

This option sets the initial mode for fields selection display in refined search.

See more

When checked, enables the option to “see more” for the filter records. This is recommended when the selected field has a big amount of records. You will be able to click to “see more” or “see less”.

Quantity

This option sets the initial amount of records to be displayed for each field selected.

Date

This option sets the date format that is displayed in the date fields inside the filter.

Sorting

This option sets the records sorting for each selected field.

Message for empty fields

This option sets a message to be displayed when the field has empty values. You can also use a variable from Scriptcase language

Group By

Group By Settings

These are the general settings of the “Group By” in the Grid, independently of its type, static or dynamic. Here we can define some Group By viewing options, such as the use of Tree view, for example.

GROUP BY SETTINGS	
ATTRIBUTE	VALUE
Enable TreeView	<input type="checkbox"/>
Group By Line	Before the records ▼
Group By Header	<input type="checkbox"/>
Group By sorting	<input checked="" type="checkbox"/>
Display Titles	<input checked="" type="checkbox"/>
Record count title	<input type="text"/>
Value Separator	=>
Tab a Group By	10px
Separates the Group By	10px

The option **Enable TreeView** isn't available in the Infinite Scroll.

- **Enable TreeView** : Defines the use of TreeView in “Group By”, which allows you to expand or collapse the records displayed in Group by.
- **Group By Line** : Sets the positioning of group by in relation to group records. The options are **Before the records** or **After the records**.
- **Group By Header** : Lets you display the Group By header on all pages.
- **Group By sorting** : It allows to order the fields respecting the Group By.
- **Display Titles** : Allows the label display of the fields within the groups.
- **Record count title** : Sets a title for the records quantity column.
- **Value Separator** : Define the separator between the title and the field value in the GROUP BY.
- **Tab a Group By** : Sets the left margin of Group By. The value must be informed in pixel.
- **Separates the Group By** : Sets the spacing between two Group By. The value must be informed in pixel.

Dynamic Group By

In this screen we define the fields available in Dynamic Group By and will be summarized in Grid and Summary when the Dynamic Group By is used.

Select Fields

In this screen we define the fields available in the Dynamic Group By and will be summed in the Grid and Summary when the dynamic Group By is used.

This Group By works independently from any other Group By configuration or Totals already performed, that is, the fields defined to be summarized in the Grid or Summary in the Dynamic Group will be visible only when the Dynamic Group is used.

We will be able to see all available fields for the Group By configuration and totals in the **Grid Fields**.

The **Use Dynamic Group By** option enables the Group By in the run-time application.

Fields used when using the Grid must be configured to be displayed on the Grid.

GROUP BY

Use dynamic Group By

GRID FIELDS	GROUP BY FIELDS	GRID TOTALS	SUMMARY TOTALS
<ul style="list-style-type: none"> T customerid T companyname T contactname T contacttitle 📅 birthdate T country # regionid T stateid T city T address T postalcode T phone T fax # cityid \$ creditlimit T cardtype T cardnumber T notes # Record Count 			

- **Grid Fields:** List of all the fields of the application.
- **Group By Fields:** Defines the fields that are part of the Group By.
- **Grid Totals:** Defines the fields that are part of the Grid Totals.
- **Summary Totals:** Defines the fields that are part of the Summary Totals.

Group By Fields

We must drag and drop the fields that will be part of the Group By in **Group By Fields**.

GROUP BY FIELDS

country	*
regionid	*
birthdate	Year ▾ *
birthdate	Semester ▾ *

Each field can only be added once to the **Group By Fields**, except for the date and datetime fields.

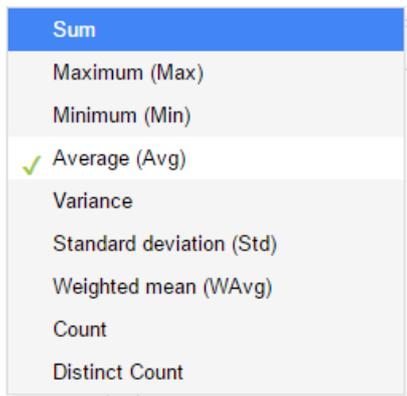

Date and Datetime fields

For date and datetime fields, some display intervals have been added, so these fields can be added two or more times to the Group By.

birthdate	Year ▾ *
-----------	----------

<ul style="list-style-type: none"> ✓ Year 2014,2015 Year & Semester 2001/S1 Year & Four-Month 2001/Fm3 Year & Quarter 2015/Q1 Year & Two-Months 2001/Tm6 Year & Month March 2015 Year & Week Week 1/2004 Full date 1/1/2016 	<ul style="list-style-type: none"> Semester S1 Four-Months 3 Quarter Q1,Q2 Two-months 6 Month January, February Week Week 1, Week 2 Day 31 Week Day Sunday, Monday
---	--

All Grid fields can be added to the “totals”, the only difference being the functions available. Numeric fields can use all the available summarization functions, since the non-numeric fields can use only the count and the different count.

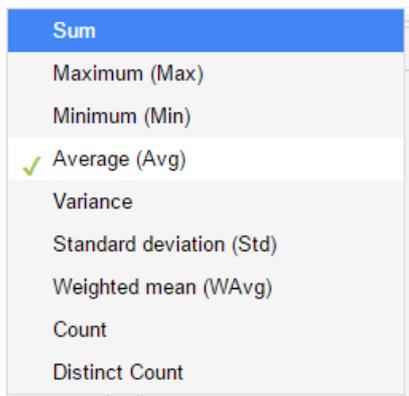

The fields configured in this totals can be edited in **Grid > Totals > Fields > Dynamic Group By**

Summary Totals

The fields added to the Summary totals will only be visible in Summary at the time Dynamic Group By is used.

All Grid fields can be added to the “totals”, the only difference being the functions available. Numeric fields can use all the available summarization functions, since the non-numeric fields can use only the count and the different count.

The fields configured in this totals can be edited in **Summary > Fields > Dynamic Group By**

Fields

The fields added to the **Grid Fields** will be listed within the Fields folder so that they can be edited individually.

General Settings

Categories: Text and Barcode

GENERAL SETTINGS: CUSTOMERID	
ATTRIBUTE	VALUE
Data Type	Text ▼
Group by label	<input type="text"/>
Case Settings	<input type="text"/> ▼
Field Mask	<input type="text"/>
SQL Type	VARCHAR

- **Data Type:** Defines the data type of the field in the HTML.
- **Group by label:** Defines a label of the fields displayed in the Group By.
- **Case Settings:** Converts the text according to the selected option.
 - **Upper Case:** Transforms the text in upper case.
 - **Lower Case:** Transforms the text in lower case.
 - **Capitalize first word:** It transforms the first word in the upper case or lower case, according to the text retrieved, that is, if the text retrieved by the application is in lower case, this option will make upper case only the first word.
 - **Capitalize all words:** Transforms all words in the upper case or lower case, according to the text retrieved, that is, if the text retrieved by the application is in lower case, this option will transform upper case into all words.
- **Field Mask:** On this field you will configure the display mask according to the table informed in Applications > Grid > Fields > Text.
- **SQL Type:** Informs the data type of the field in the database.

Categories: Number and Calculated

GENERAL SETTINGS: EMPLOYEEID	
ATTRIBUTE	VALUE
Data Type	Integer
Group by label	
Field Mask	
SQL Type	INT

- **Data Type:** Defines the data type of the field in the HTML.
- **Group by label:** Defines a label of the fields displayed in the Group By.
- **Field Mask:** On this field you will configure the display mask according to the table informed in Applications > Grid > Fields > Text.
- **SQL Type:** Informs the data type of the field in the database.

Categories: Special and Date/Time

GENERAL SETTINGS: ORDERDATE	
ATTRIBUTE	VALUE
Data Type	Date
Group by label	{lang_othr_cons_title_YYYY}
	Year of %s
Label of the values	{lang_othr_valueYYYY}
SQL Type	DATE

- **Data Type:** Defines the data type of the field in the HTML.
- **Group by label:** Defines a label of the fields displayed in the Group By.
- **SQL Type:** Informs the data type of the field in the database.

Lookup Settings

Lookup settings	
Methods for the Lookup	Automatic
SQL Select Statement	<div style="border: 1px solid gray; padding: 5px;"> <p>None</p> <p>Automatic</p> <p>Manual</p> <p>Inherit from Grid</p> </div>
Multiple Values	<input type="radio"/> Yes <input checked="" type="radio"/> No
Delimitter	
Display original and lookup value	<input type="radio"/> Yes <input checked="" type="radio"/> No
Separated by	
Choose connection	

This option is available in the fields of the categories: Text, Number, Calculated, Special and Barcode.

On this option, it's possible to setup the display lookup for the fields cited above.

Three lookup methods are available.

- **Automatic** - SQL must be assembled to display the desired information. You can build a sql using the **Create select** option.
- **Manual** - The values that will be displayed in the application are informed in the interface. The value to be displayed (Label) and the corresponding value to the database (Value) must be informed.
- **Inherit from Grid** - Inherits the lookup setting configured in this field, in the field options of the grid application.

For more information about using the Grid Lookup, access Application > Grid > Fields > Text.

Values Format

- **Attributes**
 - **Field Position** : Defines how the information contained in the Group By line will be displayed and organized.
 - **Columns** : Defines the amount of columns information contained in the Group By line will displayed and organized.
 - **Display Label** : Defines if the field label will be displayed.

- **Line break** : Displays or not the Group By line with the value divided in another line.
- **Records amount** : Defines whether the Group By row will display the number of group records.
- **Break PDF Page (Grid)** : Defines if the PDF file, generated by the GRID, will contain each group by printed in a new page.
 - Ex. In a report you can have some orders where they can be displayed on different pages.
- **Break PDF Page (Summary)** : Defines if the Summary PDF file, generated by the GRID will contain each Group By printed in a new page.
 - Ex. In a report you can have some orders where they can be displayed on different pages. .
- **Break HTML Page (Grid)** : Displays each Grid Group By in a different HTML page.
- **Break HTML Page (Summary)** : Displays each Summary Group By in a different HTML page.
- **Start TreeView** : Defines the initial state of the TreeView.
- **Sorting** : If this option is set to “Yes”, the selected fields will sorted without the need to be clicked on, the sorting will be done respecting the criteria of the Group By.
- **Fields** : Defines which fields are going to displayed in the Group By row. It’s also possible to define if it’s going to be displayed in the Totals or in the Summary of this field by selecting Value or Sum, before clicking on the button “On/Off”.

Group By Line Layout (Label)

▲ Group by line layout (Label)	
ATTRIBUTE	VALUE
Font Style	<input type="text"/> Aa
Font Size	<input type="text" value="v"/>
Font Color	<input type="text"/> 
Background Color	<input type="text"/>

- **Summary Totals:** Defines the fields that are part of the Summary Totals.

Group By Fields

You need to drag and drop the fields that'll be part of the Group By in the **Group By Fields**.

GROUP BY FIELDS

customerid	Eixo Y	*
orderid	Eixo Y	*
employeeid	Eixo Y	*
orderdate	Year ▾	Eixo Y *
orderdate	Semester ▾	Eixo Y *

Each field can only be added once to the **Group By Fields**, except for the date and datetime fields.

Date and Datetime fields

For date and datetime fields, some display intervals have been added, so these fields can be added two or more times to the Group By.

birthdate

Year ▾ *

✓ Year 2014,2015	Semester S1
Year & Semester 2001/S1	Four-Months 3
Year & Four-Month 2001/Fm3	Quarter Q1,Q2
Year & Quarter 2015/Q1	Two-months 6
Year & Two-Months 2001/Tm6	Month January, February
Year & Month March 2015	Week Week 1, Week 2
Year & Week Week 1/2004	Day 31
Full date 1/1/2016	Week Day Sunday, Monday

Grid Totals

The fields added in this total will be visible only in the Grid (if the total field is visible in the Grid) at the time that the group by is used.

GRID TOTALS

priceorder	Avg	*
priceorder	Variance	*
orderdate	Count	*

All Grid fields can be added to the “totals”, the only difference being the functions available. Numeric fields can use all the available summarization functions, since the non-numeric fields can use only the count and the different count.

Sum
Maximum (Max)
Minimum (Min)
✓ Average (Avg)
Variance
Standard deviation (Std)
Weighted mean (WAvg)
Count
Distinct Count

The fields configured in this totals can be edited in **Grid > Totals > Fields > Dynamic Group By**

Summary Totals

The fields added to the Summary totals will only be visible in Summary at the time Dynamic Group By is used.

SUMMARY TOTALS

<input checked="" type="checkbox"/> freight	Avg ▾	✖
<input checked="" type="checkbox"/> freight	Variance ▾	✖

All Grid fields can be added to the “totals”, the only difference being the functions available. Numeric fields can use all the available summarization functions, since the non-numeric fields can use only the count and the different count.

Sum
Maximum (Max)
Minimum (Min)
✓ Average (Avg)
Variance
Standard deviation (Std)
Weighted mean (WAv)
Count
Distinct Count

The fields configured in this totals can be edited in **Summary > Fields > Dynamic Group By**

Edit Group By

After the creation steps, all the Group By will be listed in the **Static Group By** folder, below the Settings item.

Expanding the Group By Folder, you will see the **settings** icon, where you can edit the entire Group By.

You can also view the fields used in the Group By, that can be edited independently from the Grid Layout, see the following:

Fields

The fields added to the **Grid Fields** will be listed within the Fields folder so that they can be edited individually.

General Settings

- **Group by label:** Defines a label of the fields displayed in the Group By.
- **SQL Type:** Informs the data type of the field in the database.

Lookup Settings

Lookup settings

Methods for the Lookup: Automatic

SQL Select Statement: [Create Select](#)

Multiple Values: Yes No

Delimiter:

Display original and lookup value: Yes No Separated by:

Choose connection:

This option is available in the fields of the categories: Text, Number, Calculated, Special and Barcode.

On this option, it's possible to setup the display lookup for the fields cited above.

Three lookup methods are available.

- **Automatic** - SQL must be assembled to display the desired information. You can build a sql using the **Create select** option.
- **Manual** - The values that will be displayed in the application are informed in the interface. The value to be displayed (Label) and the corresponding value to the database (Value) must be informed.
- **Inherit from Grid** - Inherits the lookup setting configured in this field, in the field options of the grid application.

For more information about using the Grid Lookup, access Application > Grid > Fields > Text.

• Attributes

- **Field Position** : Defines how the information contained in the Group By line will be displayed and organized.
- **Columns** : Defines the amount of columns information contained in the Group By line will displayed and organized.
- **Display Label** : Defines if the field label will be displayed.
- **Line break** : Displays or not the Group By line with the value divided in another line.
- **Records amount** : Defines whether the Group By row will display the number of group records.
- **Break PDF Page (Grid)** : Defines if the PDF file, generated by the GRID, will contain each group by printed in a new page.
 - Ex. In a report you can have some orders where they can be displayed on different pages.
- **Break PDF Page (Summary)** : Defines if the Summary PDF file, generated by the GRID will contain each Group By printed in a new page.
 - Ex. In a report you can have some orders where they can be displayed on different pages. .
- **Break HTML Page (Grid)** : Displays each Grid Group By in a different HTML page.
- **Break HTML Page (Summary)** : Displays each Summary Group By in a different HTML page.
- **Start TreeView** : Defines the initial state of the TreeView.
- **Sorting** : If this option is set to “Yes”, the selected fields will sorted without the need to be clicked on, the sorting will be done respecting the criteria of the Group By.
- **Fields** : Defines which fields are going to displayed in the Group By row. It's also possible to define if it's going to be

displayed in the Totals or in the Summary of this field by selecting Value or Sum, before clicking on the button "On/Off".

Group By Value.

- **Attributes**
 - **Font Style** : Defines the font that is going to be used in the Value.
 - **Font Size** : Defines the size of the font used in the Group By Value.
 - **Font Color** : Font color for the Group By Value.
 - **Bold Text** : Defines if the value will have a Bold Text.

Events

These events are only available for static Group By.

The **OnGroupByAll** event occurs after running the Group By, that allows you to manipulate the totals variables.

Total variables are created based on the fields selected for group by and totals.

The following is an example of the available variables:

Assuming that an application has a Group By **state** and **city** and two summarization per **parcel** and **balance**, the following summarization variables are available:

Variables	Description
{count_ger}	Contains the total number of records.
{sum_parcel}	Contains the general sum of the parcel field.
{sum_balance}	Contains the overall sum of the balance field.
{count_state}	Contains the total amount of records, from the state group by being processed.
{sum_parcel_state}	Contains the general sum of the 'state' field and the 'parcel' field that are being processed.
{sum_balance_state}	Contains the general sum of the 'balance' field and the 'parcel' field that are being processed.
{count_city}	Contains the total number of records, of the city group by being processed.
{sum_parcel_city}	Contains the general sum of the 'parcel' and 'city' field that are being processed.
{sum_balance_city}	Contains the general sum of the 'balance' and 'city' fields that are being processed.

To access the summarization variables by group, simply replace the Group By name with **Group By**. Example: {sum_balance_city} for {sum_quebra_balance}

Variables	Description
{count_quebra}	The total number of records in the Group By that is being processed.
{sum_quebra_parcel}	Contains the general sum of the parcel field, of the Group By that is being processed.
{sum_quebra_balance}	Contains the sum total of the balance field, of Group By that is being processed.

Example:

In an application that has Group By by state and city and totals a balance field in Group By totals, we want to display the average in place of the balance. A method is created in the **OnGroupByAll** event, with the following content:

```
{sum_quebra_balance} = {sum_quebra_balance} / {count_quebra};
```

Totals

The total fields will be displayed only when the Grid application is using at least one Group By.

Settings

The settings below can be applied for the Grid totals only.

Summarization Functions ?		
ATTRIBUTE	VALUE	DESCRIPTION
Results in a single line.	<input checked="" type="checkbox"/>	Display the Main Total title and its value on a single line.
Display Total	On every page ▼	Pages where the total will be displayed.
Group Subtotal	Below ▼	Display the Group subtotal after the records of the Group By.
Record Count	<input checked="" type="checkbox"/>	Display the record count in the total.

- **Results in a single line.:** This option sets the display of the **General Total** title and its results in a single line.

- Example for this option **Enabled:**

Grand Summary(872) - Sum	R\$ 267.620,19
- Max	R\$ 4.791,60
- Min	R\$ 0,00

- Example for this option **Disabled:**

Grand Summary (872)	
Sum	R\$ 267.620,19
Max	R\$ 4.791,60
Min	R\$ 0,00

- **Display Total :** This option indicates in which pages the General Totals will be displayed. The options are: **On every page**, **On the last page** or **Do not display**. ***Group Subtotal :** This option defines where the subtotal of group by will be displayed.
- **Record Count :** This option allows you to view the amount of records by the General Total title.

- Example for this option **Enabled:** **Grand Summary(872)** * Example for this option **Disabled:**

Grand Summary

Layout settings

Display settings of the group subtotal.

Layout settings ?		
reg1		
GROUP BY FIELD	LABEL	DISPLAY
date_YYYYMMDD2	Group Subtotal	<input checked="" type="checkbox"/>
reg2		
GROUP BY FIELD	LABEL	DISPLAY
region		<input checked="" type="checkbox"/>

- **Label** - This field sets the Label for the **Group Subtotal**.
- **Display** - This option sets if the **Group Subtotal** will be displayed.

Select Fields

Using the select fields area you can set the total fields and the total options for each field. The same field can be used more than once in the Grid totals area, just if they are using different summaries types.

To define the fields that will be used for totals, drag them to the area, **Grid Totals**.

The screenshot shows a configuration window titled "Group By" with a question mark icon in the top right. It is divided into two main sections: "GRID FIELDS" and "GRID TOTALS".

GRID FIELDS: A list of fields with their data types:

- # id
- date
- T region
- T product_category
- T product
- T customer_name
- # qty sold
- \$ cost
- \$ sales
- \$ profit

GRID TOTALS: A list of four entries, each with a field name and a summary type:

- sales (Sum)
- sales (Max)
- sales (Min)
- sales (Avg)

Note: The total fields will only be displayed if they are also selected to be displayed within the Grid application module.

