- **GET:** Defines that the variable must be passed by the URL, that is, visible by the browser.
- **POST:** Defines that the variable must be passed through the POST method of an HTML form.

Settings

- **Optional:** Check it to don't validate the variable at runtime.

Type (In / Out)

Defines whether the variable comes from another application (In), or it is starting in the current app (Out).

Description

Indicates where the application is using the variable.

Search Application Links Overview

This feature allows the developer to create links between applications of the same project, expanding the integration of applications. All link options are grouped under the Application Links menu.

Application Links

In the first access to the menu, we can see the list of existing connections in the application.

If the application does not have a configured link, the application list screen will be displayed with the message: **This application does not have any link. Click here to create one now.**

ID

Link identification ID.

Type

The type of link created, some links such as Edit Link allow only one link per application. In this case, the developer will be able to check the connection types that already exist in the application

Target Application

This info show the target application name.

Actions

This column has edit options for the links.

Properties

It allows accessing the binding properties where it is possible to configure the binding behavior.

Link

Displays the links screen, where it is possible to configure the link that was made with the application informed in the target application column. In this option it is possible to change the parameter passed in the connection as well as the target application.

Delete

Permanently deletes the connection in the applications.

Through the option [Restore Applications](#), it is possible to get a previous version of the application, making it possible to recover the link deleted.

Links Type

The Calendar application has the following links options

- [Application Link](#) - Allows you to link a control with any project application.
- [Capture Link](#): It allows the creation of links from the filter fields of the Grid application, in order to enable the recovery of the value to fill in the field, with another Grid application of the project.

Calendar Applications Link Types x Target Application available to link

Check the links types of the Calendar application and the target applications available for each link types.

Only **Capture link** have some restrictions in the target application use, allowing only to use of Grid

application.

Application Link Capture Link

<u>Grid</u>	<input type="text"/>	<input type="text"/>

Blank	<input type="text"/>	<input type="text"/>
<u>Calendar</u>	<input type="text"/>	<input type="text"/>

Application Link

Creating an Application Link

This type of link allows the developer to create a link from a grid to a form with the objective of editing the register of a grid's row.

In the link options, we will choose the **Application Link**. When we choose this option, edit a register from a Grid will be possible.

Applications list

After we select this option, will be displayed the applications list to what you want to create the link.

This screen can be viewed from the following ways:

All:

In which is possible to see all the project's applications. **Example:**

By folder:

In which is possible to see the applications according to the folders in which each of them are.

By type:

In which is possible to see the applications grouped by its respective types.

Definition of Parameters

In this setting we are going to define the type of parameter that will be passed to the next application.

We have two options at **Type of Parameters**, they are:

Fixed value:

This option allows the user to define a fixed value that will be used to the call of the next application.

No value:

This option allows to create the link without the need to send any parameter to the next application.

It is also possible to see a refresh button at its right side.

This button should be used when a new parameter is added to the target application, so the new parameter can be loaded in the current application to make the link.

Link properties

In this screen we will set the application display mode that will be called in the link.

There are five display options, they are:

Open in the same window:

When we use this option the target application will be displayed in the same window of the application, and the target application will have a back button so we can return to the previous application.

Open in another window:

When we use this option the target application will be displayed in other browser window, and the target application will have a exit button so we can close this window.

Open in an iframe:

When we use this option the target application will be displayed in the same window of our application, however it will be displayed in a iframe in one of the four options available in the iframe settings.

Open in a parent:

When we use this option the target application will be displayed in the same window of our application, and the target application will have a back button so we can return to the previous application.

Modal:

When we use this option the target application will be displayed in the same window of our application, however it will be displayed in a small window above the current application.

Display the button new in the grid:

When we select the option **Yes**, the button **New** is created in the grid to insert new registers.

Also, when we select the option **Yes**, it is displayed two new options **Label to the New button** and **Hint to the New button**:

Label to the New button:

In this option we will inform a name for the button that will be displayed in the Grid.

Hint to the New button:

In this option we will inform a message that will be displayed when the mouse cursor is over the **New** button.

Shortcut key to the New button:

Indicates the shortcut key to the button add new register.

Display the button New in the grid:

When we select the option **Yes**, the button **New** is created in the grid to insert new registers.

Shortcut key to the New button:

Indicates the shortcut key to the button add New Register.

Label to the New button:

In this option we will inform a name for the button that will be displayed in the Grid.

Hint to the New button:

In this option we will inform a message that will be displayed when the mouse cursor is over the **New** button.

Open in an iframe.

When we use this option the target application will be displayed in the same window of our application, and

the target application will have a back button so we can return to the previous application.

When we select this option, we can set the following options:

Shortcut key to the New button:

Indicates the shortcut key to the button add New Register.

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Iframe properties

In this settings, we can define some iframe details that will display the target application.

Display the target application's header:

When the option **Yes** is selected, the header of the target application is also displayed in the iframe.

Iframe position in relation to the main application:

In this option, we will define in which position in relation to the main application the iframe will be displayed, there are four options:

Below: The iframe will be displayed below the main application.

Above: The iframe will be displayed above the main application.

Right: The iframe will be displayed on the right of the main application.

Left: The iframe will be displayed on the left the main application.

Action after an insert:

In this option, we will define what will happen after a register insert, there are two options:

Reload the grid: The current page will be refreshed after the insert.

Move to the end of the grid: After the insert will be displayed the last page of the grid will the last register inserted.

Iframe height:

Allows to set the iframe height.

Iframe width:

Allows to set the iframe width.

Display the button New in the grid:

When we select the option **Yes**, the button **New** is created in the grid to insert new registers.

Shortcut key to the New button:

Indicates the shortcut key to the button add New Register.

Label to the New button:

In this option we will inform a name for the button that will be displayed in the Grid.

Hint to the New button:

In this option we will inform a message that will be displayed when the mouse cursor is over the **New** button.

Form Properties

In those settings, we can define which buttons will be available in the target form application. Initially we have five options, that are:

Enable Insert button:

In this option we can define if the **New** button will be available in the target application.

Enable Update button:

In this option we can define if the **Save** button will be available in the target application.

Enable Delete button:

In this option we can define if the **Delete** button will be available in the target application.

Enable Navigation buttons:

In this option we can define if the buttons **first, previous, next and last** will be available in the target application.

Enable register editing button in the grid:

In this option we can define if the edit register button, which is the **pencil** in the grid, will be available.

Capture Link

Creating a Capture Link

The capture link is used to return a value from a **Grid** to a **Form** field.

In the types of links options, we will choose the **Capture Link**. After selection this option, we should also choose which field we want to return the value of.

Applications list

After we select this option, will be displayed the applications list to what you want to create the link.

This screen can be viewed from the following ways:

All:

In which is possible to see all the project's applications. **Example:**

By folder:

In which is possible to see the applications according to the folders in which each of them are.

By type:

In which is possible to see the applications grouped by its respective types.

Definition of Parameters

In this setting we are going to define the type of parameter that will be passed to the next application.

We have two options at **Type of Parameters**, they are:

Fixed value:

This option allows the user to define a fixed value that will be used to the call of the next application.

No value:

This option allows to create the link without the need to send any parameter to the next application.

It is also possible to see a refresh button at its right side.

This button should be used when a new parameter is added to the target application, so the new parameter can be loaded in the current application to make the link.

Application with no parameters

However, when the target application does not have any defined parameters, the following screen is displayed:

Clicking in the button, you will be taken to the target application to create a parameter, so you can use the update button in the **parameters definitions** to refresh them.

Link properties

In this screen we will set the application display mode that will be called in the link.

In this type of link there is only one display option:

Modal:

When we use this option the target application will be displayed in the same window of our application, however it will be displayed in a small window above the current application.

Modal

When we use this option the target application will be displayed in the same window of the application, however she will be displayed in a small window above the current application.

When we select this option, we can set the following options:

Modal:

In this option we are going to define if the target application will be opened in a Modal.

Yes: This option will make the target application be opened in a modal. **No:** This option will make the target application be opened in a new window.

If **Yes** is selected in the previous option, the Modal **Height** and **Width** will be available.

![Modal with yes][modal2]

Height:

Allows to set the Modal height.

Width:

Allows to set the Modal width.

If **No** is selected in the previous option, only those options will be available.

Allows to modify manually in the update:

When we select the option **Yes**, the button **New** is created in the grid to insert new registers.

Allows to modify manually in the insert:

Indicates which shortcut key to the button add new register.

Allows to modify automatically in the update:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Allows to modify automatically in the insert:

Choosing the option **Yes**, the window will be closed after doing the insert of a register.

Search Application Button link Settings

Creating a Button Link

Allows the developer to create a link where the call to the other application will be done through a button.

In the type of links options, we will choose the **Button Link**. Choosing this option it will be possible to create a link to any other application.

List of applications

After selecting this option, The list of applications to what you want to create a link will be displayed.

This screen can be viewed in the following ways:

All:

In which is possible to see all the project's applications. **Example:**

By folder:

In which is possible to see the applications according to the folders in which each of them are.

By type:

In which is possible to see the applications grouped by its respective types.

Definition of Parameters

In this setting we are going to define the type of parameter that will be passed to the next application.

We have two options at **Type of Parameters**, they are:

Fixed value:

This option allows the user to define a fixed value that will be used to the call of the next application.

No value:

This option allows to create the link without the need to send any parameter to the next application.

It is also possible to see a refresh button at its right side.

This button should be used when a new parameter is added to the target application, so the new parameter can be loaded in the current application to make the link.

Link properties

In this screen we will set the application display mode that will be called in the link.

There are five display options, they are:

Open in the same window:

When we use this option the target application will be displayed in the same window of the application, and the target application will have a back button so we can return to the previous application.

Open in another window:

When we use this option the target application will be displayed in other browser window, and the target application will have a exit button so we can close this window.

Modal:

When we use this option the target application will be displayed in the same window of our application, however it will be displayed in a small window above the current application.

Open in the same window

When we use this option the target application will be displayed in the same window of the application, and the target application will have a back button so we can return to the previous application.

When we select this option, we can set the following options:

![Same window][mesma_janela]

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Open in another window

When we use this option the target application will be displayed in another browser window.

When we select this option, we can set the following options:

![Another window][outra_janela]

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Close the form after an update:

Choosing the option **Yes**, the window will be closed after doing the update of a register.

Close the form after an insert:

Choosing the option **Yes**, the window will be closed after doing the insert of a register.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Open the application in a tab inside the menu:

Choosing the option **Yes**, the application will be open in a **menu tab**, when executed from a menu application, instead of opened in another browser window.

Choosing the option **Yes**, there are also some other settings to be displayed:

![Other window yes][outra_janela1]

Title to the tab:

This option allows the developer to set a title to the tab that will be opened when used in a Menu application.

Hint to the tab:

This option allows the developer to set a message to be displayed when the mouse cursor is over the tab Menu.

Active tab icon:

This option allows the developer to set an icon to be displayed in the tab when used in a menu application.

Modal

When we use this option the target application will be displayed in the same window of the application, however she will be displayed in a small window above the current application.

When we select this option, we can set the following options:

![Modal][modal]

Height:

Allows to set the Modal's height.

Width:

Allows to set the Modal's width.

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Close the form after an update:

Choosing the option **Yes**, the window will be closed after doing the update of a register.

Close the form after an insert:

Choosing the option **Yes**, the window will be closed after doing the insert of a register.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Search Application Programming

ScriptCase has incorporated the concept of Object Oriented programming, using attributes, resources, methods and libraries. It is possible to create your own business rules in applications, and by using these concepts you can reap huge rewards in terms of better organization and improved development.

Attributes

The attributes are variables that has the global scope declared in the application. An attribute that can be referenced in all the methods and the application's events.

The screenshot shows a web interface titled 'ATTRIBUTES SETTINGS'. It features a table with two columns: 'ATTRIBUTE' and 'VALUE'. Below the table, there is a section labeled 'Attributes' containing an input field for 'Attribute Name'. To the right of the input field are four blue buttons: 'Include', 'Update', 'Delete', and 'Clean'. A vertical scrollbar is visible to the right of the buttons.

Attributes configuration Interface.

Attribute Name : This field allows to inform the attributes name, after typing the name just click on **include**. In case you want to **update** click on the attributes name (located on the buttons' right side), do the necessary modifications and click on update. In case it is necessary to **delete** an attribute, it is necessary to do same process as the update, but when selecting the attribute, it is necessary to click on the delete button. The **clear** button, as the name suggests, it clears the list of all the attributes listed on the right.

Internal libraries

To use the internal libraries just select the correspondent (Project Libraries for example). This process allows the methods existing in the library, to be visible in all the application's Events and Methods.

See how to manage the libraries by [clicking here](#).

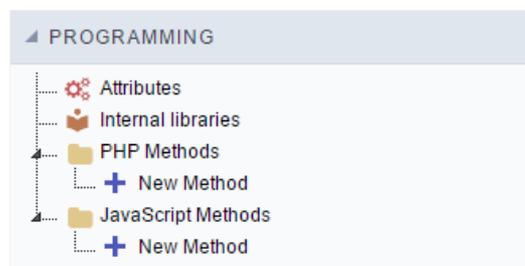

The screenshot displays a list of internal libraries under the heading 'INTERNAL LIBRARIES - SCRIPTCASE'. The first entry is 'sc_ssn.php' with a checkbox. Below it are sections for 'INTERNAL LIBRARIES - PUBLIC', 'INTERNAL LIBRARIES - PROJECT: PROJECT1', and 'INTERNAL LIBRARIES - USER: ADMIN', each followed by the text 'No library found for this session.'

Internal Libraries management Interface

PHP Methods

Methods are function or procedures declared by the developer, that helps when applying the routines. Using methods in the applications allows to reuse your code throughout the application, optimizing the development experience.

Creating a new method

- Give the method a name and click Create. As in the image below.

PHP methods are incorporated into the same class, so it is not possible to use two functions with the same name even when used in different methods.

A dialog box titled 'New Method - PHP'. It has a text input field for 'Name' containing 'new_method' and a blue 'Create' button below it.

- Methods can receive parameters.

- Add the amount of variables:

A dialog box titled 'Definition of the parameters of the method:'. It shows the method name 'new_method' and a list with one item: '• No defined parameter.'. At the bottom, there is an 'Add' button, a text input field containing '1', the text 'Parameter(s)', and a 'Cancel' button. A 'Save' button is centered below the dialog.

- Defining the variables:

A dialog box titled 'Insertion of Parameters'. It contains a table with three columns: 'Name', 'Type', and 'Value Standard'. The 'Type' column has a dropdown menu open, showing 'For Value' (selected) and 'For References'. Below the table are 'Save', 'Back', and 'Cancel' buttons.

Name	Type	Value Standard
	For Value	

- **Name** : Type in the variable's name.
- **Type** : Selecting the type of variables: For Value or For Reference.

- **Value Standard** : The parameter's value used to initialize when calling the method.

References allows to create a second name for a variable that you can use to read and modify the variable's original information.

- Editing a parameter:

Definition of the parameters of the method:

new_method

Parameters
\$test = test

Add 1 Parameter(s) Cancel

Save

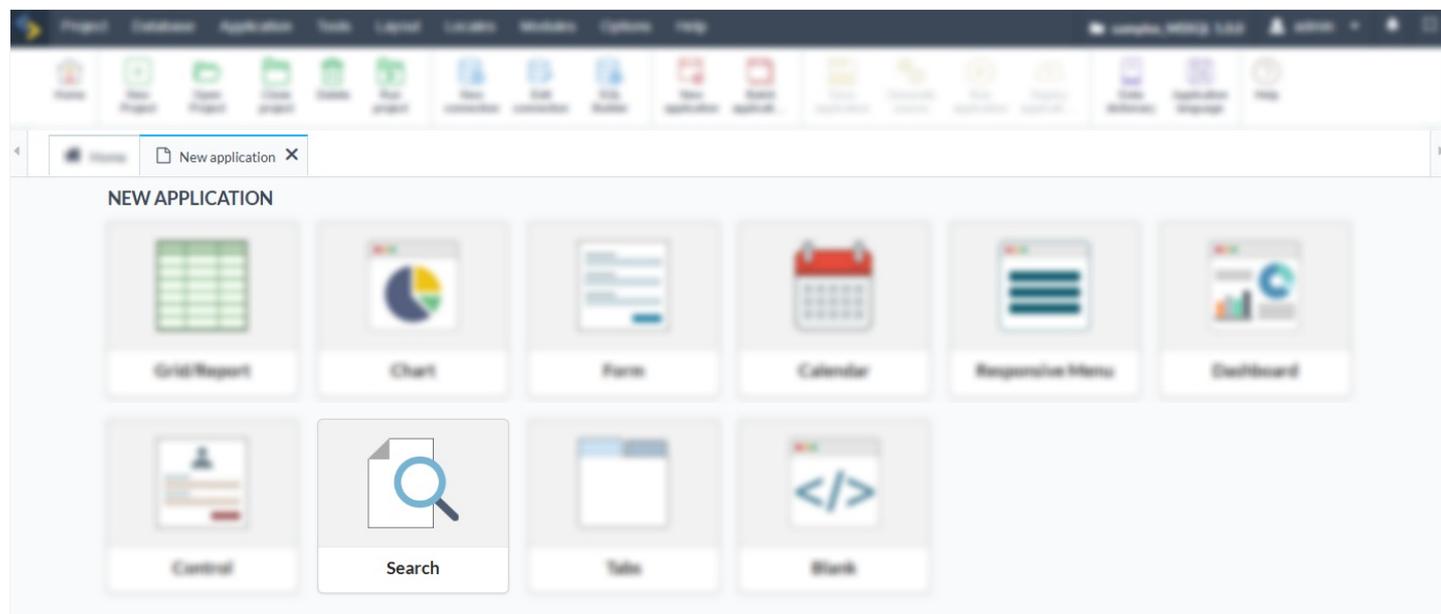

- : Checking all the parameters in the parameter list.
- : Uncheck all the parameters in the parameter list.
-  : Edit the selected parameter of the list.
-  : Deletes the selected variable of the list.

Creating a Search Application

New Application

The process of creating an application is quite simple and intuitive.

You only need to select the type of application you want to generate from the list of applications available in Scriptcase, and it will be generated automatically.

Application Data

SEARCH

APPLICATION DATA EDIT FIELDS THEME

Connection * Name *

conn_example search_dbo_orders

Table

dbo.orders

Fields

16 selected

Localization

Inherit project default language

SQL Select Statement *

```
SELECT
orderid,
customerid,
employeeid,
orderdate,
requireddate,
shippeddate,
shipvia,
freight,
priceorder,
shipcountry,
```

SQL Builder

Connection

Defines the connection used for the creation of the application. The existing connections in the project will be listed.

Name

The name of the application being created. It cannot contain special characters.

Table

Defines the tables to be used in the application. (Form and Calendar can only use one table).

Fields

Defines the fields that will be part of the applications.

Localization

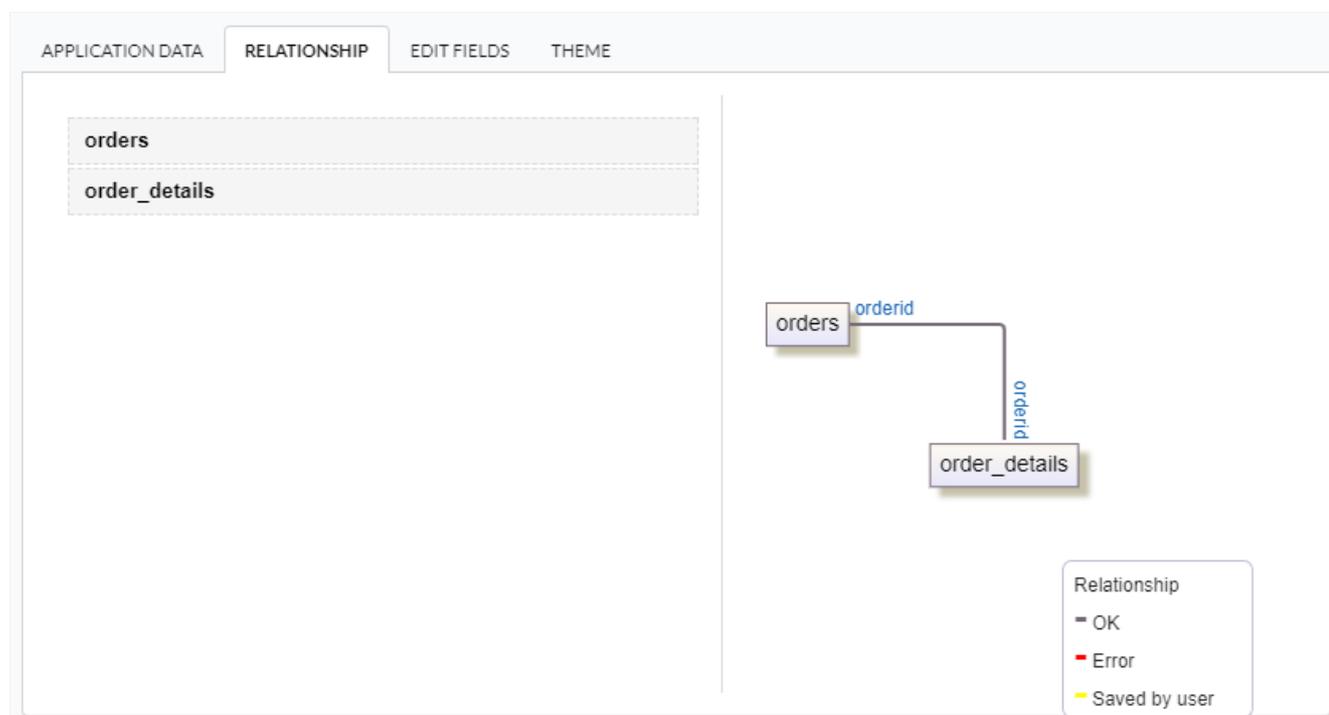

The language of the application to be created. The project's default language is automatically selected.

SQL

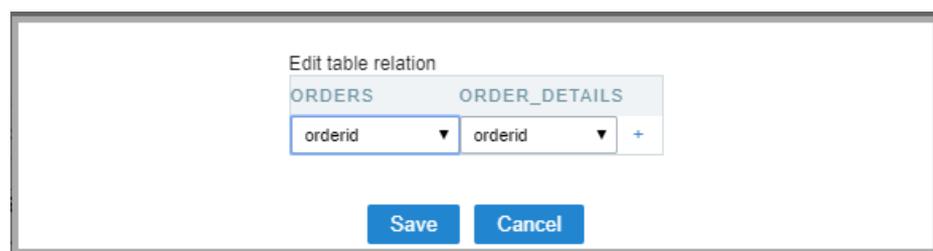

Displays the SELECT command generated after selecting the tables and fields. This field also allows the insertion of a previously created SQL statement, as long as it uses tables that exist in the database selected in the connection.

Relationship

When select two or more tables, the tab "Relationship" will be displayed. In this tab we can see the relationship created between the tables, where we can edit the related fields.

When we click in a link, in the screen above, it will displayed the related field's edition form, as you can see in the image below.

Edit Fields

This screen displays the fields of the selected tables and allows adjustments to be made before creating the application, such as changing the data type, display name, and other configurations.

SEARCH

APPLICATION DATA EDIT FIELDS THEME

Fields	Label	Datatype	Search
orderid	<input type="text" value="Orderid"/>	<input type="text" value="Integer"/>	<input checked="" type="checkbox"/>
customerid	<input type="text" value="Customerid"/>	<input type="text" value="Text"/>	<input checked="" type="checkbox"/>
employeed	<input type="text" value="Employeeid"/>	<input type="text" value="Integer"/>	<input checked="" type="checkbox"/>
orderdate	<input type="text" value="Orderdate"/>	<input type="text" value="Date"/>	<input checked="" type="checkbox"/>
requireddate	<input type="text" value="Requireddate"/>	<input type="text" value="Date"/>	<input type="checkbox"/>

Search Application Mobile Optimization

The Mobile settings allows to define the automatic optimization of generated applications to run on mobile devices.

See below the available settings.

Enable mobile optimization

Mobile optimization	
ATTRIBUTE	VALUE
Enable mobile optimization	<input checked="" type="checkbox"/>
Enable scroll up button	<input checked="" type="checkbox"/>
Scroll up button position	Right ▾

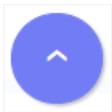

This option changes how the application HTML elements works, adapting them automatically to run on mobile devices.

It enables this option by default when creating a new application.

See some examples of adapted screen:

Enable back to top button

It enables the displaying of the button **back to top button** in the Grid, Filter, Detail and Summary modules.

It enables this option by default when creating a new application.

Back to top button position

Defines the position of the **back to the top** button:

The options are:

- **Right** - Position the button in the bottom right corner;
- **Left** - Position the button in the bottom left corner;

When creating a new application, the button is configured on the right by default.

See below for placement examples.

Button in the bottom right corner

Customerid => AROUT			
	Orderid	Customerid	Employee
...	10.355	AROUT	
...	10.383	AROUT	
[1 a 829 de 829]			

Button in the bottom left corner

Customerid => AROUT			
	Orderid	Customerid	Employee
...	10.355	AROUT	
...	10.383	AROUT	
[1 a 829 de 829]			

Pin the bottom toolbar

Defines the behavior of the lower toolbar when running the application on mobile devices with the **Simplified toolbar** option disabled.

When enabling these options, the lower toolbar will behave similarly to the upper toolbar, remaining fixed on the screen and thus facilitating access to the configured resources.

Example of fixed bottom toolbar

Customerid	Companyname	Contact
ALFKI	04-close-project.md	Exem texto

Go to 1 View 10

If you choose to uncheck this feature, the lower toolbar will be fixed at the end of the application, so access to the configured buttons will only be available when scrolling to the end of the page.

Example of Traditional Toolbar

▲ Contactname => Ann Devon			
	Customerid ↕	Companyname ↕	Contact
...	EASTC	Eastern Connection	Ann D

Go to View ⌵ ⏪ ⏩ 1

This setting is available when the **Simplified Toolbar** options is turned off.

PDF Report Settings

PDF Report Settings

PDF REPORT SETTINGS	
ATTRIBUTE	VALUE
PDF Orientation	Portrait ▼
Type	Records per Page ▼
Friendly URL	<input type="text"/>
PDF measure unit	Millimeters ▼
PDF Format	Letter (216 x 279 mm) ▼
PDF Destination	Browser ▼
Automatic page break	<input checked="" type="checkbox"/>
Upper Margin	<input type="text"/>
Bottom Margin	<input type="text"/>
Right Margin	<input type="text"/>
Left Margin	<input type="text"/>
Search Create	<input type="checkbox"/>
Page Amount	<input type="text" value="1"/>
Amount of Columns	<input type="text" value="1"/>
Columns Width	<input type="text" value="0"/>
Columns Height	<input type="text" value="0"/>

PDF Report Settings Interface.