When positioning the fields, you must define what summarization will be used, to select that you must click in the combo box and select one of the available options, that will be according to the data type (integer, date, text...).

The screenshot shows a close-up of the "GRID TOTALS" configuration. A dropdown menu is open for the "sales" field, which currently has "Sum" selected. The menu lists the following options:

- Sum (checked with a green checkmark)
- Maximum (Max)
- Minimum (Min)
- Average (Avg)
- Variance
- Standard deviation (Std)
- Weighted mean (WAvg)
- Count
- Distinct Count

The summarization options available are:

- **Sum** : Sets a sum of the values for the selected field.
- **Maximum** : Displays the highest value identified in the selected field.
- **Minimum** : Displays the lowest value identified in the selected field.
- **Average (Avg)** : Calculates the arithmetic mean of the values for the selected field.

- **Variance** : Calculates the dispersion of the values related to the average.
- **Standard Deviation** : Measures the variability of values around the average, the minimum value of the standard deviation is 0 indicating that there is variability, i.e. that all values are equal to the mean.
- **Weighted mean (WAVg)** : Calculates the weighted average for the selected field. To set the weight used in the calculation of the average access field settings selected in **Totals > Fields (select the field where you are using the Weighted mean) > Weighted average weight**.
 - **Weighted average weight** : Field that will be used as weighted average weight. In calculating the weighted average, each set value is multiplied by its “weight”, that is its relative importance.
- **Count** : Displays the total number of records for the selected field.
- **Distinct Count** : Displays the total number of records for the selected field, distinguishing the values.

Important note: The fields in the Grid totals are displayed only on Grids with no Group by or with empty Group by.

Positioning

Summary Fields Order - Default

Defines the positioning and the label used by Grid totals. There are three display formats,, **Default**, **Grouped** or **By field**

To add the same field two or more times in the Totals or use different types of summaries in selected fields, this option will not be displayed.

The option **Default** returns the result below the column being summarized. When you use the total for more than one column of the Grid, using the same type of summarization, the results are displayed on the same line.

Summary Fields Order ?

Default
 Grouped
 By field
 Alignment Left

- **Title:** Defines a title for the Summary, if not informed the default title will be "Summary". For no title to be displayed, enter the HTML tag ` `.
- **Quantity Title:** Title Amount of Record.
- **Horizontal Total:** Show horizontal total for Summaries of matrix type.
- **Vertical Total:** Display vertical total for Summaries of matrix type.
- **The chart icon positioning:** Chart icon positioning (left or right).
- **Positioning of the Total icon:** Total icon positioning (left or right).
- **Page Width:** Width value for the Summary page.
- **Width unit:** Unit of measure used for width. Auto (width value is ignored), pixels and percentage.
- **Display SubTotal label:** Displays the Total label or the Value itself.
- **Display line number:** Display the sequence number of the record in the Summary.
- **Display the hover on the Summary lines:** Apply the hover attribute by hovering the mouse cursor over the Summary lines.
- **Short value:** Displays the value abbreviated in the summary.
- **Display icon only on mouse over:** Displays the sorting icon only when the mouse is on the field label.
- **Fixed Label:** Establishes the column label in the screen top during the page scrolling.
- **Fixed columns:** This option allows that the Group By columns displayed on the Y-axis of the summary to be fixed during horizontal scrolling.
- **Refresh Interval:** Page refresh interval in seconds. If zero is provided there will be no refreshing.

Layout Settings

You can define the layout of the Summary for each type of Group By.

Layout setting ?

rule1

GROUP BY FIELD	POSITION	SORTING	FILL EMPTY LABELS	LINK GRID	ALIGNMENT
date_YYYY	 Y axis	Database value ▼	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	▼
date_MM		Database value ▼	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	▼

Tabular format

- **Group By Field:** Group By fields selected in the Grid.
- **Position:** Defines whether to use the x-axis or y-axis position.
- **Sorting:** Sets the sorting by the database value or by the display value.
- **Fill Empty Labels:** Defines whether the empty labels will be filled.
- **Link Grid:** Creates a link in the selected field.
- **Alignment:** Sets the layout alignment type to center, left, or right.
- **Tabular format:** Sets the Summary to the tabular format.

Toolbar

The toolbar is divided into two parts, top and bottom, so you can define which buttons will be displayed in both places. Button selection works independently.

You can also define which buttons will be displayed when the application is accessed by a mobile device, just access the Mobile tab.

For more information about the toolbar, access Application > Grid > Toolbar.

TOOLBAR

ATTRIBUTE	VALUE	DESCRIPTION
Configure the toolbar below for a "classic web version " and also for a "mobile version".		
<div style="display: flex; justify-content: space-between;"> Desktop Mobile </div> <div style="display: flex; justify-content: space-between;"> <div style="width: 30%;"> <p>Top Toolbar</p> <ul style="list-style-type: none"> Navigation <ul style="list-style-type: none"> Exit Export <ul style="list-style-type: none"> PDF WORD XLS XML CSV RTF Print Others <ul style="list-style-type: none"> Configure Detail Group By </div> <div style="width: 30%;"> <p>Left</p> <ul style="list-style-type: none"> {lang_btms_expt} PDF WORD XLS XML CSV RTF Print Chart Settings Configure </div> <div style="width: 30%;"> <p>Buttons organization on top toolbar.</p> <div style="border: 1px solid gray; padding: 5px;"> <p>Group</p> <p>Add Edit Delete</p> </div> </div> </div> <hr/> <div style="display: flex; justify-content: space-between;"> <div style="width: 30%;"> <p>Bottom Toolbar</p> <ul style="list-style-type: none"> Navigation <ul style="list-style-type: none"> Exit Export <ul style="list-style-type: none"> PDF WORD XLS XML CSV RTF Print Others <ul style="list-style-type: none"> Configure Detail Group By </div> <div style="width: 30%;"> <p>Left</p> <ul style="list-style-type: none"> Center Right </div> <div style="width: 30%;"> <p>Buttons organization on top toolbar.</p> <div style="border: 1px solid gray; padding: 5px;"> <p>Group</p> <p>Add Edit Delete</p> </div> </div> </div>		

Application Hotkeys

Scriptcase allows creating shortcut keys to your applications. You can select a predefined template or create specific actions for an application.

Application Hotkeys

ATTRIBUTE	VALUE	DESCRIPTION
Use hotkeys	<input checked="" type="checkbox"/>	Define if the application will use hotkeys
Hotkeys template	SC_DefaultHotkeys	Select the hotkey template from previously created schemas

Clean +

ACTION	KEYBINDING
No hotkeys configured	

Clean +

Use hotkeys

Defines if the application uses hotkeys. When you enable this option, the default shortcut keys settings are disabled.

Hotkeys templat

Select the [hotkey template](#) previously created.

Action

Selects the triggered action when pressing the selected key.

Keybinding

Selects the keys responsible for executing the chosen action.

Add “+”

Adds a new action on the keys list.

Clear

It clears the selected hotkeys preference.

Options

Options	
ATTRIBUTE	VALUE
The number of links displayed	<input type="text" value="5"/>
Jump to	<input type="text" value="Page"/> ▼
Records per page	<input type="text" value="10,20,50"/>
Rows counter	<input type="checkbox"/>
Format Row Counter	<input type="text" value="{lang_othr_smry_info}"/>

The number of links displayed

Allows you to define the number of page links when the Page Navigation option is enabled.

Jump to

Allows you to define whether the redirection will be to a page or record.

Records per page

Allows you to define the options for the number of lines displayed in the combobox.

Rows counter

Shows the sequential number of rows in a partition of a result set. To use it, you must remove the row counter button from the toolbar.

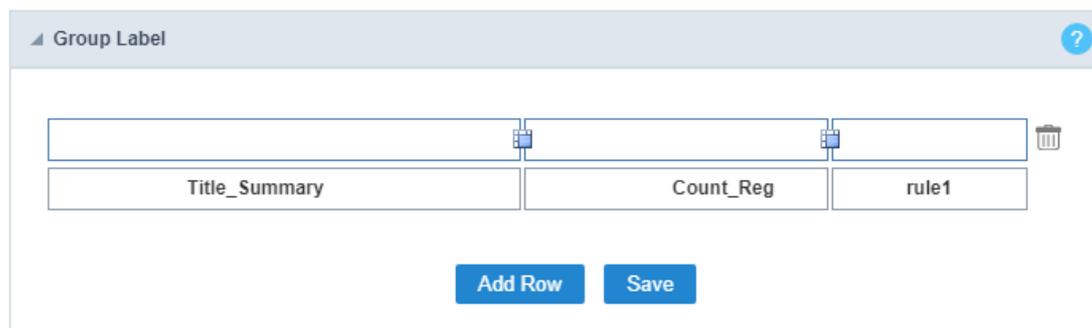

Format Row Counter

Allows you to define the format in which the counter lines will be displayed.

Example: [1 to 10 of 200].

Group Label

Click on Add Row, so that the group label can be added.

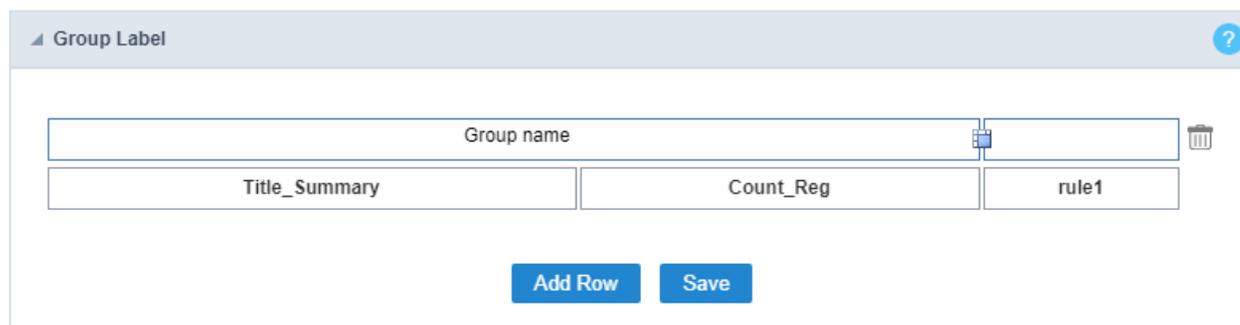

With this option, you can enter one or more titles for the columns of your applications.

If you have dynamic display fields, Group Label will not work.

To merge two or more cells, click the icon positioned between them.

To add a title, click the pencil icon to add a title.

Cell Properties ✕

Title

Font

Font size

Horizontal alignment

Vertical Alignment

Font Color

Background Color

Title Sets the title that will be displayed in your Group Label.

Font Sets the font type of the title of your group label.

Font Size Sets the font size of the title of your group label.

Horizontal alignment Sets the horizontal alignment of the title of your group label. Being left, center or right.

Vertical alignment Sets the horizontal alignment of the title of your group label. Being middle, low or top.

Font Color Sets the color of the title text of your group label.

Background Color Sets the background color of the space where the title of your group label will be displayed.

Sorting

You can define the fields in which you wish to allow the sorting, when running the application.

This configuration must be performed in each of the application group by.

Summary Fields Order
?

Define the fields that can be sorted for this grouping in the Summary and its initial settings

On/Off

All

None

*sales_sum
 *sales_max
 *sales_min
 *date_YYYY
 *date_MM

Default sorting column	<input style="width: 90%;" type="text"/>	Select the initial sorting column of the summary.
Sorting Order	<input style="width: 90%;" type="text"/>	Select the initial sorting order
Sorting from the Group By	<input style="width: 90%; value: date_YYYY" type="text"/>	Start the sorting from this Group By.

- **Fields:** Select the fields that you want to allow sorting.
- **Default sorting column:** Select a field for initial sorting in the Summary.
- **Sorting Order:** Choose whether the sort will be ascending or descending.
- **Sorting from the Group By:** Select one of the Group By for initial sorting.

Limit

Lets you limit the amount of records to be retrieved from SQL and displayed in the Summary.

This option is only available for static group by.

Limit settings
?

ATTRIBUTE	VALUE	DESCRIPTION
Field	<input style="width: 90%; value: id" type="text"/>	Field to perform limit filter
Summarization	<input style="width: 90%; value: Sum" type="text"/>	In which summarization function the limit will be applied
Limit type	<input style="width: 90%; value: Top" type="text"/>	Set if the limit will be realized for the first or for the last.
Quantity	<input style="width: 90%;" type="text"/>	Number of records to be applied for the limit

- **Field:** Defines the field that will be used to perform the limit.
- **Summarization:** Defines the summarization function in which the limit will be performed.
- **Limit type:** Sets the sorting that the limit will be applied, DESC or ASC.
- **Quantity:** Sets the amount of records that will be returned.

Charts

One of the modules of the Grid application is the charts, which in turn are generated based on Grid summary information.

Scriptcase charts are generated in HTML5.

Chart Settings

In the settings screen, you can edit the settings of all available charts.

ATTRIBUTE	VALUE	DESCRIPTION
<input checked="" type="checkbox"/> Bar		Font size <input type="text"/>
<input checked="" type="checkbox"/> Pie		Abbreviated value <input type="radio"/> Yes <input checked="" type="radio"/> No
<input checked="" type="checkbox"/> Line		Export Chart <input type="radio"/> Yes <input checked="" type="radio"/> No
<input checked="" type="checkbox"/> Area		Subtitle <input type="text" value="Below"/>
<input type="checkbox"/> Gauge		Bar - Orientation <input type="text" value="Vertical"/>
<input type="checkbox"/> Radar		Bar - width (between 20 and 70) <input type="text"/>
<input type="checkbox"/> Funnel		Bar - Value orientation <input type="text" value="Vertical"/>
<input type="checkbox"/> Pyramid		Bar - Value position <input type="text" value="Inside"/>
		Bar - Dimension <input type="text" value="3D"/>
		Bar - Stacking <input type="text" value="off"/>
		Bar - Series group <input type="text" value="Set"/>

To edit the specific settings for each Chart, select the Chart you want to edit.

To define the available charts when running the application, check the box next to the name of the Charts.

Below you will detail the specific settings of each of the Charts.

Bars

- **Font Size:** Sets the font size in the Chart. Enter only the font size, for example: 15.
- **Abbreviated value:** Defines whether or not the values displayed in the Chart should be abbreviated.
- **Subtitled:** Sets the subtitled position of the Chart.
- **Bar - Orientation:** Orientation of the vertical or horizontal bars on the Chart.
- **Bar - width (between 20 and 70):** You can set the width from 20 to 70.
- **Bar - Value orientation:** The orientation of the Chart is defined and can be placed vertically.
- **Bar - Value position:** You can choose where the value will position itself.
- **Bar - Dimension:** Bar Dimension (2D or 3D) on the chart.
- **Bar - Stacking:** Stack the Bars in a single Bar (In series).
- **Bar - Series group:** Group the Bar chart in series.

Pie

- **Font Size:** Sets the font size in the Chart. Enter only the font size, for example: 15.
- **Abbreviated value:** Defines whether or not the values displayed in the Chart should be abbreviated.
- **Subtitled:** Sets the subtitled position of the Chart.
- **Pie - Format:** Pie or Donut format.
- **Pie - Dimension:** Dimension of the Pie Chart.
- **Pie - Sorting:** Ordering the Pie Chart.
- **Pie - Values format:** Formatting the displayed data.

Line

- **Font Size:** Sets the font size in the Chart. Enter only the font size, for example: 15.
- **Abbreviated value:** Defines whether or not the values displayed in the Chart should be abbreviated.
- **Subtitled:** Sets the subtitled position of the Chart.

- **Line - Shape:** Line Format
- **Line - Series group:** Line grouping type.

Area

- **Font Size:** Sets the font size in the Chart. Enter only the font size, for example: 15.
- **Abbreviated value:** Defines whether or not the values displayed in the Chart should be abbreviated.
- **Subtitled:** Sets the subtitled position of the Chart.
- **Area - Shape:** Format of the area displayed on the Chart.
- **Area - Stacking:** Stack the areas on the Chart.
- **Area - Series group:** Group the Chart in series.

Gauge

- **Font Size:** Sets the font size in the Chart. Enter only the font size, for example: 15.
- **Abbreviated value:** Defines whether or not the values displayed in the Chart should be abbreviated.
- **Subtitled:** Sets the subtitled position of the Chart.
- **Gauge - Shape:** Display format of the Chart.

Radar

- **Font Size:** Sets the font size in the Chart. Enter only the font size, for example: 15.
- **Abbreviated value:** Defines whether or not the values displayed in the Chart should be abbreviated.
- **Subtitled:** Sets the subtitled position of the Chart.

Funnel

- **Font Size:** Sets the font size in the Chart. Enter only the font size, for example: 15.
- **Abbreviated value:** Defines whether or not the values displayed in the Chart should be abbreviated.
- **Subtitled:** Sets the subtitled position of the Chart.
- **Funnel - Dimension:** Funnel dimension (2D or 3D) on the chart.

Pyramid

- **Font Size:** Sets the font size in the Chart. Enter only the font size, for example: 15.
- **Abbreviated value:** Defines whether or not the values displayed in the Chart should be abbreviated.
- **Subtitled:** Sets the subtitled position of the Chart. **Pyramid - Dimension:** Dimension (2D or 3D) on the Chart. **Pyramid - Values format:** Formatting the displayed data. **Pyramid - Sliced:** Display format of the Chart.

Below are the settings common to all Chart types.

Summary chart type	<input type="text" value="Both - starting by synthetic"/>	Chart generation mode.
Create link on the chart	<input type="text" value="Create link to a child chart"/>	Creates link inside the chart to display the related data
Display Values	<input type="checkbox"/>	Display the values of the generated chart.
Axis of Chart General Total	<input type="text" value="Column"/>	Display grand total chart as bar chart or line chart.
Display Y-Axis With Zero.	<input checked="" type="checkbox"/>	Force zero display on the axis Y.
Label orientation on the x-axis	<input type="text" value="Horizontal"/>	Defines the labels orientation on the x-axis as vertical or horizontal. If you choose horizontal option and there are many values to be displayed, in such a way that they do not fit in the scale, the orientation will be automatically changed to vertical. This option is only available for charts type: Column, Line and Area.
Chart Width	<input type="text" value="800"/>	Chart width in pixels.
Chart Height	<input type="text" value="600"/>	Chart height in pixels.
Values sorting	<input type="text"/>	Sort values in charts.

- **Summary chart type:** Defines how the Charts will be generated: analytical, synthetic, or both.
 - **Synthetic** They should restrict themselves to the first Group By the condition and allow the user to use the links to see details of the next set of criteria, increasing the level of detail.
 - **Analytical** They appear with the whole Group By criteria, creating a complete detailed Chart that does not allow the linking of other detailed Charts.
- **Create link on the chart:** Allows the Charts to have a link in their elements for detailed Grid applications or Charts. The data shown will be relative to the value clicked on the Chart.
- **Display Values:** Displays the values of the generated Chart.
- **Axis of Chart General Total:** Option to display the Chart of the grand total as column or row.
- **Display Y-Axis With Zero.:** Force display of the zero value on the Y axis.
- **Label orientation on the x-axis:** Sets the orientation of the labels on the X axis to vertical or horizontal. If the horizontal option is chosen and there are many values to be displayed so that they do not fit in the scale, the orientation will be automatically changed to vertical. This option is only available for Charts of type: Column, line and area.
- **Chart Width:** Width in pixels of the generated Charts.
- **Chart Height:** Height in pixels of the Charts generated.
- **Values sorting:** Sort the values of the Charts.

Column Charts

You can define the display of the column Charts as well as the label for the Chart and the axes. These settings are set individually for each Group By.

If the user sets up more than one field, the analytical chart will only generate with the first two.

Generate columns charts ?

Configure below which Charts will be displayed for each grouping and their basic parameters

Group by: rule1

	VIEW CHART	VIEW VALUE IN CAPTIONS	CHART TITLE	TITLE X	TITLE Y
date_YYYY					
sales - sum	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
sales - max	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
sales - min	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
date_MM					
sales - sum	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
sales - max	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
sales - min	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

Line charts (totals)

The use of line Chart (totals) configuration is only available when you have a Group By with at least two fields.

To configure this option, go to the "Group By" menu and create a static Group By some fields or add fields to dynamic Group By.

Generate line charts (totals) ?

Configure below which Charts will be displayed for each grouping and their basic parameters

Group by: rule1

	VIEW CHART	VIEW VALUE IN CAPTIONS	CHART TITLE	TITLE X	TITLE Y
Grand Total					
sales - sum	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
sales - max	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
sales - min	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
date_YYYY					
sales - sum	<input type="checkbox"/>	<input type="checkbox"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
sales - max	<input type="checkbox"/>	<input type="checkbox"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
sales - min	<input type="checkbox"/>	<input type="checkbox"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
date_MM					
sales - sum	<input type="checkbox"/>	<input type="checkbox"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
sales - max	<input type="checkbox"/>	<input type="checkbox"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
sales - min	<input type="checkbox"/>	<input type="checkbox"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

Layout

The Chart theme tool enables you to fully edit Chart themes.

These themes can be set only for the current application, when changed in the application itself or for all Charts when these settings are performed in the Charts editor.

For more information, access [Layout > Chart Themes](#).

Fields

All fields added in the Summary totals, in the dynamic Group By or in the static Group By, will be listed here separated by the Group By name.

General Settings

General settings of total fields in the Summary.

General Settings: sales_sum		
ATTRIBUTE	VALUE	DESCRIPTION
Data Type	<input type="text" value="Integer"/>	Field data type.
Type	Default	Field type.
Label	<input type="text" value="Sales ({{lang_btms_smry_msge_sum}})"/>	Field title.
	Sales (Sum)	

- **Data Type:** Defines the data type for the field.
- **Label:** Defines the label for the displayed field in the Summary.

Values Formatting

Integer Type

General Settings: sales_sum		
ATTRIBUTE	VALUE	DESCRIPTION
Regional Settings	<input checked="" type="checkbox"/>	Apply regional settings to the field.
Color of Negative	<input type="text"/> 	Color for negative values.

- **Regional Settings:** When you activate it you apply the regional settings for this field. To configure them, click on the menu [Locales > Regional Settings](#).
- **Color of Negative:** In this field you can enter a color in hexadecimal. (Example: # 000000)

Decimal Type

General Settings: sales_sum		
ATTRIBUTE	VALUE	DESCRIPTION
Regional Settings	<input checked="" type="checkbox"/>	Apply regional settings to the field.
Color of Negative	<input type="text"/> 	Color for negative values.
Decimal precision	<input type="text" value="2"/>	Field decimal precision.
Complete with Zeros	<input checked="" type="checkbox"/>	Complete the field value with zeros.

- **Regional Settings:** When you activate it you apply the regional settings for this field. To configure them, click on the menu

Locales > Regional Settings.

- **Color of Negative:** In this field you can enter a color in hexadecimal. (Example: # 000000)
- **Decimal Precision:** Number of decimal places your field will have on display.
- **Complete with Zeros:** Enables the field value to be filled with zeros.

Currency Type

▲ General Settings: sales_sum		
ATTRIBUTE	VALUE	DESCRIPTION
Regional Settings	<input checked="" type="checkbox"/>	Apply regional settings to the field.
Currency Format	<input type="checkbox"/>	Display field with currency format.
Color of Negative	<input type="text"/> 	Color for negative values.
Decimal precision	<input type="text" value="2"/>	Field decimal precision.
Complete with Zeros	<input checked="" type="checkbox"/>	Complete the field value with zeros.

- **Regional Settings:** When you activate it you apply the regional settings for this field. To configure them, click on the menu Locales > Regional Settings.
- **Currency Format:** When you enable this option the application will display the currency symbol according to the regional setting.
- **Color of Negative:** In this field you can enter a color in hexadecimal. (Example: # 000000)
- **Decimal Precision:** Number of decimal places your field will have on display.
- **Complete with Zeros:** Enables the field value to be filled with zeros.

Visual Settings of Totals in Group By

▲ Visual settings of totalization in a Group By		
ATTRIBUTE	VALUE	DESCRIPTION
Text Font	<input type="text"/> 	Field text font.
Font Size	<input type="text" value="▼"/>	Font size.
Font Color	<input type="text"/> 	Font color.
Background Color	<input type="text"/> 	Background color.

Text Alignment	<input type="text" value="Align right"/> ▼	Horizontal alignment of the text.
Vertical text alignment	<input type="text" value="Align on the top"/> ▼	Vertical alignment of the text.

- **Font :** Allows you to define the font used in the Group By label.
- **Font Size :** Allows you to set the font size used in the Group By label.
- **Font Color :** Label color in Group By.
- **Background Color :** Group By background color.
- **Bold Text :** Enables or disables the Group By label text in bold.
- **Text Alignment:** Sets the horizontal positioning of text.
- **Vertical text alignment:** Sets the vertical positioning of text.

Visual Settings of The General Total

Visual setting of the General Total		
ATTRIBUTE	VALUE	DESCRIPTION
Text font	<input type="text"/> Aa	Field text font.
Font Size	<input type="text"/>	Font size.
Font Color	<input type="text"/> 	Font color
Background Color	<input type="text"/> 	Background color.
Bold Text	<input type="text"/>	Bold text formatting.
Text Alignment	Align right <input type="text"/>	Horizontal alignment of the text.
Vertical text alignment	Align on the top <input type="text"/>	Vertical alignment of the text.

- **Font** : Allows you to define the font used in the Group By label.
- **Font Size** : Allows you to set the font size used in the Group By label.
- **Font Color** : Label color in Group By.
- **Background Color** : Group By background color.
- **Bold Text** : Enables or disables the Group By label text in bold.
- **Text Alignment**: Sets the horizontal positioning of text.
- **Vertical text alignment**: Sets the vertical positioning of text.

Layout

Header

In this configuration, you can define the information that will be displayed in the header and footer of the Summary.

HEADER	
ATTRIBUTE	VALUE
Display Header	<input checked="" type="checkbox"/>
Insertion Title	<input type="text" value="{lang_othr_frmi_tit} - orders"/>
Update Title	<input type="text" value="{lang_othr_frmu_tit} - orders"/>
Header Variables	
SC_HEADER	Title <input type="text"/>
SC_VALUE	Date <input type="text"/> ?

This screen may vary depending on the header format you choose within the Display folder.

- **Display Header**: This flag determines whether the header will be displayed.
- **Summary Title**: Lets you enter a title to be displayed in the application.
- **Variables**: Variable fields can be filled with any of the types displayed in the Combobox, depending on the type you need to associate a content with the required one. Below you describe the existing types:

- **Field:** When the “**Field**” option is chosen, it will open a Combobox next to the fields that are part of the “**Select**”. By choosing one of these fields, you are associating the value of the field to display in the Header or Footer.
 - **Date :** When “**Date**” type is selected, the system date in mm/dd/yyyy format will be displayed in the Application Header or Footer. There are several display formats using the date and time of the server. The format can be entered in the text field next to it. To access existing formats click on  and an explanatory window will appear.
 - **Image :** When the image type field is selected, a field for filling in the image name on the server appears. To locate the existing images and select one, click on the “**Choose Image**” icon and to make new images available on the server click on “**Upload**” .
 - **Value:** When “**Value**” type is selected, the content that is filled in the text field next to option, appears in the Header or Footer. You can enter texts and “**Global variables**”. Ex: “Employee Name: [v_name]”.

Footer

FOOTER	
ATTRIBUTE	VALUE
Display Footer	<input type="checkbox"/>
Footer Variables	
NM_FOOTER_DATA	<input type="text"/>
NM_FOOTER_LOGO	<input type="text"/>
NM_FOOTER_TITLE	<input type="text"/>

This screen may vary depending on the Footer format you choose within the Display folder.

- **Display Footer:** This flag determines whether the Footer will be displayed in the application.
- **Variables:** Variable fields can be filled with any of the types displayed in the Combobox, depending on the type you need to associate a content with the required one. Below you describe the existing types:
 - **Field:** When the “**Field**” option is chosen, it will open a Combobox next to the fields that are part of the “**Select**”. By choosing one of these fields, you are associating the value of the field to display in the Header or Footer.
 - **Date :** When “**Date**” type is selected, the system date in mm/dd/yyyy format will be displayed in the Application Header or Footer. There are several display formats using the date and time of the server. The format can be entered in the text field next to it. To access existing formats click on  and an explanatory window will appear.
 - **Image :** When the image type field is selected, a field for filling in the image name on the server appears. To locate the existing images and select one, click on the “**Choose Image**” icon and to make new images available on the server click on “**Upload**” .
 - **Value:** When “**Value**” type is selected, the content that is filled in the text field next to option, appears in the Header or Footer. You can enter texts and “**Global variables**”. Ex: “Employee Name: [v_name]”.

Search

Settings

Settings		
ATTRIBUTE	VALUE	DESCRIPTION
Display combobox quantity	<input type="checkbox"/>	Displays the amount of existing records in the database next to the value in the filter combo.

- **Display combo box quantity** : Allow to display the quantity of existence records in the table net to the value in search combo.

Settings of search fields

To define the fields that will be used in the Summary search, use drag-and-drop to position the fields within Search Fields.

The order of the fields, within Search Fields, will be the display order in the generated application.

This search works only in Grid summary.

Search fields settings	
GRID FIELDS	SEARCH FIELDS
# id	T region_1 <input type="button" value="Edit"/> x
📅 date	# id_1 <input type="button" value="Edit"/> x
T region	\$ sales_1 <input type="button" value="Edit"/> x
T product_category	
T product	
T customer_name	
# qty sold	
\$ cost	
\$ sales	
\$ profit	

Editing Fields

The same field can be added more than once to the Search, these fields will be visible in the generated application since it uses distinct settings, if they are using the same configuration only one of the fields will be displayed.

The display settings of the fields are performed individually, and can be accessed by adding the field in the search and clicking edit.

you will separate the explanation of the display settings from the fields according to the types.

Types: Text/Special

Configuration interface for text and special fields.

Portuguese - Brazil

Egllsh

Spanish

Multiselect box
Use the multiselect option to allow users to select multiple values at once in the filter.

Ok Cancel

Choose Component

You must define how the field will be used in the Search. Each field type, text, number, and date have different configuration options.

- **Search field label** : Defines the label of the field that will be displayed in the Search.
- **Choose component type**: It defines the format of use of the fields in the Search, for text fields you have the Select Box and the Multi select box.

Choose values

The **default value** field allow us to define a default value to the summary search in the initial application charge.

Choose component
Choose values
Lookup

Select below the date ranges to allow system users to filter the Summary according to the periods displayed:

Default value:

Sets a default value for filter on the initial load of the application.

Specify the default filter value to apply. Ensure that the value is present in the column. Enclose the comma containing values inside the double quotes.

Ej.:West

Lookup

In this tab, you can configure the display lookup in the Search field. For more information on creating a view lookup, access **Application > Grid > Fields > Text**.

Types: Date/Time

Configuration interface for date and date time fields.

Search Settings ✕

Choose component Choose values

Field label for display birthdate_1

Choose the display component:

Date Range
Use this option so that users can filter using a date range determined by them.

From 24 Apr 2017 00 00 00
 To 15 Oct 2012 00 00 00

Actual Period Simple select ▼
Use this option so that users can filter according to an actual date period. For example: 2019, 2015, etc.

2017 ▼
 2017
 2016
 2015

Relative Period Simple select ▼
Use relative period so that users can filter according to a period, for example: current year, last month, current quarter, etc.

Last Year ▼
 Last Year
 Last semester
 Last trimester

Seasonal Period Simple select ▼
Use seasonal periods so that users can filter according to the repeated periods. For example: every month of April, every quarter, every Saturday, etc.

January ▼
 January
 February
 March

Choose Component

You must define how the field will be used in the Search. Each field type, text, number, and date have different configuration options.

- **Search field label** : Defines the label of the field that will be displayed in the Search.
- **Choose component type**: Defines the format of use of the fields in the Search, for fields date and datetime, you will have the following options: Date Range, Actual Period, Relative Period and Seasonal Period.

Choose Values - Date Range

For datetime fields, you must enable the option **Include Time** so that the hours can be included in the search

Select below the date ranges to allow system users to filter the Summary according to the periods displayed:

Include time

Example: (From Jan 1st 2006 15:50:20 to Jan 1st 2010 20:15:50)

Choose Values - Actual Period

You must define the period that will be used in the search. When running the application, you will have a select with the dates displayed according to the selected period.

Select below the date ranges to allow system users to filter the Summary according to the periods displayed:

Year

All the distinct values in the column will be listed

Default value:

Sets a default value for filter on the initial load of the application.

Choose Values - Relative Period

You must define which periods are available for use in the search.

Select below the date ranges to allow system users to filter the Summary according to the periods displayed:

Select values

Year
Quarter
Month
Week
Day
Time only

Current year
 Last year
 Next year

Default value:

None

Sets a default value for filter on the initial load of the application.

Specify the default filter value to apply. Ensure that the value is present in the column. Enclose the comma containing values inside the double quotes.

Single: Last Year
Multi: Last Year,Current Year

Choosing Values - Seasonal Period

The available values are separated by tabs:

Select below the date ranges to allow system users to filter the Summary according to the periods displayed:

Select values

Quarter
 Month
 Week
 Week Day
 Day
 Time only

Quarter 1
 Quarter 2
 Quarter 3
 Quarter 4

Default value:

Sets a default value for filter on the initial load of the application.

Specify the default filter value to apply. Ensure that the value is present in the column. Enclose the comma containing values inside the double quotes.

Single: October
 Multi: May, October

- **Quarter:** Defines the quarters used in the search.
- **Month:** Defines the usage of the months of the year.
- **Week:** Defines the usage of the weeks of the year.
- **Week Day:** Defines the use of the days of the week.
- **Day:** Defines the usage of the days of the month.
- **Only Time:** Defines the use of the day time (Available only in the datetime field)

Types: Number

Configuration interface for numeric fields.

Search Settings ✕

 Lookup

Field label for display:

Choose a function:

Choose the display component:

Range to be incremented

Slider

Use the slider component to allow the user to quickly filter numerical data by sliding a graphical thumb between the end points of a track that corresponds to a range of values.

Choose Component

You must define how the field will be used in the Search. Each field type, text, number, and date have different configuration options.

- **Search field label** : Defines the label of the field that will be displayed in the Search.
- **Choose function to apply**: Defines the function that will be used in the search for setting the value. For example, when choosing sum, the range is the range between the lowest and the result of the sum greater.
 - **Actual Values**: This option sets the display of the actual value of the field, saved in the database, without the use of any of the aggregate functions. When using this option, two types of searches, select box and Multi select box usage are added, as well as enabling lookup settings for numeric fields.
- **Choose component type**: Defines the format used for the fields in the search, for numeric fields, you have the Range and selecting **Actual Values** will be displayed **Select Box** and **Multi select box**.

Lookup

For numeric fields, this option is available only when you use the **Actual Values** option and the way the field is used in the search is **Select box** or **Multi select box**.

In this tab, you can create a display lookup in the search field. For more information about creating view lookup, go to **Application > Grid > Fields > Integer**.

Advanced Search Settings

Through the table below we set all the options that will be part of the application Grid Search.

Horizontal Alignment

Allows you to define the Horizontal positioning of the Search Form.

Margins

Defines the position of the margins of the Search Form.

Keep Values

It keeps the searched values when the user returns to the search form.

Keep Columns and Order Selection

Set it to preserve the selected columns and sorting for each search, if they went changed by the user through the toolbar options.

Use Enter to

It allows you to define the action that the Enter Key has on the Search form. **Tabulate** enables you to navigate between fields, and **Submit** performs the search(activates the Search button).

Display Tags

Allows displaying as tags, the searches used for the Grid.

Display after filtering

Display tags only after performing an advanced search. If disabled, it will always display a tag, regardless of the advanced search.

Unify results

Sets the chars limit to group the result of the tags. This option should be used when the field type is multiple-select.

Treeview in the Tags

Sets the use of Treeview for tags.

Initial status of the Treeview

It sets the initial state of the Treeview. (If the app is using Treeview for tags)

Start open

It displays the tags.

Start close

It displays the full description of the tags as text.

Clear other filters after submit

After applying the advanced filter, all other filters will be deleted.

Interact with the dynamic filter

Apply the same filter in matching fields between Advanced and Dynamic Filter, when not showing the labels.

Highlight

Highlights the results in the query. It only works for “Exactly the same”, “Contains” and “Equal start” conditions.

To customize how the highlight will be displayed, you must access the theme editing tool .

- 1** - Access the **Layout > Application Themes** menu.
- 2** - Choose the desired theme and click **Advanced Mode**.
- 3** - Then look for the sub-item **Grid**, within the item of the same name.
- 4** - In this sub-item you will find the option “Line”, which contains the folders **Line Odd and Even** . In each of these folders you will find the option **Quicksearch highlight**, with the options for editing Text, Border and Background of the searched terms.

Select Fields for Advanced Search in Grid

Adding and Removing Application Fields

The fields must be configured using the selection buttons, located between the columns.

- - Move all fields to the right.
- - Moves only selected fields to the right
- - Moves only the selected fields to the left.
- - Move all fields to the left.

In the left column, there are the application fields that are not in use in the filter, while the right column shows all the selected fields and the order in which they will be displayed.

To add fields to the filter, select the fields you want in the filter and click the button.

To select fields in sequence, simply click on a field and drag. Pressing control (Ctrl) allows you to select multiple alternate fields.

Search and positioning

Field display order

The fields will be displayed in the application respecting the order defined in the right column.

The display order must be defined using the sort buttons and which will move the selected fields in the column.

Remembering that the fields must be positioned inside a block (**customers**) which must be inside a page (**Pag1**).

Check below the use of the buttons to order the fields

Save and Restore

Below the columns are two buttons:

- **Save** which records the current placement of fields in columns.
- **Restore** which reorganizes the fields returning to the last position saved.

Restoring the positioning of the fields to the last saved definition.

Grid Search Toolbar

Search Toolbar

The Search toolbar is divided in two parts: Top and Bottom, in a way that is possible to define the buttons that will be displayed in both bars. The selection of buttons in the top and bottom toolbar works independently, allowing the buttons to be displayed in both bars at the same time.

 *Toolbar Interface.*

Navigation:

Groups the options relative to the navigation buttons that can be displayed in the application.

- **Search:** Execute the search.
- **Clean:** Clean the all the search fields.
- **Edit:** Enable the **Save Tag** option.
- **Exit:** Exit the application.

Others:

Groups a diversity of options relative to the application.

- **Languages:** Displays a combobox with the names available, defined in the project properties.
- **Themes:** Displays a combobox with the themes available, defined in the project properties.
- **HelpCase:** Displays a button to redirect to the help page.

Separator

- **-----:** Displays a line separating the buttons, when used the Group Buttons.

Use in-line buttons:

Allows the alignment of the filter buttons next to the fields.

Inline buttons: Allows you to select which buttons will be displayed next to the field, and you can sort them according to your wishes. This option is available by enabling **Use buttons inline** in the button settings.

When activating the **Inline Buttons** option, the screen to configure the buttons will be displayed.

The buttons available in this in-line button option are the same as those shown in the standard toolbar described above.

This is the result when using a radio button on the line

Button Settings

 *Button Settings Interface.*

- **Hotkey:** Allows you to set keyboard hotkeys to a button.
- **Position of the in-line buttons:** Sets the positioning of the buttons to the right or left of the fields.
- **Column Quantity:** Sets the number of display columns of the buttons, allowing you to configure whether they will be displayed side-by-side or distributed in columns.

Options ![Options Interface.][barra_ferramentas_filtro_opcoes] *Options Interface.* * __Button Position(Top/Bottom)__ Positioning the buttons of the toolbar Top/Bottom. -->

Grid's Advanced Search Events Overview

In events, blocks can be used with global variables, local, JavaScript code, CSS codes and Scriptcase macros.

onScriptInit - Advanced Search - Grid

This event occurs just once before it display the search form. It can be used to set some default values to the fields. For example: {company} = [glo_company]; Date fields are used differently, They use a suffix "day" for day, "month" for month and/or "year" for year. For example, The {Birth} field will be: {Birth_day}=date("d"); {Birth_month}=date("m"); {Birth_year}=date("Y");

onRefresh - Advanced Search - Grid

onRefresh

This event occurs when the form application is reloaded, is possible to reload the form based on fields (select , radio, checkbox)

onSave - Advanced Search - Grid

This event occurs always that some search setting is saved in the filter application.

onValidade

This event occurs when the search form is submitted. Ex. in order to prevent some searches or to validate any search params if(strlen({name}) <= 0) { sc_error_message(" Please fill the name field before submit your search "); }

Grid's Advanced Search Layout Overview

On this module are available the features of editing, attributes and display of the application, in a way that you can apply display themes, organize blocks, define values and the format of the Header/Footer and etc.