• Attributes

- **PDF Orientation** : Using this option you can set whether to print the PDF in portrait or landscape orientation.
- **Type** : PDF type
 - **Records per Page** : Only applicable to Grids aligned horizontally, which allows you to set the number of records that will be printed per page.
 - **Records per Line** : Allows you to set the records that will be printed per page in the pdf.
- **Friendly URL** : This field allows you to change the URL that will be called by the application. Allowed characters are the same available on URLs: a-z, A-Z, 0-9, -_. This option can also be changed on the home screen, on the “Friendly URL” column at the applications list.
- **PDF measure unit** : Using this option you can define the unit of measurement of the position of objects in the PDF. Used in printing format, it can be: points, millimeters, centimeters and counts.
- **PDF Format** : Using this option you can select the Form type in which the PDF will be printed (letter, A4, etc).
- **PDF Destination** : Using this option you can set where the PDF will be sent to the Browser, Download or server.
 - **Browser** : If you use this option the PDF will open within the browser.
 - **Download** : The PDF will open for download. you must inform the name of the file to be generated. E.g.: file.pdf
 - **Server** : The PDF will be sent to the server. It is necessary to inform the path of the file to be generated. E.g.: c:\folder\file.pdf
- **Automatic page break**: Use automatic page break on pages.

- **Margins** : Allows you to view the application on the page according to the values reported in the margins (right, left, top and bottom) in millimeters.
- **Search Creation** : Using this option you can set the PDF startup mode by the Search. So the initial mode will be a Search application.
- **Page Amount** : Allows you to set the number of pages that will be printed in the PDF.
- **Amount of Columns** : Allows you to set the number of columns that are printed, what allows you to create applications for issuing of labels printing for example.
- **Columns Width** : Allows you to set the width of the columns in the application.
- **Columns Height** : Allows you to set the height of the columns in the application.

Font and Background

Configuring the PDF Preview allows you to set values of text and layout preview.

Font and Background	
ATTRIBUTE	VALUE
Text Font	<input type="text"/>
Text Font Size	<input type="text" value="12"/>
Font Color	<input type="text" value="#000000"/> 
Text Font Style	<input type="checkbox"/> Bold <input type="checkbox"/> <i>Italic</i> <input type="checkbox"/> <u>Underline</u>
Show Ruler	<input type="checkbox"/>
Image	<input type="text"/> 
Width	<input type="text" value="0"/>
Height	<input type="text" value="0"/>
X Position	<input type="text" value="0.000000"/>
Y Position	<input type="text" value="0.000000"/>
To print	<input checked="" type="checkbox"/>

PDF Report visualization interface settings.

- **Text Font** : Here you can choose the font family to be used initially by the Report PDF.
- **Text Font Size** : Here you can choose the font size .
- **Font Color** : Here you can choose the font color .
- **Text Font Style** : Allows you to choose the style of the text, if this will be bold, italic, or underlined, or any other combination.
- **Show Ruler** : Sets whether the PDF printing displays ruler at the edges of the pages.
- **Image** : Allows you to insert a background image on the page. This image will be also printed, it can be a watermark for your document for example.
- **Width** :Sets the image width, in pixels, to be inserted into the page.
- **Height** :Sets the image height, in pixels, to be inserted into the page.
- **X Position** : Sets the abscissa of the initial image position.
- **Y Position** : Sets the ordinate of the initial image position.
- **Print** : This option sets whether the image will be printed on the application.

PDF Report SQL Settings

SQL Settings

This interface allows configuring the related database settings, such as the SQL statement, the used database connection, case sensitive, and others.

ATTRIBUTE	VALUE	DESCRIPTION
SQL Select Statement	<pre>SELECT customerid, companyname, contactname, contacttitle, birthdate, country, regionid, stateid, city,</pre>	
Limit	<input type="text"/>	It sets the number of records to be retrieved from the SQL statement.
SQL Preparation	<input type="text"/>	
Connection	<input type="text" value="conn_example"/>	Connection name to access the database.
Use Customized Message	<input type="checkbox"/>	Use a customized error message when the application has no records.
No Records Message	<input type="text"/>	When the application has no records, it will display this customized text.
Font	<input type="text" value="Aa"/>	Font face of the error message.
Font Size	<input type="text" value="12"/>	Font size of the error message.
Font Color	<input type="text" value="#000000"/>	Font color of the error message.
Variable for Table	<input type="text"/>	Variable name used for replacing the table name. Please indicate the name of the table that will be replaced by the variable value.
Fields Variables	<div style="border: 1px solid black; padding: 5px;"> <p>Variable</p> <input type="text"/> <p>customerid</p> </div>	Variables for substitution of the field names on the application. For each dynamically determined field, inform the name of the variable and the field that will be substituted.
Case Sensitive	<input checked="" type="checkbox"/>	Use case sensitive.

Grid

SQL configuration

SQL Select Statement

It allows you to define the primary SQL of the application. You can edit this SQL to add or delete fields.

Limit

Lets you limit the display in the number of records retrieved by SQL query.

SQL Preparation

You can enter SQL commands or procedure names to execute them before the primary SQL of the application.

Connection

It allows defining the database connection of the application. You can change the connection to another one that has the same table.

Use Customized Message

Lets you define to display the “no records” message or not.

No Records Message

Lets you set the message when the application has no records.

Font

This option is available when using the “Use Customized Message” option. It lets you set the font for the message.

Font Size

This option is available when using the “Use Customized Message” option. It lets you to set the font size.

Font Color

This option is available when using the “Use Customized Message” option. It lets you to set the font color.

Variable for Table

It allows to use a variable to change a part of the string containing the table name.

Fill the first input with the name of the variable (replace to). The second input you should fill with the part of the name of the table you want to replace (replace from).

Fields Variables

It allows to use a variable to change a part of the string containing the field name.

Fill the first input with the name of the variable (replace to). The second input you should fill with the part of the name of the field you want to replace (replace from).

Case sensitive

It defines if the database connection uses case sensitive or not.

Security

Security	
ATTRIBUTE	VALUE
Use Security	<input checked="" type="checkbox"/>
Url output of the security	<input type="text" value="app_login"/>
Use Password	<input checked="" type="checkbox"/> <input type="text" value="password"/>
Request password just once	<input checked="" type="checkbox"/>
Enable direct call by URL	<input checked="" type="checkbox"/>
Enable CSRF	<input checked="" type="checkbox"/>

Use security

With this option enabled, when accessing the application, an “unauthorized user” message will be displayed, preventing access

to the application.

When enabled, application access is only possible through the macro `sc_apl_status` or through **security module**.

[Click here](#) to access the macro documentation `sc_apl_status`.

In the development environment, the use of the above options for testing purposes may be suppressed, preventing the password being requested or access being blocked at each execution of the applications. To do this, disable the options “Enable security usage” and “Enable password usage” in the menu **Configuration > My Scriptcase**.

Security exit url

Defines which application the user will be redirected to after the “unauthorized user” warning.

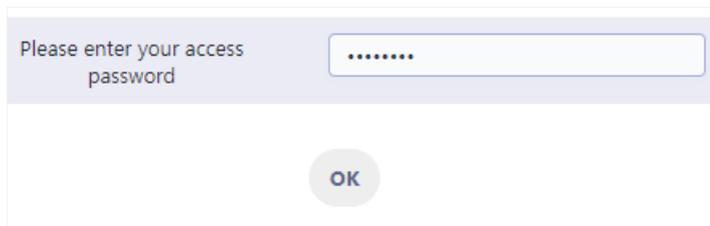

Url output of the security	<input type="text" value="app_login"/>
----------------------------	--

Use password

When enabling the option, you will be asked to define a password for accessing the application.

Use Password	<input checked="" type="checkbox"/> <input type="text" value="password"/>
--------------	---

When running the application using the active password, you will be asked for the password before accessing the application.

Please enter your access password

OK

The password will be requested regardless of the “use security” setting or the use of the security module.

Request password only once

This option defines the behavior of the use password option.

When this option is enabled, the password will be requested only once per session.

When disabling, the password will be requested every time the application will be accessed.

Allow direct calling by URL

Allows an application to be called by typing the URL directly into browsers.

When disabled, when accessing the application by typing the URL directly, the invalid data error will be displayed. With this configuration, the application can only be accessed through a menu application, for example.

PDF Report Log Configuration

This interface allows you to define a Log schema to the app. The Log schema tracks what the end-users are doing in the app. Those are the events it can tracks: Access, Insert, Update, and delete.

To learn how to create a Log schema [see here](#).

LOG	
ATTRIBUTE	VALUE
Schema	log  
Events	<div style="display: flex; align-items: center; gap: 10px;"><div style="border: 1px solid #ccc; width: 100px; height: 40px; position: relative;"><div style="position: absolute; top: -10px; right: 0; border-left: 1px solid #ccc; border-right: 1px solid #ccc; border-bottom: 1px solid #ccc; width: 10px; height: 10px; text-align: center;">▲</div><div style="position: absolute; bottom: -10px; right: 0; border-left: 1px solid #ccc; border-right: 1px solid #ccc; border-top: 1px solid #ccc; width: 10px; height: 10px; text-align: center;">▼</div></div><div style="text-align: center;"><div style="background-color: #007bff; color: white; padding: 5px 10px; border-radius: 3px;">Add >></div><div style="background-color: #007bff; color: white; padding: 5px 10px; border-radius: 3px; margin-top: 5px;">Remove <<</div></div><div style="border: 1px solid #ccc; width: 100px; height: 40px; position: relative;"><div style="position: absolute; top: -10px; right: 0; border-left: 1px solid #ccc; border-right: 1px solid #ccc; border-bottom: 1px solid #ccc; width: 10px; height: 10px; text-align: center;">▲</div><div style="position: absolute; bottom: -10px; right: 0; border-left: 1px solid #ccc; border-right: 1px solid #ccc; border-top: 1px solid #ccc; width: 10px; height: 10px; text-align: center;">▼</div></div></div>

Application Log configuration

Schema Select an existing log schema for the application.

Events You can select just specific events to save in the log.

PDF Advanced settings

Interface

Using this interface you can define the display layout of cells containing the values of the fields in the body of the report.

PDF interface

Seq	Cell	X Pos	Y Pos	Width	Alignment	Fields
1	cell_customerid	10	10	0	Left	customerid
2	cell_companyname	10	20	0	Left	companyname
3	cell_contactname	10	30	0	Left	contactname
4	cell_contacttitle	10	40	0	Left	contacttitle
5	cell_birthdate	10	50	0	Left	birthdate
6	cell_country	10	60	0	Left	country
7	cell_regionid	10	70	0	Left	regionid
8	cell_stateid	10	80	0	Left	stateid

Add cell(s) in the body of the report.

settings.

- **Attributes**

- **Seq** : Sequential number of cells (ascending order).
- **Cell** : Cell name.
- **Pos X** : Sets the abscissa of the cell.
- **Pos Y** : Sets the ordinate of the cell.
- **Width** : Sets the cell width.
- **Alignment** : Sets the cell alignment.
- **Field** : Here you have to select the field that will be displayed within the cell, according to the application SQL.

Code

Scriptcase creates the codes automatically, so by changing that within the option "code" you will assume the PDF creation PHP code.

```

1      /*----- Page 1 -----*/
2      sc_pdf_print($cell_customerid);
3      sc_pdf_print($cell_companyname);
4      sc_pdf_print($cell_contactname);
5      sc_pdf_print($cell_contacttitle);
6      sc_pdf_print($cell_birthdate);
7      sc_pdf_print($cell_country);
8      sc_pdf_print($cell_regionid);
9      sc_pdf_print($cell_stateid);
10     sc_pdf_print($cell_city);
11     sc_pdf_print($cell_address);
12     sc_pdf_print($cell_postalcode);
13     sc_pdf_print($cell_phone);
14     sc_pdf_print($cell_fax);
15     sc_pdf_print($cell_cityid);
16     sc_pdf_print($cell_creditlimit);
17     sc_pdf_print($cell_cardtype);
18     sc_pdf_print($cell_cardnumber);
19     sc_pdf_print($cell_notes);
20     /*-----*/
21

```

Configuration interface of the

PDF Code.

The application “Rport PDF” was developed based on a library called [TCPDF](#), so that you can use the available library methods or a corresponding macro from the table below. In order to use some method you must use \$pdf object, for example: \$pdf->AcceptPageBreak(parameters).

In order to access the TCPDF documentation [Click here](#)

Macros ReportPDF

Scriptcase Macro	Description
sc_pdf_text	This method allows you to place a string.
sc_pdf_write	This method prints the text of the current position.
sc_pdf_set_y	Sets the current y-axis position.
sc_pdf_set_xy	Sets the current position of the x-axis and y-axis.
sc_pdf_set_top_margin	Defines the top of the margin.
sc_pdf_set_right_margin	Sets the right margin.
sc_pdf_set_left_margin	Sets the left margin.
sc_pdf_set_margins	Sets the left, top, and right margin.
sc_pdf_set_title	Defines the title of the document.
sc_pdf_set_text_color	Sets the color to use for the text.
sc_pdf_set_subject	Defines the subject of the document.
sc_pdf_set_line_width	Sets the length of the pdf line.

<code>sc_pdf_line</code> Scriptcase Macro	Description
<code>sc_pdf_set_keywords</code>	Associates keywords with the document.
<code>sc_pdf_set_font</code>	Sets the current font size.
<code>sc_pdf_add_font</code>	Defines which font will be used in the text.
<code>sc_pdf_close</code>	Defines the closing of the pdf document.
<code>sc_pdf_error</code>	This method is automatically called in case of a fatal error.
<code>sc_pdf_add_page</code>	Adds a new page to the pdf document.
<code>sc_pdf_footer</code>	This method is responsible for rendering the footer of the pdf document.
<code>sc_pdf_header</code>	This method is responsible for rendering the header of the pdf document.
<code>sc_pdf_get_string_length</code>	Returns the length of a string.
<code>sc_pdf_get_y</code>	Returns the current y-axis position.
<code>sc_pdf_get_x</code>	Returns the current x-axis position.
<code>sc_pdf_link</code>	Adds the link to a rectangular area of the page.
<code>sc_pdf_image</code>	Embed an image in the document.
<code>sc_pdf_set_author</code>	Defines the author of the document.
<code>sc_pdf_set_auto_page_break</code>	Enables or disables the automatic page breaking mode.
<code>sc_pdf_set_compression</code>	Activates or deactivates page compression.
<code>sc_pdf_output</code>	Send the document to a given destination.
<code>sc_pdf_set_creator</code>	Defines the creator of the document.
<code>sc_pdf_set_display_mode</code>	Defines the way the document is to be displayed by the viewer.
<code>sc_pdf_accept_page_break</code>	Whenever a page break condition is met, the method is called.
<code>sc_pdf_ln</code>	Performs a line break.
<code>sc_pdf_rect</code>	Outputs a rectangle. It can be drawn (border only), filled (with no border) or both.
<code>sc_pdf_set_draw_color</code>	Defines the color used for all drawing operations (lines, rectangles and cell borders)
<code>sc_pdf_set_fill_color</code>	Defines the color used for all filling operations.
<code>sc_pdf_multi_cell</code>	This method allows printing text with line breaks.
<code>sc_pdf_cell</code>	Prints a cell (rectangular area) with optional borders, background color and character string.

Scriptcase Macro	Description
sc_pdf_add_link	Creates a new internal link and returns its identifier.
sc_pdf_alias_nb_pages	Defines an alias for the total number of pages.
sc_pdf_set_link	Defines the page and position a link points to.

sc_pdf_text

Description:

This method allows to place a string precisely on the page.

Parameters:

y: y-axis

txt: string

link: URL

Example:

```
sc_pdf_text("1","1","Your Text Here");
```

Scope:

Layout PDF > Código > Layout e Corpo

sc_pdf_write

Description:

This method prints text from the current position. When the right margin is reached (or the \n character is met) a line break occurs and text continues from the left margin. Upon method exit, the current position is left just at the end of the text. It is possible to put a link on the text.

Parameters:

h: height

txt: string

link: URL

Example:

```
sc_pdf_write(150,'Your Text Here','https://www.scriptcase.net');
```

Scope: *PDF Layout > Code > Layout & body*

sc_pdf_set_y

Description:

Sets the current y-axis position.

Parameters:

y: y-axis

Example:

```
sc_pdf_set_y(180,true);
```

Scope: *PDF Layout > Code > Layout & body*

sc_pdf_set_x

Description:

Sets the current x-axis position.

Parameters:

x: x-axis

Example:

```
sc_pdf_set_x(180);
```

Scope: *PDF Layout > Code > Layout & body*

sc_pdf_set_xy

Description:

Sets the current position of the x-axis and y-axis.

Parameters:

x: y-axis

y: x-axis

Example:

```
sc_pdf_set_x(180,180);
```

Scope: *PDF Layout > Code > Layout & body*

sc_pdf_set_top_margin

Description:

Defines the top margin. The method can be called before creating the first page.

Parameters:

margin: the margin

Example:

```
sc_pdf_set_top_margin(1000);
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_set_right_margin

Description:

Defines the right margin. The method can be called before creating the first page.

Example:

```
sc_pdf_set_right_margin(1000);
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_set_left_margin

Description:

Defines the left margin. The method can be called before creating the first page.

Example:

```
sc_pdf_set_left_margin(1000);
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_set_margins

Description:

Defines the left, top and right margins. By default, they equal 1 cm. Call this method to change them.

Parameters:

left: margin left

top: margin top

right: margin right

Example:

```
sc_pdf_set_margins(200, 200, 200);
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_set_title

Description:

Defines the title of the document.

Parâmetro:

`title: title of the document`

Example:

```
sc_pdf_set_title("Your Title Here");
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_set_text_color

Description:

Defines the color used for text. It can be expressed in RGB components or gray scale. The method can be called before the first page is created and the value is retained from page to page.

Example:

```
sc_pdf_set_text_color(106,13,173);  
sc_pdf_write(150,'Your Text Here','https://www.scriptcase.net');
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_set_subject

Description:

Defines the subject of the document.

Example:

```
sc_pdf_set_subject("Your Subject here");
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_set_line_width

Description:

Defines the line width.

Parameters:

width: margin width

Example:

```
sc_pdf_set_line_width(1500);  
sc_pdf_line(50,25,70,35);
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_line

Description:

Draws a line between two points.

Example:

```
sc_pdf_line(50,25,70,35);
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_set_keywords

Description:

Associates keywords with the document, generally in the form 'keyword1 keyword2 ...'.

Parameters:

keywords: list of keywords

Example:

```
sc_pdf_set_keywords(test test2, true);
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_set_font**Description:**

Sets the font used to print character strings. It is mandatory to call this method at least once before printing text or the resulting document would not be valid.

Parameters:**family**

Font to be defined.

- Courier (fixed-width)
- Helvetica or Arial (synonymous; sans serif)
- Times (serif)
- Symbol (symbolic)
- ZapfDingbats (symbolic)

style

Font style to be set.

- empty string: **regular**
- B: **bold**
- I: **italic**
- U: **underline**

size

Font size to be set.

Example:

```
sc_pdf_set_font('Arial', 'B', 14)
```

Scope: *PDF Layout > Code > Layout & body*

sc_pdf_add_font

Description:

Defines which font will be used in the text. You can pass parameters for font-family, font-style and font-size.

Parameters:

family

Font to be defined.

- Courier (fixed-width)
- Helvetica or Arial (synonymous; sans serif)
- Times (serif)
- Symbol (symbolic)
- ZapfDingbats (symbolic)

style

Font style to be set.

- empty string: **regular**
- B: **bold**
- I: **italic**
- U: **underline**

size

Font size to be set.

file

The font file

By default, the name is constructed from the family and style, in lower case with no spaces.

Example:

```
sc_pdf_add_font('Comic', 'I', 'comici.php');
```

Scope:

Layout PDF > Code > Layout & body

sc_pdf_close

Description:

Terminates the PDF document. It is not necessary to call this method explicitly because Output() does it automatically.

Example:

```
sc_pdf_close();
```

Scope:

sc_pdf_error

Description:

This method is automatically called in case of a fatal error; it simply throws an exception with the provided message.

Example:

```
sc_pdf_error("Your Text Here");
```

Scope: *PDF Layout > Code > Layout & body*

sc_pdf_add_page

Description:

Adds a new page to the document.

Example:

```
sc_pdf_add_page('Portrait','A4',0);
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_footer

Description:

This method is used to render the page footer. It is automatically called by `sc_pdf_add_page()` and `sc_pdf_close()` and should not be called directly by the application.

Example:

```
sc_pdf_footer();
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_header

Description:

This method is used to render the page header. It is automatically called by `sc_pdf_add_page()` and should not be called directly by the application.

Example:

```
sc_pdf_header();
```

Scope: *PDf Layout > Code > Layout & body*

`sc_pdf_get_string_length`

Description:

Returns the length of a string in user unit. A font must be selected.

Example:

```
sc_pdf_get_string_length("Text To Be Measured");
```

Scope:

PDf Layout > Code > Layout & body

`sc_pdf_get_y`

Description:

Returns the current y-axis position.

Example:

```
sc_pdf_get_y();
```

Scope:

PDf Layout > Code > Layout & body

`sc_pdf_get_x`

Description:

Returns the current x-axis position.

Example:

```
sc_pdf_get_x();
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_link

Description:

Puts a link on a rectangular area of the page. Text or image links are generally put via `Cell()`, `Write()` or `Image()`, but this method can be useful for instance to define a clickable area inside an image.

Parameters:

x : x-axis

y : y-axis

w : width

h : height

link : url

Example:

```
sc_pdf_link(100,100,10,10,'https://scriptcase.com.br');
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_image

Description:

Embeds an image in the document. Image size can be set in several ways. Supported formats: JPEG, PNG and GIF, the GD extension must be enabled to use GIF.

Parameters:

link : url path

x : x-axis

y : y-axis

w : width

h : height

type : image format

Example:

```
sc_pdf_image('http://chart.googleapis.com/chart?cht=p3&chd=t:60,40&chs=250x100&chl=HelloWorld', 60, 30, 90, 0,'PNG');
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_set_author

Description:

Defines the author of the document.

Example:

```
sc_pdf_set_author("Scriptcase");
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_set_auto_page_break

Description:

Enables or disables the automatic page breaking mode. When enabling, the second parameter is the distance from the bottom of the page that defines the triggering limit. By default, the mode is on and the margin is 2 cm.

Example:

```
sc_pdf_set_auto_page_break(true, 10);
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_set_compression

Description:

Activates or deactivates page compression. When activated, the internal representation of each page is compressed, which leads to a compression ratio of about 2 for the resulting document.

Note: the **Zlib** extension is required for this feature. If not present, compression will be turned off.

Example:

```
sc_pdf_set_compression(true);
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_output

Description:

Send the document to a given destination: browser, file or string. In the case of a browser, the PDF viewer may be used or a download may be forced.

Parameters:

- **I: send the file inline to the browser. The PDF viewer is used if available.**
- **D: send to the browser and force a file download with the name given by name.**
- **F: save to a local file with the name given by name (may include a path).**
- **S: return the document as a string.**

Example 1: Save the document to a local directory:

```
$pdf->Output('F', 'reports/report.pdf');
```

Example 2: Force a download:

```
$pdf->Output('D', 'report.pdf');
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_set_creator

Description:

Defines the creator of the document. This is typically the name of the application that generates the PDF.

Example:

```
sc_pdf_set_creator("X Creator","true");
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_set_display_mode

Description:

Defines the way the document is to be displayed by the viewer.

Parameters:

zoom:

- *fullpage*: displays the entire page on screen
- *fullwidth*: uses maximum width of window

- *real*: uses real size (equivalent to 100% zoom)
- *default*: uses viewer default mode

layout:

- *single*: displays one page at once
- *continuous*: displays pages continuously
- *two*: displays two pages on two columns
- *default*: uses viewer default mode

Example:

```
sc_pdf_set_display_mode("fullpage", "");
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_accept_page_break**Description:**

Whenever a page break condition is met, the method is called, and the break is issued or not depending on the returned value. This method is called automatically and should not be called directly by the application.

Example:

```
sc_pdf_accept_page_break();
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_ln**Description:**

Performs a line break. The current abscissa goes back to the left margin and the ordinate increases by the amount passed in parameter.

Example:

```
sc_pdf_ln();
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_rect

Description:

Outputs a rectangle. It can be drawn (border only), filled (with no border) or both.

Parameters:

- *x* : x-axis
- *y* : y-axis
- *w* : width
- *h* : height

Estilo de renderização:

D or empty string: draw. This is the default value. F: fill DF ou FD: Draw and fill

Example:

```
sc_pdf_rect($x, $y, $w, $h, 'D');
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_set_draw_color**Description:**

Defines the color used for all drawing operations (lines, rectangles and cell borders). It can be expressed in RGB components or gray scale. The method can be called before the first page is created and the value is retained from page to page.

Example:

```
sc_pdf_set_draw_color(245, 232, 125);
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_set_fill_color**Description:**

Defines the color used for all filling operations (filled rectangles and cell backgrounds). It can be expressed in RGB components or gray scale. The method can be called before the first page is created and the value is retained from page to page.

Example:

```
sc_pdf_set_fill_color(245, 232, 125);
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_multi_cell

Description:

This method allows printing text with line breaks. They can be automatic (as soon as the text reaches the right border of the cell) or explicit (via the `\n` character). As many cells as necessary are output, one below the other.

Parameters:

- **w**: cell width
- **h**: cell height
- **txt**: string to print
- **border**: Indicates if borders must be drawn around the cell block.
- **align**: Sets the text alignment. Possible values are:
 - L: left alignment*
 - C: center*
 - R: right alignment*
 - J: justification (default value)*
- **fill**: Indicates if the cell background must be painted (*true*) or transparent (*false*). Default value: *false*.

Example:

```
_sc_pdf_multi_cell(63, 10, "YourText", 1);
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_cell

Description:

Prints a cell (rectangular area) with optional borders, background color and character string. The upper-left corner of the cell corresponds to the current position. The text can be aligned or centered. After the call, the current position moves to the right or to the next line. It is possible to put a link on the text. If automatic page breaking is enabled and the cell goes beyond the limit, a page break is done before outputting.

Parameters:

- **w**: cell width
- **h**: cell height
- **txt**: string to print
- **border**: Indicates if borders must be drawn around the cell block.
- **align**: Sets the text alignment. Possible values are:
 - L: left alignment*
 - C: center*
 - R: right alignment*
 - J: justification (default value)*
- **fill**: Indicates if the cell background must be painted (*true*) or transparent (*false*). Default value: *false*.
- **link**: URL

Example:

```
sc_pdf_cell(60, 6, 'Your Text', 0);
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_add_link

Description:

Creates a new internal link and returns its identifier. An internal link is a clickable area which directs to another place within the document.