Blocks

Conceptually a block is a “container” where you can position the fields of the Applications: Form, Control or Grid with Slide orientation.

By default, the applications created in ScriptCase are built with a only one block, with the same name as the application. You can add the amount of blocks that you want to organize in a more convenient way. The page below, observe that theirs a column Organization, and that is where you’ll define if the next block will be set beside or below the current one.

Application Block configuration

On the left side of each block there are two icons, first has the function to edit all the information relative to the block and the second is to delete the block.

- Organizing the position of the Blocks
 - See below how to modify the display order of the Blocks in one Page.

Click and drag the block that you desire to modify to its new position.

Application Block Display configuration

- See how to remove a block from display

Click on the block desired and drag it to the item “Blocks not Shown”. This way, you can also drag the block to another page if desired. See the images below.

Application Block Display configuration

Application Block Display configuration

- **Attributes**

- **Block**

- **Name** : Name of the Block.
- **Label** : Title of the block that’ll be displayed in the application.

- **Title**

- **Display** : Flag that controls the title display of the block.

- **Label**

- **Display** : Flag that controls id the label of the fields will be displayed in the block.
- **Position** : Options to display label :
 - **Above** : The label will be displayed above the field.
 - **Beside** : The label will be displayed beside the field.
 - **Below** : The label will be displayed below the field.

- **Fields**

- **Columns** : Amount of columns that are displayed side by side in the block.
- **Position** : The way that the fields are displayed in the block :
 - **Below** : The fields are displayed one below the other respecting the amount of columns.
 - **Beside** : The fields are displayed one beside the other respecting the amount of columns.
 - **Line** : The fields are displayed one beside the other without the tabulation.

- **Organization**

- **Next** : The way that the blocks are displayed in the page:
 - **Below** : Indicates that the next block will be placed below the current one.
 - **Beside** : Indicates that the next block will be placed beside the current one.
 - **Tabs** : Indicates that the next block will be placed in a different tab then the current one.
- **Width** : Specifies the width that block will occupy in pixels or percentage, in case the value is in percentage, inform the (%).
- **Collapse** : Enables the option to close the block.

- Create New Block

To include new blocks in an Application, click on the button . Next, you’ll see the following interface to define the name and label of the block. At the end click on Create.

- **Attributes**

- **Name** : Name of the Block.
- **Label** : Title of the block that'll be displayed in the application.

- Edit Blocks

To edit a block just click on the icon , that is on the left side of the block. Next, you'll see the following interface to define the parameters of the blocks. At the end click on save.

- 
- **Name** : Name of the block.
 - **Title** : Block title for display.
 - **Display Title** : This option, when active, allows to display the block title.
 - **Title Font** : Font applied to the block title.
 - **Font Size** : Size of the font applied to the block title.
 - **Font Color** : Font color for the block title.
 - **Background Color** : Background Color of the block title.
 - **Background image** : Background image for the block title.
 - **Title Height** : Height in pixels of the block title line.
 - **Horizontal Alignment** : Horizontal Alignment of the block title (Left, Center and Right).
 - **Vertical Alignment** : Vertical Alignment the block title (Top, Middle and Bottom).
 - **Display Label** : Display the labels of the fields in the block.
 - **Columns** : Amount of field columns in a block.
 - **Columns Width** : How the width of the block is defined.
 - **Label Color** : Color of the field labels.
 - **Fields Organization** : How the fields are organized in the block.
 - **Label Position** : Position of the field labels relating to the data.
 - **Next Block** : Position of the next block relating to the current block.
 - **Border Color** : Border color for the block.
 - **Border Width** : Border Width for the block.
 - **Block Width** : Width for the block.
 - **Block Height** : Height for the block.
 - **Cell Spacing** : Cell Spacing in the block.
 - **Collapse** : Enables the option to close the block.

Layout Settings

On this interface, you can define the theme for display of a specific application, this being because ScriptCase uses a Standard Definition of Values per project, that besides the Display Theme, allows to define values for other attributes on a Project level.

Header Template:

Allows to choose the template that's going to be used as the Header of the application.

Footer Template:

Allows to choose the template that's going to be used as the Footer of the application.

Button:

Allows to choose the button theme for the application.

Themes:

Choose one of the existing themes, it'll load the display mode (colors ,fonts, etc.) that'll be part of the application.

Header & Footer

Header

In this block, it's the definition of the variables content that'll be part of the header.

This page may change depending on the header format chosen in the Layout Settings.

Display Header:

This option determines if the header will display.

Title:

Allows to inform the title displayed in the application.

Header Variables:

The field variables can be informed with anyone of displayed in the Combo box. Depending on the type, it'll be necessary to associate the content with the field. Below there are the types of content:

- **Field** : When you choose the option "**Field**", it'll open a Combo box beside to choose the field you want. Selecting the desired field, it'll associate the value of the field with the header.
- **Title** : This option when selected it'll display in the header the value informed in the "**Application Title**".
- **Date** : When selected the "**Date**" type, it'll display the system's date in the header. There are a diversity of formats using the date and time of the server. The format can be informed in the text field that appears beside the field. To access the existing formats, click on the icon and you'll view a page display the formats.
- **Image** : When selecting the image type, it displays a field to inform the name of the existing image in the server. To locate the images existing and selecting one, click the icon "**Choose Image**" and to upload new images click on the button "**Upload**" .
- **Value** : When selecting the type "**Value**", the content informed in the text field that appears beside, it'll be displayed in the header, you can inform texts and "**Global Variables**". e.g. "Employee Name: [v_name]".

Depending on the Application, you may have more than one title option.

Footer

This page may change depending on the footer format chosen in the Layout Settings.

Display Footer:

This option determines if the footer will display.

Footer Variables

The field variables can be informed with anyone of displayed in the Combo box. Depending on the type, it'll be necessary to associate the content with the field. Below there are the types of content:

- **Field** : When you choose the option "**Field**", it'll open a Combo box beside to choose the field you want. Selecting the desired field, it'll associate the value of the field with the footer.
- **Date** : When selected the "**Date**" type, it'll display the system's date in the footer. There are a diversity of formats using the date and time of the server. The format can be informed in the text field that appears beside the field. To access the existing formats, click on the icon and you'll view a page display the formats.
- **Image** : When selecting the image type, it displays a field to inform the name of the existing image in the server. To locate the images existing and selecting one, click the icon "**Choose Image**" and to upload new images click on the button "**Upload**".
- **Value** : When selecting the type "**Value**", the content informed in the text field that appears beside,

it'll be displayed in the footer, you can inform texts and "**Global Variables**". e.g. "Employee Name: [v_name]".

Dynamic Search Settings

On this screen, the general behavior of the dynamic filter in the application will be defined.

Filter type

Defines the type of filter that will be used in the application.

Filter Builder

Allows the end user to create filters during the use of the application, combining different conditions and logical operators (AND/OR) to create more robust filters and generate more qualified reports.

Below is an example of how the filter builder works.

The user can add multiple fields or nested conditions to combine the use of logical operators.

Dynamic filter

Allows the end user to build filters during the use of the application by adding the fields that should compose the filter according to their needs, within the same logical operator.

Below is an example of how the dynamic filter works.

The user must select the logical operator that will be used for all filter fields: All conditions (AND) or any condition (OR).

Use the ENTER key for

This attribute defines the behavior of the ENTER key when the filter screen is being displayed.

Grid Filter Builder Settings

Enable/Disable

This attribute defines whether the user can disable fields or nestings in the filter builder, keeping them disabled until the application is reloaded.

Example of the disable button

Display filter condition

Defines whether the filter condition will be displayed while the user builds their filter.

When enabled, the condition is assembled as the user adds the filter's conditions and logical operators. When disabled, this condition will not be displayed.

Modal Filter

Defines the location where the filter builder will open in the application.

When enabled, the filter will open in a modal. If disabled, the filter will be displayed in a div below the application's toolbar. See below for examples of both behaviors.

Opening in a modal

Div below the toolbar

Highlight results

This attribute defines whether the search results will be highlighted in the application.

The highlight color is defined by the application's theme.

Example of highlighted results after search

Save Search in Filter Build (Grid)

This feature allows the end-user to save his searches in a profile. You can create some rules, like to save the searches by user login.

Select Fields for Filter Build in Grid

On this screen, the fields that will be available for use in the dynamic filter must be defined.

In the **left column**, all application fields and the **Search** field are displayed, which helps in locating the fields. In the **right column** are the fields selected to be displayed in the filter.

Adding and Removing Application Fields

The fields must be configured using the selection buttons, located between the columns.

- - Move all fields to the right.
- - Moves only selected fields to the right
- - Moves only the selected fields to the left.
- - Move all fields to the left.

In the left column, there are the application fields that are not in use in the filter, while the right column shows all the selected fields and the order in which they will be displayed.

To add fields to the filter, select the fields you want in the filter and click the button.

To select fields in sequence, simply click on a field and drag. Pressing control (Ctrl) allows you to select multiple alternate fields.

Search and positioning

Field display order

The fields will be displayed in the application respecting the order defined in the right column.

The display order must be defined using the sort buttons and which will move the selected fields in the column.

Remembering that the fields must be positioned inside a block (**customers**) which must be inside a page (**Pag1**).

Check below the use of the buttons to order the fields

Save and Restore

Below the columns are two buttons:

- **Save** which records the current placement of fields in columns.
- **Restore** which reorganizes the fields returning to the last position saved.

Restoring the positioning of the fields to the last saved definition.

Select Fields for Dynamic Search in Grid

On this screen, the fields that will be available for use in the dynamic filter must be defined.

Restoring the positioning of the fields to the last saved definition.

05 Quick Search

Quicksearch is an option that allows to search data in various fields of the application by using the text box in the toolbar.

Quick Search Settings

In the quick search settings you can find the following options:

Quicksearch layout

Simplified: Standard quicksearch view. This option displays the input where we must inform the terms to be searched for.

Extended: In this layout, in addition to the simplified layout options described above, it is possible to select the columns where a search will be carried out and the criteria to be selected.

The criteria must be selected in the option **Research Criteria**, they are:

Contains, Equal beginning, Exactly equal, Does not contain, Different, Greater than, Greater than equal, Less than and Less equal

Highlight results

Highlights the result of the research performed.

Maintain search condition

This option defines the behavior of quicksearch in relation to the advanced filter.

When activated, quicksearch takes into account the search performed in the advanced filter, so the quicksearch search will be carried out in conjunction with the advanced search.

When you disable the option, quicksearch completely disregards the search performed in the advanced filter.

Button within the search area

Defines the placement of the search button, whether it will be in the text area or outside it.

Option Enable -

Option Disabled -

Display combobox in the simplified layout

When active, display combobox with the fields selected in the **Quicksearch extended fields** option

Watermark

Watermark that will be displayed in quicksearch. A lang or a fixed text can be used.

By default, we use the lang: {lang_othr_qk_watermark}

Quicksearch width

Width in pixels of the Quicksearch input.

Settings for Individual Search by field

This configuration defines the fields that are available in the quicksearch combobox, when activating the Extended Layout option, in the general settings

Fields for individual search

Use fields displayed in the application: When selecting this option, only the fields displayed in the application will be available in the combobox.

Define fields manually: Allows the developer to select the fields that will be available in the quicksearch combobox.

Search settings in the 'All Fields' option

This option defines the fields that will be used in quicksearch, regardless of their configuration. That is, all fields selected in this option will always be available in the search.

Search in All Fields

All Fields added to the fields of the Individual Search : In addition to the fields selected in this option, the fields selected in the **Quicksearch extended fields** option will be available in the quicksearch search.

Only those selected for All Fields: Only the fields selected in this option will be available in the search through quicksearch

Search Criteria

Defines quicksearch search criteria.

When checking the options, the combobox with the criteria will be displayed

These are the options available as a quicksearch search criterion.

- **Contains**
- **Equal beginning**
- **Exactly equal**
- **Does not contain**
- **Different**
- **Greater than**
- **Greater than equal**
- **Less than**
- **Less equal**

Grid's Search Fields Overview

The applications can have two types of fields.

Table Fields

Columns of the table connected to the application and their data types.

Example:

In a table with the following structure:

```
CREATE TABLE `orders` (
  `orderid` int(11) NOT NULL,
  `customerid` varchar(5) NULL DEFAULT NULL,
  `employeeid` int(11) NULL DEFAULT NULL,
  `orderdate` date NULL DEFAULT NULL,
  `requireddate` date NULL DEFAULT NULL,
  PRIMARY KEY (`orderid`) USING BTREE
);
```

These are the listed fields on left menu **Fields**:

Virtual Fields

Fields created inside application to assist in the development process.

How to create a virtual field

1. Inside an application, access the left menu **Fields** and click on **New Field** option.
2. Choose how many fields do you want to create:

1. Create the fields and define type, name and label for each one:

- **Type**: Data type of the field.
- **Name**: Internal name of the field. Used to identify the field on events and Scriptcase interface.
- **Label**: Title of the field displayed on the application.

Scriptcase **doesn't insert** virtual fields on the table after its creation.

Types of fields by applications

Application Table Fields Virtual Fields

Grid	<input type="text"/>	<input type="text"/>
Procedure	<input type="text"/>	<input type="text"/>
Chart	<input type="text"/>	<input type="text"/>
Form	<input type="text"/>	<input type="text"/>
Control	<input type="text"/>	<input type="text"/>
Calendar	<input type="text"/>	<input type="text"/>
Search	<input type="text"/>	<input type="text"/>
PDF Report	<input type="text"/>	<input type="text"/>

The applications **Menu**, **Tree Menu**, **Dashboard** and **Blank** were not listed because they haven't manage fields.

Text

General Settings

This type of field allows the developer to create quickly fields to display data from the database, where the final user can see the data in the way it was set by the developer.

Type of Data

Defines the type of the field in the application. In this case we should select **Text**.

Label

Defines the title that will be displayed in the field when the application is executed. The terminology used in the interface is fundamental to the system have a good usability, whe should use names and familiar terms to the final user of the application, instead of using terms from the system.

For example, this text field that has the name **customerid**, the client would have a much better understanding of the functionality of the field when we define the label as **Customer Name**.

Not only a fixed text, the **Label** attribute allows the use of langs to define the field's title, making it possible to use your application in a multi language project.

Case Settings

This option allows the developer to inform how the text will be displayed in runtime.

The options available are:

Lower Case: Every letter in the text will be converted to lower case.

Upper Case: Every letter of the text will be converted to upper case.

Capitalize first word: The first letter of the first world will be converted to upper case.

Capitalize all words: The first letter of every words will be converted to upper case.

Show HTML Content

When this option is active every HTML, CSS and JavaScript content that are in the database will be displayed with the main value.

Field Mask

Defines the field mask. There are two types of mask described in the table below:

Character Description

X	It is overridden by any characters returned by the database. Filled is required and the value will be completed with leading zeros when there are fewer characters than the size of the mask.
Z	It is overridden by any characters returned by the database. Its filling is optional and when there are fewer characters than the mask size, nothing will be done about the characters that are missing. In addition the leading zeros will be suppressed. When used in conjunction with the X necessarily the use of this character is to the left of the mask.
9	It represents any numeric character (from 0-9)
A	It represents an alpha numeric character (A-Z,a-z)
*	It represents any alpha-numeric character (A-Z,a-z,0-9)entered by the user.

For example, it is possible to set the mast to display a telephone number:

It will be show with this format on runtime:

It is also possible to set the field mask like those examples:

Field mask examples:

Telephone number

Field	Mask Input	Typed Value	Formatted Value
Phone Number	+99 99 9999 - 9999	123456789012	+12 34 5678 - 9012
Phone Number	(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
Phone Number	(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
Phone Number	(zz) xxxx - xxxx	12345678	() 1234 - 5678
Software Key (Letters only)	AAAA-AAAA-AAAA-AAAA	QWERTYUIASDFGHJK	QWER-TYUI-ASDF-GHJK
Software Key (Letters and numbers)	xxxx-xxxx-xxxx-xxxx	Q1W2E3R4T5Y6U7I8	Q1W2-E3R4-T5Y6-U7I8
License Plate	AAA - 9999	QWE1234	QWE - 1234
Scriptcase Serial Key	A999A999A999-**	D111H111G111DG2P	D111H111G111-DG2P
Multiple masks (Phone Number)	9999-9999;(99)9999-9999;	9999 999 9999	+99 99 9999-9999

Repeat Value:

When this option is active the value of the field will be repeated if the previous database register is the same.

Example:

SQL Type

Informs the type of the field in the database.

Field Behavior

Use autocomplete:

Field automatically turns into autocomplete according to existing values in the database.

Use Select2

Uses the new component for data selection, allowing searches within the select comboBox.

Width for the Select2

Sets a width for the area in the Select2.

Amount of characters

Sets the amount of characters to start the search.

Amount of rows

Sets the maximum number of rows to list the search result.

Width:

Defines a width in pixels for a result box.

Search options:

Defines the validation that will be made to fetch the search result.

Start equals to: Will return the records with the same start value as in the database.

Any part: Will return the records when exist the character in any part of the record.

End equals to: Will return the records with the same final value as in the database.

Position between values:

Defines the position that objects will be displayed.

Text Between Values

Text that will appear when using a filter condition between two values.

OnChange Submit:

Submit search on this field changing.

Show Condition:

To show or not the search condition. It only works if the search has at least one condition.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.

- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Integer

On this page, you will learn how you can configure settings related to the Number field. From the use of specific symbols display to the mode in which they are displayed. And thus, boost the application.

Data type:

It sets the application field type. When the field is set as Number, it is permissible to define formatting rules of integers.

Label:

It sets the title that will be displayed in the field when you run the application. The terminology used in the interface is fundamental for your system has a good usability. In this case, we recommend you to use names and terms familiar to the end user of the application, instead of using terms originated in the system.

Field Mask Input:

It sets the mask input for the field. There are two types of mask as described in the table below:

Character Description

- X It is overridden by any characters returned by the database. Filled is required and the value will be completed with leading zeros when there are fewer characters than the size of the mask.
- Z It is overridden by any characters returned by the database. Its filling is optional and when there are fewer characters than the mask size, nothing will be done about the characters that are missing. In addition the leading zeros will be suppressed. When used in conjunction with the X necessarily the use of this character is to the left of the mask.
- 9 It represents any numeric character (from 0-9)
- A It represents an alpha numeric character (A-Z,a-z)
- * It represents any alpha-numeric character (A-Z,a-z,0-9)entered by the user.

Mask Input Examples:

Field	Mask Input	Typed Value	Formatted Value
Phone Number	+99 99 9999 - 9999	123456789012	+12 34 5678 - 9012
Phone Number	(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
Phone Number	(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
Phone Number	(zz) xxxx - xxxx	12345678	() 1234 - 5678
Software Key (Letters only)	AAAA-AAAA-AAAA-AAAA	QWERTYUIASDFGHJK	QWER-TYUI-ASDF-GHJK
Software Key (Letters and numbers)	xxxx-xxxx-xxxx-xxxx	Q1W2E3R4T5Y6U7I8	Q1W2-E3R4-T5Y6-U7I8
License Plate	AAA - 9999	QWE1234	QWE - 1234
Scriptcase Serial Key	A999A999A999- **	D111H111G111DG2P	D111H111G111-DG2P
Multiple masks (Phone Number)	9999-9999;(99)9999-9999;	9999 999 9999	+99 99 9999-9999

Repeat value:

This option when enabled will allows you to repeat the field value if it is equal to the value of the previous record in the database.

Example:

Tipo SQL:

Reports the SQL type of the field as it is configured in the database.

Use regional settings:

It allows you to apply regional settings to the number fields formatting. When this option is not selected it will be displayed the attributes group, minus sign and negative number format.

Grouping:

It allows you to define which character is used to separate thousands. This option is only available when the option to use regional settings is disabled.

Negative sign:

It allows you to define which character will be used for the display of negative numbers. This option is only available when the option to use regional settings is disabled.

Negative number format:

It allows you to define the placement of the negative sign in relation to value. This option is only available when the option to use regional settings is disabled.

Color for the negative values:

It allows you to define a color when the value is negative, improving the understanding of the end user about that kind of value.

Example:

c

Display the value in words:

The value of the field will be displayed in full on application. This feature can facilitate the comprehension and understanding of the user.

Example:

Line size:

Maximum size in characters to be displayed in the value cell, in full. When this value is exceeded the line will break within the cell.

Lookup Settings

The Lookup is a way used to provide the end user a list of values description/name where the items can be selected and used in the application. For example, for a field sex that in the database is represented with M or F values can be presented as male or female dynamically with the lookup. So you will be able to retrieve these values from a database table or manually, if the reference table does not exist.

Example:

Lookup Methods

There are two lookup methods available:

Manual: To use this method it is necessary to inform the selection conditions manually to the Lookup.

Automatic: To use this method it is necessary to use a lookup query from the database to access the reference table.

Editing-automatic lookup:

Select Command:

It sets the SQL command that will retrieve the value to display inside the Grid field. The command must have the following format

```
SELECT field_to_be_displayed FROM table WHERE key_field = {grid_field}
```

The Grid field must be always referenced between curly braces {}, So at run time, the field braces will be replaced by its value in the table.

Multiple Options:

When the Select command informed return multiple values, the option must be selected.

Delimiter:

It sets the tab of values returned by the Select command, this option should be filled when the “Yes” option is checked in the multiple attribute options.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

Use a specific connection:

This option allows you to select another existing connection in the project, other than the current connection, to select the values for the lookup.

Edit Lookup - Manual:

Lookup used to modify the display of the field with predefined values.

Lookup Types

It sets the operating mode of the lookup can be: single value, multiple values (delimiter), multiple values (position) and multiple values (binary).

Single value: it will be displayed only one value for the field. There is a direct replacement of the value stored in the Bank for a label defined in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value of “M” will be replaced by “Male”.

Multiple Values (Delimiter):

By using this option it will be displayed multiple values for the selected field. The values must be separated by a delimiter to be informed. A replacement of parts from a string stored in the field, separated by a delimiter for values contained in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value S;M will be replaced by Sports and Movies.

Delimiter: Character used to separate the values within the same string.

Multiple Values (Position)

Allows you to recover information stored in a single string of the selected field. In order for this information to be retrieved must be informed, in addition to the label, the starting position and the number of bytes that each information occupies within the string.

As an example we will use a string to store Sex, Marital status and Hobby respectively. Sex occupies one byte, Status one byte and Hobby two bytes .

For this purpose we define the list as:

Label	Value	Start	Size
Male	M	1	1
Female	F	1	1
Married	M	2	1
Single	S	2	1
Study	ST	3	2
Sportes	SP	3	2
Reading	LE	3	2

Example: the string MMST would be presented in the query as: Male Married Study

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value M will be replaced by Male.

Start: : Starting position in the string where the information is recorded. The first position is always 1.

Size : Number of bytes that the information occupies in the string.

Multiple values (binary):

It allows you to retrieve several information stored in decimal form of the selected field.

As examples we will use the following list (although not informed in the interface of inclusion of values in the list, each item has a value assigned automatically according to the order):

Assigned value	Description in Lookup
1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

To display the data, a decomposition of the decimal number stored in the bank is performed. For example, numbers 11 and 12 (written in the database) would be decomposed as follows:

11 = 1 + 2 + 8 = (Sports - Culture - Reading)

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

12 = 4 + 8 = (Leisure - Reading)

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

Label:

Text that will be displayed in the Grid.

Include Button:

Includes in the list the values populated in the Label and value fields.

Alter Button:

It changes the attributes of the selected item.

Delete Button:

Deletes the selected item.

Clean Button:

It cleans the fields

Save Button:

Allows the user to save the entire list, for later use using the Load Lookup definition option.

Load Lookup definition:

Allows you to load a predefined value list for use as a lookup.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set

in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** :Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Decimal

General Settings

Decimal field Configuration Interface.

Data Type

Define the field type to Decimal. It allows defining the Decimal number format.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Accumulated

It defines the field to accumulate values of another field. This option is only available for virtual fields.

Accumulator field

It is available when the option "Accumulated" is enabled. This configuration defines which field will accumulate the values. The field should be Integer, Currency, or Decimal.

Grid Mask

It defines a mask for the field value. There is two types of masks:

Character	Description
X	It sets the placeholder to any character for replacing. If the entered number of characters is less than the mask size, It completes the field value with zeros (Filling full-size field entry is required).
Z	It sets the placeholder to any character for replacing, but it suppresses zeros at field left (Complete field filling is optional). Use it on the left when combined with the X mask.

Mask Examples

Mask	Field Value	Formatted Value
(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
(zz) xxxx - xxxx	1234567890	(12) 3456 - 7890
(zz) xxxx - xxxx	12345678	() 1234 - 5678
(zz) xxxx - xxxx	0012345678	() 1234 - 5678

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Field Behavior

Use autocomplete:

Field automatically turns into autocomplete according to existing values in the database.

Use Select2

Uses the new component for data selection, allowing searches within the select comboBox.

Width for the Select2

Sets a width for the area in the Select2.

Amount of characters

Sets the amount of characters to start the search.

Amount of rows

Sets the maximum number of rows to list the search result.

Width:

Defines a width in pixels for a result box.

Search options:

Defines the validation that will be made to fetch the search result.

Start equals to: Will return the records with the same start value as in the database.

Any part: Will return the records when exist the character in any part of the record.

End equals to: Will return the records with the same final value as in the database.

Position between values:

Defines the position that objects will be displayed.

Text Between Values

Text that will appear when using a filter condition between two values.

OnChange Submit:

Submit search on this field changing.

Show Condition:

To show or not the search condition. It only works if the search has at least one condition.

Values format

Decimal Field Format of Values with Regional Settings.

- **Regional Settings** : Allows to apply the Regional Settings to format the number of the field. When not enabled, the attributes Digit Grouping Separator, Decimal Separator, Negative sign and Negative number format.
- **Decimal Precision** : Defines the amount of decimal places for the field.
- **Digit grouping** : Defines if the field will display the digits separator.
- **Decimal Separator** : Defines the decimal separator.
- **Accept** : Determines if the field, will accept only negative, positive or both numbers.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.

- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Currency

General Settings

Currency field Configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Currency, you can currency values to the field.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Currency Field Behavior Interface of the Search Configuration.

- **Use auto-complete** : The field behaves as an auto-complete according to the values existing in the database.
- **Amount of characters** : Sets the amount of characters to start the search.
- **Amount of rows** : Sets the maximum number of rows to list the search result.
- **Width** : Sets the width in pixels for the result box.
- **Search options** : Defines the validation that will be made to fetch the search result.
- **Position between values** : This option sets the position that objects will be displayed.
- **Text between values** : Text that will appear between values.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Values format

Currency Field Format of Values with Regional Settings.

- **Regional Settings** : Allows to apply the Regional Settings to format the number of the field. When not enabled, the attributes Digit Grouping Separator, Decimal Separator.
- **Decimal Precision** : Defines the amount of decimal places for the field.
- **Digit grouping** : Defines if the field will display the digits separator.
- **Decimal Separator** : Defines the decimal separator.
- **Accept** : Determines if the field, will accept only negative, positive or both numbers.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

Date

General Settings

- **Data Type** : Define the type of field for the application. When set to Date, you can inform a date.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Watermark**: Displays a watermark in the field input.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the datatype of field in the database.

Values format

- **Regional Settings** : Allows to apply the Regional Settings to format the dates of the field. When not enabled, it will be displayed the date separator attribute.
- **Date separator** : Allows you to inform the separator symbol for the date.
- **Display** : Select the format of the day for display.
- **Internal Format** : Allows to define the format the field when the SQL type is different from **Date**. You need to use the characters **A**, **M** and **D** that correspond to **Year**, **Month** and **Day**.
- **Use Combo-box** : Allows you to select the date using a combo-box.
 - **Year as Combo** : Allows to use the year combo to select the date.
 - **Initial Year** : First year displayed in the combo.
 - **Actual Year +** : Display the current plus the amount of years informed.
- **Month in full textual** : Displays the Month format in Full.
- **Display Calendar** : Enables the a calendar icon beside the field, this allows to select the date from a calendar with the format already setup.
 - **New Calendar** : Defines if the JQuery calendar (New Calendar) is going to be displayed or the old format.
 - **Years Limit** : Amount of years displayed in the calendar.
 - **View week number** : Displays the number of the week in the application.
 - **Additional months** : Displays the additional months of the calendar.
 - **Show Combo year and month** : Displays the year and month of the calendar in the combo box.

Field Behavior

- **Position between values** : This option sets the position that objects will be displayed.
- **Text between values** : Text that will appear between values.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Special Conditions

- **All Period** : Searches for all periods of dates.
- **Today** : Searches in today's date.
- **Yesterday** : Searches in yesterday's date.
- **Last 7 days** : Searches the last 7 days. Ex: ((01/01/2017 01/07/2017)).
- **This month** : Searches the dates from the first day of the current month.
- **Last month** : Searches the dates from the first day of lasts month.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of

Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

 - **Additional months** : Displays the additional months of the calendar.
 - **Show Combo year and month** : Displays the year and month of the calendar in the combo box.

Field Behavior

Date Field Behavior Interface of the Search Configuration.

- **Position between values** : This option sets the position that objects will be displayed.
- **Text between values** : Text that will appear between values.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Special Conditions

Datetime Field Special Conditions.

- **All Period** : Searches for all periods of dates.
- **Today** : Searches in todays date.
- **Yesterday** : Searches in yesterdays date.
- **Last 7 days** : Searches the last 7 days. Ex: ((01/01/2017 01/07/2017)).
- **This month** : Searches the dates from the first day of the current month.
- **Last month** : Searches the dates from the first day of lasts month.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**

- **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Select

General Settings

Select field Configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Select, you can select multiple option from a combo box (Select Field).
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Select Field Behavior Interface of the Search Configuration.

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Search Lookup

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

• Lookup Methods

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

Selecting the lookup type.

◦ Lookup Method - Automatic

Lookup used to list the values that will be displayed on the Checkbox field. These values will be recovered dynamically using the Select command.

Automatic Lookup Interface.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the `key_field` will be stored in the table field.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimitation.

- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Height** : Defines the height for the select object.
- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to

a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.
- **Link** : Allows to create a link to another form allowing to manipulate the list displayed on the select field. After the manipulation, the select object it updated automatically.

◦ **Lookup Method - Manual**

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

Manual Lookup Interface.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

Setting up Single Value Lookup

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Default** : With this option enabled, the selected item will be inserted to the table when committed.
- **Height** : Defines the height for the select object.

- **Multiple Values (delimiter)**

You can store various values for the select field. The values are separated by the informed delimiter. For example: the combination **Sport, Cinema** and **Tourism** selected in form will be stored like **E;C;T** in case the delimiter is ; (semi coma).

Setting up Multiple Values (delimiter)

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Height** : Defines the height for the select object.

- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of

bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in the database would be stored the following value **MSRD**.

Setting up Multiple Values (position)

- **Label** : Text that will be displayed in the item list of the select field.
 - **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
 - **Negative** : Value to be saved in the table in case there is not any valued selected on the field.
 - **Start** : Starting position of the string that is going to be stored. The first position is always 1.
 - **Size** : Amount of bytes that is going to occupy in the string.
 - **Height** : Defines the height for the select object.
- **Multiple Values (binary)**

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute	Value	Lookup	Description
1		Sports	
2		Culture	
4		Pleasure	
8		Reading	
16		Music	

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute	Value	Lookup	Description
1		Sports	
2		Culture	
4		Pleasure	
8		Reading	
16		Music	

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute	Value	Lookup	Description
-----------	-------	--------	-------------

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

Editing Lookup Configuration Multiple Values (Binary)

- **Label** : Text that will be displayed in the item list of the select field.
- **Height** : Defines the height for the select object.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

Displaying the original lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Lookup Method - Actual value

This lookup is used to list all the values in the selected field.

This lookup will apply a “distinct” to your SQL query.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.

- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Double Select

General Settings

Double Select field Configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Double Select, your allowed to have multiple options selected.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Double Select Field Behavior Interface of the Search Configuration.

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Search Lookup

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or F can be presented like Male or Female or in a dynamic way, getting these values from the database.

Lookup Settings Display for the field.
Automatic Lookup Interface..

- **SQL Select Statement** : Defines the SQL command that will get the values displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the `key_field` will be stored in the table field.
- **Height** : Set the height(lines) of the field interface.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter than (;).
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Selects another specific connection existing in the project. The select command will be done on the second connection.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**

- **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Check box

General Settings

Check box field Configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Check box, your allowed to have multiple options selected.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Check box Field Behavior Interface of the Search Configuration.

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Search Lookup

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or F can be presented like Male or Female or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

• Lookup Methods

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query). *Selecting the lookup type.*

◦ Lookup Method - Automatic

Lookup used to list the values that will be displayed on the CheckBox field. These values will be recovered dynamically using the Select command.

Automatic Lookup Interface.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the `key_field` will be stored in the table field.

- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Option check all** : Displays two options on the field to check and uncheck all.

- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Selects another specific connection existing in the project. The select command will be done on the second connection.

◦ **Lookup Method - Manual**

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

Manual Lookup Interface.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).

- **Single Value** :

Setting up Single Value Lookup

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Default** : With this option enabled, the selected item will be inserted to the table when committed.
- **Columns** : Set the amount of columns, for the list of items.

- **Multiple Values (delimiter)**

You can store various values for the checkBox field. The values are separated by the informed delimiter. For example: the combination **Sport, Cinema** and **Tourism** selected in form will be stored like **E;C;T** in case the delimiter is ; (semi coma).

Setting up Multiple Values (delimiter)

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Columns** : Set amount of columns, for the list of items.

- **Multiple Values (position)**

Stores a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Martial Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man, Single** and **Read**, in the database would be stored the

following value **MSRD**.

Setting up Multiple Values (position)

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Negative** : Value to be saved in the table in case there is not any valued selected on the field.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.
- **Columns** : Set the amount of columns, for the list of items.

▪ **Multiple Values (binary)**

Stores a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

Setting up Multiple Values (Binary)

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Columns** : Allows you to inform the amount of columns, for the list of items.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Saves all the items of the list, to use on other fields, just click on Load lookup definition.

- **Load lookup definitions** : Refreshes the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Option check all** : Displays two options on the field to check and uncheck all.

- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

• CSS of the Title

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

• CSS of the Field

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

• CSS of the Input Object

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio,

- Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Radio

General Settings

Radio field Configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Radio, your allowed to select one of the options listed.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Radio Field Behavior Interface of the Search Configuration.

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Search Lookup

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

• Lookup Methods

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query). *Selecting the lookup type.*

◦ Lookup Method - Automatic

Lookup used to list the values that will be displayed on the Checkbox field. These values will be recovered dynamically using the Select command.

Automatic Lookup Interface.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the `key_field` will be stored in the table field.

- **Columns** : Allows you to inform the amount of columns, for the list of items.

- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.

- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

◦ **Lookup Method - Manual**

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

Manual Lookup Interface.

- **Label** : Text that will be displayed in the item list of the radio.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Default** : With this option enabled, the selected item will be inserted to the table when committed.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

Displaying the original lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

-
- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
 - **Help Type**
 - **Pop-up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

 Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Text Auto-Complete

General Settings

Text Auto-Complete field Configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Text auto complete, you can inform a value based on the select statement of the lookup settings and it will manipulate an internal Text for the data.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Text Auto-Complete Field Behavior

Interface of the Search Configuration.

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **Case Settings** : Allows to convert the letters of the field when losing the focus. The options are:
 - **Upper Case** : All in Upper Case.
 - **Lower Case** : All in Lower Case.
 - **Capitalize first word** : Capitalizes the first letter of the word.
 - **Capitalize all words** : Capitalizes the first letter of all the words.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Search Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field.
- **Rows** : Allows to define the amount of records displayed in the field.
- **Width** : Defines the width the size of capture box (Capture Text).
- **Search options** : Allows to define the search settings of the field(Start equal to, Any part and End equals to).
- **Capture Text** : When not enabled, you will only view the field to inform the data. See an example below. *lookup Settings configuration Interface.*
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

lookup Settings validation configuration Interface.

- **Show label with the description** : Displays a label with the description.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

-
- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.

Number Auto-Complete

General Settings

![Number Auto-Complete Field Behavior Interface of the Search Configuration.][filtro_cons_número_auto]
Number Auto-Complete Field Behavior Interface of the Search Configuration.

- **Data Type** : Define the type of field for the application. When set to Number auto complete, you can inform a value based on the select statement of the lookup settings and it will manipulate an internal number for the data.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Number Auto-Complete Field Behavior Interface of the Search Configuration.

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **Position between values** : This option sets the position that objects will be displayed.
- **Text between values** : Text that will appear between values.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Values format

Number Auto-Complete Field Format of Values with Regional Settings.

- **Regional Settings** : Allows to apply the Regional Settings to format the number of the field. When not enabled, the attributes Digit Grouping Separator, Decimal Separator, Negative sign and Negative number format.
- **Decimal Precision** : Defines the amount of decimal places for the field.
- **Digit grouping** : Defines if the field will display the digits separator.
- **Decimal Separator** : Defines the decimal separator.
- **Accept** : Determines if the field, will accept only negative, positive or both numbers.

Search Lookup

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

Date Comparison

Special field that allows you to change the functioning of a date type field in the summary filter, enabling the comparison of metrics over time. To use this type of field, it is necessary to have a date type field created, and later change its type to Date Comparison.

It is only available in the advanced filter and its operation is exclusive to the query summary module.

Example of the field in the summary filter

Example of the Generated summary

When using the comparison, the summary will be assembled showing the values for the periods informed.

General Configuration

In this block are the general settings of the field, and where it will be 'transformed' into a comparative data field, simply access the settings of a data field and change the *Data* type to **Date comparison**

Data type of the field.

This attribute defines the type of field in the application. This definition implies the configuration options that will be displayed to the developer as well as the behavior of the field when running the application.

During the application creation process, Scriptcase maps the fields of the table(s) used and defines the data type of the fields according to their SQL type.

For example

Fields of type varchar in the table will be defined as text in the **Data Type** attribute.

It is possible to change the field's data type, however it is important to take into account the **SQLType**, displayed in the General Configuration block, to define the field's data type.

Search Label

Defines the title of the column displayed in the executed application and can be defined using: Lang, Text or Global variable.

Lang

The use of lang in the attribute definition is recommended for creating multilingual systems. The langs must be previously defined using the option [Traduzir aplicações](#) or through [Dicionário de Dados](#).

Fixed text

In this case, the column title will not be changed due to user interaction, such as changing the application language, for example.

It is a good option for systems created with just one language.

Global variable

The use of global variables allows you to change the column title according to your system business rule.

We also provide the macro [sc_label](#) which allows you to change the column title regardless of how the label attribute was defined.

Example of a column title

Use same label used on the Grid

This option, when activated, allows you to use the title of the field defined in the grid, in this case the value defined in the **Label filter** attribute will be disregarded.

Value Formatting

Regional Settings

Allows you to apply regional date formatting settings to the field, according to the application language. When disabling the use of *regional settings*, some settings will be displayed such as: **Date separator**, **First Day** and **Display**.

Check below for more details about each configuration option.

It is possible to change regional settings in general, allowing the use of the option and the same configuration in all your projects, according to the language used. For this configuration, access the Menu *Locales* > [Configurações Regionais](#)

Date separator

Defines the character that will be used to visually separate the parts of the date (day, month and year). The characters normally used are: slashes ("/"), hyphens ("-") and periods (").

Alguns exemplos

- **slashes (/):** 25/10/2023
- **hyphens (-):** 25-10-2023
- **periods (.):** 25.10.2023

This option will be displayed if the **Use regional settings** attribute is disabled.