Example:

```
sc_pdf_add_link();
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_alias_nb_pages

Description:

Defines an alias for the total number of pages. It will be substituted as the document is closed.

Example:

```
sc_pdf_cell(0, 10, 'Page','{nb}', 0, 0, 'C')  
sc_pdf_alias_nb_pages();
```

Scope:

PDF Layout > Code > Layout & body

sc_pdf_set_link

Description:

Defines the page and position a link points to.

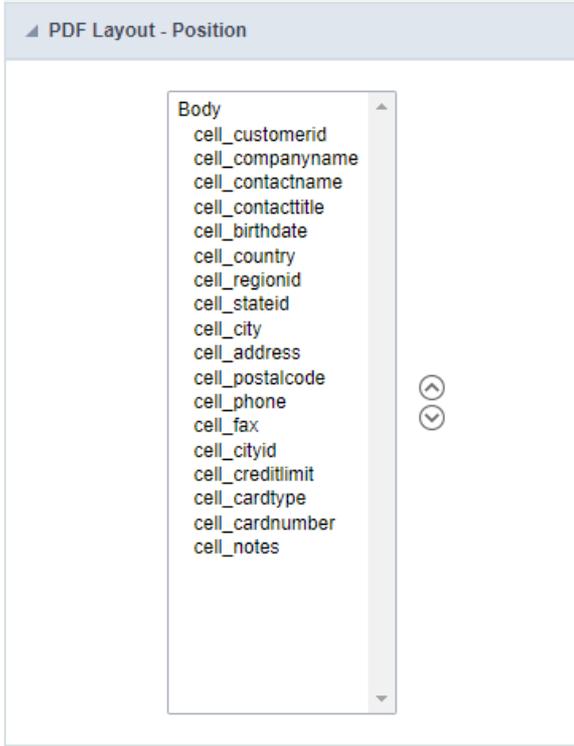

Example:

```
sc_pdf_set_link(\$link);
```

Scope:

Positioning

This interface allows you to define the display order of the fields (selecting through the arrows next to the right frame).

Configuration interface of the PDF fields placement.

PDF Report - Fields Overview

The applications can have two types of fields.

Table Fields

Columns of the table connected to the application and their data types.

Example:

In a table with the following structure:

```
CREATE TABLE `orders` (
  `orderid` int(11) NOT NULL,
  `customerid` varchar(5) NULL DEFAULT NULL,
  `employeeid` int(11) NULL DEFAULT NULL,
  `orderdate` date NULL DEFAULT NULL,
  `requireddate` date NULL DEFAULT NULL,
  PRIMARY KEY (`orderid`) USING BTREE
);
```

These are the listed fields on left menu **Fields**:

Virtual Fields

Fields created inside application to assist in the development process.

How to create a virtual field

1. Inside an application, access the left menu **Fields** and click on **New Field** option.
2. Choose how many fields do you want to create:

1. Create the fields and define type, name and label for each one:

- **Type**: Data type of the field.
- **Name**: Internal name of the field. Used to identify the field on events and Scriptcase interface.
- **Label**: Title of the field displayed on the application.

Scriptcase **doesn't insert** virtual fields on the table after its creation.

Types of fields by applications

Application Table Fields Virtual Fields

Grid	<input type="text"/>	<input type="text"/>
Procedure	<input type="text"/>	<input type="text"/>
Chart	<input type="text"/>	<input type="text"/>
Form	<input type="text"/>	<input type="text"/>
Control	<input type="text"/>	<input type="text"/>
Calendar	<input type="text"/>	<input type="text"/>
Search	<input type="text"/>	<input type="text"/>
PDF Report	<input type="text"/>	<input type="text"/>

The applications **Menu**, **Tree Menu**, **Dashboard** and **Blank** were not listed because they haven't manage fields.

PDF Report - Text Field

General Settings

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.

- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.

- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Martial Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute	Value	Lookup	Description
1			Sports
2			Culture
4			Pleasure
8			Reading
16			Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

PDF Report - Multiple Lines Text Field

General Settings

Multiple Lines Text field Configuration Interface.

- **Data Type** : Define the type of field for the application. When it is defined as a Multiple Lines Text, it accepts letters, numbers and special characters in multiple lines.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Case Settings** : Convert the letter from the field when losing focus. The options are:
 - **Upper case** : All in Upper Case
 - **Lower case** : All in Lower case
 - **Capitalize first word** : Capitalizes the first letter of the first word
 - **Capitalize all words** : Capitalizes the first letter of all the the words
- **Show HTML content** : Determines if the HTML contained in the field will be displayed or not. If enabled, the HTML will be displayed, otherwise the HTML will be interpreted by the browser.
- **Grid Mask** : Defines the mask for the field display. There are two typed of masks described below:

Character	Description
X	Placeholder to any character. Replaced by any character. If number of characters entered are less then the mask size, the field value is completed with zeros (Filling full size field entry is required).
Z	Replaced by any character retrieved from database. Suppress zeros at field left (Complete field filling is optional). When used combined with the mask character X it should be placed at the mask left.

Mask Examples

Mask	Field Value	Formatted Value
(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
(zz) xxxx - xxxx	1234567890	(12) 3456 - 7890
(zz) xxxx - xxxx	12345678	() 1234 - 5678
(zz) xxxx - xxxx	0012345678	() 1234 - 5678

- **Do Not Repeat Value** : Do not repeat the value of the field in case it is the same as the previous record.

- **Run content in JavaScript** : If enabled, the JavaScript will be interpreted by the browser, otherwise the JavaScript will be displayed.
- **SQL Type** : Informs the data type of field in the database.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter than (;).
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML, CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital

Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

$$1 (\text{Sports}) + 2 (\text{Culture}) = 3$$

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

$$1 (\text{Sports}) + 4 (\text{Pleasure}) + 8 (\text{Reading}) = 13$$

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
 - **Default value** : Defines the default value, used in the cases where the select command does not return any values.
 - **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
 - **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

PDF Report - Integer Field

On this page, the developer can configure the settings for your field of type number. From the use of specific display symbols to the mode in which they are displayed. Thus, it can streamline its application.

Data type:

It sets the application field type. When the field is set as Number, it is permissible to define formatting rules of integers.

Field Mask Input:

It sets the mask input for the field. There are two types of mask as described in the table below:

Character Description

- X It is overridden by any characters returned by the database. Filled is required and the value will be completed with leading zeros when there are fewer characters than the size of the mask.
- Z It is overridden by any characters returned by the database. Its filling is optional and when there are fewer characters than the mask size, nothing will be done about the characters that are missing. In addition the leading zeros will be suppressed. When used in conjunction with the X necessarily the use of this character is to the left of the mask.
- 9 It represents any numeric character (from 0-9)
- A It represents an alpha numeric character (A-Z,a-z)
- * It represents any alpha-numeric character (A-Z,a-z,0-9)entered by the user.

Mask Input Examples:

Field	Mask Input	Typed Value	Formatted Value
Phone Number	+99 99 9999 - 9999	123456789012	+12 34 5678 - 9012
Phone Number	(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
Phone Number	(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
Phone Number	(zz) xxxx - xxxx	12345678	() 1234 - 5678
Software Key (Letters only)	AAAA-AAAA-AAAA-AAAA	QWERTYUIASDFGHJK	QWER-TYUI-ASDF-GHJK
Software Key (Letters and numbers)	xxxx-xxxx-xxxx-xxxx	Q1W2E3R4T5Y6U7I8	Q1W2-E3R4-T5Y6-U7I8
License Plate	AAA - 9999	QWE1234	QWE - 1234
Scriptcase Serial Key	A999A999A999-**	D111H111G111DG2P	D111H111G111-DG2P
Multiple masks (Phone Number)	9999-9999;(99)9999-9999;	9999 999 9999	+99 99 9999-9999

Tipo SQL:

Reports the SQL type of the field as it is configured in the database.

Use regional settings:

It allows you to apply regional settings to the number fields formatting. When this option is not selected it will be displayed the attributes group, minus sign and negative number format.

Grouping:

It allows you to define which character is used to separate thousands. This option is only available when the option to use regional settings is disabled.

Negative sign:

It allows you to define which character will be used for the display of negative numbers. This option is only available when the option to use regional settings is disabled.

Negative number format:

It allows you to define the placement of the negative sign in relation to value. This option is only available when the option to use regional settings is disabled.

Color for the negative values:

It allows you to define a color when the value is negative, improving the understanding of the end user about that kind of value.

Example:

Display the value in words:

The value of the field will be displayed in full on application. This feature can facilitate the comprehension and understanding of the user.

Example:

Line size:

Maximum size in characters to be displayed in the value cell, in full. When this value is exceeded the line will break within the cell.

Lookup Settings

The Lookup is a way used to provide the end user a list of values description/name where the items can be selected and used in the application. For example, for a field sex that in the database is represented with M or F values can be presented as male or female dynamically with the lookup. So you will be able to retrieve these values from a database table or manually, if the reference table does not exist.

Example:

Lookup Methods

There are two lookup methods available:

Manual: To use this method it is necessary to inform the selection conditions manually to the Lookup.

Automatic: To use this method it is necessary to use a lookup query from the database to access the reference table.

Editing-automatic lookup:

Select Command:

It sets the SQL command that will retrieve the value to display inside the Grid field. The command must have the following format