First day

Defines the first day of the week to be displayed in the calendar in the date field, for selecting dates.

First day change example

In this example, the *First day* was defined as Monday, changing the order in which the days of the week are displayed in the field calendar.

This option will be displayed if the **Use regional settings** attribute is disabled.

Display

Defines the date display format by selecting one of the listed formats.

The options are:

- dd-mm-aaaa
- mm-dd-aaaa
- aaaa-mm-dd

This option will be displayed if the **Use regional settings** attribute is disabled.

View week number

Defines whether the number of weeks will be displayed in the date field calendar.

Example of a calendar with number of weeks

Special Conditions

Defines the special conditions that will be displayed in the date field calendar, see the example below.

Example of special conditions in the date field calendar

If no interval is enabled, the calendar in the date field will not have any special conditions.

Example of the date field without special conditions

Select Values

In this attribute, the special conditions that will be listed as an option in the application must be defined. The predefined intervals are grouped according to the period they refer to. For example, the condition *Last week* is in the tab **Week**.

In each of the tabs it is also possible to create personalized intervals using the button [Add new range](#).

In the tab , all selected ranges will be listed, so that the display order can be changed according to the user's needs.

Sorting tab

In this tab, all selected conditions will be listed, allowing the intervals to be reordered according to the system's needs. You can also remove conditions one by one or using the button **Remove all**.

Add New Range

Clicking on *add new range* will open a screen with some options for adding new ranges. To add an interval, we must select the type (next or last) and enter the period (value).

For example, adding a range in the year tab, defined *Last* in the attribute as **Type** and reporting 2 in the attribute **Value** a range will be created: **Last two years**

This button is available on the **Year, Quarter, Month, Week** and **Day** tabs.

Type

Defines whether the created interval will refer to a future period (next) or a previous period (last).

- **Next** - Defines that the created interval will refer to a future date, for example, **Next year**.
- **Last** - Defines that the range will refer to a previous date, for example, **Last Year**.

Value

Sets the amount of time for the interval.

This field only accepts positive integer values greater than zero.

Title

Defines the text that will be displayed in the application. When creating a new range, a lang is automatically

generated, it is also possible to use a fixed text.

Include Current

This option changes how the created interval works, adding the current period to the interval.

For example, adding an interval to the year tab, defining *Next* in the **Type** attribute and entering 2 in the **Valor** attribute and checking the **Include current** option will create an interval: **Next 2 years from current**.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse

leaves the help icon.

- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Application Settings (Grid)

Settings

With this interface, you can set the common attributes of the app.

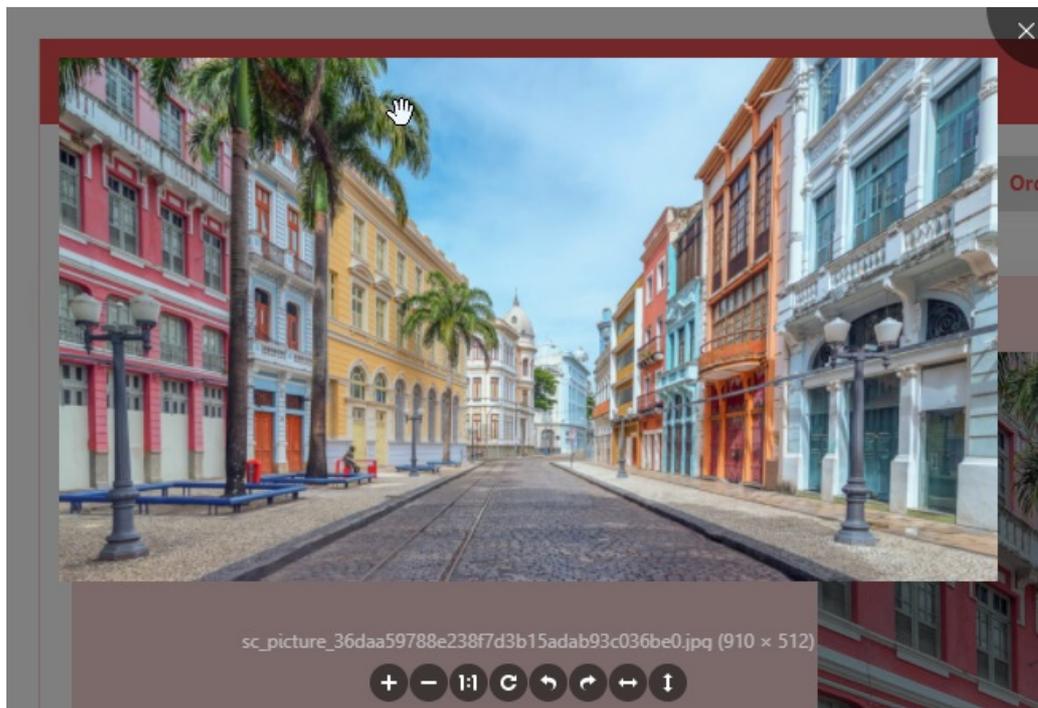

SETTINGS	
ATTRIBUTE	VALUE
Application Code	grid_customers (9.00.0000)
Description	<input type="text"/>
Documents Path	<input type="text" value="C:/Program Files/NetMake/v9/www"/>
Image Directory	<input type="text" value="/scriptcase/file/img"/>
Application images	<input type="button" value="Add"/> <input type="button" value="Delete"/>
Language	<input type="text" value="English (United States)"/>
Share Location Variable	<input checked="" type="checkbox"/>
Charset	<input type="text"/>
Share Theme Variable	<input checked="" type="checkbox"/>
Folder	<input type="text" value="root"/>
Edit by Project	<input checked="" type="checkbox"/>
Timeout	<input type="text" value="0"/>
HelpCase Link	Application <input type="text"/> Search <input type="text"/> Summary <input type="text"/>

Application Settings Interface

• Attributes

- **Application Code** : It is the name that defines an application. An app can be renamed at the [List of Application](#).
- **Description** : This field contains a brief description of the application objectives.
- **Documents Path** : The absolute path to store uploaded documents in the application.
- **Image Directory** : The filesystem directory to store the application images.
- **Application images** : Import images into the application to allows using them in the application.
- **Language** : Set the default language of the application. Display all the application hints and messages in the selected language.
- **Share Location Variable** : Define if the app shares the regional settings with other applications through a session variable.
- **Charset** : Define a specific charset to use in the application.
- **Share Theme Variable** : Define if the app shares the Theme settings with other applications through a session variable.
- **Folder** : Define the project folder that contains the app.

- **Edit by Project** : Define if other project developers can edit the application.
- **Timeout** : Set the session runtime timeout in seconds. If the value is Zero, it assumes the default timeout of the PHP.
- **HelpCase Link** : It allows to associate a [HelpCase](#) file with the application.
- **Image Viewer**: Activates the image viewer features in the running application. By clicking on the image the user can drag, rotate, invert, and enlarge the selected image.

Notification Settings

Notification settings	
ATTRIBUTE	VALUE
Use SweetAlert	<input checked="" type="checkbox"/>
SweetAlert position	Center ▾
Script Error	<input type="checkbox"/>
SQL Error	<input checked="" type="checkbox"/>
Debug Mode	<input type="checkbox"/>
Ajax Error Output	<input checked="" type="checkbox"/>

- **Use SweetAlert**: Use the SweetAlert to display messages from the application. When this option is active, it will replace the browser's "confirm" and "alert".
- **SweetAlert position using Toast** : The position to display error messages on the application.
- **Script Error** : Allows displaying the line code where there is an error..
- **SQL Error** : Allows displaying the SQL statement if it got an error.
- **Debug Mode** : Runs the application in Debug mode, showing all SQL statements the application is executing.
- **Ajax Error Output** : Enables the Ajax alert for debugging errors.

Navigation

This interface allows defining the navigating behavior of the application

NAVIGATION	
ATTRIBUTE	VALUE
Exit URL	<input type="text"/> 
Close on Exit	<input type="checkbox"/>
Redirect URL	<input type="text"/> 
Redirect Variable	<input type="text"/>

Navigation Interface.

Exit URL

URL to where the user goes when he clicks on the “exit” button.

Close on Exit

Close the browser window when the user clicks on the “exit” button.

Redirect URL

Redirect to another URL in case there aren’t any global variables available.

Redirect Variable

Creates a variable with the application name and sends it to the redirected application.

Global Variables

This screen shows all global variables used in the application

The global variable is an external parameter required for running the application. The application can include global variables in the WHERE clause, field definitions and names, event programming, and so on.

You can define global variables by using square brackets ([variable]). You can pass the parameters to the application through one of the methods: Session, Post, and Get

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(“) instead of the brackets([]) because of the conflict with the of Global Variables syntax{:target=”_blank”} Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

APPLICATION	
	Settings
	Navigation
	Messages
	Global Variable

Global variables Interface.

Example:

```
Select CustomerID, CustomerName from Customers WHERE CustomerID = '[v_customerid]'
```

We do not recommend using session variables (global variables) with the same name as the table fields.

In this case, the variable **v_customerid** is displaying in the global variables configuration.

VARIABLE SETTINGS	
ATTRIBUTE	VALUE
global	<div style="border: 1px solid black; padding: 5px;"> <p>Scope</p> <p><input type="checkbox"/> SESSION</p> <p><input checked="" type="checkbox"/> POST</p> <p><input checked="" type="checkbox"/> GET</p> </div> <div style="border: 1px solid black; padding: 5px; margin-top: 5px;"> <p>Settings</p> <p><input type="checkbox"/> Optional</p> </div> <div style="border: 1px solid black; padding: 5px; margin-top: 5px;"> <p>Type</p> <p><input type="radio"/> Out</p> <p><input checked="" type="radio"/> In</p> </div>

Global variables configuration Interface.

Attribute

It shows the variable's name in the application.

Value

Defines the behavior of the variables, divided into three blocks, they are:

Scope

Defines how the application receives the variable. A variable defined as the POST method in the app does not receive value if it comes with the GET method. Those are the methods available:

- **Session:** Defines that the variable must be created as a PHP session variable by another application.
- **GET:** Defines that the variable must be passed by the URL, that is, visible by the browser.
- **POST:** Defines that the variable must be passed through the POST method of an HTML form.

Settings

- **Optional:** Check it to don't validate the variable at runtime.

Type (In / Out)

Defines whether the variable comes from another application (In), or it is starting in the current app (Out).

Description

Indicates where the application is using the variable.

Grid's Links Overview

This feature allows the developer to create links between applications of the same project, expanding the integration of applications. All link options are grouped under the Application Links menu.

Application Links

In the first access to the menu, we can see the list of existing connections in the application.

If the application does not have a configured link, the application list screen will be displayed with the message: **This application does not have any link. Click here to create one now.**

ID

Link identification ID.

Type

The type of link created, some links such as Edit Link allow only one link per application. In this case, the developer will be able to check the connection types that already exist in the application

Target Application

This info show the target application name.

Actions

This column has edit options for the links.

Properties

It allows accessing the binding properties where it is possible to configure the binding behavior.

Link

Displays the links screen, where it is possible to configure the link that was made with the application informed in the target application column. In this option it is possible to change the parameter passed in the connection as well as the target application.

Delete

Permanently deletes the connection in the applications.

Through the option [Restore Applications](#), it is possible to get a previous version of the application, making it possible to recover the link deleted.

Links Type

The Grid application has the following links options

- [Edit Link](#) - Allows the creation of a link with form applications in order to edit the records listed in the grid.
- [Capture Link](#): It allows the creation of links from the filter fields of the Grid application, in order to enable the recovery of the value to fill in the field, with another Grid application of the project.
- [Field Link](#): Allows you to create a link through the application fields to any application in the project.
- [Button Link](#): It allows creating a link through the buttons created by the developer in the query application, to any application in the project.

Grid Applications Link Types x Application available to link

Check the list of applications that can be associated with the available connection types.

The restrictions on the choice of applications are the **Edit Link** which only allows linking with a form and the **Capture Link** where it is possible to link the filter fields with only one other grid application.

	Edit Link	Field Link	Capture Link	Button Link
Grid	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Chart	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Edit Link

Creating an Editing Link

This type of link allows the developer to create a link from a grid to a form with the objective of editing the register of a grid's row.

In the link options, we will choose the **Application Link**. When we choose this option, edit a register from a Grid will be possible.

Applications list

After we select this option, will be displayed the applications list to what you want to create the link.

This screen can be viewed from the following ways:

All:

In which is possible to see all the project's applications. **Example:**

By folder:

In which is possible to see the applications according to the folders in which each of them are.

By type:

In which is possible to see the applications grouped by its respective types.

Definition of Parameters

In this setting we are going to define the type of parameter that will be passed to the next application.

We have two options at **Type of Parameters**, they are:

Fixed value:

This option allows the user to define a fixed value that will be used to the call of the next application.

No value:

This option allows to create the link without the need to send any parameter to the next application.

It is also possible to see a refresh button at its right side.

This button should be used when a new parameter is added to the target application, so the new parameter can be loaded in the current application to make the link.

Link properties

In this screen we will set the application display mode that will be called in the link.

There are five display options, they are:

Open in the same window:

When we use this option the target application will be displayed in the same window of the application, and the target application will have a back button so we can return to the previous application.

Open in another window:

When we use this option the target application will be displayed in other browser window, and the target application will have a exit button so we can close this window.

Open in an iframe:

When we use this option the target application will be displayed in the same window of our application, however it will be displayed in a iframe in one of the four options available in the iframe settings.

Open in a parent:

When we use this option the target application will be displayed in the same window of our application, and the target application will have a back button so we can return to the previous application.

Modal:

When we use this option the target application will be displayed in the same window of our application, however it will be displayed in a small window above the current application.

Open in the same window.

When we use this option the target application will be displayed in the same window of the application, and the target application will have a back button so we can return to the previous application.

When we select this option, we can set these following options:

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Display the button new in the grid:

When we select the option **Yes**, the button **New** is created in the grid to insert new registers.

Also, when we select the option **Yes**, it is displayed two new options **Label to the New button** and **Hint to the New button**:

Label to the New button:

In this option we will inform a name for the button that will be displayed in the Grid.

Hint to the New button:

In this option we will inform a message that will be displayed when the mouse cursor is over the **New** button.

Shortcut key to the New button:

Indicates the shortcut key to the button add new register.

Open in another window

When we use this option the target application will be displayed in another browser window.

When we select this option, we can set the following options:

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Close the form after an update:

Selecting this option will direct the application to the exit application or to the application that initially called the Form, after the record has been updated.

Close the form after an insert:

Selecting this option will direct the application to the exit application or to the application that initially called the Form, after the record has been inserted.

Open the application in a tab inside the menu:

Choosing the option **Yes**, the application will be open in a **menu tab**, when executed from a menu application, instead of opened in another browser window.

Display the button New in the grid:

When we select the option **Yes**, the button **New** is created in the grid to insert new registers.

Shortcut key to the New button:

Indicates the shortcut key to the button add New Register.

Label to the New button:

In this option we will inform a name for the button that will be displayed in the Grid.

Hint to the New button:

In this option we will inform a message that will be displayed when the mouse cursor is over the **New** button.

Open in an iframe.

When we use this option the target application will be displayed in the same window of our application, and the target application will have a back button so we can return to the previous application.

When we select this option, we can set the following options:

Shortcut key to the New button:

Indicates the shortcut key to the button add New Register.

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Iframe properties

In this settings, we can define some iframe details that will display the target application.

Display the target application's header:

When the option **Yes** is selected, the header of the target application is also displayed in the iframe.

Iframe position in relation to the main application:

In this option, we will define in which position in relation to the main application the iframe will be displayed, there are four options:

Below: The iframe will be displayed below the main application.

Above: The iframe will be displayed above the main application.

Right: The iframe will be displayed on the right of the main application.

Left: The iframe will be displayed on the left the main application.

Action after an insert:

In this option, we will define what will happen after a register insert, there are two options:

Reload the grid: The current page will be refreshed after the insert.

Move to the end of the grid : After the insert will be displayed the last page of the grid will the last register inserted.

Iframe height:

Allows to set the iframe height.

Iframe width:

Allows to set the iframe width.

Modal

When we use this option the target application will be displayed in the same window of the application, however she will be displayed in a small window above the current application.

When we select this option, we can set the following options:

Height:

Allows to set the Modal height.

Width:

Allows to set the Modal width.

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Close the form after an update:

Selecting this option will direct the application to the exit application or to the application that initially called the Form, after the record has been updated.

Close the form after an insert:

Selecting this option will direct the application to the exit application or to the application that initially called the Form, after the record has been inserted.

Display the button New in the grid:

When we select the option **Yes**, the button **New** is created in the grid to insert new registers.

Shortcut key to the New button:

Indicates the shortcut key to the button add New Register.

Label to the New button:

In this option we will inform a name for the button that will be displayed in the Grid.

Hint to the New button:

In this option we will inform a message that will be displayed when the mouse cursor is over the **New** button.

Form Properties

In those settings, we can define which buttons will be available in the target form application. Initially we have five options, that are:

Enable Insert button:

In this option we can define if the **New** button will be available in the target application.

Enable Update button:

In this option we can define if the **Save** button will be available in the target application.

Enable Delete button:

In this option we can define if the **Delete** button will be available in the target application.

Enable Navigation buttons:

In this option we can define if the buttons **first, previous, next and last** will be available in the target application.

Enable register editing button in the grid:

In this option we can define if the edit register button, which is the **pencil** in the grid, will be available.

Grid Field Link Settings

Creating a field link

Allows to create a link, represented through a link, from a grid's column to any project's existing application. All the links are displayed in a dropdown if there are more than one link to the same field.

In the types of link option, we will choose the **Field link**.

Applications list

After we select this option, will be displayed the applications list to what you want to create the link.

This screen can be viewed from the following ways:

All:

In which is possible to see all the project's applications. **Example:**

By folder:

In which is possible to see the applications according to the folders in which each of them are.

By type:

In which is possible to see the applications grouped by its respective types.

Definition of Parameters

In this setting we are going to define the type of parameter that will be passed to the next application.

We have two options at **Type of Parameters**, they are:

Fixed value:

This option allows the user to define a fixed value that will be used to the call of the next application.

No value:

This option allows to create the link without the need to send any parameter to the next application.

It is also possible to see a refresh button at its right side.

This button should be used when a new parameter is added to the target application, so the new parameter can be loaded in the current application to make the link.

Link properties

In this screen we will set the application display mode that will be called in the link.

There are five display options, they are:

Open in the same window:

When we use this option the target application will be displayed in the same window of the application, and the target application will have a back button so we can return to the previous application.

Open in another window:

When we use this option the target application will be displayed in other browser window, and the target application will have a exit button so we can close this window.

Modal:

When we use this option the target application will be displayed in the same window of our application, however it will be displayed in a small window above the current application.

Open in the same window

When we use this option the target application will be displayed in the same window of the application, and the target application will have a back button so we can return to the previous application.

When we select this option, we can set the following options:

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Open in another window

When we use this option the target application will be displayed in another browser window.

When we select this option, we can set the following options:

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Close the form after an update:

Choosing the option **Yes**, the window will be closed after doing the update of a register.

Close the form after an insert:

Choosing the option **Yes**, the window will be closed after doing the insert of a register.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Open the application in a tab inside the menu:

Choosing the option **Yes**, the application will be open in a **menu tab**, when executed from a menu application, instead of opened in another browser window.

Open in an iframe

When we use this option the target application will be displayed in the same window of our application, and the target application will have a back button so we can return to the previous application.

When we select this option, we can set the following options:

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Iframe properties

In this settings, we can define some iframe details that will display the target application.

Iframe position in relation to the main application:

In this option, we will define in which position in relation to the main application the iframe will be displayed, there are four options:

Below: The iframe will be displayed below the main application.

Above: The iframe will be displayed above the main application.

Right: The iframe will be displayed on the right of the main application.

Left: The iframe will be displayed on the left the main application.

Iframe height:

Allows to set the iframe height.

Iframe width:

Allows to set the iframe width.

Modal

When we use this option the target application will be displayed in the same window of the application, however she will be displayed in a small window above the current application.