```
SELECT field_to_be_displayed FROM table WHERE key_field = {grid_field}
```

The Grid field must be always referenced between curly braces {}, So at run time, the field braces will be replaced by its value in the table.

Multiple Options:

When the Select command informed return multiple values, the option must be selected.

Delimiter:

It sets the tab of values returned by the Select command, this option should be filled when the “Yes” option is checked in the multiple attribute options.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

Use a specific connection:

This option allows you to select another existing connection in the project, other than the current connection, to select the values for the lookup.

Edit Lookup - Manual:

Lookup used to modify the display of the field with predefined values.

Lookup Types

It sets the operating mode of the lookup can be: single value, multiple values (delimiter), multiple values (position) and multiple values (binary).

Single value: it will be displayed only one value for the field. There is a direct replacement of the value stored in the Bank for a label defined in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value of “M” will be replaced by “Male”.

Multiple Values (Delimiter):

By using this option it will be displayed multiple values for the selected field. The values must be separated by a delimiter to be informed. A replacement of parts from a string stored in the field, separated by a delimiter for values contained in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value S;M will be replaced by Sports and Movies.

Delimiter: Character used to separate the values within the same string.

Multiple Values (Position)

Allows you to recover information stored in a single string of the selected field. In order for this information to be retrieved must be informed, in addition to the label, the starting position and the number of bytes that each information occupies within the string.

As an example we will use a string to store Sex, Marital status and Hobby respectively. Sex occupies one byte, Status one byte and Hobby two bytes .

For this purpose we define the list as:

Label	Value	Start	Size
Male	M	1	1
Female	F	1	1
Married	M	2	1
Single	S	2	1
Study	ST	3	2
Sportes	SP	3	2
Reading	LE	3	2

Example: the string MMST would be presented in the query as: Male Married Study

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value M will be replaced by Male.

Start: : Starting position in the string where the information is recorded. The first position is always 1.

Size : Number of bytes that the information occupies in the string.

Multiple values (binary):

It allows you to retrieve several information stored in decimal form of the selected field.

As examples we will use the following list (although not informed in the interface of inclusion of values in the list, each item has a value assigned automatically according to the order):

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

To display the data, a decomposition of the decimal number stored in the bank is performed. For example, numbers 11 and 12 (written in the database) would be decomposed as follows:

$$11 = 1 + 2 + 8 = (\text{Sports} - \text{Culture} - \text{Reading})$$

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

$$12 = 4 + 8 = (\text{Leisure} - \text{Reading})$$

Assigned value Description in Lookup

1	Sports
2	Culture

Assigned value Description in Lookup

4	Leisure
8	Reading
16	Music

Label:

Text that will be displayed in the Grid.

Include Button:

Includes in the list the values populated in the Label and value fields.

Alter Button:

It changes the attributes of the selected item.

Delete Button:

Deletes the selected item.

Clean Button:

It cleans the fields

Save Button:

Allows the user to save the entire list, for later use using the Load Lookup definition option.

Load Lookup definition:

Allows you to load a predefined value list for use as a lookup.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

PDF Report - Decimal Field

General Settings

Decimal field Configuration Interface.

Data Type

Define the field type to Decimal. It allows defining the Decimal number format.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Accumulated

It defines the field to accumulate values of another field. This option is only available for virtual fields.

Accumulator field

It is available when the option "Accumulated" is enabled. This configuration defines which field will accumulate the values. The field should be Integer, Currency, or Decimal.

Grid Mask

It defines a mask for the field value. There is two types of masks:

Character	Description
X	It sets the placeholder to any character for replacing. If the entered number of characters is less than the mask size, It completes the field value with zeros (Filling full-size field entry is required).
Z	It sets the placeholder to any character for replacing, but it suppresses zeros at field left (Complete field filling is optional). Use it on the left when combined with the X mask.

Mask Examples

Mask	Field Value	Formatted Value
(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
(zz) xxxx - xxxx	1234567890	(12) 3456 - 7890
(zz) xxxx - xxxx	12345678	() 1234 - 5678
(zz) xxxx - xxxx	0012345678	() 1234 - 5678

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the attributes Grouping, Negative Symbol and negative number format.

Digit Grouping Separator

It defines the character to separate the thousands.

Decimal Separator

It defines the decimal separator.

Negative sign

It defines the character to represent negative numbers.

Negative number format

It defines the position of the Negative sign.

Color of Negative

It defines a color for the field when the value is negative.

Decimal Precision

It defines the number of decimal places for the field.

Complete with zeros

Defines the decimal places that will or not be completed zeros to the right. Example: The value is 125,50, but the decimal precision is 3. If the option is enabled, then the value will 125,500.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the

select command separated by the character in the “Separated by” field.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Martial Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.

- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
 - **Default value** : Defines the default value, used in the cases where the select command does not return any values.
 - **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

PDF Report - Percent Field

General Settings

Percentage field Configuration Interface.

Data Type

Define the field type to Percentage.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Accumulated

It defines the field to accumulate values of another field. This option is only available for virtual fields.

Accumulator field

It is available when the option "Accumulated" is enabled. This configuration defines which field will accumulate the values. The field should be Integer, Currency, or Decimal.

Grid Mask

It defines a mask for the field value. There is two types of masks:

Character	Description
X	It sets the placeholder to any character for replacing. If the entered number of characters is less than the mask size, It completes the field value with zeros (Filling full-size field entry is required).
Z	It sets the placeholder to any character for replacing, but it suppresses zeros at field left (Complete field filling is optional). Use it on the left when combined with the X mask.

Mask Examples

Mask	Field Value	Formatted Value
(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
(zz) xxxx - xxxx	1234567890	(12) 3456 - 7890
(zz) xxxx - xxxx	12345678	() 1234 - 5678
(zz) xxxx - xxxx	0012345678	() 1234 - 5678

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the attributes Grouping, Negative Symbol and negative number format.

Digit Grouping Separator

It defines the character to separate the thousands.

Decimal Separator

It defines the decimal separator.

Negative sign

It defines the character to represent negative numbers.

Negative number format

It defines the position of the Negative sign.

Color of Negative

It defines a color for the field when the value is negative.

Decimal Precision

It defines the number of decimal places for the field.

Complete with zeros

Defines the decimal places that will or not be completed zeros to the right. Example: The value is 125,50, but the decimal precision is 3. If the option is enabled, then the value will 125,500.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value

returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.

- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
 - **Default value** : Defines the default value, used in the cases where the select command does not return any values.
 - **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
 - **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and

lookup value is enabled.

PDF Report - Currency Field

General Settings

Currency field Configuration Interface.

Data Type

Define the field type to Currency. It allows defining the currency number format.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Accumulated

It defines the field to accumulate values of another field. This option is only available for virtual fields.

Accumulator field

It is available when the option "Accumulated" is enabled. This configuration defines which field will accumulate the values. The field should be Integer, Currency, or Decimal.

Grid Mask

It defines a mask for the field value. There is two types of masks:

Character	Description
X	Placeholder to any character. Replaced by any character. If number of characters entered are less then the mask size, the field value is completed with zeros (Filling full size field entry is required).
Z	Replaced by any character retrieved from database. Suppress zeros at field left (Complete field filling is optional). When used combined with the mask character X it should be placed at the mask left.

Mask Examples

Mask	Field Value	Formatted Value
(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
(zz) xxxx - xxxx	1234567890	(12) 3456 - 7890
(zz) xxxx - xxxx	12345678	() 1234 - 5678
(zz) xxxx - xxxx	0012345678	() 1234 - 5678

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

![Displaying repeated values.][cons_configuracao_geral_texto_nao_repetir_valor]

SQL Type

It informs the data type of field in the database.

Values Format

Interface of Values Format.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the attributes Grouping, Negative Symbol and negative number format.

Currency Format

It defines if the field displays the Currency Symbol of the Regional Settings.

Currency Symbol

It allows setting the character that represents the Currency Symbol.

Digit Grouping Separator

It defines the character to separate the thousands.

Decimal Separator

It defines the decimal separator.

Negative sign

It defines the character to represent negative numbers.

Negative number format

It defines the position of the Negative sign.

Color of Negative

It defines a color for the field when the value is negative.

Decimal Precision

It defines the number of decimal places for the field.

Complete with zeros

Defines the decimal places that will or not be completed zeros to the right. Example: The value is 125,50, but the decimal precision is 3. If the option is enabled, then the value will 125,500.

Display full value

It displays the full value. Example: 2018(Two thousand eighteen).

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter than (;).
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.

- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
 - **Default value** : Defines the default value, used in the cases where the select command does not return any values.
 - **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
 - **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

PDF Report - HTML Image Field

General Settings

 *HTML Image field Configuration Interface.*

Data Type

Define the type of field. When setting it to HTML Image, it allows to display an image into the field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Image

Define an image to be displayed. The icon "Select Image" lists all images from Scriptcase and your uploaded images. The "Upload an image" option allows you to send a copy to the Scriptcase server.

New Link

This button allows the creation of a field link with some other application..

This way, it is possible, for example, to create a link with a blank to delete a record from the grid, passing the record ID as a parameter.

See more information about field binding by [clicking here](#).

Border

Define the width of the Image border in Pixels.

Width

Define the image width size in Pixels.

Height

Define the image height size in Pixels.

PDF Report - Credit Card Field

General Settings

Credit Card Number Configuration Interface.

- **Data Type** : Select the type of field for the application. When it is defined as a Credit Card Number, you can define some rules for the display format of the Credit Card.
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name would be "Client Name".
- **Do Not Repeat Value** : Do not repeat the value of the field in the case it is the same as the previous record.

- **SQL Type** : Informs the data type of the field in the database.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced by the curly brackets `{}`. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter than `(;)`.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML, CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains

this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

PDF Report - E-mail Field

General Settings

Email field Configuration Interface.

- **Data Type** : Defines the type of field for the application. When it is defined as an Email, when you click on the field you be offered a choice for your email client and send an email to that specific email.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be easier to the user understand if the name is "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Do Not Repeat Value** : Do not repeat the value of the field in case it is the same as the previous record.

- **SQL Type** : Informs the data type of field in the database.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
 - **Default value** : Defines the default value, used in the cases where the select command does not return any values.
 - **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
 - **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

PDF Report - URL Field

General Settings

URL field Configuration Interface.

Data Type

Define the type of field. When setting it to YouTube, it allows displaying an Youtube video on the field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
 - **Default value** : Defines the default value, used in the cases where the select command does not return any values.
 - **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
 - **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

PDF Report - Date Field

General Settings

Date field Configuration Interface.

Data Type

Define the type of field. When setting it to Date, you can inform its format into this field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Format of Values without Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the date separator attribute (Check the Regional Settings).

Display

It offers predefined formats for displaying dates.

Detail Mask

Define the format of the field in the Grid. It uses the patterns of PHP function Date.

d-m-Y	25-09-2009
F/Y	September/2009
j/n/Y \a\s g:i:s A	25/9/2001 as 14:30:11 PM
l, d \d\e F \d\e Y	Thursday, 25 of January of 2009
h:i:s	11:33:20
#h:i:s	123:43:27 (accumulating the hours)

Internal Format

It allows defining the field format when the SQL type is different from **Date**. You must use the characters **Y**, **M** and **D** that correspond to **Year**, **Month** and **Day**.

- **Example 1** : If the field is storing the Date value in a **char(8)** where the positions **1** to **4** represents the year, the positions **5** and **6** is the month and the position **7** and **8** is the day, you must define the internal format as: **YYYYMMDD**
- **Example 2** : If the field is storing the Date value in a **char(6)** where the positions **1** and **2** represents the month and the positions **3** to **6** is the year, you must define the internal format as: **MMYYYY**

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter than (;).
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML, CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute	Value	Lookup	Description
1			Sports
2			Culture
4			Pleasure
8			Reading
16			Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute	Value	Lookup	Description
1			Sports
2			Culture
4			Pleasure

Attribute Value Lookup Description

8 Reading

16 Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1 Sports

2 Culture

4 Pleasure

8 Reading

16 Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
 - **Default value** : Defines the default value, used in the cases where the select command does not return any values.
 - **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
 - **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

PDF Report - Time Field

General Settings

Time field Configuration Interface.

Data Type

Define the type of field. When setting it to Time, you can inform a time format into this field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Format of Values without Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the date separator attribute (Check the Regional Settings).

Display

It offers predefined formats for displaying dates.

Detail Mask

Define the format of the field in the Grid. It uses the patterns of PHP function Date.

d-m-Y	25-09-2009
F/Y	September/2009
j/n/Y \a\s g:i:s A	25/9/2001 as 14:30:11 PM
l, d \d\e F \d\e Y	Thursday, 25 of January of 2009
h:i:s	11:33:20
#h:i:s	123:43:27 (accumulating the hours)

Internal Format

It allows defining the field format when the SQL type is different from **Date**. You must use the characters **Y**, **M** and **D** that correspond to **Year**, **Month** and **Day**.

- **Example 1** : If the field is storing the Date value in a **char(8)** where the positions **1** to **4** represents the year, the positions **5** and **6** is the month and the position **7** and **8** is the day, you must define the internal format as: **YYYYMMDD**
- **Example 2** : If the field is storing the Date value in a **char(6)** where the positions **1** and **2** represents the month and the positions **3** to **6** is the year, you must define the internal format as: **MMYYYY**

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter than (;).
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML, CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute	Value	Lookup	Description
1			Sports
2			Culture
4			Pleasure
8			Reading
16			Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute	Value	Lookup	Description
1			Sports
2			Culture
4			Pleasure

Attribute Value Lookup Description

8 Reading

16 Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1 Sports

2 Culture

4 Pleasure

8 Reading

16 Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
 - **Default value** : Defines the default value, used in the cases where the select command does not return any values.
 - **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
 - **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

PDF Report - Date and time Field

General Settings

Date and Time field Configuration Interface.

Data Type

Define the type of field. When setting it to Date and Time, you can inform its format into this field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Format of Values without Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the date separator attribute (Check the Regional Settings).

Display

It offers predefined formats for displaying dates.

Detail Mask

Define the format of the field in the Grid. It uses the patterns of PHP function Date.

d-m-Y	25-09-2009
F/Y	September/2009
j/n/Y \a\s g:i:s A	25/9/2001 as 14:30:11 PM
l, d \d\e F \d\e Y	Thursday, 25 of January of 2009
h:i:s	11:33:20
#h:i:s	123:43:27 (accumulating the hours)

Internal Format

It allows defining the field format when the SQL type is different from **Date**. You must use the characters **Y**, **M** and **D** that correspond to **Year**, **Month** and **Day**.

- **Example 1** : If the field is storing the Date value in a **char(8)** where the positions **1** to **4** represents the year, the positions **5** and **6** is the month and the position **7** and **8** is the day, you must define the internal format as: **YYYYMMDD**
- **Example 2** : If the field is storing the Date value in a **char(6)** where the positions **1** and **2** represents the month and the positions **3** to **6** is the year, you must define the internal format as: **MMYYYY**

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter than (;).
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML, CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute	Value	Lookup	Description
1			Sports
2			Culture
4			Pleasure
8			Reading
16			Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute	Value	Lookup	Description
1			Sports
2			Culture
4			Pleasure

Attribute Value Lookup Description

8 Reading

16 Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1 Sports

2 Culture

4 Pleasure

8 Reading

16 Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
 - **Default value** : Defines the default value, used in the cases where the select command does not return any values.
 - **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
 - **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

PDF Report - Image (Database) Field

General Settings

Upload field Configuration Interface.

Data Type

Define the type of field. When setting it to Image (Database), all the Images files are stored and loaded directly from the Database.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Image Border

Width of the Image border in Pixels.

Image Height

Image height size in Pixels.

Image Width

Image width size in Pixels.

Maintain Aspect

It maintains the original aspect ratio of the image when resizing it.

Open in Another Window

Allows to open the image in another window.

SQL Type

It informs the data type of field in the database.

PDF Report - Image (File Name) Field

General Settings

Upload field Configuration Interface.

Data Type

Define the type of field. When setting it to Image (File Name), all the Images files are stored and loaded directly from the Database.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Image Border

Width of the Image border in Pixels.

Image Height

Image height size in Pixels.

Image Width

Image width size in Pixels.

Maintain Aspect

It maintains the original aspect ratio of the image when resizing it.

Cloud storage API

Profile with the API information (Dropbox, Google Drive or Amazon S3) used to upload the file to the cloud created in Tools > API.

Storage API directory

Directory name for upload to the Cloud Storage API. Eg.: files/docs/{id}. The file will be saved in the root folder if this field is empty.

Storage API cache directory

Local directory for caching files sent to the cloud via the storage API.

Open in Another Window

Allows to open the image in another window.

Subdirectory for local storage

Local subdirectory or on the server where the files are stored. eg: {CustomerId} , [glo_var_seq]

Image Caching

Time in minutes the image cache will be kept in the server before being deleted.

Repeat value

Repeat the field value if it is equal to the previous record.

SQL Type

It informs the data type of field in the database.

PDF Report - QRCode Field

General Settings

QRCode field Configuration Interface.

Data Type

Define the type of field. When setting it to QRCODE, it allows you to transform values into a QRCODE.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

SQL Type

It informs the data type of field in the database.

Watch below a video showing an example with QRCODE

Values Format

Interface of Values Format.

Level of error correction

The Codewords are 8 bits long and use the Reed-Solomon error correction algorithm with four error correction levels. The higher the error correction level, the less storage capacity.

Image Size

Set the size of the QRCODE image.

Margin

Set the margins of the QRCODE.

Interface of Values Format.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.

- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

PDF Report - Bar code Field

General Settings

Configuration Interface of the Barcode Field.

- **Data Type** : DataType of the field for the application.
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name would be "Client Name".
- **SQL Type** : Database field type.

Watch below a video showing an example about the Barcode field:

Values Format

Configuration Interface of the Barcode Field.

- **Type** : Type of Barcode.
- **Text** : Barcode Text for illustration purposes.
- There are **18 types of barcodes**, that are listed below:

Barcode configuration interface.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**
 - **Text Font** : Allows choosing the font type, which will be applied in the application field.
 - **Font Size** : Allows choosing the font size, which will be applied to the application object.
 - **Italic Text** : Allows to apply the italic type in the font.
 - **Bold Text** : Allows you to apply bold type to the font.
 - **Number of characters** : Number of characters to display.
 - **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
 - **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
 - **Background Image** : Allows you to add a background image to the field.
 - **Line Break** : Enables the possibility of a line break for the field.
 - **Content color** : Changes the content color of the query field and the grouped field, when available.
 - **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
 - **Width** : To define the width of the field.
 - **Height** : To set the height of the field.
 - **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
 - **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
 - **Title color** : Allows you to choose a color for the field title using a color palette.

- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

PDF Report - SubSelect Field

General Settings

SubSelect field configuration Interface.

Increment : Defines the space between the record lines of the SubSelect field. **Connection** : Displays a list of connections created in the current project. **Table** : Displays the tables related to the database connection selected previously. **SubSelect** : Displays the SQL of the chosen table in the previous option. Allowed to be modified and use field variables and global variables. **SQLBuilder** : Opens the ScriptCase SQLBuilder, to build the SQL commands.

Signature

Configuración General

Configuration Interface of the Signature Field.

The signature field will help you creating more sophisticated forms and making it possible to store signatures in your database. Inside our development environment we have specific settings that will help you to customize your field, those options are:

- **Data Type** : You can define the type of field for the application. When it is defined as a text, it accepts letters, numbers and special characters.
- **Label** : Lets you define a label to the field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name is "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Background color** : Defines a color to the field background by using a valid hexadecimal color value or by choosing a color from the color palette.
- **Pen color**: Set a color to the pen by using a valid hexadecimal color value or by choosing a color from the color palette.
- **Width** : Lets you define a width to the field.
- **Height** : Set a height to the field.
- **Subtitle** : Defines the subtitle that will be displayed beside the field.
- **Initial Value** : Lets you define the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
- **Save Variable** : Save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Set the name for the session variable that will receive the field value.
- **Disabled Field** : Define if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : Displays the HTML Object that will be used to display the field in the form.
- **SQL Type** : Displays the data type of field in the database.

Configuración de Visualización

You can set CSS values for the field individually. Thus, for example, you can highlight one field of the others in the application. As CSS field properties, when changed, they are added to a class created automatically by ScriptCase for each application field.

Individual field CSS settings, when inserted, override theme settings ([CSS of applications Themes](#)) selected for application.

The settings are divided into three property blocks, these blocks are:

CSS of Title

This makes it possible to change the CSS properties of the field's Label.

In the example below, You can see the difference of field title configurations. While the field **Contactname** have the same formatting, inherits the theme of the application, the field **Contacttitle** have a different formation of of others, from the changes made in the CSS of the field.

CSS of field

Changes the CSS properties of the `<td>` where the input object (where the user enters data for insertion into a form) is positioned. In the image below, you can see where the change is applied.

Field Contacttitle with changes to Field CSS properties, changing background color and horizontal alignment

CSS of Input object

Changes the CSS properties in the Input of field object, where the user type the data in a form.

Field with changes to CSS properties of Input Object, changing background color and input source color

CSS properties

The available configuration options are basically the same for each of the configuration blocks above.

description of available configuration attributes

Font

Changes the font of the text according to the fonts selected using the *font-family* property.

In this option, some types of fonts are provided to you (as shown below).

Font Size

Changes the font size of the text using the property *font-size* in the field class.

You need to select the available value from our list, the measure used for this property is the pixel.

Font Color

Define the font color used by the property *color* in the field class.

Background color

Define the background color using the property *background-color* in the field class.

The colors that will be used in the two color properties listed above, **Font color** and **Background color**, can be entered via the color palette - - available next to the field or manually entered values in the accepted formats that are: *Hexadecimal, RGB, RGBA, HSL, HSLA* or *o Color name*.

Color palette

By clicking on the color palette icon - - next to the field, a window will open with some default colors.

When you select one of the colors, a value in hexadecimal format (HEX) will be entered, representing the chosen color.

Hexadecimal

Acronym for hexadecimal, this code is composed of the pound sign (#) plus six digits. The first two define the intensity of the color red, the middle two are green and the last two are blue.

Bold

Applies bold style to the font.

Underline

Lets you apply the underlined style to the font.

Border style

Defines the border font style.

Border Collapse

Defines the border collapse.

Border size

Changes the size of the title border.

Border color

Chooses the border color , using a color palette to apply to the title.

Horizontal alignment

Position the filter label at desired location (left,rigth,center e justify).

Vertical alignment

Position the label of the filter in the wanted location baseline, sub, super, top, text-top, middle, bottom, text-bottom).

Not available in Input Object CSS

Width

To set the width of the title.

Height

To set the height of the title.

PDF Report Events Overview

Most Scriptcase applications, with the exception of Tabs and Dashboard applications, have events that can be used to create business rules, validations and changes to the application's CSS, among other things.

When events are executed?

Each event is executed at a certain moment in the application and has an execution order, for this reason, they have different functions within the creation of a business rule and validations.

They can be triggered automatically, as in the case of the **onApplicationInit** and **onScriptInit** events, where they are executed when the application starts. Also, they can be triggered through user interaction, as with the **onNavigate** and **onValidate** events, which are executed when browsing the application or submitting a form, respectively.

For information about the timing of events execution or other information, access the documentation of the desired event.

how they work?

By default, the events already have handle for opening `<?php` and closing `?>` of PHP tags, so they are ready to receive PHP code and macros from Scriptcase.

However, it is possible to use other languages in the event, such as **JQuery**, **JavaScript**, **CSS** and **HTML**. For this, it is necessary to close the PHP tag `?>` of the event, so that the code can be added.

Remembering that it is necessary to reopen the event's PHP tag `<?php`, otherwise the application will not run correctly.

When closing the PHP tag in a Scriptcase event, the executed language is HTML.

Example of using other languages:

onApplicationInit - Report PDF

This event occurred before the application execute the SQL, and execute only once. Is used to do verification of variables, and security verification.

onScriptInit - Report PDF

This event occurs when the application is loaded, or reloaded. Occurs before the application runs the SQL statement, so using this event it is possible to modify the grid SQL statement dynamically, based on any logical. Macros frequently called on this event: `sc_select_field`, `sc_select_order`, `sc_select_where(add)`, etc

onRecord - Report PDF

This event occurs immediately before displaying a row, it is used to calculate any cell value.

onHeader - Report PDF

This event occurs before the header display. This event is frequently used when it is required to display any calculated value on report header.

onFooter - Report PDF

This event is used when in the footer we need to display some calculated value, it is in this event that we write the calculation necessary to assemble some value that we want to display.

Code Editor

Scriptcase has Events to allow the developers to customize the application code. By using the events, the developers can program custom actions at a specific execution time (e.g. After a record is inserted, when it is loaded, upon submitting a Form, ...) and for a specific application type. In the events area you can use global and local variables, JavaScript, CSS, HTML, PHP codes and also Scriptcase macros.

Scriptcase code editor is used within events and has a series of shortcuts to help in the applications development.

At the top section of the editor, there are some options that allows us to change the editor theme or expand it, for example. These options can also be activated using the hotkeys.

- - Increases the area occupied by your code editor.
- - Expand the sides of the code editor.
- - Activates the search in the code editor.
- - Enables replace in the code editor.
- - Defines the code editor theme.

The hotkeys are available in all browsers compatible with Scriptcase.

[Click Here](#) to view the Scriptcase hotkeys documentation.

Search

Settings

With this interface, you can define general options of the Search Form.

SEARCH SETTINGS	
ATTRIBUTE	VALUE
Search Criteria	AND ▼
Display Condition	<input type="checkbox"/>
Use auto-complete in the fields.	Defined in the field ▼

Search configuration Interface.

Search Criteria

Allows to select the logical operator **AND** or **OR** to define the criteria of the search;

Display Condition

Gets the condition of the search available for the user to choose one. He can select “AND” or “OR” in a Combobox.

Use auto-complete in the fields

Automatically turns the field into an autocomplete according to the existing values in the database. If the user chooses **Yes**, the autocomplete will enable automatically in all inputs that contain a relationship. If the user decides **No**, so no autocompletes will be displayed. Otherwise, the option selected is **Defined in the field** it'll keep the settings for each field individually.

Search Criteria

With this interface, you can configure the conditions available for each field of the Search form.

SEARCH CRITERIA		
ATTRIBUTE	VALUE	DESCRIPTION
Check the field that is part of the search and select in the right combo-box an option to enable or disable a search option.		
<ul style="list-style-type: none"> customerid companyname contactname contacttitle birthdate country regionid stateid city address postalcode phone 	<ul style="list-style-type: none"> *Contains *Not Contains *Equal to *Empty .Different .Beginning with .Greater than .Greater equal .Less than .Less equal .Between two values .In 	<ul style="list-style-type: none"> On/Off All None

Search configuration Interface.

We can see the fields list on the left combo. On the right, the list of options for filtering the selected field. To select an option, click on one of them (Equal to, Beginning with, Contains, etc.) and then the button On/Off. The arrows, on the right, allows altering the order of the fields.

For the Date type fields, you can define special conditions for the search, accessing the field configurations, and editing the Special Conditions Settings.

Below the list are the buttons to enable the selected options:

- **On/Off:** Enables or disables the field or the option chosen.
- **All:** Marks all fields or options.
- **None:** Unmarks all the fields or options.

Advanced Search

Settings

Through the table below we are able to set all the options that will be part of the application "Grid Search".

Margins

Defines the position of the margins of the Search Form.

Keep Values

It keeps the searched values when the user returns to the search form.

Keep Columns and Order Selection

Set it to preserve the selected columns and sorting for each search, if they went changed by the user through the toolbar options.

Use Enter to

It allows you to define the action that the Enter Key has on the Search form. **Tabulate** enables you to navigate between fields, and **Submit** performs the search(activates the Search button).

Display Tags

Allows displaying as tags, the searches used for the Grid.

Display after filtering

Display tags only after performing an advanced search. If disabled, it will always display a tag, regardless of the advanced search.

Unify results

Sets the chars limit to group the result of the tags. This option should be used when the field type is multiple-select.

Treeview in the Tags

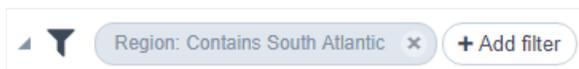

Sets the use of Treeview for tags.

Initial status of the Treeview

It sets the initial state of the Treeview. (If the app is using Treeview for tags)

Start open

It displays the tags.

Start close

It displays the full description of the tags as text.

Clear other filters after submit

After applying the advanced filter, all other filters will be deleted.

Interact with the dynamic filter

Apply the same filter in matching fields between Advanced and Dynamic Filter, when not showing the labels.

Highlight

Highlights the results in the query. It only works for “Exactly the same”, “Contains” and “Equal start” conditions.

To customize how the highlight will be displayed, you must access the theme editing tool.

- 1 - Access the **Layout > Application Themes** menu.
- 2 - Choose the desired theme and click **Advanced Mode**.
- 3 - Then look for the sub-item **Grid**, within the item of the same name.
- 4 - In this sub-item you will find the option “Line”, which contains the folders **Line Odd and Even**. In each of these folders you will find the option **Quicksearch highlight**, with the options for editing Text, Border and Background of the searched terms.

Select fields

![Interface for filter fields selection.][filtro_avancado_configuracao_selecionar_campos] *Interface for filter fields selection.*

Required

Defines which fields of application will be required for the Search.

![Required fields interface.][filtro_avancado_configuracao_campos_obrigatorios] *Required fields interface.*

The application generated will be displayed a bullet (*) next to the field and an error message is generated if not assigned no value.

![Configuration interface of the marker placement.][filtro_avancado_configuracao_campos_obrigatorios_posicionamento] *Configuration interface of the marker placement.*

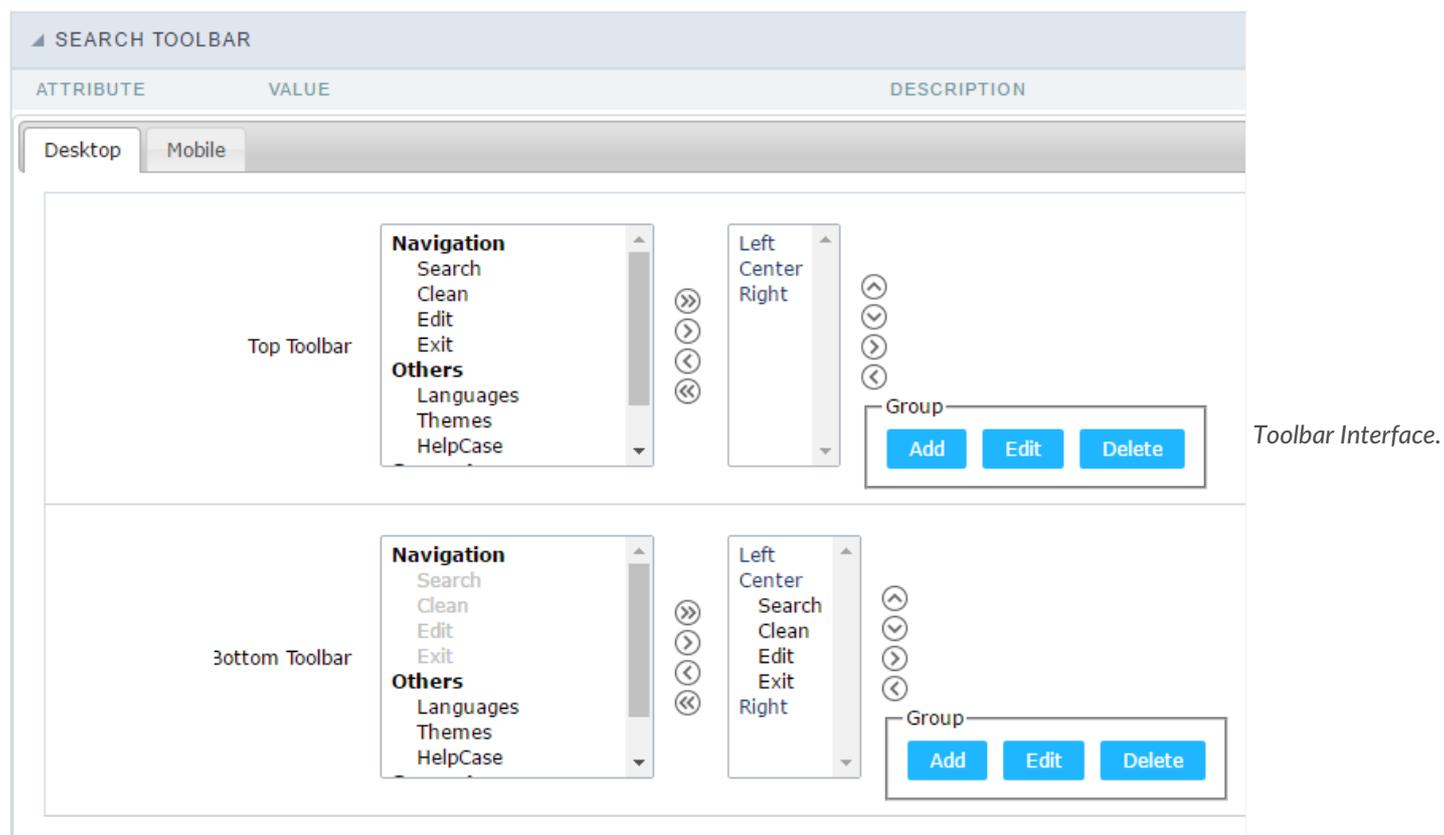

- **Marker position** : Marker’s position relative to the field.
- **Display message** : Displays whether or not the validation error message.

Toobar

Search Toolbar

The Search toolbar is divided in two parts: Top and Bottom, in a way that is possible to define the buttons that will be displayed in both bars. The selection of buttons in the top and bottom toolbar works independently, allowing the buttons to be displayed in

both bars at the same time.

Navigation:

Groups the options relative to the navigation buttons that can be displayed in the application.

- **Search:** Execute the search.
- **Clean:** Clean the all the search fields.
- **Edit:** Enable the **Save Tag** option.
- **Exit:** Exit the application.

Others:

Groups a diversity of options relative to the application.

- **Languages:** Displays a combobox with the names available, defined in the project properties.
- **Themes:** Displays a combobox with the themes available, defined in the project properties.
- **HelpCase:** Displays a button to redirect to the help page.

Separator

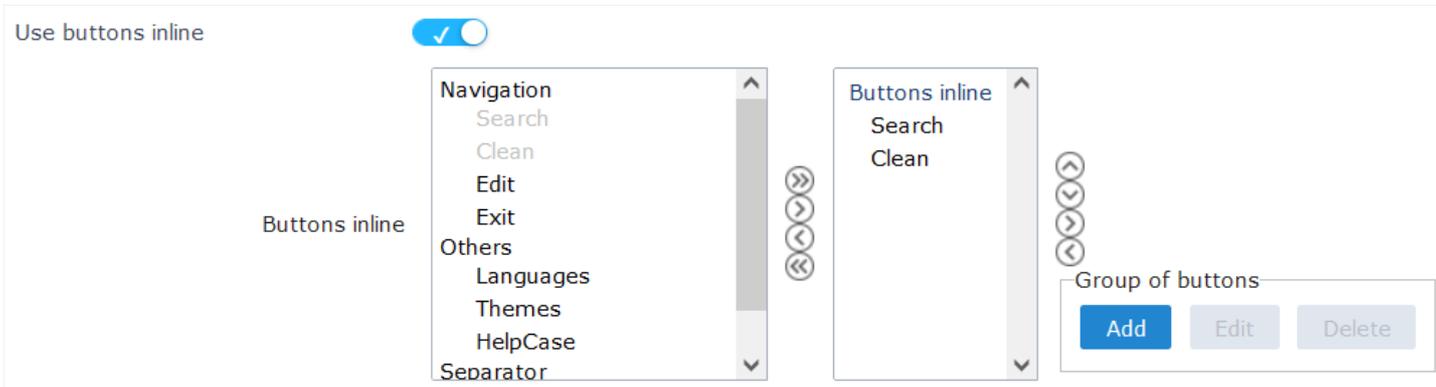

- -----: Displays a line separating the buttons, when used the Group Buttons.

Use in-line buttons:

Allows the alignment of the filter buttons next to the fields.

Inline buttons: Allows you to select which buttons will be displayed next to the field, and you can sort them according to your wishes. This option is available by enabling **Use buttons inline** in the button settings.

When activating the **Inline Buttons** option, the screen to configure the buttons will be displayed.

The buttons available in this in-line button option are the same as those shown in the standard toolbar described above.

This is the result when using a radio button on the line

Button Settings

BUTTON SETTINGS

Save Filter Interface.

Events

In event blocks can be used global variables, local, JavaScript code, CSS codes and Scriptcase macros.

onScriptInit

This event occurs when the application its loaded, or reload. Occurs before the application runs the SQL statement, so using this event it is possible to modify the grid SQL statement dynamically, based on any logical. Macros frequently called on this event: `sc_select_field`, `sc_select_order`, `sc_select_where(add)`, etc.

onRefresh

This event occurs when the form application is reloaded, is possible to reload the form based on fields (select , radio, checkbox)

onSave

This event occurs always that some search setting is saved in the filter application.

onValidate

This event occurs when the search form is submitted. Ex. in order to prevent some searches or to validate any search params if(`strlen({name}) <= 0`) { `sc_error_message(" Please fill the name field before submit your search ")`; }

Layout

This module lets you editing display options for the application. You can apply visualization themes, organize blocks, define values, and the display format of the Header and Footer.

Layout Settings

ScriptCase creates an app by using default values defined per project, but you can change those values for a specific application on this interface.

LAYOUT SETTINGS		
Header Template	<input type="text" value="Flat"/>	Template name used for the application header.
Footer Template	<input type="text" value="Default"/>	Template name used for the application footer.
Button	<input type="text"/>	Use different buttons than what was defined in the color scheme.
Themes	<input type="text" value="Sc9_Rhino"/>	Use different themes from the one defined for the color scheme

Application Layout

Settings

Header Template

Allows choosing the look of the application Header.

Footer Template

Allows choosing the look of the application Footer.

Button

Allows choosing the button theme for the application.

Themes

Choose one of the selected themes in the project properties. It defines the look of the application, like colors, fonts, and others.

Header & Footer

Header

Here we can define if we want to display the header or not, the application title, and fill the header variables. The header looks according to the selected template in the Layout settings interface.

▲ HEADER	
ATTRIBUTE	VALUE
Display Header	<input checked="" type="checkbox"/>
Insertion Title	<input type="text" value="{lang_othr_frmi_tit} - orders"/>
Update Title	<input type="text" value="{lang_othr_frmu_tit} - orders"/>
Header Variables	
SC_HEADER	<input type="text" value="Title"/>
SC_VALUE	<input type="text" value="Date"/> <input type="text"/> ?

Application Header Configuration

Display Header

This option determines if we want to display the header or not.

Title

Allows informing the title of the application.

Header Variables

We must fill the variable fields with one of the types available in the Combobox. Depending on the type, you need to associate content with it. Those are the types:

- **Field:** When you choose the option “**Field**”, it opens a Combobox to choose a field to associate the field value with the header.
- **Title:** It displays the value of “**Application Title**” in the header.
- **Date:** It displays the system’s date in “yyyy/mm/dd” format in the header. There are several display formats available, and you can change it by using the text field beside it. To access existing formats, click on the hint to see an explanation.
- **Image:** It displays a field to inform the name of an existing image in the server. You can select an image by clicking on the icon “**Choose Image**”, and you still can upload new images by using the button “**Upload**”.
- **Value:** It displays the content of the text input. You can inform static texts and “**Global Variables**”. e.g. “Employee Name: [v_name]”.

Depending on the Application, you may have more than one title option.

Footer

FOOTER	
ATTRIBUTE	VALUE
Display Footer	<input type="checkbox"/>
Footer Variables	
NM_FOOTER_DATA	<input type="text"/>
NM_FOOTER_LOGO	<input type="text"/>
NM_FOOTER_TITLE	<input type="text"/>

Application Footer Settings

This page may change depending on the footer template chosen in the Layout Settings.

Display Footer

This option determines if we want to display the footer or not.

Footer Variables

We must fill the variable fields with one of the types available in the Combobox. Depending on the type, you need to associate content with it. Those are the types:

- **Field:** When you choose the option "**Field**", it opens a Combobox to choose a field to associate the field value with the header.
- **Date:** It displays the system's date in "yyyy/mm/dd" format in the header. There are several display formats available, and you can change it by using the text field beside it. To access existing formats, click on the hint to see an explanation.
- **Image:** It displays a field to inform the name of an existing image in the server. You can select an image by clicking on the icon "**Choose Image**", and you still can upload new images by using the button "**Upload**". .
- **Value:** It displays the content of the text input. You can inform static texts and "**Global Variables**". e.g. "Employee Name: [v_name]".

Fields

This is a list of fields available for use in the filter. Click on the desired field to access the configuration instructions.

Text Field	Field Select
Integer Field	Field Double Select
Decimal Field	Field Checkbox
Currency Field	Field Radio
Date Field	Field Text Auto-Complete
Field time	Field Number Auto-Complete
Field Datetime

Application Settings Interface

• Attributes

- **Application Code** : It is the name that defines an application. An app can be renamed at the [List of Application](#).
- **Description** : This field contains a brief description of the application objectives.
- **Documents Path** : The absolute path to store uploaded documents in the application.
- **Image Directory** : The filesystem directory to store the application images.
- **Application images** : Import images into the application to allows using them in the application.
- **Language** : Set the default language of the application. Display all the application hints and messages in the selected language.
- **Share Location Variable** : Define if the app shares the regional settings with other applications through a session variable.
- **Charset** : Define a specific charset to use in the application.
- **Share Theme Variable** : Define if the app shares the Theme settings with other applications through a session variable.
- **Folder** : Define the project folder that contains the app.

- **Edit by Project** : Define if other project developers can edit the application.
- **Timeout** : Set the session runtime timeout in seconds. If the value is Zero, it assumes the default timeout of the PHP.
- **HelpCase Link** : It allows to associate a [HelpCase](#) file with the application.

Notification Settings

Notification settings	
ATTRIBUTE	VALUE
Use SweetAlert	<input type="checkbox"/>
Error Position on the field	Down ▾
Show the Error Title in the Application	<input checked="" type="checkbox"/>
Show the Error Title in the Field	<input type="checkbox"/>
Error Title	{lang_errm_errt}
Script Error	<input type="checkbox"/>

Ajax Error Output	<input checked="" type="checkbox"/>

- **Use SweetAlert**: Use the SweetAlert to display messages from the application. When this option is active, it will replace the browser's "confirm" and "alert".
- **SweetAlert position using Toast** : The position to display error messages on the application.
- **Error Position on the field** : The position to display error messages when criticizing the field.
- **Show the Error Title in the Application** : Define to display the title line of the error message or not.
- **Show the Error Title in the Field** : Define to display the title line of the error message in the field or not.
- **Script Error** : Allows displaying the line code where there is an error..
- **SQL Error** : Allows displaying the SQL statement if it got an error.
- **Debug Mode** : Runs the application in Debug mode, showing all SQL statements the application is executing.
- **Ajax Error Output** : Enables the Ajax alert for debugging errors.

Navigation

This interface allows defining the navigating behavior of the application

NAVIGATION	
ATTRIBUTE	VALUE
Exit URL	<input type="text"/> 
Close on Exit	<input type="checkbox"/>
Redirect URL	<input type="text"/> 
Redirect Variable	<input type="text"/>

Navigation Interface.

Exit URL

URL to where the user goes when he clicks on the “exit” button.

Close on Exit

Close the browser window when the user clicks on the “exit” button.

Redirect URL

Redirect to another URL in case there aren’t any global variables available.

Redirect Variable

Creates a variable with the application name and sends it to the redirected application.

Global Variables

This screen shows all global variables used in the application

The global variable is an external parameter required for running the application. The application can include global variables in the WHERE clause, field definitions and names, event programming, and so on.

You can define global variables by using square brackets ([variable]). You can pass the parameters to the application through one of the methods: Session, Post, and Get

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(“) instead of the brackets([]) because of the conflict with the of Global Variables syntax{:target=”_blank”} Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

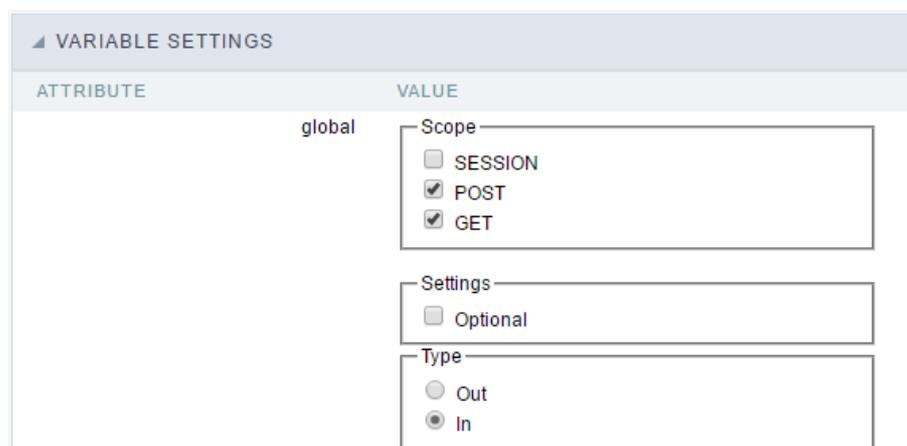

Global variables Interface.

Example:

```
Select CustomerID, CustomerName from Customers WHERE CustomerID = '[v_customerid]'
```

We do not recommend using session variables (global variables) with the same name as the table fields.

In this case, the variable **v_customerid** is displaying in the global variables configuration.

Global variables configuration Interface.

Attribute

It shows the variable's name in the application.

Value

Defines the behavior of the variables, divided into three blocks, they are:

Scope

Defines how the application receives the variable. A variable defined as the POST method in the app does not receive value if it comes with the GET method. Those are the methods available:

- **Session:** Defines that the variable must be created as a PHP session variable by another application.
- **GET:** Defines that the variable must be passed by the URL, that is, visible by the browser.
- **POST:** Defines that the variable must be passed through the POST method of an HTML form.

Settings

- **Optional:** Check it to don't validate the variable at runtime.

Type (In / Out)

Defines whether the variable comes from another application (In), or it is starting in the current app (Out).

Description

Indicates where the application is using the variable.

PDF Report Programming

In this version of ScriptCase is incorporated the concept of programming with the use of attributes, methods, resources and libraries. In the previous version it was already possible to create business rules in applications using this concept. The big difference now is that this can be done in a more organized, facilitating both the development as the understanding of the rule by another developer.

Attributes

The attributes are variables that has the global scope declared in the application. An attribute that can be referenced in all the methods and the application's events.

Attributes configuration Interface.

Attribute Name : This field allows to inform the attributes name, after typing the name just click on **include**. In case you want to **update** click on the attributes name (located on the buttons' right side), do the necessary modifications and click on update. In case it is necessary to **delete** an attribute, it is necessary to do same process as the update, but when selecting the attribute, it is necessary to click on the delete button. The **clear** button, as the name suggests, it clears the list of all the attributes listed on the right.

Internal Libraries

To use the internal libraries just select the correspondent (Project Libraries for example). This process allows the methods existing in the library, to be visible in all the application's Events and Methods.

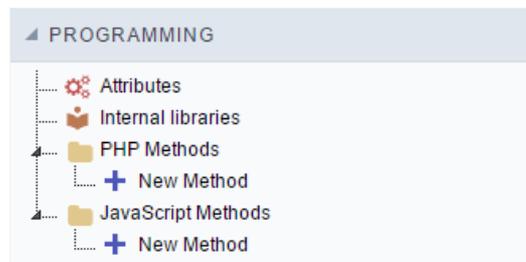

See how to manage the libraries by [clicking here](#).

Internal Libraries management Interface

PHP Methods

Methods are function or procedures declared by the developer, that helps when applying the routines. Using methods in the applications allows to reuse your code throughout the application, optimizing the development experience.

Creating a new method

- Give the method a name and click Create. As in the image below.

PHP methods are incorporated into the same class, so it is not possible to use two functions with the same name even when used in different methods.

A screenshot of a dialog box titled 'New Method - PHP'. It has a text input field labeled 'Name' containing the text 'new_method'. Below the input field is a blue button labeled 'Create'.

- Methods can receive parameters.

- Add the amount of variables:

A screenshot of a dialog box titled 'Definition of the parameters of the method:'. It shows the name 'new_method' in a text field. Below it, there is a list with one item: '• No defined parameter.'. At the bottom, there is an 'Add' button, a text input field containing '1', the text 'Parameter(s)', and a 'Cancel' button. Below the entire dialog is a 'Save' button.

- Defining the variables:

A screenshot of a dialog box titled 'Insertion of Parameters'. It contains a table with three columns: 'Name', 'Type', and 'Value Standard'. The 'Type' column has a dropdown menu open, showing three options: 'For Value', 'For Value', and 'For References'. Below the table are three buttons: 'Save', 'Back', and 'Cancel'.

Name	Type	Value Standard
	For Value	
	For Value	
	For References	

- **Name** : Type in the variable's name.

- **Type** : Selecting the type of variables: For Value or For Reference.
- **Value Standard** : The parameter's value used to initialize when calling the method.

References allows to create a second name for a variable that you can use to read and modify the variable's original information.

- Editing a parameter:

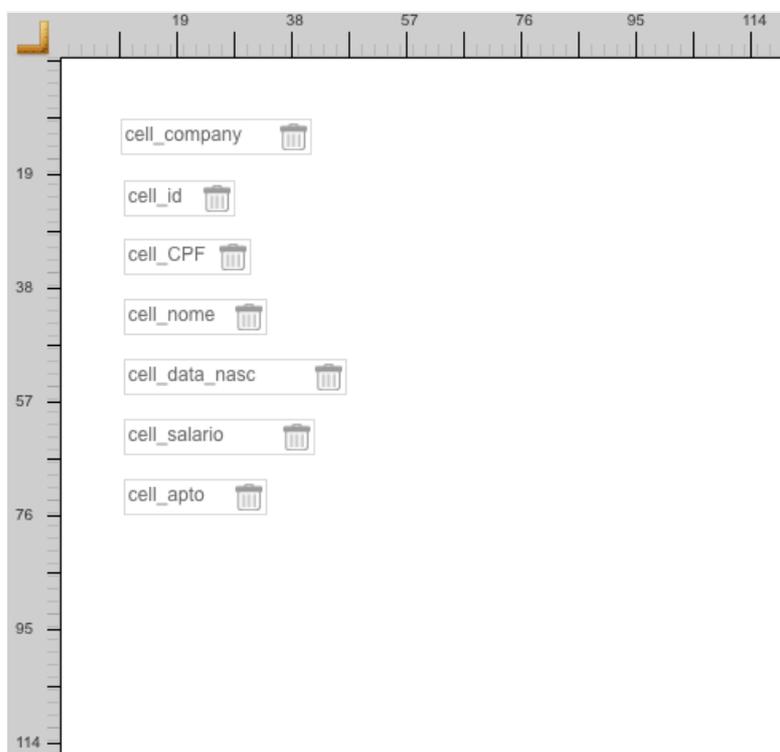

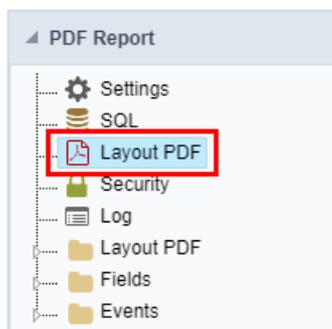

The screenshot shows a dialog box titled "Definition of the parameters of the method:". The main area contains the text "new_method". Below this is a "Parameters" list box containing "\$test = test". To the right of the list box are two circular arrows (up and down) for navigation. Below the list box are three icons: a checked checkbox, an unchecked checkbox, a pencil icon, and a red X icon. At the bottom of the dialog, there is an "Add" button, a text input field containing "1", the label "Parameter(s)", a "Cancel" button, and a "Save" button.

- : Checking all the parameters in the parameter list.
- : Uncheck all the parameters in the parameter list.
-  : Edit the selected parameter of the list.
-  : Deletes the selected variable of the list.

PDF Report Layout PDF

The PDF Report application has a way of positioning the report fields in a simple and dynamic way, using the drag and drop functionality.

In the PDF Layout, at the main screen, you can change some application settings. These settings are also present in PDF Report > Settings.

Using Drag and Drop functionality, you can configure the placement of fields in this interface. To change them you need to click on the field you prefer to change the position and drag to their new position.

Clicking on a specific field opens a field configuration screen.

Properties

Property	Value
Name	cell_companyname
Field	companyname
Pos X	10
Pos Y	20
Width	0
Alignment	Left
Font	Arial
Font Size	0
Font Color	—
Font Style	<input type="checkbox"/> Bold <input type="checkbox"/> Italic <input type="checkbox"/> Underline
Show	<input checked="" type="checkbox"/>

- **Name:** On this field, it is necessary to inform a name to identify the field.
- **Field:** On this option, you need to select the field from the table that will be used in the cell. In case you have selected a field from the “Special” category you will see the following:
 - **System Date:** The current date of the system on which the application runs.
 - **Current Page:** Number of the current page that the cell is located.
 - **Total Page:** Total number of application pages.
 - **Label:** Selecting this option will open an input so you can inform the text that will be displayed.
- **Pos X:** Positioning the X axis. Up and down.
- **Pos Y:** Positioning the Y axis. Left and Right.
- **Width:** Enter the width of the cell. The unit of value is pixel.
- **Alignment:** In this field, you will select the alignment of the cell text: Left, Right or Center.
- **Font:** In this field, you will select a source according to the list.
- **Font Size:** Here you inform the font size of the text that will be displayed.
- **Font Color:** In this field, you will inform a color in hexadecimal. (Example: # 000000)
- **Font Style:** In this field, you will mark the style of the font: Bold, Italic and / or Underline. (You can select more than one option)
- **Show:** In this field, you enable or disable the field display.

General Setting - Text Fields

Property	Value
Data Type	Multiple Lines Text
Case Settings	
Show HTML content	<input checked="" type="checkbox"/>
Amount of characters	50
Field Mask	
SQL Type	VARCHAR

- **Data Type** : Define the type of field for the application.
- **Case Settings** : Convert the letter from the field when losing focus. The options are:
 - **Upper case** : All in Upper Case.
 - **Lower case** : All in Lower case.
 - **Capitalize first word** : Capitalizes the first letter of the first word.
 - **Capitalize all words** : Capitalizes the first letter of all the the words.
- **Show HTML content** : Determines if the HTML contained in the field will be displayed or not. If enabled, the html will be displayed, otherwise the html will be interpreted by the browser.
- **Amount of characters**: Defines the field width. This option is available only for the field type **Multiple lines text**.
- **Field Mask**: In this field, you can configure a display mask according to the table given in Applications> Grid > Fields> Text.
- **SQL Type** : Informs the data type of field in the database.

General Setting - Integer Fields

Properties	General Settings	Lookup settings
Data Type	Integer	?
Field Mask		?
SQL Type	INTEGER	?
Regional Settings	<input checked="" type="checkbox"/>	?
Color of Negative	—	?

- **Data Type** : Define the type of field for the application.
- **Field Mask**: In this field, you can configure a display mask according to the table given in Applications> Grid > Fields> Text.
- **SQL Type** : Informs the data type of field in the database.
- **Regional Settings** : Allows to apply the Regional Settings to format of the fields. When not enabled, you will view attributes for set yourself. You can change of the Regional Settings in **Locales >Regional settings**. For more information [click here](#).
- **Color of Negative**: In this field, you will inform a color in hexadecimal. (Example: # 000000)

General Setting - Currency Fields

Properties	General Settings	Lookup settings
Data Type	Currency	?
Field Mask		?
SQL Type	INT	?
Regional Settings	<input checked="" type="checkbox"/>	?
Currency Format	<input checked="" type="checkbox"/>	?
Color of Negative	—	?
Decimal precision	0	?
Complete with Zeros	<input checked="" type="checkbox"/>	?

- **Data Type** : Define the type of field for the application.
- **Field Mask**: In this field, you can configure a display mask according to the table given in Applications> Grid > Fields> Text.

- **SQL Type** : Informs the data type of field in the database.
- **Regional Settings** : Allows to apply the Regional Settings to format of the fields. When not enabled, you will view attributes for set yourself. You can change of the Regional Settings in **Locales >Regional settings**. For more information [click here](#).
- **Currency Format** : Defines the content of the field that if it will be presented with the currency format.
- **Color of Negative**: In this field, you will inform a color in hexadecimal. (Example: # 000000)
- **Decimal Precision** : Number of decimal places. This value is part of the field size.
- **Complete with Zeros** : Defines the decimal places that will or not be completed zeros to the right. Example: The value is 125,50, but the decimal precision is 3. If the option is enabled, then the value will 125,500.

General Setting - Decimal Fields

Property	Value
Data Type	Decimal
Field Mask	
Repeat value	<input checked="" type="checkbox"/>
SQL Type	INT
Regional Settings	<input checked="" type="checkbox"/>
Color of Negative	—
Decimal precision	0
Complete with Zeros	<input checked="" type="checkbox"/>

- **Data Type** : Define the type of field for the application.
- **Field Mask**: In this field, you can configure a display mask according to the table given in Applications> Grid > Fields> Text.
- **SQL Type** : Informs the data type of field in the database.
- **Regional Settings** : Allows to apply the Regional Settings to format of the fields. When not enabled, you will view attributes for set yourself. You can change of the Regional Settings in **Locales >Regional settings**. For more information [click here](#).
- **Color of Negative**: In this field, you will inform a color in hexadecimal. (Example: # 000000)
- **Decimal Precision** : Number of decimal places. This value is part of the field size.
- **Complete with Zeros** : Defines the decimal places that will or not be completed zeros to the right. Example: The value is 125,50, but the decimal precision is 3. If the option is enabled, then the value will 125,500.

General Setting - Percent Fields

Property	Value
Data Type	Percent
Related Field	
Field Mask	
Repeat value	<input checked="" type="checkbox"/>
SQL Type	INT
Regional Settings	<input checked="" type="checkbox"/>
Color of Negative	—
Decimal precision	0
Complete with Zeros	<input checked="" type="checkbox"/>

- **Data Type** : Define the type of field for the application.
- **Related Field**: Field that contains the values for the calculation of the percentage.
- **Field Mask**: In this field, you can configure a display mask according to the table given in Applications> Grid > Fields> Text.
- **SQL Type** : Informs the data type of field in the database.
- **Color of Negative**: In this field, you will inform a color in hexadecimal. (Example: # 000000)

General Settings - Date/Time Fields

Property	Value	Help
Data Type	Date and Time	?
SQL Type	VARCHAR	?
Regional Settings	<input checked="" type="checkbox"/>	?
Display	ddmmyyyy hhmmss	?
Internal Format		? ?

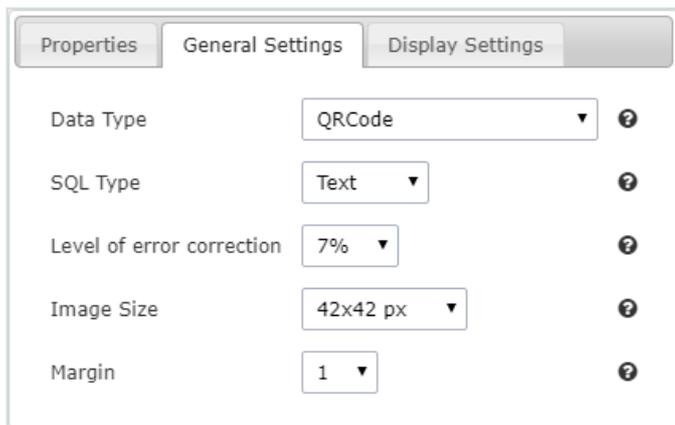

- **Data Type** : Define the type of field for the application.
- **SQL Type** : Informs the data type of field in the database.
- **Regional Settings** : Allows to apply the Regional Settings to format of the fields. When not enabled, you will view attributes for set yourself. You can change of the Regional Settings in **Locales >Regional settings**. For more information [click here](#).
- **Display**: Offers a series of formats predefined for displaying dates.
- **Internal Format**: Defines the internal format of the fields (for database storage) date, time, and datetime if the field type in SQL is varchar type.

General Settings - Bar code Fields

Property	Value	Help
Data Type	Bar code	?
Label	barcode	?
Height	0	?
Width	0	?
SQL Type	Text	?

- **Data Type** : Define the type of field for the application.
- **Height**: Sets the height in pixel of the image display. Must contain only numbers.
- **Width**: Sets the width in pixel of the image display. Must contain only numbers.
- **SQL Type** : Informs the data type of field in the database.

General Settings - QRCode Fields

Property	Value	Help
Data Type	QRCode	?
SQL Type	Text	?
Level of error correction	7%	?
Image Size	42x42 px	?
Margin	1	?

- **Data Type** : Define the type of field for the application.
- **SQL Type** : Informs the data type of field in the database.
- **Level of error correction**: Codewords are 8 bits long and use the Reed–Solomon error correction algorithm with four error correction levels. The higher the error correction level, the less storage capacity.
- **Image Size**: Lets you set the display size of the QR Code by selecting one of the available sizes.
- **Margin**: Lets you set the margin width around the QR Code by selecting one of the available sizes.

Creating a PDF Report Application

New Application

With the growing evolution of the Grid/Report application's features for generating reports, the old PDF Report application was removed from the interface. However, it is still possible to use it.

To enable this functionality, the Scriptcase administrator must access the **Options > Settings** menu and open the System Settings page.

At the bottom of the page, after the foreign key configuration section, you can enable the old menu application to display it as an option when creating new applications.

Mostrar una opción en el asistente de despliegue para almacenar variables de sesión PHP en la base de datos	<input type="radio"/> Sí <input checked="" type="radio"/> No
Pase el ID de la sesión de PHP en la url	<input type="radio"/> Sí <input checked="" type="radio"/> No
Optimización de clave externa	<input checked="" type="radio"/> Sí <input type="radio"/> No
Mostrar aplicación de Menú antigua	<input checked="" type="radio"/> Sí <input type="radio"/> No
Mostrar la aplicación Informe PDF	<input type="radio"/> Sí <input checked="" type="radio"/> No
Timezone	<input type="text"/>

[Actualizar](#)

Once enabled, the application will appear on the new application creation screen, as shown in the image below.

  customerid,
  employeeid,
  orderdate,
  requireddate,
  shippeddate,
  shipvia,
  freight,
  priceorder,
  shipcountry,

```

SQL Builder

Connection

Defines the connection used for the creation of the application. The existing connections in the project will be listed.

Name

The name of the application being created. It cannot contain special characters.

Table

Defines the tables to be used in the application. (Form and Calendar can only use one table).

Fields

Defines the fields that will be part of the applications.

Localization

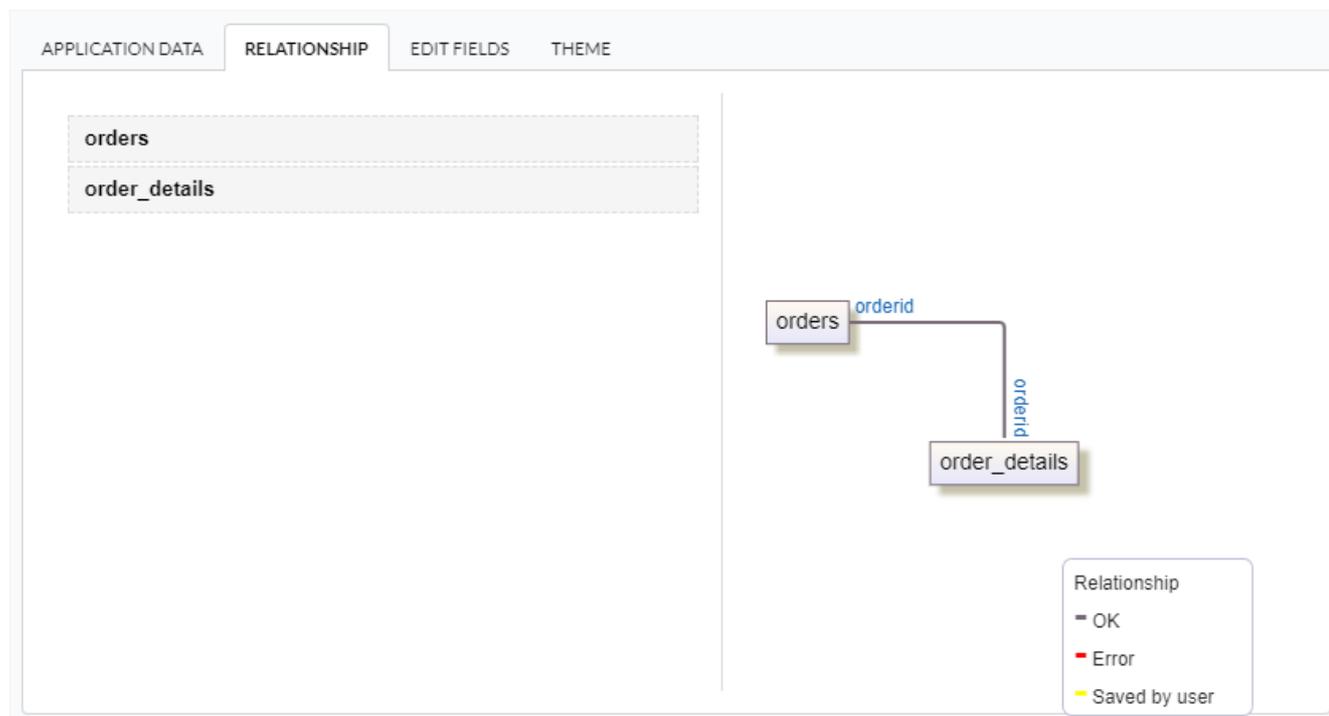

The language of the application to be created. The project's default language is automatically selected.

SQL

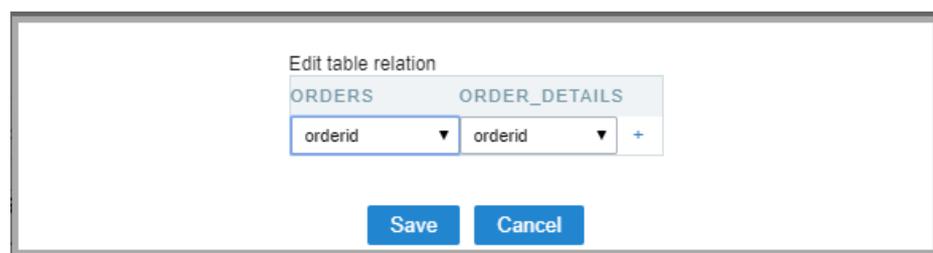

Displays the SELECT command generated after selecting the tables and fields. This field also allows the insertion of a previously created SQL statement, as long as it uses tables that exist in the database selected in the connection.

Relationship

When select two or more tables, the tab “Relationship” will be displayed. In this tab we can see the relationship created between the tables, where we can edit the related fields.

When we click in a link, in the screen above, it will displayed the related field's edition form, as you can see in the image below.

Edit Fields

This screen displays the fields of the selected tables and allows adjustments to be made before creating the application, such as changing the data type, display name, and other configurations.

PDF REPORT

APPLICATION DATA EDIT FIELDS THEME

Fields	Label	Datatype	Search
orderid	<input type="text" value="Orderid"/>	<input type="text" value="Integer"/>	<input checked="" type="checkbox"/>

Form Calendar Settings

This interface is useful for editing the main display settings of the app.

Settings	
ATTRIBUTE	VALUE
Friendly URL	<input type="text" value="Form"/>
Line break in title	<input checked="" type="checkbox"/>
Horizontal Alignment	<input type="text" value="Center"/>
Vertical Alignment	<input type="text" value="Center"/>
Margins	<input type="text" value="10"/> Top <input type="text" value="10"/> Down <input type="text" value="10"/> Right <input type="text" value="10"/> Left
Inputs 100% width	<input checked="" type="checkbox"/>
Table Width Unit	<input type="text" value="Percent"/>
Table Width	<input type="text" value="20"/>
Table Columns	<input type="text" value="Automatic"/>

Form Settings Interface.

Friendly URL

Allows to define a URL for the application different from the application name. You can use the following chars (a-z, A-Z, 0-9, - _). You still can change it on the initial screen of the home project, through the "Friendly URL" column in the apps list.

Line break in title

Use it if you want to break the line on the field titles.

Horizontal Alignment

Allows you to set the alignment of the application on the page.

Vertical Alignment

Allows you to define the initial vertical alignment of the application (Above, Centered and Below).

Margins

Allows to define the margins of the application (Right, Left, Up and Down) in pixels.

Table Width

The width of the form table. Scriptcase uses Plain HTML to generate applications by using tables lines and cells.

Table Width Unit

Measurement unit for the table width defined in the previous option, being: percentage, pixel, or automatic.

Table Columns

This parameter defines the column (fields) width of the table (application).

Labels width

When the previous option is set to “Provided” you must inform the width of the labels here.

Layout and Behavior

This interface allows setting the behavior of the app.

Layout and Behavior	
ATTRIBUTE	VALUE
Notify discarded changes	<input checked="" type="checkbox"/>
Automatic tab	<input type="checkbox"/>
Highlight Text on Focus	<input checked="" type="checkbox"/>
Use Enter to	<input type="text" value=""/>
Field with Initial Focus	<input type="text" value="accountid"/>
Highlight Field with Error	<input checked="" type="checkbox"/>
Display icon only on mouseover	<input checked="" type="checkbox"/>

Layout and Behavior configuration Interface.

Notify discarded changes

Notifies the user when any changes made will be lost when reloading the data.

Automatic tab

Changes the focus to the next field when the amount of characters reaches its defined limit.

Highlight Text on Focus

Highlights the field when selected.

Use Enter to

Allows to use the “Enter” key to pass the focus to the next field.

Field with Initial Focus

Determines the field starts with focus when accessing the application. This option doesn't work with fields that contain a watermark.

Highlight Field with Error

Focus the field with the error when submitting the form.

Use a template from the HTML Editor

Allows to use the TinyMCE editor. You can edit and create your HTML Templates.

Edit

Fields Configuration.

Fields

It allows accessing the field settings (a pencil icon on the left). You can change the field position by dragging them to the desired position. Drag a field to "fields not displayed" if you don't want it in the app.

Label

It defines the title of the field in the app. For example: if the field name in the database is fld_txt_customer_name, you can display the label "Customer Name".

Data type

It informs the data type of the field.

New

It defines if the field is available when inserting new records.

Update

It defines if the field is available when updating records.

Read-Only

It defines the field as a label. The user can't change its value.

Required

It defines if the field must contain a value.

PK

It defines the Primary Keys fields.

DB value (Insert)

Defines a default value for the field when inserting a new record, like an auto-increment, Date, DateTime, or IP.

DB value (Update)

Defines a default value for the field when updating a record, like an auto-increment, Date, DateTime, or IP.

Page

It shows the pages available in the application. All apps have a page, at least. Each page contains one or more blocks.

Blocks

It shows the blocks available in the application. Blocks contain fields. All apps have a block, at least. A block is displayed if it contains one or more fields.

Page Fields Not Shown

Here we can see the fields that are not in the application.

Observe that you can drag any line to the desired position, blocks, and page. Pages contain Blocks, and Blocks contain fields.