When we select this option, we can set the following options:

Height:

Allows to set the Modal height.

Width:

Allows to set the Modal width.

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Close the form after an update:

Choosing the option **Yes**, the window will be closed after doing the update of a register.

Close the form after an insert:

Choosing the option **Yes**, the window will be closed after doing the insert of a register.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Grid's Properties

In those settings we can define how our target grid will be displayed. We initially have six options, that are:

Initial module:

We can define how our application will be executed in those two options:

Grid: The application will be executed as a grid.

Search: The application will be executed as a search.

Quantity of rows:

In this option we can define the quantity of rows that will be displayed in the target application.

Quantity of Columns:

In this option we can define the quantity of columns that will be displayed in the target application.

Pagination:

In this option we can define if the target application's pagination will be total or partial, in case partial is the selected option the quantity of rows will be the informed previously.

Enable header:

In this option we can define if the target application's header will be displayed.

Enable Navigation buttons:

In this option we can define if the buttons **first, previous, next and last** will be available in the target application.

Capture Link

Creating a Capture Link

The capture link is used to return a value from a **Grid** to a **Form** field.

In the types of links options, we will choose the **Capture Link**. After selection this option, we should also choose which field we want to return the value of.

Applications list

After we select this option, will be displayed the applications list to what you want to create the link.

This screen can be viewed from the following ways:

All:

In which is possible to see all the project's applications. **Example:**

By folder:

In which is possible to see the applications according to the folders in which each of them are.

By type:

In which is possible to see the applications grouped by its respective types.

Definition of Parameters

In this setting we are going to define the type of parameter that will be passed to the next application.

We have two options at **Type of Parameters**, they are:

Fixed value:

This option allows the user to define a fixed value that will be used to the call of the next application.

No value:

This option allows to create the link without the need to send any parameter to the next application.

It is also possible to see a refresh button at its right side.

This button should be used when a new parameter is added to the target application, so the new parameter can be loaded in the current application to make the link.

Application with no parameters

However, when the target application does not have any defined parameters, the following screen is displayed:

Clicking in the button, you will be taken to the target application to create a parameter, so you can use the update button in the **parameters definitions** to refresh them.

Link properties

In this screen we will set the application display mode that will be called in the link.

In this type of link there is only one display option:

Modal:

When we use this option the target application will be displayed in the same window of our application, however it will be displayed in a small window above the current application.

Modal

When we use this option the target application will be displayed in the same window of the application, however she will be displayed in a small window above the current application.

When we select this option, we can set the following options:

Modal:

In this option we are going to define if the target application will be opened in a Modal.

Yes: This option will make the target application be opened in a modal. **No:** This option will make the target application be opened in a new window.

If **Yes** is selected in the previous option, the Modal **Height** and **Width** will be available.

![Modal with yes][modal2]

Height:

Allows to set the Modal height.

Width:

Allows to set the Modal width.

If **No** is selected in the previous option, only those options will be available.

Allows to modify manually in the update:

When we select the option **Yes**, the button **New** is created in the grid to insert new registers.

Allows to modify manually in the insert:

Indicates which shortcut key to the button add new register.

Allows to modify automatically in the update:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Allows to modify automatically in the insert:

Choosing the option **Yes**, the window will be closed after doing the insert of a register.

- [Linking Applications](#)

Button Link

Creating a Button Link

Allows the developer to create a link where the call to the other application will be done through a button.

In the type of links options, we will choose the **Button Link**. Choosing this option it will be possible to create a link to any other application.

List of applications

After selecting this option, The list of applications to what you want to create a link will be displayed.

This screen can be viewed in the following ways:

All:

In which is possible to see all the project's applications. **Example:**

By folder:

In which is possible to see the applications according to the folders in which each of them are.

By type:

In which is possible to see the applications grouped by its respective types.

Definition of Parameters

In this setting we are going to define the type of parameter that will be passed to the next application.

We have two options at **Type of Parameters**, they are:

Fixed value:

This option allows the user to define a fixed value that will be used to the call of the next application.

No value:

This option allows to create the link without the need to send any parameter to the next application.

It is also possible to see a refresh button at its right side.

This button should be used when a new parameter is added to the target application, so the new parameter can be loaded in the current application to make the link.

Link properties

In this screen we will set the application display mode that will be called in the link.

There are five display options, they are:

Open in the same window:

When we use this option the target application will be displayed in the same window of the application, and the target application will have a back button so we can return to the previous application.

Open in another window:

When we use this option the target application will be displayed in other browser window, and the target application will have a exit button so we can close this window.

Modal:

When we use this option the target application will be displayed in the same window of our application, however it will be displayed in a small window above the current application.

Open in the same window

When we use this option the target application will be displayed in the same window of the application, and the target application will have a back button so we can return to the previous application.

When we select this option, we can set the following options:

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Open in another window

When we use this option the target application will be displayed in another browser window.

When we select this option, we can set the following options:

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Close the form after an update:

Choosing the option **Yes**, the window will be closed after doing the update of a register.

Close the form after an insert:

Choosing the option **Yes**, the window will be closed after doing the insert of a register.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Open the application in a tab inside the menu:

Choosing the option **Yes**, the application will be open in a **menu tab**, when executed from a menu application, instead of opened in another browser window.

Choosing the option **Yes**, there are also some other settings to be displayed:

Title to the tab:

This option allows the developer to set a title to the tab that will be opened when used in a Menu application.

Hint to the tab:

This option allows the developer to set a message to be displayed when the mouse cursor is over the tab Menu.

Active tab icon:

This option allows the developer to set an icon to be displayed in the tab when used in a menu application.

Modal

When we use this option the target application will be displayed in the same window of the application, however she will be displayed in a small window above the current application.

When we select this option, we can set the following options:

Height:

Allows to set the Modal's height.

Width:

Allows to set the Modal's width.

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Close the form after an update:

Choosing the option **Yes**, the window will be closed after doing the update of a register.

Close the form after an insert:

Choosing the option **Yes**, the window will be closed after doing the insert of a register.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Form Properties

In those settings, we can define which buttons will be available in the target form application. Initially we have five options, that are:

Enable Insert button:

In this option we can define if the **New** button will be available in the target application.

Enable Update button:

In this option we can define if the **Save** button will be available in the target application.

Enable Delete button:

In this option we can define if the **Delete** button will be available in the target application.

Enable Navigation buttons:

In this option we can define if the buttons **first, previous, next and last** will be available in the target application.

Enable register editing button in the grid:

In this option we can define if the edit register button, which is the **pencil** in the grid, will be available.

Enabling the option **Enable navigation buttons**, one more option will be displayed:

Keep the WHERE clause in the target application:

Enabling this option, the WHERE clause of the grid application will be kept to the target application.

- [Linking Applications](#)

Grid Programming

In this version of ScriptCase is incorporated with the concept of programming with the use of attributes, methods, resources and libraries. In the previous versions it was already possible to create business rules in applications using this concept, but the big difference now is that this can be done in a more organized and dynamic way, facilitating both the development as the understanding of the rule by another developer.

Attributes

The attributes are variables that has the global scope declared in the application. An attribute that can be referenced in all the methods and the application's events.

Attributes configuration Interface.

Attribute Name : This field allows to inform the attributes name, after typing the name just click on **include**. In case you want to **update** click on the attributes name (located on the buttons' right side), do the necessary modifications and click on update. In case it is necessary to **delete** an attribute, it is necessary to do same process as the update, but when selecting the attribute, it is necessary to click on the delete button. The **clear** button, as the name suggests, it clears the list of all the attributes listed on the right.

Internal Libraries

To use the internal libraries just select the correspondent (Project Libraries for example). This process allows the methods existing in the library, to be visible in all the application's Events and Methods.

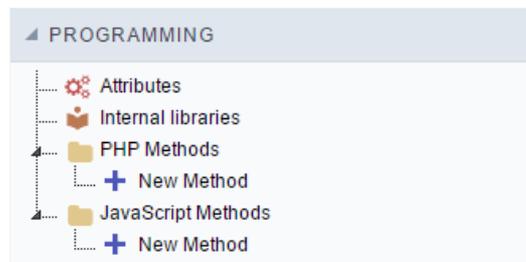

See how to manage the libraries by [clicking here](#).

Internal Libraries management Interface

PHP Methods

Methods are function or procedures declared by the developer, that helps when applying the routines. Using methods in the applications allows to reuse your code throughout the application, optimizing the development experience.

Creating a new method

- Give the method a name and click Create. As in the image below.

PHP methods are incorporated into the same class, so it is not possible to use two functions with the same name even when used in different methods.

A screenshot of a dialog box titled 'New Method - PHP'. It has a text input field labeled 'Name' containing the text 'new_method'. Below the input field is a blue button labeled 'Create'.

- Methods can receive parameters.

A screenshot of a code editor showing a function definition. The function is named 'new_method' and contains the code 'echo "Hello World!!!";'. The editor has a toolbar with icons for function, search, and theme, and a 'Theme' dropdown menu set to 'default'.

- Add the amount of variables:

A screenshot of a dialog box titled 'Definition of the parameters of the method:'. It shows the method name 'new_method' and a list of parameters. The list is empty, with the text 'No defined parameter.' below it. At the bottom, there is an 'Add' button, a text input field containing '1', the text 'Parameter(s)', a 'Cancel' button, and a 'Save' button.

- Defining the variables:

A screenshot of a dialog box titled 'Insertion of Parameters'. It has a table with three columns: 'Name', 'Type', and 'Value Standard'. The 'Type' column has a dropdown menu open, showing three options: 'For Value', 'For Value', and 'For References'. Below the table are three buttons: 'Save', 'Back', and 'Cancel'.

Name	Type	Value Standard
	For Value	
	For Value	
	For References	

- **Name** : Type in the variable's name.

- **Type** : Selecting the type of variables: For Value or For Reference.
- **Value Standard** : The parameter's value used to initialize when calling the method.

References allows to create a second name for a variable that you can use to read and modify the variable's original information.

- Editing a parameter:

The screenshot shows a dialog box titled "Definition of the parameters of the method:". The main area contains the text "new_method". Below this is a "Parameters" list box containing "\$test = test". To the right of the list box are two circular arrows (up and down) for navigation. Below the list box are three icons: a checked checkbox, an unchecked checkbox, a pencil icon, and a red X icon. At the bottom of the dialog, there is an "Add" button, a text input field containing "1", the label "Parameter(s)", a "Cancel" button, and a "Save" button.

- : Checking all the parameters in the parameter list.
- : Uncheck all the parameters in the parameter list.
-  : Edit the selected parameter of the list.
-  : Deletes the selected variable of the list.

Creating a Grid/Report Application

New Application

The process of creating an application is quite simple and intuitive.

You only need to select the type of application you want to generate from the list of applications available in Scriptcase, and it will be generated automatically.

Application Data

GRID/REPORT

APPLICATION DATA EDIT FIELDS THEME

Connection * Name *

conn_example grid_dbo_orders

Table

dbo.orders

Fields

16 selected

Localization

Inherit project default language

Create also a Form to edit the Grid. Run application after creation

Form name for editing

form_dbo_orders

SQL Select Statement *

```
SELECT
orderid,
customerid,
employeeid,
orderdate,
requireddate,
shippeddate,
shipvia,
freight,
priceorder,
shipcountry,
```

SQL Builder

Connection

Defines the connection used for the creation of the application. The existing connections in the project will be listed.

Name

The name of the application being created. It cannot contain special characters.

Table

Defines the tables to be used in the application. (Form and Calendar can only use one table).

Fields

Defines the fields that will be part of the applications.

Localization

The language of the application to be created. The project's default language is automatically selected.

SQL

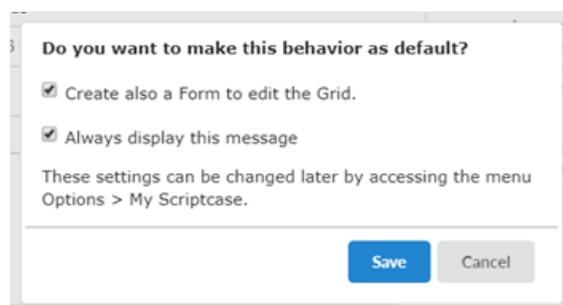

Displays the SELECT command generated after selecting the tables and fields. This field also allows the insertion of a previously created SQL statement, as long as it uses tables that exist in the database selected in the connection.

Create also a Form to edit the Grid

This option creates a form application linked to the grid, automatically establishing an edit link between the applications. For more details about the edit link, [click here](#).

This option is available only when the grid is created using a table.

When this option is selected, a dialog box will appear asking the developer to define the default behavior for creating future grid applications.

- **Create also a Form to edit the Grid** - Defines the default behavior for creating future grid applications.
- **Always display this message** - Determines whether this dialog box will always be displayed.

This configuration can be modified later by accessing the menu **Options > My Scriptcase**.

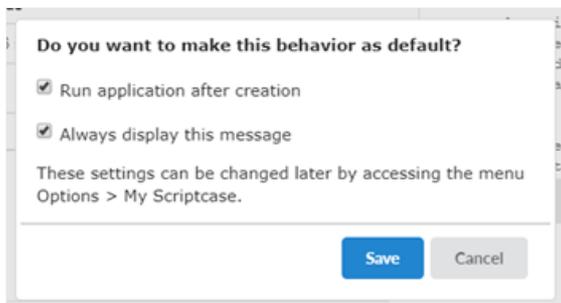

After confirming the default behavior, you will need to specify the name of the form to be created.

Run application after creation

This option defines whether the grid will be executed after it is created.

Run application after creation

When this option is selected, a dialog box will appear where the default behavior of Scriptcase for creating other grids in the project must be defined.

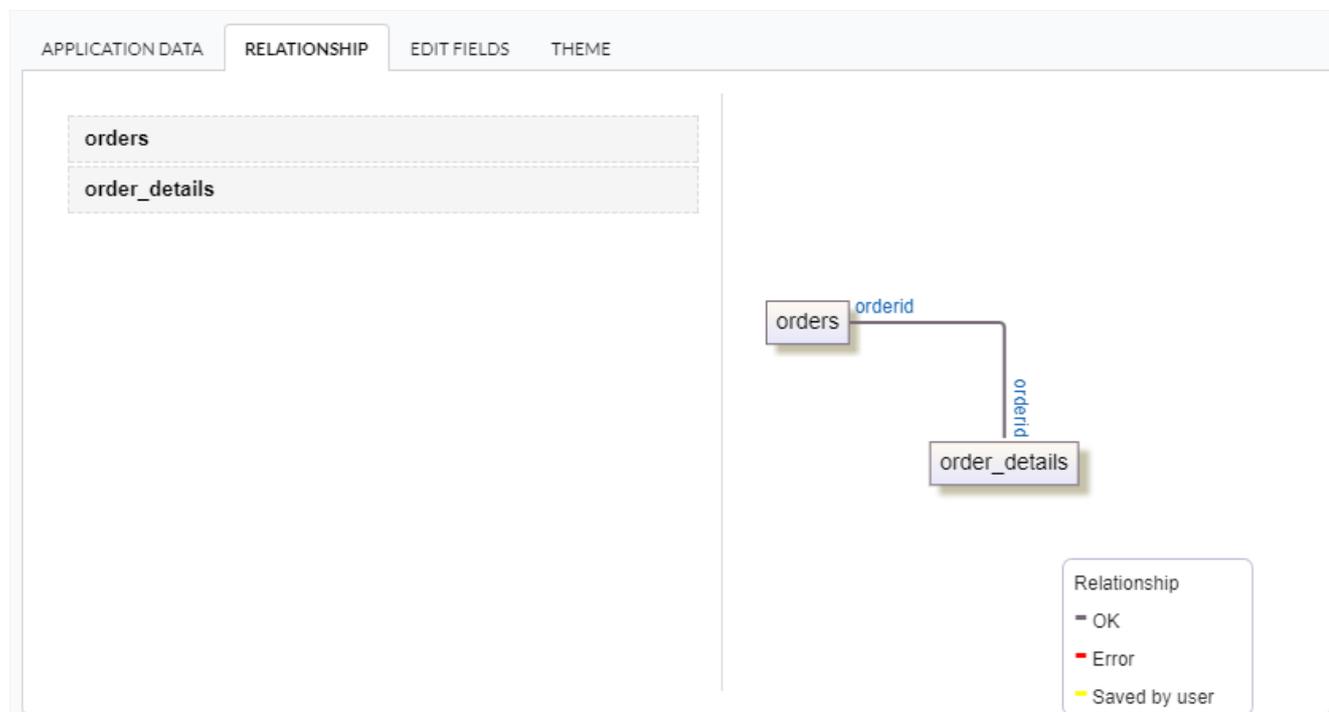

You can configure the grid to run by default by selecting the option **Run the application after creation** and clicking save.

If you deselect the option **Always show this message**, this dialog box will no longer appear.

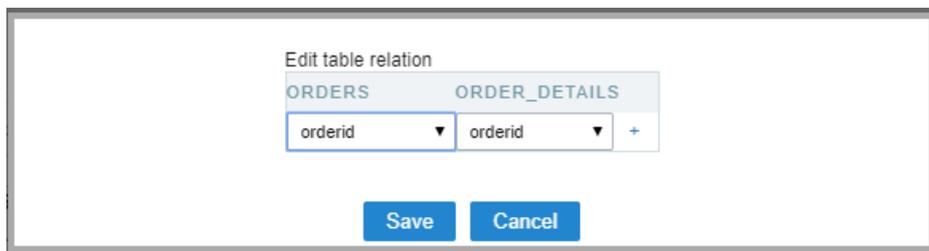

This configuration can be changed later by accessing the menu **Options > My Scriptcase**.

Relationship

When select two or more tables, the tab “Relationship” will be displayed. In this tab we can see the relationship created between the tables, where we can edit the related fields.

When we click in a link, in the screen above, it will displayed the related field's edition form, as you can see in the image below.

Editing Fields

This screen displays the fields of the selected tables and allows adjustments to be made before creating the application, such as changing the data type, display name, and other configurations.

Fields	Label	Datatype	Grid	Search
orderid	Orderid	Integer	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
customerid	Customerid	Text	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
employeeid	Employeeid	Integer	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
orderdate	Orderdate	Date	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
requireddate	Requireddate	Date	<input checked="" type="checkbox"/>	<input type="checkbox"/>
shippeddate	Shippeddate	Date	<input checked="" type="checkbox"/>	<input type="checkbox"/>
shipvia	Shipvia	Integer	<input type="checkbox"/>	<input type="checkbox"/>
freight	Freight	Currency	<input type="checkbox"/>	<input type="checkbox"/>
priceorder			<input type="checkbox"/>	<input type="checkbox"/>

Fields

Names of the database fields.

Label

Names of the fields in the generated application's interface.

Datatype

Specifies the field's data type.

Grid

Defines the fields available in the grid.

Search

Defines the fields available in the filter.

Theme

On this screen, you can select the theme that the application will use. The default project theme, which can be checked and modified in **Project > Properties**, is automatically selected.

The screenshot shows the 'THEME' configuration interface. On the left, a dropdown menu is set to 'Sc9_Rhino'. The main preview area displays a document layout with the following structure:

- Header**: A bar containing navigation icons (back, forward) and 'Add' and 'Save' buttons.
- Block 1.1**: A section containing a 'Title 1' label and an 'Object text' input field.
- Block 2.1**: A table with three columns: 'Title 1', 'Title 2', and 'Title 3'.

Title 1	Title 2	Title 3
11111111	22222222	33333333
11111111	22222222	33333333
- Footer**: A bar at the bottom of the page.

[Related Videos](#) ▷

Grid Mobile Optimization

The Mobile settings allows to define the automatic optimization of generated applications to run on mobile devices.

See below the available settings.

Mobile optimization

Mobile optimization	
ATTRIBUTE	VALUE
Enable mobile optimization	<input checked="" type="checkbox"/>
Enable scroll up button	<input checked="" type="checkbox"/>
Scroll up button position	Right ▾

Enable mobile optimization

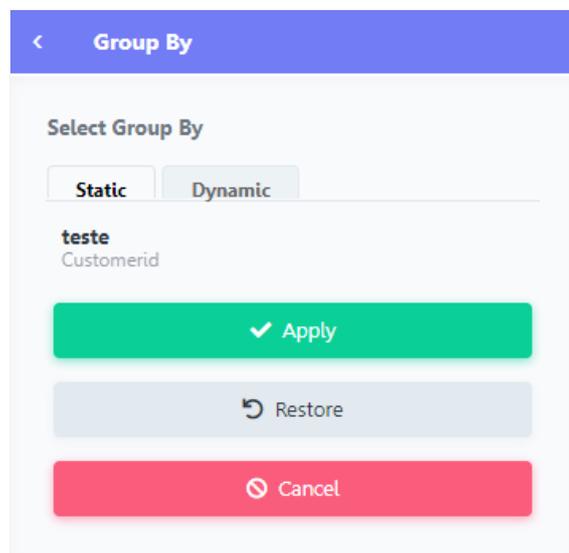

Mobile optimization	
ATTRIBUTE	VALUE
Enable mobile optimization	<input checked="" type="checkbox"/>
Enable scroll up button	<input checked="" type="checkbox"/>
Scroll up button position	Right ▾

This option changes how the application HTML elements works, adapting them automatically to run on mobile devices.

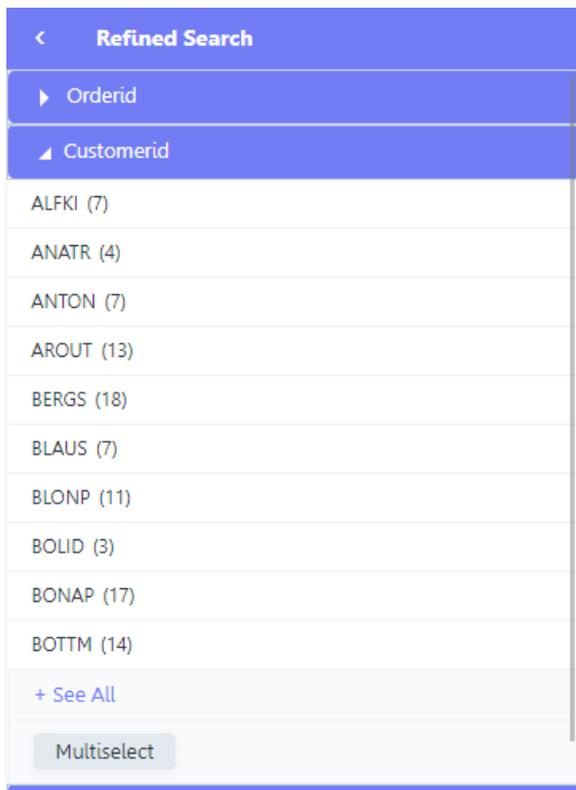

It enables this option by default when creating a new application.

See some examples of adapted screen:

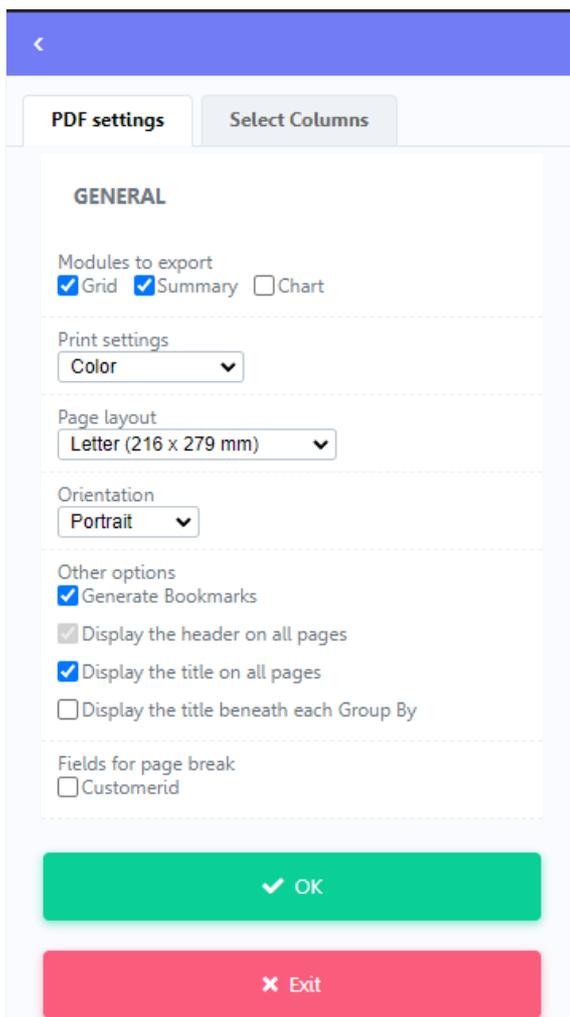

Group by Selection Screen

Refined Search Screen

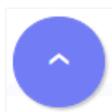

PDF Export Setup Screen

Enable back to top button

It enables the displaying of the button **back to top button** in the Grid, Filter, Detail and Summary modules.

It enables this option by default when creating a new application.

Back to top button position

Defines the position of the **back to the top** button:

The options are:

- **Right** - Position the button in the bottom right corner;
- **Left** - Position the button in the bottom left corner;

When creating a new application, the button is configured on the right by default.

See below for placement examples.

Button in the bottom right corner

Customerid => AROUT			
	Orderid ↕	Customerid ↕	Employee
...	10.355	AROUT	
...	10.383	AROUT	
[1 a 829 de 829]			

Button in the bottom left corner

Customerid => AROUT			
	Orderid ↕	Customerid ↕	Employee
...	10.355	AROUT	
...	10.383	AROUT	
[1 a 829 de 829]			

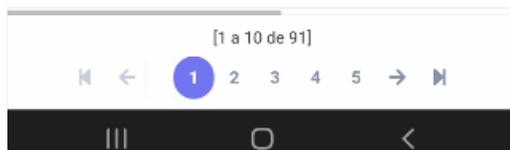

Simplified Toolbar

Defines the display format of the application's bottom toolbar, alternating between **simplified** when the option is enabled and **traditional** when these options are disabled.

To define the buttons that should compose your application's toolbar on mobile, access the **Toolbar** menu, then the **Mobile** tab.

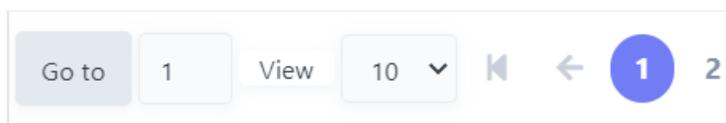

Activating it, the simplified toolbar is applied to the app by displaying only the navigation buttons and record counter as the image below.

Simple Toolbar Example

When disabling this option, the application will run with the traditional toolbar, allowing the use of the same button settings to run on the desktop or mobile devices.

Traditional Toolbar Example

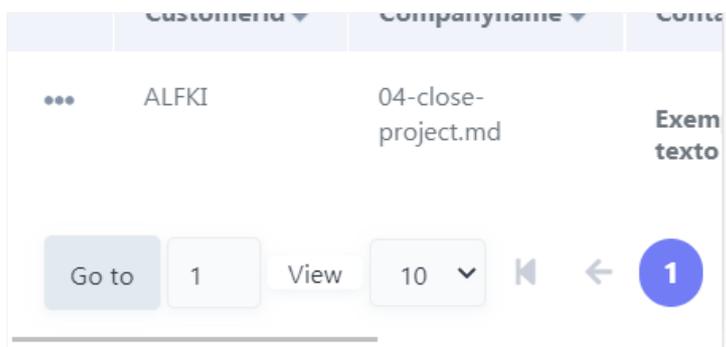

When choosing to use the traditional toolbar, the **Pin bottom toolbar** option will be enabled.

Pin the bottom toolbar

Defines the behavior of the lower toolbar when running the application on mobile devices with the **Simplified toolbar** option disabled.

When enabling these options, the lower toolbar will behave similarly to the upper toolbar, remaining fixed on the screen and thus facilitating access to the configured resources.

Example of fixed bottom toolbar

If you choose to uncheck this feature, the lower toolbar will be fixed at the end of the application, so access to the configured buttons will only be available when scrolling to the end of the page.

Example of Traditional Toolbar

▲ Contactname => Ann Devon			
	Customerid ↕	Companyname ↕	Conta
...	EASTC	Eastern Connection	Ann D

Go to	1	View	10 ▼	⏪	←	1
-------	---	------	------	---	---	---

This setting is available when the **Simplified Toolbar** options is turned off.

Overview

Action Bar

In the Action Bar menu, we can create new buttons (Ajax or Connection) in our grid, these will be positioned next to the records, as already occurs with the Detail buttons query detail button{:.icon} and Editing application button edit link in query{:.icon}.

This feature also allows you to change the ordering and positioning of all buttons on the action bar, including those automatically created by the tool.

The buttons created in the action bar are only available in the query module with **Horizontal** orientation.

Visual and Button settings

See in detail how to use the action bar.

- [Management and ordering](#) - Details of the initial screen of the **action bar** menu.
- [Link Button](#) - Details of creating and using the button.
- [Ajax Button](#) - See how to create and use the button.
- [Edit bar Visual](#) - General editing of action bar buttons display.

Action Bar Macros

Macro	Ajax Button	Link Button	Description
sc_actionbar_clicked_state	<input type="checkbox"/>	<input type="checkbox"/>	Returns the current state of the ajax button created in the action bar.
sc_actionbar_state	<input type="checkbox"/>	<input type="checkbox"/>	Changes the current state of the button to a new state.
sc_actionbar_disable	<input type="checkbox"/>	<input type="checkbox"/>	Disables action bar buttons.
sc_actionbar_enable	<input type="checkbox"/>	<input type="checkbox"/>	Enables action bar buttons, disabled by sc_actionbar_disable macro.
sc_actionbar_hide	<input type="checkbox"/>	<input type="checkbox"/>	Hides an action bar button.
sc_actionbar_show	<input type="checkbox"/>	<input type="checkbox"/>	Show action bar buttons, hidden by sc_actionbar_disable macro.

Links Relacionados

- [sc_actionbar_state](#)
- [sc_actionbar_clicked_state](#)
- [sc_actionbar_disable](#)
- [sc_actionbar_enable](#)
- [sc_actionbar_hide](#)
- [sc_actionbar_show](#)

Button List

On this screen, all the action buttons of the application will be listed.

Button ordering and placement

Both the ordering and the positioning of the action bar buttons will be carried out on this screen using dropdown. Just keep the left mouse button pressed over the desired button and position it in the desired location.

Buttons can only be positioned at the ends of the grid, either on the left side or on the right side.

You can also sort the **detail button** and the **application edit button**

.

Column of Actions

In this column we have some access links for the individual configuration of the buttons.

Configuration options by button type

Configuration link	Link button	Ajax button	Description
properties	<input type="text"/>	<input type="text"/>	Access the screen link properties from the link button.
Link	<input type="text"/>	<input type="text"/>	Screen of link configuration , allowing to redo the connection or to add some new parameter in the existing connection.
Ajax	<input type="text"/>	<input type="text"/>	Access the button ajax event created.
Visual	<input type="text"/>	<input type="text"/>	Access the screen button visual . In this screen we will have the individual configurations of the appearance of the buttons.
Delete	<input type="text"/>	<input type="text"/>	Deletes the button and all its settings. When deleting an Ajax button the event will also be deleted

Create New Button

Accesses the button creation screen, which can be of all types: [Link](#) and [Ajax](#)

Edit Bar Visual

This button opens the general editing screen for the visual of the action buttons. [Click here](#) for more details on editing the visual

Creating Link button

The **action button** of the *link type* allows you to create a link between the source application (grid) and any application in the project (destination application). This link will be activated in the onclick event of the button.

Source Application is used to identify the application where the link will be created. The Source application will have the call to the **Destination Application**, which refers to the application that will be called after activating the connection.

Example of the action button in the application

See below how to create and configure this type of button.

Creating a link button

on the screen of [list of buttons](#) click **Create New Button**.

Button data

Then, select the **Type** and inform the **name** of the button.

The **name** field only allows numbers, unaccented letters and underscores.

Button visual settings

On this screen you must define the appearance of the button for displaying in your application.

Check out the detailed view configuration options below.

Display type

This attribute defines the display format which can be: **FontAwesome**, **Button**, **Image** or **text**.

Some display options are displayed according to the **type of display** used.

The options are:

FontAwesome

This is the default value of the attribute. In this setting, the button will be shown only how a font awesome icon.

See a font awesome example

Button

In this configuration, the button will be shown as a standard Scriptcase button, inheriting the button theme used in your application.

After selecting this option, another option (**Button format**) will be displayed and you will have to define how the button label will be displayed. In this attribute you can choose between:

- **FontAwesome** - The button will only display with FontAwesome.
- **Text** - The button will only display with text.
- **Font Awesome and text** - The button will appear with FontAwesome and text, with the text positioned to the right.
- **Text and Font Awesome** - The button will appear with FontAwesome and text, with the text positioned to the left.

See a button example

Image

Using this option, you must upload or select an image in the Scriptcase image manager.

Example of action button as image

Text

Using this option, the action bar button will be display how a link.

Example of action button as Text

ID

This attribute defines the name to a button state.

No allowed the use langs or anytype variables in this attribute.

Font Awesome

Defines the font awesome that will be displayed in the button.

This option is displayed when selecting in the **Type of Display** attribute the values: *FontAwesome* or *Button*

Action button example as Font Awesome image

Image

Defines the image that will be displayed in the application when selecting **Type of display** as *image*.

Click on the icon to open the [image manager][link_gerenciodor_img] `{:target="_blank"}` and select the desired image.

Text

The **text** attribute define text that will be display how a link in the action bar.

This option is displayed when selecting in the **Type of Display** attribute the values: *Button* or *Text*

The text definition has no character restriction and can be done with a **fixed text** or using a **lang**, to create systems with multiple languages.

[See more details](#) about langs and about our [Data dictionary](#).

Color

Sets the color of the Font Awesome icon. Cif no value is informed, the icon assumes the color defined in the general configuration of the [action bar visual](#).

Displayed only when using **Type of display** as *FontAwesome*

Color (Hover)

Sets the color of the Font Awesome icon in hover state, when hovering the mouse over the icon.

Available when selecting **Display Type** as *FontAwesome*.

Color (Active)

Sets the color of the Font Awesome icon in the active state.

Available when selecting **Display Type** as *FontAwesome*.

Button Visual

This attribute defines the color of the button. You can select a color from the list or use the *Theme* option to inherit the button layout used in your application.

Only available when selecting **Display Type** as *Button*.

Button Visual (Hover)

This attribute sets the color of the button on button hover. You can select a color from the list or use the *Theme* option to inherit the button layout used in your application.

Only available when selecting **Display Type** as *Button*.

Hint

Defines the help text for the button.

The text definition has no character restriction and can be done with a **fixed text** or using a **lang**, to create systems with multiple languages.

[See more details](#) about langs and about our [Data dictionary](#).

Confirmation Message

The confirmation message is displayed after clicking the button and before that action is performed.

Confirmation Message example

The text definition has no character restriction and can be done with a **fixed text** or using a **lang**, to create systems with multiple languages.

[See more details](#) about langs and about our [Data dictionary](#).

After making the visual settings, click on **Save button and configure link**. The button settings will be saved and you will be redirected to the link creation screen to define the application and target application behavior.

Application List

All project applications available for the link will be listed. In this step, the developer must select the destination application that will be used in the connection.

Finding Applications

To assist in locating the application, you can use the **grouping buttons** or the **Search** field.

Search field

The search is performed by application name.

Grouping Buttons

In this grouping there are three visualization options:

All

Lists all applications in the project alphabetically **a-z**.

Example of applications without clustering

By folder

Lists applications grouped by their folder, according to the organization of applications in the [Explorer Project](#).

Example of applications grouped by Folder

- **Item 1** - List of folders created in [Explorer Project](#). Select the folder and all applications in the folder will be displayed on the **item 2**.
- **Item 2** - List of applications in the folder selected in the __Item 1__.

By type

Lists applications grouped by their respective type.

Example of applications grouped by type

Item 1 - Types of existing applications in Scriptcase. Select the type of application you want to list, the applications corresponding to the selected type will be listed in **item 2**. **Item 2** - List of applications referring to the type selected in **item 1**.

When selecting the destination application, click on **Next** ».

Parameters Definition

In this step, the developer must inform the values that will be passed to the parameters of the destination application.

These parameters can be:

- [Global Variables](#) - Which can be defined in the events or in the target application's SQL.
- Primary Key - For connections created with applications of the types: [Form](#) and [Calendar](#).

Parameters

Lists all parameters defined in the target application.

Type

Defines the source type of the value that will be sent to the parameter defined in the destination application.

The options are:

- **Fields** - It uses the value of a field from the source application as a parameter.
- **Variable** - It uses the value of a global variable, defined in the source application, as a parameter. **This option will only be listed if a global variable is defined in an event in the source application.**
- **Fixed value** - It uses a fixed value, defined in the value column, as a parameter. **In this option only alphanumeric values are allowed.**
- **No value** - Using this option no value is passed. When using this option as a parameter for a primary key, the target application will be displayed in include mode.

Value

Defines the value that will be sent as a parameter. The options in this column change according to the selected **Type**.

- When selecting **Campo** - The value column will list all the fields of the source application, which will send the value.
- When selecting **Variable** - All global variables defined in the source application will be listed.
- When selecting **Fixed value** - A field will be displayed for the value to be informed. The use of variables is not allowed in this option and we must use only alphanumeric values.
- When selecting **No Value** - In this case, no value will be sent to the parameter.

Refresh Button

This button enables ajax reloading of the list of parameters, in this way it is possible to change or add a parameter in the destination application without the need to restart the creation of the connection in progress.

Link Properties

These properties define the behavior of links, such as opening location and return URL.

Link operation mode

Defines how the target application will be displayed on the link. This attribute is also responsible for defining the available configurations according to the selected link operation mode. Check the Table below.

Open in the same window

The destination application will be displayed on the same screen as the source application. With this display option, the exit button of the destination application must have the behavior of returning to the previous application.

Open in another Window

The target application will open in a new browser window. With this display option, the target application's exit button should close the open window.

Open in another tab

The target application will open in a browser tab. With this display option, the exit button on the target application should close the open tab.

Open in Iframe

The destination application will be displayed in an iframe next to the source application.

open in parent

The target application will be displayed in the parent of the source application.

If used in a security module, this option displays the destination application on the same menu screen, overlapping the application and keeping the session logged in at login.

Modal

The target application will be displayed in a modal. With this display option, the exit button on the target application should close the open tab.

Link Properties attributes available according to selected Link Operation Mode

Link Attributes and Modes of Operation	Open in the same window	Open in another Window	Open in another tab	Open in Iframe	open in parent	Modal
Called application exit URL	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Closes the form after an update	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Close form after insertion	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Open the application in a tab within the menu	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Title for Tab	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Tab hint	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Active Tab Icon	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Inactive Tab Icon	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Width	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Height	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

Exit URL for the target application

This attribute defines to which page or other application of the project the target application of the link will return. This return can be triggered through the back button or through some behavior configuration performed in the link, for example, the **Closes the form after an update** option (This attribute is exclusive for links with forms).

It is possible to define an external URL, for example <https://scriptcase.net>, or a project application where it will be necessary to inform only the application name.

If no value is informed, the return will be to the source application itself. This option is only available when the Link Operation Mode is set to: Open in same Window or Open in parent.

Close form after update

This attribute defines the behavior of the form when performing a record update from a link.

When you check yes, the form opened in the connection will be closed automatically when updating the record. If the attribute is marked as **não**, the destination application will remain open after the update, allowing new registry changes to be made.

This attribute is available only when the target application is a **form**.

Close form after insert

![[Define se o formulário chamado será fechado após realizar inserção de algum registro]][img_att_fechar_no_insert]

This attribute defines the behavior of the form when inserting a record from a connection.

When you check yes, the form opened in the connection will be closed automatically when inserting a record. If the attribute is marked as **not**, the target application will remain open after inserting records, thus allowing new records to be inserted. [img_att_fechar_no_insert]:
/assets/images/docs/app/comum/ligacao/geral/atributos_propriedade/att_fechar_no_insert.png

This attribute is available only when the target application is a **form**.

Open the application in tab within the menu