Display Settings

Settings of messages display.

Calendar Fields positioning

In this configuration screen we have a list of all the fields available in the application, whether they are fields mapped from the table or virtual fields (Created only in the Scriptcase interface).

It is also possible to allow the end user to manipulate the application's fields in the way they prefer, for that we must add the **columns button** in the application's toolbar.

In the **left column**, we have a list with all the fields available for use and in the **right column** we have a list of the fields that were selected to be displayed in the running application.

Adding and Removing Application Fields

The fields must be configured using the selection buttons, located between the columns.

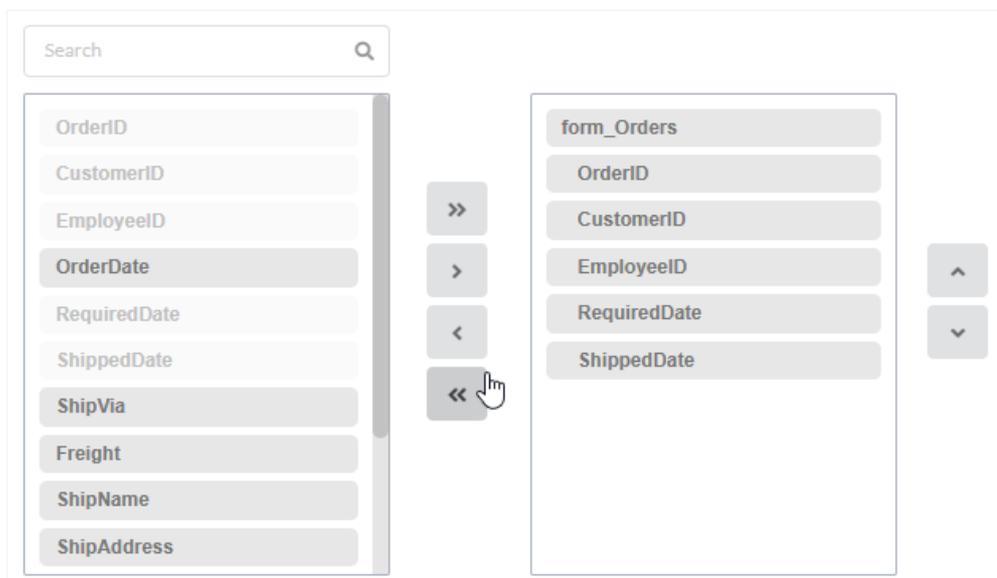

- **»** - Move all fields to the right.
- **>** - Moves only selected fields to the right
- **<** - Moves only the selected fields to the left.
- **«** - Move all fields to the left.

In the left column, there are the application fields that are not in use in the filter, while the right column shows all the selected fields and the order in which they will be displayed.

To add fields to the filter, select the fields you want in the filter and click the **>** button.

To select fields in sequence, simply click on a field and drag. Pressing control (Ctrl) allows you to select multiple alternate fields.

Search and positioning

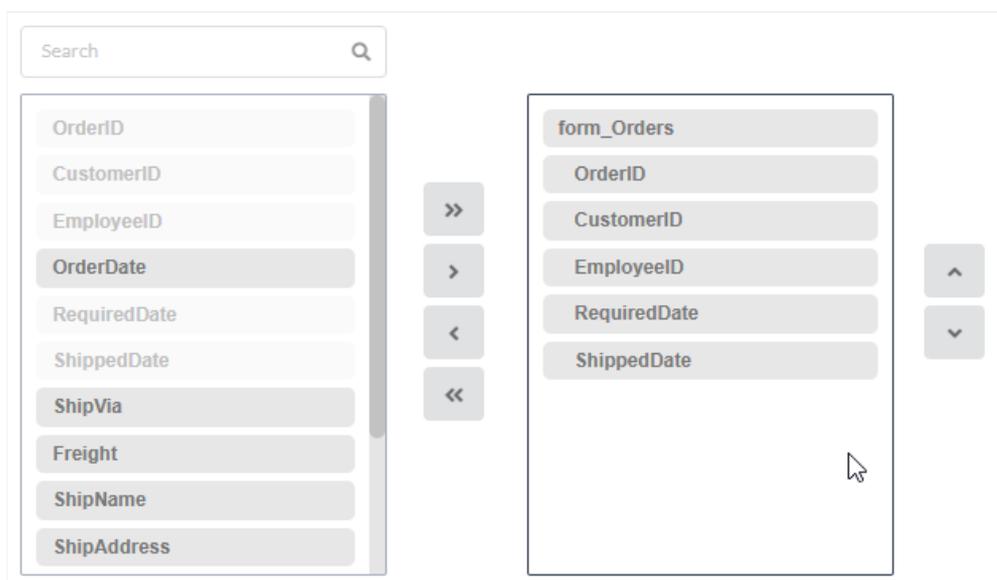

Field display order

The fields will be displayed in the application respecting the order defined in the right column.

The display order must be defined using the sort buttons  and  which will move the selected fields in the column.

Remembering that the fields must be positioned inside a block (**customers**) which must be inside a page (**Pag1**).

Check below the use of the buttons to order the fields

Save and Restore

Below the columns are two buttons:

- **Save** which records the current placement of fields in columns.
- **Restore** which reorganizes the fields returning to the last position saved.

Restoring the positioning of the fields to the last saved definition.

Search

OrderID		form_Orders	
CustomerID		OrderID	
EmployeeID	>>	CustomerID	
OrderDate	>	EmployeeID	^
RequiredDate	<	RequiredDate	v
ShippedDate	<<	ShippedDate	
ShipVia			
Freight			
ShipName			
ShipAddress			

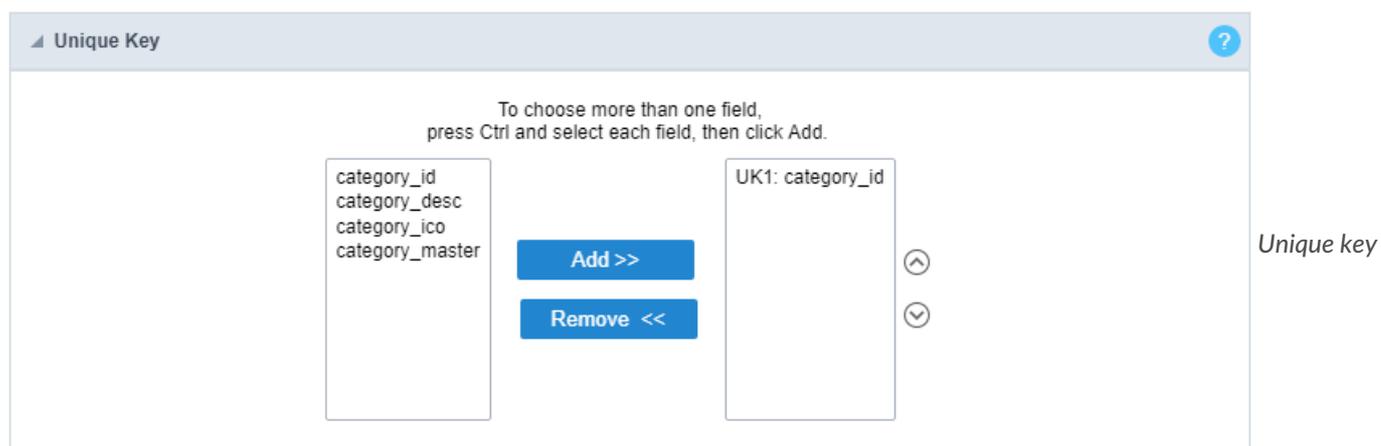

Restore Save

Unique key

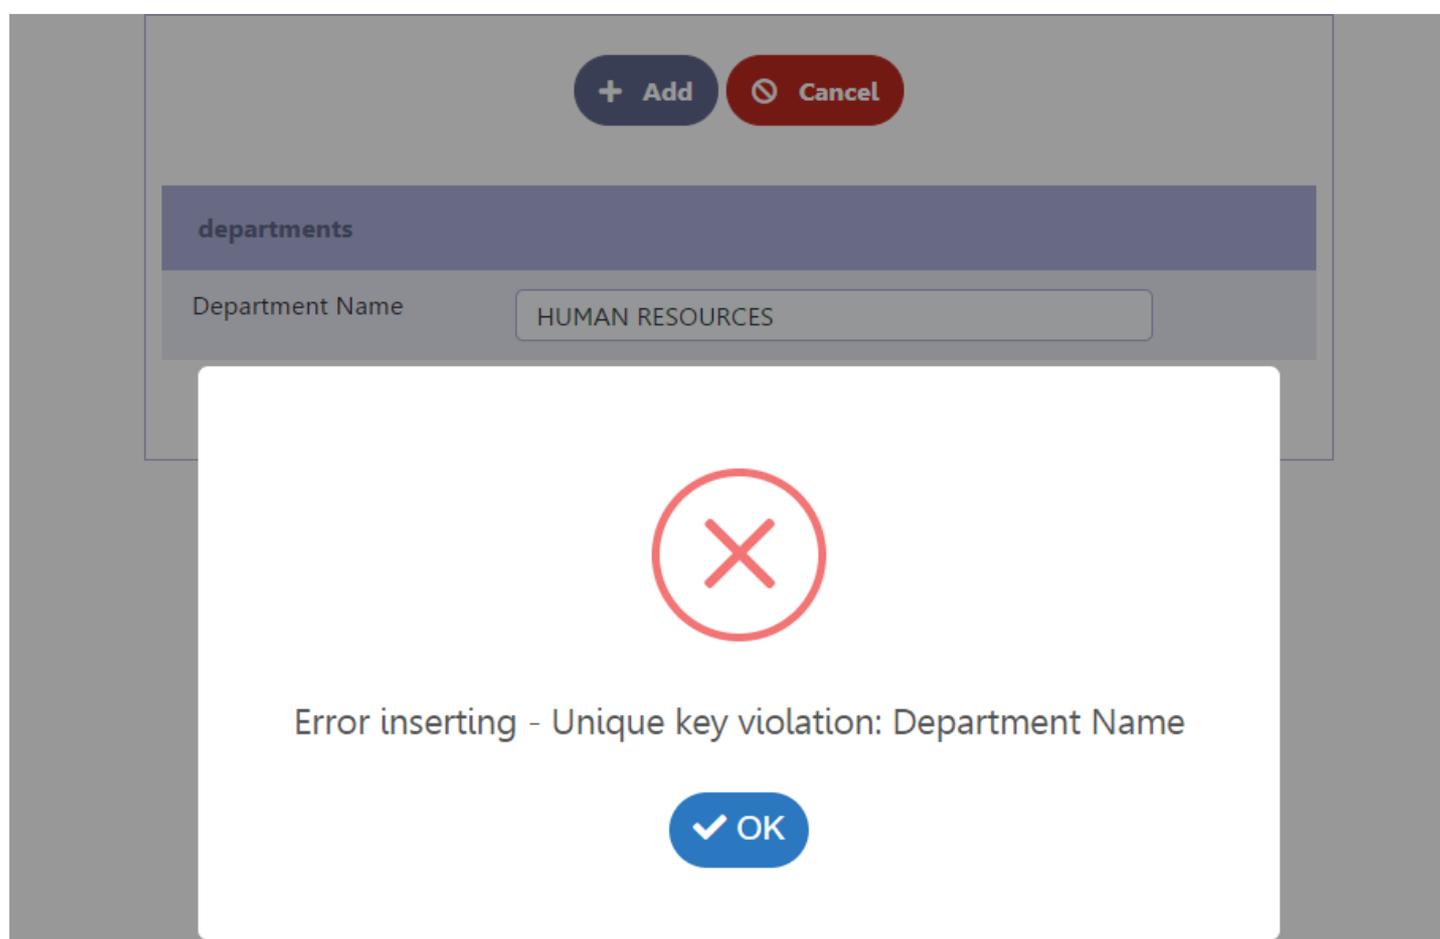

With the unique key option you can inform which fields' data should not have repetitions within the database.

configuration Interface

If you want to combine two or more fields as unique, select the fields by holding the CTRL key of your keyboard and then click on the "Add" button.

The user will receive message if tries to insert a repeated value into the application. The validation and message are created automatically by Scriptcase, you are able to customize it by accessing the [application language](#) option and searching for the lang variable: `{lang_errm_inst_uniq}`. This lang variable contains a pre-set error message content.

Unique key message example

Navigation:

Buttons relative to the navigation of the application.

Next	Move to the next page that can be a single record or a list of records.
Previous	Returns to displays the previous page records or a single record.
First	Move to the First page or record
Last	Move to the Last page or record
Exit	Close the application
Navigation by page	Displays a “page-number” navigation bar. Example: 1 2 3 4 5
Reload	Displays a button to reload the query data

Export:

The options available to export the Records. Scriptcase generates the following export formats for Forms:

PDF	Generates all the data of the application in a PDF format.
Print	Creates an HTML with the records ready for printing.

Update:

The CRUD options available in the Form.

Insert	Inserts the record into the database.
Update	Saves the changes made in a record.
Delete	Deletes the selected record.
Cancel	Cancel the changes made in a record before the insertion.

Others:

Other options available in the Form application.

Jump To	Move to the informed page or record.
Copy	Copy the current record data to another one.
Quick Search	Perform a quick search in the records of the application.
Dynamic Search	It displays the fields of the search to filter the records.
Languages	Displays a Combobox with the languages available in the project properties.
Themes	Displays a Combobox with the languages available in the project properties.
Rows Counter	Displays the number of records retrieved in the application.
HelpCase	Displays a button to open the help page.

Separator:

-----	Displays a line separating the buttons.

It is the displayed name for the button group in the application.

Hint\Title

Displays a hint to the end-user when the mouse is on the group of buttons.

Button Type

Allows displaying the button group as a Button, Image, or Link.

Image

Allows selecting an image for the button.

Display

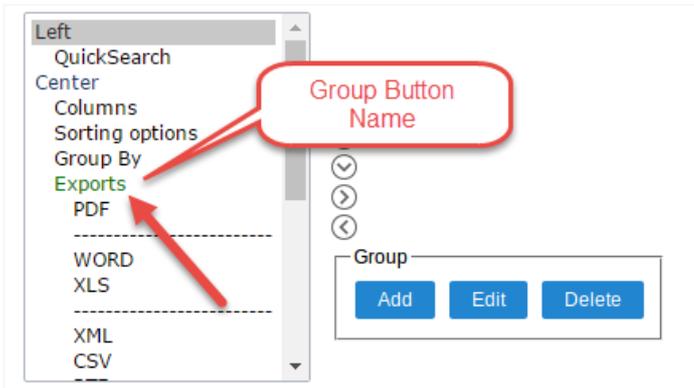

Defines if the button displays only Text, only image, or both.

Display Position

Defines the position of the Text or Image (Text to the right, Image to the right).

After creating a button group, you need to move the grouped buttons below of the Button Group and then move them to the

right. Like the image below:

Buttons Settings

Button	Label	Hint
QuickSearch		
Dynamic Search		
Insert		
Cancel		
Update		
Delete		
Exit		
Jump to		
First		
Previous		
Navigation by page		
Next		
Last		
Rows Counter		
New		

Button:

It displays the buttons available in the application.

Label:

Allows defining the labels of the buttons to display for the users.

Hint:

Allows defining the buttons hint that to display for the users.

Application Hotkeys

Scriptcase allows creating shortcut keys to your applications. You can select a predefined template or create specific actions for an application.

Application Hotkeys ?

ATTRIBUTE	VALUE	DESCRIPTION
Use hotkeys	<input checked="" type="checkbox"/>	Define if the application will use hotkeys
Hotkeys template	<div style="border: 1px solid #ccc; padding: 2px; display: inline-block;">SC_DefaultHotkeys</div> ▼ ↻ ✎	Select the hotkey template from previously created schemas

Clean
+

ACTION	KEYBINDING
No hotkeys configured	

Clean
+

Use hotkeys

Defines if the application uses hotkeys. When you enable this option, the default shortcut keys settings are disabled.

Hotkeys template

Select the [hotkey template](#) previously created.

Action

Selects the triggered action when pressing the selected key.

Keybinding

Selects the keys responsible for executing the chosen action.

Add “+”

Adds a new action on the keys list.

Clear

It clears the selected hotkeys preference.

Options

Options	
ATTRIBUTE	VALUE
Format Row Counter	<input type="text"/>
The number of links displayed	<input type="text" value="5"/>
Help by Block	<input type="checkbox"/>
General Help	<input type="checkbox"/>
Toolbar buttons	<input type="text" value="A DIV below the toolbar."/>

Format Row Counter:

Allows defining the format of the row counter displayed on the application.

Example: (1 to 10 of 200)

The Number of Links Displayed:

Defines the number of links per page, when the navigation option is disabled.

Help by Block:

Indicates if the helps messages from relatives fields are grouped by block. In each field, we can define a help text. With this option activated, it shows up an icon in the block title bar to call the help page.

General Help:

The General Help “consolidates” all the fields help pages in a single page, putting an icon in the toolbar to call the help page.

Calendar SQL Settings

This interface allows configuring the related database settings, such as the Primary Key, Filters, Sorts.

SQL SETTINGS		
ATTRIBUTE	VALUE	DESCRIPTION
Select primary key fields.		
	<div style="display: flex; justify-content: space-around;"> <div style="text-align: center;"> <input type="button" value="On/Off"/> <input type="button" value="All"/> <input type="button" value="None"/> </div> <div style="border: 1px solid #ccc; padding: 5px;"> <div style="display: flex; justify-content: space-between;"> *orderid ▲ </div> <div style="font-size: 0.8em;"> customerid employeed orderdate requireddate shippeddate shipvia freight priceorder shipcountry </div> <div style="display: flex; justify-content: space-between;"> ▼ ⬆ ⬇ ⬆ </div> </div> </div>	
Where clause	<input type="text"/>	SQL
Order By	<input type="text"/>	
Connection	<input type="text" value="conn_mysql"/>	
Table Name	<input type="text" value="orders"/>	
Variable for Table	<input type="text"/>	
Case Sensitive	<input checked="" type="checkbox"/>	

configuration Interface.

Select primary key fields

It lets you define the Primary key of the Form. ScriptCase already identifies Primary Keys, but you can manually inform or change it by using the buttons beside the fields list. See how the buttons work:

- **On/Off** : Adds or Removes the attribute that defines the primary key for the field. The primary key fields have an asterisk beside their names.
- **All** : Defines all fields as Primary Keys.
- **None** : Defines none fields as Primary Keys.
- **Sorting Button** : These are the arrows on the right side of the Combo box. It allows ordering the fields of the Primary Key, placing it in the desired order. To order them, click on the field and use the arrows to move it.

Where clause

It allows adding a WHERE clause to filter the SQL records.

Order By

It allows adding an ORDER BY clause to determine the order to display the records. By default, it uses the primary key to sort the records.

Connection

It allows defining the database connection of the application. You can change the connection to another one that has the same table.

Table Name

It informs the database table used in the Form.

Variable for Table

It allows to use a variable to change a part of the string containing the table name.

Var
orders

Variable for Table Configuration.

Fill the first input with the name of the variable (replace to). The second input you should fill with the part of the name of the table you want to replace (replace from).

Case sensitive

It defines if the database connection uses case sensitive or not.

Procedures

This interface allows configuring a Form application to execute the Stored Procedures from your database for Insert, Update and Delete records in the form. You don't need to use the three options simultaneously. If a Procedure option is not enabled, it continues to work as default by using the INSERT, UPDATE and DELETE commands.

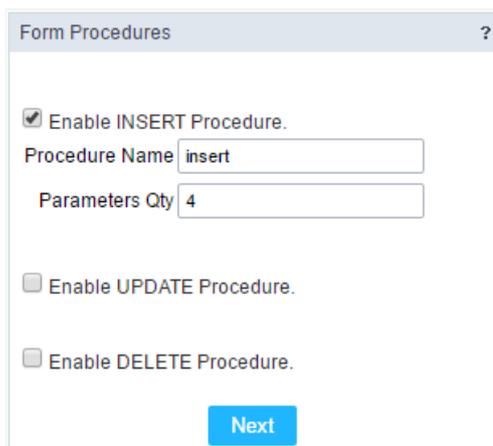

See below, the step-by-step to enable a Stored Procedure for inserting records into the database.

The screenshot shows a dialog box titled "Form Procedures" with a question mark icon. It contains three unchecked checkboxes: "Enable INSERT Procedure.", "Enable UPDATE Procedure.", and "Enable DELETE Procedure.". At the bottom right, there is a blue "Next" button.

Form Stored Procedures Interface.

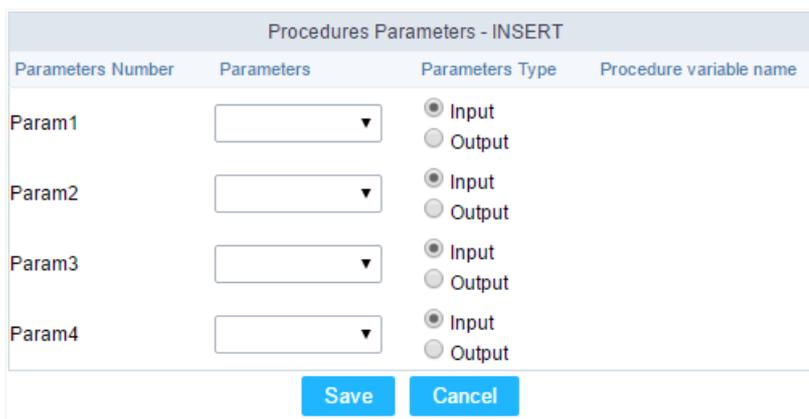

- Let's check the first option: "Enable INSERT Procedure". Then, inform the Name of the Procedure and the number of parameters.

The screenshot shows the "Form Procedures" dialog box with the "Enable INSERT Procedure." checkbox checked. Below it, the "Procedure Name" field contains the text "insert" and the "Parameters Qty" field contains the number "4". The "Enable UPDATE Procedure." and "Enable DELETE Procedure." checkboxes remain unchecked. A blue "Next" button is at the bottom right.

Defining parameters for the Procedure.

- Now associate the fields for each parameter of the Stored Procedure and the type of parameter (Input or Output). Click on the "Save" button to finish.

The screenshot shows a table titled "Procedures Parameters - INSERT". The table has four columns: "Parameters Number", "Parameters", "Parameters Type", and "Procedure variable name". There are four rows, each corresponding to a parameter (Param1 to Param4). Each row has a dropdown menu in the "Parameters" column and two radio buttons in the "Parameters Type" column, labeled "Input" and "Output". The "Input" radio button is selected for all parameters. At the bottom of the table, there are two buttons: "Save" and "Cancel".

Parameters Number	Parameters	Parameters Type	Procedure variable name
Param1	<input type="text"/>	<input checked="" type="radio"/> Input <input type="radio"/> Output	
Param2	<input type="text"/>	<input checked="" type="radio"/> Input <input type="radio"/> Output	
Param3	<input type="text"/>	<input checked="" type="radio"/> Input <input type="radio"/> Output	
Param4	<input type="text"/>	<input checked="" type="radio"/> Input <input type="radio"/> Output	

Passing the values to the Stored Procedure Parameters.

JavaScript

To coding with JavaScript in Scriptcase Form application, we must associate a JavaScript event to a form field.

Edit JavaScript Interface.

Select the object

This Combo box displays the fields of the form application, and also the form itself as an object

Select the event

Use it to associate the event with the selected field to apply the JS code. View the events available:

- **onclick:** Acts when clicking on the field.
- **onblur:** Acts when the focus leaves the object.
- **onChange:** Acts when the focus leaves the object, and there are changes in the value.
- **onFocus:** Runs when the focus gets in the object.
- **onMouseOver:** Runs when the mouse pointer hovers the object.
- **onMouseOut:** Runs when the mouse pointer moves out the object.

Events related to the Form

The events below are associated directly with the form object.

- **OnLoad:** This event runs when the page is loaded, also when clicking on the navigating buttons.
- **onSubmit:** This event runs when clicking on the “New”, “Save”, and “Delete” buttons.

Edit JavaScript

*Select the object and event, then click on the Edit button. It opens a page to inform custom JavaScript routines and standar

```
![[Edit JavaScript Interface]][javascript_edicao_code]
```

```
*Edit JavaScript Interface*
```

> The JavaScript language doesn't have the same behavior in all the browsers available. A tip is to test running the applicati

- **OnClick Example**

- When clicking on a field of type radio, you can enable or disable form fields according to the selected value.

```
if(document.F1.gender[0].checked){
  document.F1.maternity.disabled = false;
  document.F1.maternity.style.background='FFFFFF'
}
if(document.F1.gender[1].checked){
  document.F1.maternity.disabled = true;
  document.F1.maternity.style.background='FCEEB3'
}
```

To access the values of a radio field, you need to use the index.

- **OnBlur Example**

- You can define a warning for the field “weekly_work_time” when the focus is getting out it.

```
if (document.F1.tp_point[0].checked && document.F1.weekly_work_time.value > '20')
{
    alert("The work time exceeds the limit allowed");
    document.F1.weekly_work_time.value = "";
    document.F1.weekly_work_time.focus();
}
```

- **OnChange Example**

- By modifying the “Salary” of an employee and leaving the field, we’ll check if his “position” is “gardener”.

```
if (document.F1.salary.value > 2000.00 && document.F1.position.value == 'gardener'){

    alert('When I grow up, I want to be a gardener);
}
```

- **OnFocus Example**

- After informing the purchase value and selecting the payment method in a Select object “Select: pay_method”, the JavaScript code below calculates the value of the purchase.

```
if (document.F1.pay_method[document.F1.pay_method.selectedIndex].text == 'Money')
{
    document.F1.total.value = document.F1.paurchase_value.value;
}
```

- **OnMouseOver Example**

- You can change the style (background color, font and font color) when the mouse hovers the field.

```
document.F1.field_name.style.backgroundColor = "0FFCCA"
```

- **onMouseOut Example**

- Sets the background color when the mouse moves out from the field.

```
document.F1.field_name.style.backgroundColor = "FFFFFF"
```

Dependencies

This feature allows linking the tables that contain relationships, dependencies, like the tables orders and order_details. This way, it's possible to delete a record in the table orders, and it automatically deletes all the details for that order as well. Below let's see a practical example of this feature.

1. Firstly, you must define a new dependency. Then you must select the dependent table. Click on the button New Dependency to start.

► Dependency ?

Table: customers

DEPENDENCY	RELATIONSHIP KEYS	ACTIONS
orders	customers.customerid	orders.customerid ✎ Edit 🗑 Delete 👤 Dependency (1)

Message Type:

[New Dependency](#)

Creating a new Dependency.

1. You must inform the fields amount is related between both tables. In this example, we have only one field.

Add dependency

TABLE	customers
DEPENDENCY	orders ↻
FIELD QUANTITY FOR THIS RELATION	<input type="text" value="1"/>

[Next](#)
[Cancel](#)

Dependency Table configuration.

1. Then select the related key fields: order_details->Orderid - orders->Orderid.

Add dependency

TABLE	customers
DEPENDENCY	account ↻
FIELD QUANTITY FOR THIS RELATION	<input type="text" value="1"/>

[Next](#)
[Cancel](#)

Dependency Key Fields Configurations.

1. Now we need to select behaviour for the application. Then click on the button Generate Scripts to define the Dependency Rule.

► Dependency ?

Table: customers

DEPENDENCY	RELATIONSHIP KEYS		ACTIONS
orders	customers.customerid	orders.customerid	 Edit  Delete  Dependency (1)

Message Type:

To display an error message and rollback in case of 'child rows'. ▼

To display an error message and rollback in case of 'child rows'.

To perform cascade delete in case of 'child rows'.

[New Dependency](#)

Configuring dependency Rules.

[Related Videos](#) 

Security

Use security

With this option enabled, when accessing the application, an “unauthorized user” message will be displayed, preventing access to the application.

When enabled, application access is only possible through the macro **sc_apl_status** or through **security module**.

[Click here](#) to access the macro documentation sc_apl_status.

In the development environment, the use of the above options for testing purposes may be suppressed, preventing the password being requested or access being blocked at each execution of the applications. To do this, disable the options “Enable security usage” and “Enable password usage” in the menu **Configuration > My Scriptcase**.

Security exit url

Defines which application the user will be redirected to after the “unauthorized user” warning.

Use password

When enabling the option, you will be asked to define a password for accessing the application.

When running the application using the active password, you will be asked for the password before accessing the application.

The password will be requested regardless of the “use security” setting or the use of the security module.

Request password only once

This option defines the behavior of the use password option.

When this option is enabled, the password will be requested only once per session.

When disabling, the password will be requested every time the application will be accessed.

Allow direct calling by URL

Allows an application to be called by typing the URL directly into browsers.

When disabled, when accessing the application by typing the URL directly, the invalid data error will be displayed. With this configuration, the application can only be accessed through a menu application, for example.

Enable CSRF

With this option enabled, the scriptcase prevents a malicious attack on a page where unauthorized commands are transmitted through a user the page trusts.

These attacks are known as a “Cross-Site Request Forgery” attack.

Cookies

HttpOnly

These are cookies that can be set by the server or by javascript but cannot be accessed in any way by javascript.

With the HTTPOnly parameter enabled, it is very difficult to steal a session through XSS because the javascript cannot read the content of these cookies.

A widely exploited attack in XSS is the theft of user session cookies. Theft of cookies is carried out through a javascript command that sends cookies to an external URL where the attacking user has control.

This option is enabled by default in all applications.

Session ID

Enables the session id that will be stored in cookies on the client side. This option embeds the session id directly in the URLs

This option is enabled by default in all applications.

Cookie Secure

With this option enabled, cookies are protected and can only be transmitted via secure communication. Therefore, they cannot be accessed through Javascript.

The HttpOnly option must also be enabled.

Headers

Disable XSS Auditor

XSS is short for Cross-Site Scripting, which is an attack that consists of sending HTML with malicious JavaScript to a website.

It is a security attack that consists of sending HTML with malicious JavaScript to a website. If the website displays this HTML with JavaScript without filtering the malicious JavaScript code, the cookies sent by the website can be stolen and sent to an attacking website, so that it can be used to forge user sessions and access the website's user account without permissions.

Strict-Transport-Security

HSTS forces browsers to use HTTPS in the domain where it is enabled, instead of using HTTP.

When enabled, the default value is "max-age = 31536000".

The HSTS policy is set for one year (31536000 seconds). This period specifies the time the browser will access the server via HTTP

X-Frame-Options

The HTTP X-Frame-Options response header can be used to indicate whether or not the browser should render the page in a `<frame>`, `<iframe>`, `<embed>` " or '". This header provides protection against clickjacking, known as 'click swipe' - this vulnerability can steal relevant information and data from the user.

X-Frame-Options does not allow the rendering of a page in a frame, ensuring that the content of your page is not embedded in other sites

- **SAMEORIGIN:** The SAMEORIGIN directive allows the page to be loaded in a frame from the same source as the page itself. This option must be used so that the application with clickjacking protection can be used in the menu application.
- **DENY:** This directive completely disables page loading in a frame.

If no option is selected, the application can be used on any `<frame>`, `<iframe>`,

or `<object>`, allowing the application to be incorporated into another website.

X-Content-Type-Options

X-Content-Type-Options is used to protect against MIME detection vulnerabilities. With this option enabled, it prevents browsers from interpreting the page content (sniffing) and executing the data as code / tag. These vulnerabilities can occur when uploading a text file with a javascript code and the browser reading the content that is in the file and executing, even though it is just text and not part of the code.

With this enabled, the HTTP X-Content-Type-Options header is defined, by default, as "no detection".

Referrer-Policy

no-referrer.

The Referer header will be omitted completely. No reference information will be sent with requests.

no-referrer-when-downgrade.

This is the default behavior when no policy is specified, or if the value provided is invalid.

origin.

Only send the origin of the document as a reference. For example, a document at `https://example.com/page.html` will send the reference `https://example.com/`.

origin-when-cross-origin.

Sends the origin, path and query string when performing a same-origin request, but only sends the origin of the document in other cases.

same-origin.

The reference will be sent to sources on the same site, but requests between sources will not send reference information.

strict-origin.

Only send the document source as a reference when the security protocol level remains the same (HTTPS → HTTPS), but do not send it to a less secure recipient (HTTPS → HTTP).

strict-origin-when-cross-origin.

Sends the source, path and query string when performing a request from the same source, only sends the source when the security protocol level remains the same during an inter-source request (HTTPS → HTTPS), and sends no header to recipients less secure (HTTPS → HTTP)

unsafe-url.

Sends the source, path and query chain when performing any request, regardless of security.

Feature-Policy

The value of this header is a policy or set of policies that you want the browser to respect for a particular source.

The source whitelist can take on several different values:

- ``*:`` The feature is allowed in top-level navigation contexts and in nested navigation contexts (iframes).
- ``self:`` The feature is allowed in top-level navigation contexts and nested navigation contexts from the same source. It is not allowed in documents of cross origin in nested browsing contexts.
- ``none:`` The feature is not allowed in top-level browsing contexts and is not allowed in nested browsing contexts.
- ``<origin (s)>:`` specific sources for which to enable the policy (for example `https://example.com`).

Example 1 - Using only one directive Let's say you want to prevent all content from using the geolocation API on your site. You can do this by submitting a restricted 'none' whitelist to the geolocation resource:

Feature-Policy: ``geolocation 'none'``

Example 2 - Using more than one directive Functionalities within a policy are separated by semicolons.

Feature-Policy: `unsized-media 'none'; geolocation 'self' https://example.com; camera *;``

Directives

accelerometer

Controls whether the current document is allowed to collect information about the acceleration of the device

via the Accelerometer interface.

ambient-light-sensor

Controls whether the current document is allowed to collect information about the amount of light in the environment around the device through the AmbientLightSensor interface.

autoplay

Controls whether the current document is allowed to play the requested media automatically via the HTMLMediaElement interface. When this policy is disabled and there is no user action, the Promise returned by HTMLMediaElement.play () will reject it with a DOMException. The autoplay attribute on <audio> " and " elements will be ignored.

battery

Controls whether the use of the Battery Status API is allowed. When this policy is disabled, the Promise returned by Navigator.getBattery () will reject it with a NotAllowedError DOMException.

camera

Controls whether the current document is allowed to use inputs from video devices. When this policy is disabled, the Promise returned by getUserMedia () will reject it with a NotAllowedError DOMException.

display-capture

Controls whether or not the current document is allowed to use the getDisplayMedia () method to capture screen content. When this policy is disabled, the Promise returned by getDisplayMedia () will reject it with a NotAllowedError if permission is not obtained to capture the contents of the screen.

document-domain

Control whether the current document is allowed to place document.domain. When this policy is disabled, attempts to place document.domain will fail and cause a SecurityError DOMException to be thrown.

encrypted-media

Controls whether the current document is allowed to use the Encrypted Media Extensions (EME) API. When this policy is disabled, the Promise returned by Navigator.requestMediaKeySystemAccess () will reject it with a DOMException.

execution-while-not-rendered

Controls whether tasks should be performed in frames while they are not rendered (e.g. whether a frame is hidden or display: none).

execution-while-out-of-viewport

Controls whether tasks should be performed in frames while they are outside the visible viewing window.

fullscreen

Controls whether the current document is allowed to use Element.requestFullscreen (). When this policy is disabled, the returned Promise rejects it with a TypeError DOMException.

geolocation

Controls whether the current document is allowed to use the Geolocation interface. When the policy is disabled, calls to getCurrentPosition () and watchPosition () will cause function callbacks to be invoked with a PositionError of PERMISSION_DENIED.

gyroscope

Controls whether the current document is allowed to collect information about the orientation of the device through the Gyroscope interface.

layout-animations

Controls whether the current document is allowed to show layout animations.

legacy-image-formats

Controls whether the current document is allowed to show images in legacy formats.

magnetometer

Controls whether the current document is allowed to collect information about the orientation of the device through the Magnetometer interface.

microphone

Controls whether the current document is allowed to use inputs from audio devices. When this policy is disabled, the Promise returned by `MediaDevices.getUserMedia ()` will reject it with a `NotAllowedError`.

midi

Controls whether the current document is allowed to use the Web MIDI API. When this policy is disabled, the Promise returned by `Navigator.requestMIDIAccess ()` will reject it with a `DOMException`.

navigation-override

Controls the availability of mechanisms that enable the author of the page to take control over the behavior of spatial navigation, or to cancel completely.

oversized-images

Controls whether the current document is allowed to download and display large images.

payment

Controls whether the current document allows the use of the Payment Request API. When this policy is disabled, the `PaymentRequest ()` constructor will throw a `SecurityError DOMException`.

picture-in-picture

Controls whether the current document allows a video to be allowed to play in Picture-in-Picture mode via the corresponding API.

publickey-credentials-get

Controls whether the current document is allowed to use the Web Authentication API to retrieve already stored public key credentials, i.e. via `navigator.credentials.get ({publicKey: ..., ...})`.

sync-xhr

Controls whether the current document is allowed to make synchronous XMLHttpRequest requests.

usb

Controls whether the current document is allowed to use the WebUSB API.

vr

Controls whether the current document is allowed to use the WebVR API. When this policy is disabled, the Promise returned by `Navigator.getVRDisplays ()` will reject it with a `DOMException`. Keep in mind that the WebVR standard is in the process of being replaced by WebXR.

wake-lock

Controls whether the current document is allowed to use the Wake Lock API to indicate that the device should not go into a power saving mode.

screen-wake-lock

Controls whether the current document is allowed to use the Screen Wake Lock API to indicate whether or not the device should darken the screen.

xr-spatial-tracking

Controls whether or not the current document is allowed to use the WebXR Device API to interact with the WebXR session.

Content-Security-Policy

Content-Security-Policy is the name of an HTTP response header that modern browsers use to increase the security of the document (or web page).

The Content-Security-Policy header allows you to restrict resources such as JavaScript, CSS or just about anything the browser loads.

Directives**default-src**

The default-src directive defines the standard policy for fetching features such as JavaScript, Images, CSS, Fonts, AJAX requests, Frames, HTML5 Media. Not all directives go back to default-src. Refer to the Source List Reference for possible values.

DEFAULT-SRC Policy Example `default-src 'self' cdn.example.com;`

script-src

Defines valid JavaScript sources.

SCRIPT-SRC Policy Example `script-src 'self' js.example.com;`

style-src

Defines valid fonts for style sheets or CSS.

EXAMPLE__ STYLE-SRC POLICY `style-src 'self' css.example.com;`

img-src

Defines valid image sources.

Example of IMG-SRC Policy `img-src 'self' img.example.com;`

connect-src

Applies to XMLHttpRequest (AJAX), WebSocket, fetch (), `<a ping>` or EventSource. If not allowed, the browser emulates a 400 HTTP status code. **__Connect-SRC Policy Example__** `connect-src 'self';``

font-src

Defines valid fonts for font resources (loaded via @ font-face).

FONT-SRC Policy Example `font-src font.example.com;``

object-src

Defines valid plug-in sources, for example `<object>` or `<applet>`.

Example OBJECT-SRC Policy `object-src 'self';`

media-src

Defines valid audio and video sources, for example `<audio>`, HTML5, `<video>` elements.

Example of MEDIA-SRC Policy `media-src media.example.com;`

frame-src

Defines valid fonts for loading frames. In CSP, Level 2 `frame-src` has been deprecated in favor of the `child-src` directive. CSP Level 3, has not been replaced with `frame-src` and will continue to postpone `child-src` if not present.

Example FRAME-SRC `frame-src 'self';`

sandbox

Enables a sandbox for the requested resource similar to the `iframe` `sandbox` attribute. The sandbox applies a policy of the same origin, avoids pop-ups, plug-ins and blocks the execution of scripts. You can keep the `sandbox` value empty to keep all restrictions in place, or add values: `allow-forms` `allow-same-origin` `allow-scripts` `allow-popups` `allow-modals` `allow-orientation-lock` `allow-pointer-lock` `allow-presentation` `allow-popups-to-escape-sandbox` `allow-top-navigation`

Example of SANDBOX policy `sandbox allow-forms allow-scripts;`

report-uri

Instructs the browser to POST policy crash reports to this URI. You can also use `Content-Security-Policy-Report-Only` as the HTTP header name to instruct the browser to send reports only (does not block anything). This directive was discontinued at CSP Level 3 in favor of the `report-to` directive.

Example REPORT-URI `report-uri / some-report-uri;`

child-src

Defines valid fonts for web workers and nested browsing contexts loaded using elements such as `<frame>` and `<iframe>`.

Example of FILHO-SRC Policy `child-src 'self'`

form-action

Defines valid fonts that can be used as an `<form>` HTML action.

Example action policy example `form-action 'self';`

frame-ancestors

Defines valid fonts for embedding the resource using `<frame>` `<iframe>` `<object>` `<embed>` `<applet>`. Setting this directive to `'none'` should be roughly equivalent to `X-Frame-Options: DENY FRAME-ANCESTORS`. **EXAMPLE POLICY** `frame-ancestors 'none';`

plugin-types

Defines valid MIME types for plug-ins called via `<object>` and `<embed>`. To load one, `<applet>` you must specify `application / x-java-applet`.

PLUG-IN TYPES Policy Example ``plugin-types application / pdf;``

base-uri

Defines a set of allowed URLs that can be used in the attribute of an HTML basetag.

URI-BASE Policy Example ``` base-uri 'self'; ```

report-to

Defines a report group name defined by an HTTP Response Report-Header. See the reporting API for more information.

Example Report for Policy `report-to groupName;`

worker-src

Restricts URLs that can be loaded as Worker, SharedWorker or ServiceWorker.

WORKER-SRC Policy Example `worker-src 'none';``

manifest-src

Restricts URLs where application manifests can be loaded.

Example of MANIFEST-SRC Policy `manifest-src 'none';``

prefetch-src

Defines valid sources for pre-fetching and pre-rendering of requests, for example, through the linktag with `rel = "prefetch"` or `rel = "prerender"`:

`__ PREFETCH-SRC Policy Example__ prefetch-src 'none'``

navigate-to

Restricts the URLs to which the document can navigate by any means. For example, when a link is clicked, a form is submitted or `window.location` is called. If `form-action` is present, this directive will be ignored for submitting forms. Implementation status

Navigation Policy Example ``navigate-to example.com``

Captcha

Captcha

Use Captcha

Defines if the application uses Captcha.

Number of Characters

Amount of characters in the Captcha image.

Character List

List of characters used in the Captcha.

Label

The message displayed for the Captcha.

Error message

Captcha error message.

Height

Height of the Captha image. (in pixels)

Width

Width of the Captha image. (in pixels)

Font Size

Font Size of the Captha image. (in pixels)

Reload

Display the refresh button in the Captcha.

Select one layout

It offers layouts for display the Captcha.

Recaptcha

ReCAPTCHA is an API provided by Google for forms. It adds security, preventing automatic submission of forms through robots.

reCAPTCHA sample:

1. First, we must request an API Key to activate reCAPTCHA into a Scriptcase application by following the steps below:

To get a **Site key** and **Secret Key** go to the link: <https://www.google.com/recaptcha/admin#list>.

See the image:

Label

It is a project identifier to create the reCAPTCHA keys.

Choose the type of reCaptcha

We must choose the option **reCAPTCHA V2**.

Domains

We can insert multiple domains (one per line) to limit the API uses.

1. Then, we need to accept the Terms of Service (“Accept the reCAPTCHA Terms of Service”).
2. When clicking on **Register**, the page refreshes and shows the integration of reCAPTCHA information. There we can get the **Site Key** and **Secret Key**:

1. Now, we can set the Scriptcase application security:

Site Key

Key generated by Google after reCAPTCHA project creation.

Secret Key

Key generated by Google after reCAPTCHA project creation.

Theme

Defines the reCAPTCHA color. There are two options:

- **Light** :

- **Dark** :

Type

The type of reCAPTCHA. There are two options:

- **Audio**:

- **Image**:

Size

The size of reCAPTCHA. There are two options:

- **Normal** :

- **Compact**:

Position

Here we can define the reCAPTCHA component alignment:

- **Left**: Position the reCAPTCHA component at the left.
- **Center**: Position the reCAPTCHA component at the center.
- **Right** : Position the reCAPTCHA component at the right.

Calendar Log Configuration

This interface allows you to define a Log schema to the app. The Log scheme tracks what the end-users are doing in the app. Those are the events it can tracks: Access, Insert, Update, and delete.

To learn how to create a Log schema [see here](#).

LOG	
ATTRIBUTE	VALUE
Schema	log ▼ ☰
Events	<div style="display: flex; align-items: center; gap: 10px;"><div style="border: 1px solid #ccc; width: 100px; height: 40px; position: relative;"><div style="position: absolute; top: -10px; left: 50%; transform: translate(-50%, -100%);">▲</div><div style="position: absolute; bottom: -10px; left: 50%; transform: translate(-50%, 100%);">▼</div></div><div style="text-align: center;">Add >></div><div style="border: 1px solid #ccc; width: 100px; height: 40px; position: relative;"><div style="position: absolute; top: -10px; left: 50%; transform: translate(-50%, -100%);">▲</div><div style="position: absolute; bottom: -10px; left: 50%; transform: translate(-50%, 100%);">▼</div></div><div style="text-align: center;">Remove <<</div></div>

Application Log configuration

Schema Select an existing log schema for the application.

Events You can select just specific events to save in the log.

Calendar - Fields Overview

The applications can have two types of fields.

Table Fields

Columns of the table connected to the application and their data types.

Example:

In a table with the following structure:

```
CREATE TABLE `orders` (
  `orderid` int(11) NOT NULL,
  `customerid` varchar(5) NULL DEFAULT NULL,
  `employeeid` int(11) NULL DEFAULT NULL,
  `orderdate` date NULL DEFAULT NULL,
  `requireddate` date NULL DEFAULT NULL,
  PRIMARY KEY (`orderid`) USING BTREE
);
```

These are the listed fields on left menu **Fields**:

Virtual Fields

Fields created inside application to assist in the development process.

How to create a virtual field

1. Inside an application, access the left menu **Fields** and click on **New Field** option.
2. Choose how many fields do you want to create:

1. Create the fields and define type, name and label for each one:

- **Type**: Data type of the field.
- **Name**: Internal name of the field. Used to identify the field on events and Scriptcase interface.
- **Label**: Title of the field displayed on the application.

Scriptcase **doesn't insert** virtual fields on the table after its creation.

Types of fields by applications

Application Table Fields Virtual Fields

Grid	<input type="text"/>	<input type="text"/>
Procedure	<input type="text"/>	<input type="text"/>
Chart	<input type="text"/>	<input type="text"/>
Form	<input type="text"/>	<input type="text"/>
Control	<input type="text"/>	<input type="text"/>
Calendar	<input type="text"/>	<input type="text"/>
Search	<input type="text"/>	<input type="text"/>
PDF Report	<input type="text"/>	<input type="text"/>

The applications **Menu**, **Tree Menu**, **Dashboard** and **Blank** were not listed because they haven't manage fields.

Calendar - Text Field

General Settings

This type of field allows the developer to create quickly inputs to insert and update data, where the final user can inform its data to be allocated in its database.

Type of Data

Defines the type of the field in the application. In this case we should select **Text**.

Label

Defines the title that will be displayed in the field when the application is executed. The terminology used in the interface is fundamental to the system have a good usability, we should use names and familiar terms to the final user of the application, instead of using terms from the system.

For example, this text field that has the name **customerid**, the client would have a much better understanding of the functionality of the field when we define the label as **Customer Name**.

Not only a fixed text, the **Label** attribute allows the use of langs to define the field's title, making it possible to use your application in a multi language project.

Watermark

Informing a text to the **Watermark** it will be displayed in the input a text as an example that can be informed in the field. The result after set will be this:

Initial Value(type)

Allows the initial definition to the field when the form is in insert mode. It is possible to choose between two options:

Defined Value: When this option is selected, the Initial Value attribute will be available, where we should inform the field's initial value. For example, my initial value is **Arlindo**, when a new register is inserted, the field **Seller Name** will be initialized as Arlindo.

System Data: When this option is selected, the initial value will be the actual date of your computer's system.

Amount of Characters

Allows to set the width of the text field's input that varies with the amount of characters informed. Although, if the amount of characters typed are greater than the setting, the text will be pushed to the left, to keep the maximum amount of characters as defined.

Show HTML Content

When this option is active every HTML, CSS and JavaScript content that are in the database will be displayed with the main value.

Validation Image

When this option is active, a image will be displayed next to the informed field if the field is according to the settings defined by the developer.

In the example below, the field was set to receive at least 5 characters, see what happens when informed only 4 characters:

However if informed 5 or more characters the field will be displayed as:

Password Field

When this option is active, the text field will be converted to the format used in password fields. For example:

View password characters

By enabling this option, a button will be displayed in the password field so that the password is displayed when clicked.

Save Variable

Allows to save a session variable(global variable) with the field's value, to be used in others applications.

For example, in the login form the username can be saved in session and displayed on the header of others applications.

Variable Name

In this attribute we should define the name of the session variable, active in the previous item, that will receive the field's value.

We should inform only the variable's name, - **var_rating**.

The method to use its value is [global variable](#).

Field Mask

Defines the field mask. There are two types of mask described in the table below:

Character Description

- X It is overridden by any characters returned by the database. Filled is required and the value will be completed with leading zeros when there are fewer characters than the size of the mask.
- Z It is overridden by any characters returned by the database. Its filling is optional and when there are fewer characters than the mask size, nothing will be done about the characters that are missing. In addition the leading zeros will be suppressed. When used in conjunction with the X necessarily the use of this character is to the left of the mask.
- 9 It represents any numeric character (from 0-9)
- A It represents an alpha numeric character (A-Z,a-z)
- * It represents any alpha-numeric character (A-Z,a-z,0-9)entered by the user.

For example, it is possible to set the mast to display a telephone number:

It will be show with this format on runtime:

It is also possible to set the field mask like those examples:

Field mask examples:

Telephone number

Field	Mask Input	Typed Value	Formatted Value
Phone Number	+99 99 9999 - 9999	123456789012	+12 34 5678 - 9012
Phone Number	(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
Phone Number	(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
Phone Number	(zz) xxxx - xxxx	12345678	() 1234 - 5678
Software Key (Letters only)	AAAA-AAAA-AAAA-AAAA	QWERTYUIASDFGHJK	QWER-TYUI-ASDF-GHJK
Software Key (Letters and numbers)	xxxx-xxxx-xxxx-xxxx	Q1W2E3R4T5Y6U7I8	Q1W2-E3R4-T5Y6-U7I8
License Plate	AAA - 9999	QWE1234	QWE - 1234
Scriptcase Serial Key	A999A999A999-**	D111H111G111DG2P	D111H111G111-DG2P
Multiple masks (Phone Number)	9999-9999;(99)9999-9999;	9999 999 9999	+99 99 9999-9999

Validate with mask

When this option is active it is possible to insert the data with the mask set in the **Field Mask** option.

Complete to the left

When this option is used, the value defined will be added on the left of the information inserted in the field if the value is lower than the maximum set in the **Maximum Size** option.

Field size in database

Defines the field's size related to the size set in the database. This value is already set automatically by default when the application is generated.

Hidden Field

When this option is active, the field will be hidden in the application on runtime.

Label Field

When this option is active, the field will be altered to only a label where the info will be displayed, where updates or inserts will not be possible.

Save HTML tags

When this option is active, it allows to HTML tags in the field to be inserted with the data, instead of being interpreted.

Text input in JavaScript

When this option is active, it will be show every JavaScript content inserted in the database with its main value.

This option can only be used using the **Editable grid view**.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disable Field

Allows the developer to disable the field, so the user can not type a value according with the option defined by the developer.

The available options are: **No** - Initial value of the attribute, this option does not disable the field.

Update Mode - This option only disables the field when editing existing registers.

Insert Mode - This option only disables the field when inserting new registers.

Insert / Update Mode - This option disables the field when editing exciting registers or when inserting new registers.

HTML Type

HTML object used to display the field in the form.

SQL Type

Informs the type of the field in the database.

Values Format

Format of Values Interface

Case Settings

Allows converting the letters of the field when it loses focus. The options are: **Uppercase**, **Lowercase**, **Capitalize the first word**, **Capitalize all words**.

Minimum Length

Determines the minimum number of characters a user must enter in the field.

Integer values greater than or equal to 0 must be provided.

Maximum Length

Determines the maximum number of characters a user can enter in the field.

Integer values greater than or equal to 0 must be provided.

Allowed Characters

Allows to select a set of characters that can be typed into the field. The options are:

- **All** : Allows any type of character to be typed into the field
- **Selected** : Defines a set of characters allowed. Using the configuration below, will be allowed to type letters, numbers and other characters (defined in the attribute More). The letters a, b and c (defined in the Less Attribute) are not allowed.

Regular expression

Regular expression used to validate field content.

Regular expression modifier

Modifiers used in the field content validation regular expression.

Error message

Message to be displayed if the regular expression is not valid.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGres and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is be accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.

- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon ? beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon ? beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard ? icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Multiple Lines Text Field

General Settings

Multiple Lines Text field configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Multiple Lines Text , you can inform a Text value to the field in multiple lines.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Watermark** : Create a placeholder for the selected field.
- **Initial Value (type)** : Allows you to define the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : you will inform the Defined Value here.

Initial Value Configuration Interface.

- **Amount of characters** : Define the amount of characters allowed for the field.
- **Validation Image** : Allows to display an image next to the field when it is being validated.
- **Lines** : Allows to define the amount of lines that the field will have at start.
- **Save Variable** : Allows to save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Allows to define the name for the session variable that will receive the field value.
- **Field size in database** : Determines the field size in bytes. it is used to determine the max size of characters that is allowed to type in.
- **Hidden Field** : This option makes the field hidden, but still allows it's value to be processed through JavaScript or PHP.
- **Label Field** : This options make the field behave as a Read Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

- **Save HTML tags** : This option allows to save the HTML content of the field to the database.
- **Text input in JavaScript** : Allows to save JavaScript code informed in the field to the database.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of field in the database.

Values Format

Format of Values Interface

Case Settings

Allows converting the letters of the field when it loses focus. The options are: **Uppercase, Lowercase, Capitalize the first word, Capitalize all words.**

Minimum Length

Determines the minimum number of characters a user must enter in the field.

Integer values greater than or equal to 0 must be provided.

Maximum Length

Determines the maximum number of characters a user can enter in the field.

Integer values greater than or equal to 0 must be provided.

Allowed Characters

Allows to select a set of characters that can be typed into the field. The options are:

- **All** : Allows any type of character to be typed into the field
- **Selected** : Defines a set of characters allowed. Using the configuration below, will be allowed to type letters, numbers and other characters (defined in the attribute More). The letters a, b and c (defined in the Less Attribute) are not allowed.

Regular expression

Regular expression used to validate field content.

Regular expression modifier

Modifiers used in the field content validation regular expression.

Error message

Message to be displayed if the regular expression is not valid.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the values from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** : Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** : Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** : Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position

(left,right,center and justify).

- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Integer Field

General Settings

Data type:

It sets the application field type. When the field is set as Number, it is permissible to define formatting rules of integers.

Label:

It sets the title that will be displayed in the field when you run the application. The terminology used in the interface is fundamental for your system has a good usability. In this case, we recommend you to use names and terms familiar to the end user of the application, instead of using terms originated in the system.

Watermark

Informing a text for the **watermark** it will be displayed on the input text with an example of what can be reported in the field. The result after that will be configured:

Initial value (type)

Allows setting an initial value for the field when the application is in inclusion. You can choose between two options:

Pre-set value: When you select this option, the Initial Value attribute will be made available in the place where we inform the initial value of the field.

For example, my initial value is **Arlindo** when inserting a new record the **seller_name** field will start with Arlindo.

System date: When you select this option, the initial value will be the current system date of your computer.

If you select the type system date, it will be not necessary to fill in the initial value attribute.

Amount of characters

It allows you to set the width of the input text field according to the amount of characters. However, if the quantity entered is greater than the set for the characters, the text will be pushed to the left, in order to ensure the maximum amount of characters set in the option of **Values formatting**.

Validation Image

When you enable this option, an image will be shown next to the field informing whether the field is in accordance with the settings of *minimum size* and *Maximum size* (as you can see in the images below) defined in the Formatting value option.

In the example below, the field was set to receive at least 5 characters, see what happens with the image when it receives only 4 characters:

However, if the value inserted has 5 or more characters the the image will change according to example bellow:

Use slider:

It displays a slider component in the field. So you can increase or decrease the value sliding the cursor. You can also customize the increment value, if it increments the value 1 by 1, 2, 5, 10... N.

Field Mask Input:

It sets the mask input for the field. There are two types of mask as described in the table below:

Character Description

X	It is overridden by any characters returned by the database. Filled is required and the value will be completed with leading zeros when there are fewer characters than the size of the mask.
Z	It is overridden by any characters returned by the database. Its filling is optional and when there are fewer characters than the mask size, nothing will be done about the characters that are missing. In addition the leading zeros will be suppressed. When used in conjunction with the X necessarily the use of this character is to the left of the mask.
9	It represents any numeric character (from 0-9)
A	It represents an alpha numeric character (A-Z,a-z)
*	It represents any alpha-numeric character (A-Z,a-z,0-9)entered by the user.

Mask Input Examples:

Field	Mask Input	Typed Value	Formatted Value
Phone Number	+99 99 9999 - 9999	123456789012	+12 34 5678 - 9012
Phone Number	(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
Phone Number	(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
Phone Number	(zz) xxxx - xxxx	12345678	() 1234 - 5678
Software Key (Letters only)	AAAA-AAAA-AAAA-AAAA	QWERTYUIASDFGHJK	QWER-TYUI-ASDF-GHJK
Software Key (Letters and numbers)	xxxx-xxxx-xxxx-xxxx	Q1W2E3R4T5Y6U7I8	Q1W2-E3R4-T5Y6-U7I8
License Plate	AAA - 9999	QWE1234	QWE - 1234
Scriptcase Serial Key	A999A999A999-**	D111H111G111DG2P	D111H111G111-DG2P
Multiple masks (Phone Number)	9999-9999;(99)9999-9999;	9999 999 9999	+99 99 9999-9999

Validate with Mask

By enabling this option you will be able to enter data according to the mask that was configured in the option **Field Mask** and Scriptcase will validate it.

Record Variable

Allows you to record a session variable with the value of the field ([global variable] [var_glob]), to be used in other applications.

Example, in the login form the username can be saved in session and displayed in the header of other applications.

Variable Name

In this option you must set the session variable name, enabled in the previous item, which will receive the value of the field.

You need to inform only the variable name, for example: **var_seller**.

The recovery of the value is made as [Global Variable][var_glob]{:target='blank'}.

Field size in Database

This option sets the size of the field relative to the size that is configured in the database. By default this value is already configured automatically when the application is generated.

Hidden Field

This option when enabled will hide the field inside the application at the time of execution.

Label Field

By enabling this option, the field will be changed to only one label where the information will be displayed, so it is not possible to make changes or inserts in the field configured as label.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disable field

Allows you to disable the field, making it impossible for the user to enter a value according to the developer-defined option.

The available options are:

No - initial value of the attribute, this option does not disable the field. **Update mode** - This option disables the field only when editing the records. **Insert mode** - This option disables the field only inserting new records. **Update/Insert mode** - This option disables the field in both editing and inserting new records.

HTML Type

HTML object used to display the field in the application.

Tipo SQL:

Reports the SQL type of the field as it is configured in the database.

Values Format

Use regional settings:

It allows you to apply regional settings to the number fields formatting. When this option is not selected it will be displayed the attributes group, minus sign and negative number format.

Digit grouping:

It allows you to define if the field displays the digit grouping separator.

Maximum Size:

It allows you to define the maximum size that will be used in the field of the application.

Minimum Value:

It allows you to define the minimum value that will be used in the field of the application.

Maximum Value:

It allows you to define the maximum value that will be used in the field of the application.

Grouping:

It allows you to define which character is used to separate thousands. This option is only available when the option to use regional settings is disabled.

Negative sign:

It allows you to define which character will be used for the display of negative numbers. This option is only

available when the option to use regional settings is disabled.

Negative number format:

It allows you to define the placement of the negative sign in relation to value. This option is only available when the option to use regional settings is disabled.

Accept:

It allows to define if the field accept only negative values, positive-only or both.

Display Calculator:

This option when enabled will display a calculator to assist the end user to perform calculations.

Use Spin:

This option applies a Spin component to the number field. So the end user can increase or increase the numbers using it. You will also be able to set a minor or major range for the spin.

Smaller increment for the Spin::

Sets the minimum range of the Spin component.

Greater increment for the Spin:

Sets the maximum range of the Spin.

Database Value

It allows you to define how the value to be written to the database.

Preset value:

It allows you to specify a fixed value or associate it to global variables created inside the project and save it automatically to the database field.

Auto increment (automatic):

It allows you to use the increase generated automatically by the database to fill the field. It is used only when the database field is of type AUTO INCREMENT or similar. For the databases that use string, such as Oracle, PostGres and Firebird, you must inform the name of the string.

Auto increment (manual):

The application itself will simulate an auto increment in the field. So the value of the field will be calculated automatically by the application.

Date of inclusion:

The field will be populated automatically with server date during the inclusion.

Date of update:

The field will be populated automatically with server date during the update.

User IP:

The field will get the IP of the machine that is accessing the application.

Calculated by the database:

The field value is assigned by the database itself. The field will not be used in the process of updating. For example: it will be updated via a Trigger.

Null:

The field will be automatically filled with null.

Lookup Settings

The Lookup is a way used to provide the end user a list of values description/name where the items can be selected and used in the application. For example, for a field sex that in the database is represented with M or F values can be presented as male or female dynamically with the lookup. So you will be able to retrieve these values from a database table or manually, if the reference table does not exist.

Example:

Lookup Methods

There are two lookup methods available:

Manual: To use this method it is necessary to inform the selection conditions manually to the Lookup.

Automatic: To use this method it is necessary to use a lookup query from the database to access the reference table.

Editing-automatic lookup:

Select Command:

It sets the SQL command that will retrieve the value to display inside the Grid field. The command must have the following format

```
SELECT field_to_be_displayed FROM table WHERE key_field = {grid_field}
```

The Grid field must be always referenced between curly braces {}, So at run time, the field braces will be replaced by its value in the table.

Multiple Options:

When the Select command informed return multiple values, the option must be selected.

Delimiter:

It sets the tab of values returned by the Select command, this option should be filled when the "Yes" option is checked in the multiple attribute options.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

Use a specific connection:

This option allows you to select another existing connection in the project, other than the current connection, to select the values for the lookup.

Edit Lookup - Manual:

Lookup used to modify the display of the field with predefined values.

Lookup Types

It sets the operating mode of the lookup can be: single value, multiple values (delimiter), multiple values (position) and multiple values (binary).

Single value: it will be displayed only one value for the field. There is a direct replacement of the value stored in the Bank for a label defined in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value of "M" will be replaced by "Male".

Multiple Values (Delimiter):

By using this option it will be displayed multiple values for the selected field. The values must be separated by a delimiter to be informed. A replacement of parts from a string stored in the field, separated by a delimiter for values contained in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value S;M will be replaced by Sports and Movies.

Delimiter: Character used to separate the values within the same string.

Multiple Values (Position)

Allows you to recover information stored in a single string of the selected field. In order for this information to be retrieved must be informed, in addition to the label, the starting position and the number of bytes that each information occupies within the string.

As an example we will use a string to store Sex, Marital status and Hobby respectively. Sex occupies one byte, Status one byte and Hobby two bytes .

For this purpose we define the list as:

Label	Value	Start	Size
Male	M	1	1
Female	F	1	1
Married	M	2	1
Single	S	2	1

Label Value Start Size

Study ST 3 2

Sportes SP 3 2

Reading LE 3 2

Example: the string MMST would be presented in the query as: Male Married Study

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value M will be replaced by Male.

Start: : Starting position in the string where the information is recorded. The first position is always 1.

Size : Number of bytes that the information occupies in the string.

Multiple values (binary):

It allows you to retrieve several information stored in decimal form of the selected field.

As examples we will use the following list (although not informed in the interface of inclusion of values in the list, each item has a value assigned automatically according to the order):

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

To display the data, a decomposition of the decimal number stored in the bank is performed. For example, numbers 11 and 12 (written in the database) would be decomposed as follows:

$11 = 1 + 2 + 8 = (\text{Sports} - \text{Culture} - \text{Reading})$

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

$12 = 4 + 8 = (\text{Leisure} - \text{Reading})$

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

Label:

Text that will be displayed in the Grid.

Include Button:

Includes in the list the values populated in the Label and value fields.

Alter Button:

It changes the attributes of the selected item.

Delete Button:

Deletes the selected item.

Clean Button:

It cleans the fields

Save Button:

Allows the user to save the entire list, for later use using the Load Lookup definition option.

Load Lookup definition:

Allows you to load a predefined value list for use as a lookup.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

Display Settings

You can set CSS values for the field individually. Thus, for example, you can highlight one field of the others in the application. As CSS field properties, when changed, they are added to a class created automatically by ScriptCase for each application field.

Individual field CSS settings, when inserted, override theme settings ([CSS of applications \(Themes\)](#)) selected for application.

The settings are divided into three property blocks, these blocks are:

CSS of Title

This makes it possible to change the CSS properties of the field's Label.

In the example below, You can see the difference of field title configurations. While the field **Contactname** have the same formatting, inherits the theme of the application, the field **Contacttitle** have a different formation of of others, from the changes made in the CSS of the field.

CSS of field

Changes the CSS properties of the <td> where the input object (where the user enters data for insertion into a form) is positioned. In the image below, you can see where the change is applied.

Field Contacttitle with changes to Field CSS properties, changing background color and

horizontal alignment

CSS of Input object

Changes the CSS properties in the Input of field object, where the user type the data in a form.

Field with changes to CSS properties of Input Object, changing background color and input source color

CSS properties

The available configuration options are basically the same for each of the configuration blocks above.

description of available configuration attributes

Font

Changes the font of the text according to the fonts selected using the *font-family* property.

In this option, some types of fonts are provided to you (as shown below).

Font Size

Changes the font size of the text using the property *font-size* in the field class.

You need to select the available value from our list, the measure used for this property is the pixel.

Font Color

Define the font color used by the property *color* in the field class.

Background color

Define the background color using the property *background-color* in the field class.

The colors that will be used in the two color properties listed above, **Font color** and **Background color**, can be entered via the color palette - - available next to the field or manually entered values in the accepted formats that are: *Hexadecimal, RGB, RGBA, HSL, HSLA* or o *Color name*.

Color palette

By clicking on the color palette icon - - next to the field, a window will open with some default colors.

When you select one of the colors, a value in hexadecimal format (HEX) will be entered, representing the chosen color.

Hexadecimal

Acronym for hexadecimal, this code is composed of the pound sign (#) plus six digits. The first two define the intensity of the color red, the middle two are green and the last two are blue.

Bold

Applies bold style to the font.

Underline

Lets you apply the underlined style to the font.

Border style

Defines the border font style.

Border Collapse

Defines the border collapse.

Border size

Changes the size of the title border.

Border color

Chooses the border color , using a color palette to apply to the title.

Horizontal alignment

Position the filter label at desired location (left,rigth,center e justify).

Vertical alignment

Position the label of the filter in the wanted location baseline, sub, super, top, text-top, middle, bottom, text-bottom).

Not available in Input Object CSS

Width

To set the width of the title.

Height

To set the height of the title.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.**Help Description**

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type**Hint**

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be

displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Decimal Field

General Settings

Decimal field configuration Interface.

Data Type

Define the field type to Decimal. It allows defining the Decimal number format.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Watermark

Create a placeholder to specify a short hint that describes the expected value of an input field

Initial Value (type)

It allows you to define the initial value for the field when in insert mode. The options are:

- **Defined Value:** The field receives the value informed into the input option.

Initial Value Configuration Interface.

- **System Date:** The field receives the current server time.

Amount of characters

Define the number of characters allowed for the field.

Validation Image

Allows displaying an image next to the field when validating it.

Save Variable

It allows saving the value of the field in a session variable to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the session variable that will receive the field value.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Label Field

It sets the field like a Read-Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disabled Field

Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the attributes Grouping, Negative Symbol and negative number format.

Digit grouping

It defines if the field displays the digits separator.

Maximum Size

It defines the max size of the field.

Minimum Value

It defines the min value of the field.

Maximum Value

It defines the max value of the field.

Decimal Precision

It defines the number of decimal places for the field.

Digit Grouping Separator

It defines the character to separate the thousands.

Decimal Separator

It defines the decimal separator.

Negative sign

It defines the character to represent negative numbers.

Negative number format

It defines the position of the Negative sign.

Accept

It determines if the field accepts only negative, positive, or both numbers.

Show a calculator

It displays an icon beside the field to help the user calculating the field value.

Auto-complete with zeros

It automatically informs the decimal places when not specified. If disabled, the user always needs to inform the decimal value.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected

below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Currency Field

General Settings

Currency field configuration Interface.

Data Type

Define the field type to Currency. It allows defining the currency number format.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Watermark

Create a placeholder to specify a short hint that describes the expected value of an input field

Initial Value (type)

It allows you to define the initial value for the field when in insert mode. The options are:

- **Defined Value:** The field receives the value informed into the input option.

Initial Value Configuration Interface.

- **System Date:** The field receives the current server time.

Amount of characters

Define the number of characters allowed for the field.

Validation Image

Allows displaying an image next to the field when validating it.

Save Variable

It allows saving the value of the field in a session variable to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the session variable that will receive the field value.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Label Field

It sets the field like a Read-Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disabled Field

Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the attributes Grouping, Negative Symbol and negative number format.

Digit grouping

It defines if the field displays the digits separator.

Currency symbol usage

It defines if the field displays the Currency Symbol of the Regional Settings.

Maximum Size

It defines the max size of the field.

Minimum Value

It defines the min value of the field.

Maximum Value

It defines the max value of the field.

Decimal Precision

It defines the number of decimal places for the field.

Digit Grouping Separator

It defines the character to separate the thousands.

Decimal Separator

It defines the decimal separator.

Negative sign

It defines the character to represent negative numbers.

Negative number format

It defines the position of the Negative sign.

Accept

It determines if the field accepts only negative, positive, or both numbers.

Show a calculator

It displays an icon beside the field to help the user calculating the field value.

Auto-complete with zeros

It automatically informs the decimal places when not specified. If disabled, the user always needs to inform the decimal value.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The

select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Date Field

General Settings

Date field configuration Interface.

Data Type

Define the type of field. When setting it to Date, you can inform its format into this field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Watermark

Create a placeholder to specify a short hint that describes the expected value of an input field

Initial Value (type)

It allows you to define the initial value for the field when in insert mode. The options are:

- **Defined Value:** The field receives the value informed into the input option.

Initial Value Configuration Interface.

- **System Date:** The field receives the current server Date.

Amount of characters

Define the number of characters allowed for the field.

Validation Image

Allows displaying an image next to the field when validating it.

Save Variable

It allows saving the value of the field in a session variable to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the session variable that will receive the field value.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Label Field

It sets the field like a Read-Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disabled Field

Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the date separator attribute (Check the Regional Settings).

Date separator

It allows you to inform the separator symbol for the date.

First Day

Defines the first day of the week.

Display

It offers predefined formats for displaying dates.

Internal Format

It allows defining the field format when the SQL type is different from **Date**. You must use the characters **Y**, **M** and **D** that correspond to **Year**, **Month** and **Day**.

Use Combo-box

It allows you to select the date from a combo-box.

Minimum Date

- **Fixed Date**: Inform the minimum date allowed presented in the selected date format.
- **Current Date**: By clicking on the icon next to the text field, ScriptCase offers the following options:
 1. **Actual date**: Set the current date as the minimum allowed date.
 2. **Actual date with increment**: Set the minimum date with the current date more(+) the days, months, or years you want to increment.
 3. **Actual date with decrement**: Set the minimum date with the current date minus(-) the days, months, or years you want to decrement.

Maximum Date

- **Fixed Date**: Inform the maximum date allowed presented in the selected date format.
- **Current Date**: By clicking on the icon next to the text field, ScriptCase offers the following options:
 1. **Actual date**: Set the current date as the maximum allowed date.
 2. **Actual date with increment**: Set the maximum date with the current date more(+) the days, months, or years you want to increment.

3. **Actual date with decrement:** Set the maximum date with the current date minus(-) the days, months, or years you want to decrement.

Display Format

It enables the Date format beside the field when informing the date.

Date display position

Available when activating the **Display Format** flag, defines where the filling mode will be displayed. The options are: **Right**, **B Lower** and **Watermark**.

Display Calendar

It enables a calendar icon beside the field that allows selecting the date from a calendar to fill the input.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the values from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Time Field

General Settings

Time field configuration Interface.

Data Type

Define the type of field. When setting it to Time, you can inform a time format into this field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Watermark

Create a placeholder to specify a short hint that describes the expected value of an input field

Initial Value (type)

It allows you to define the initial value for the field when in insert mode. The options are:

- **Defined Value:** The field receives the value informed into the input option.

Initial Value Configuration Interface.

- **System Date:** The field receives the current server time.

Amount of characters

Define the number of characters allowed for the field.

Validation Image

Allows displaying an image next to the field when validating it.

Save Variable

It allows saving the value of the field in a session variable to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the session variable that will receive the field value.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Label Field

It sets the field like a Read-Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disabled Field

Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the Time. When not enabled, it displays the Time separator attribute (Check the Regional Settings).

Display

It offers predefined formats for displaying Time.

Minimum time

Minimum value accepted by the field.

- **Fixed Time** : Enter the minimum time that scriptcase will criticize in the time type field in the format as presented.
 - **Current Time** : When clicking on the icon next to the box, scriptcase provides the following options:
 - **Current Time with Increment** : The minimum time will be the current time (+) the days or months or years that you increment.
 - **Current Time with Decrement** : The minimum time will be the current time (-) the days or months or years that you want to decrement.

Maximum time

Maximum value accepted by the field.

- **Fixed Time**: Manually enter the maximum time that scriptcase will input in the time type field in the format as it is presented.
 - **Current Time**: When you click the icon next to the box, scriptcase provides the following options:
 - **Current Time with Increment**: The maximum time will be the current time (+) the days or months or years that you increment.
 - **Current Time with Decrement**: The maximum time will be the current time (-) the days or months or years that you want to decrement.

Display Format

It enables the Time format beside the field when informing the time.

Display position

Available when activating the **Display Format** flag, defines where the filling mode will be displayed. The options are: **Right**, **B Lower** and **Watermark**.

Display full name

Displays the full name instead of the mask. Ex: day month year.

Use Time picker

It uses the JQuery plug-in to choose the time.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Date and Hour Field

General Settings

Date and Time field configuration Interface.

Data Type

Define the type of field. When setting it to Date and Time, you can inform its format into this field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Watermark

Create a placeholder to specify a short hint that describes the expected value of an input field

Initial Value (type)

It allows you to define the initial value for the field when in insert mode. The options are:

- **Defined Value:** The field receives the value informed into the input option.

Initial Value Configuration Interface.

- **System Date:** The field receives the current server Date and Time.

Amount of characters

Define the number of characters allowed for the field.

Validation Image

Allows displaying an image next to the field when validating it.

Save Variable

It allows saving the value of the field in a session variable to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the session variable that will receive the field value.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Label Field

It sets the field like a Read-Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disabled Field

Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Values Format

Values Format

Regional Settings

Allows you to apply regional date formatting settings to the field. When not selected, the Date Separator and Time Separator attributes will be displayed.

Display

Allows you to select the display format of the date/time field.

Minimum Date

Minimum value accepted as input for the field.

- **Minimum Date :**
 - **Fixed Date** : Enter the minimum date that scriptcase will criticize in the date type field in the format as presented.
 - **Current Date** : When clicking on the icon next to the box, scriptcase provides the following options:
 - **Simple Current Date** : Will leave the current date as the maximum date, that is, no one born after the current day will enter the form.
 - **Current Date with Increment** : The minimum date will be the current date (+) the days or months or years that you want to increment.
 - **Current Date with Decrement** : The minimum date will be the current date (-) the days or months or years that you want to decrement.

Maximum Date

Maximum value accepted as input for the field.

- **Maximum Date :**
 - **Fixed Date** : Enter the maximum date manually that scriptcase will criticize in the date type field in the format as it is presented.
 - **Current Date** : When clicking the icon next to the box, scriptcase provides the following options:
 - **Simple Current Date** : Will leave the current date as the maximum date, that is, no one born after the current day will enter the form.
 - **Current Date with Increment** : The maximum date will be the current date (+) the days or months or years that you want to increment.
 - **Current Date with Decrement** : The maximum date will be the current date (-) the days or months or years that you want to decrement.
 - **Display Format** : Enables display of the mode

Minimum time

Maximum value accepted by the field.

- **Fixed Time:** Manually enter the maximum time that scriptcase will input in the time type field in the format as it is presented.
 - **Current Time:** When you click the icon next to the box, scriptcase provides the following options:
 - **Current Time with Increment:** The maximum time will be the current time (+) the days or months or years that you increment.
 - **Current Time with Decrement:** The maximum time will be the current time (-) the days or months or years that you want to decrement.

Maximum time

Maximum value accepted by the field.

- **Fixed Time:** Manually enter the maximum time that scriptcase will input in the time type field in the format as it is presented.
 - **Current Time:** When you click the icon next to the box, scriptcase provides the following options:
 - **Current Time with Increment:** The maximum time will be the current time (+) the days or months or years that you increment.
 - **Current Time with Decrement:** The maximum time will be the current time (-) the days or months or years that you want to decrement.

Hour value

Sets the value to be assigned to the time when it is empty and a date is selected in the date picker.

- **Available values are:** Start of day, End of day and Current time.

Apply date limits to the calendar

Apply Minimum and Maximum Date limits when selecting calendar dates, avoiding the selection of dates outside these limits.

Display Format

Display the field format in the data cell.

Date display position

Available when activating the **Display Format** flag, defines where the fill mode will be displayed. The options are: **Right**, **Below** and **Watermark**.

Display full name

Displays the full name instead of the mask. Ex: day month year.

Group Date and Time

Group date and time in the same field.

Display Calendar

Allows you to display a calendar icon next to the field. This allows you to select the month and year, passing the value defined in the calendar to the field.

New Calendar

Show a new calendar with jquery, or the old calendar.

Years Limit

Number of years that will be displayed on the calendar.

View week number

Display week number in application.

Additional months

Display additional months in the calendar.

Available options are: 1, 2 and 3.

Show Combo year and month

Show Combo Year and month in calendar

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the values from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of

Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - HTML Image Field

General Settings

HTML Image field Configuration Interface.

Data Type

Define the type of field. When setting it to HTML Image, it allows to display an image into the field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Image

Set it to display an image. The icon "Select Image" lists all images from Scriptcase and your uploaded images. The "Upload an image" option allows you to send a copy to the Scriptcase server.

Border

Define the width of the Image border in Pixels.

Width

Define the image width size in Pixels.

Height

Define the image height size in Pixels.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.

- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is

being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard ? icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Label Field

General Settings

Label field Configuration Interface.

Data Type

Define the type of field. When setting it to label, it displays the value with no input to change it.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Text

You can inform a text to be displayed beside the field.

Reload

It links the informed text to reload the form when clicking on it.

Position

It allows positioning the field in the block.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.

- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.

- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Card Field

General Settings

Credit Card Number Configuration Interface.

- **Data Type** : Defines the type of field for the application. When it is defined as a Credit Card Number, the field verifies if the value is valid.
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be easier to the user understand if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Watermark** : Creates a placeholder on the field with the text informed.
- **Initial Value (type)** : Set the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Amount of characters** : Defines the amount of characters allowed for the field.
- **Validation Image** : Display an image next to the field when it is being validated.
- **Save Variable** : Saves a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Set the name for the session variable that will receive the field value.
- **Field size in database** : Determines the size in bytes of the fields. It is used to determine the max amount of characters to be typed in.
- **Field Mask** : Defines the display mask for the field. There are three types of masks that can be merged.

Character	Description
9	Represents a numeric character (0-9)
A	Represents an alpha numeric character (A-Z,a-z)
*	Represents any alpha numeric character (A-Z,a-z,0-9) typed by the user.

It is possible to merge two or more masks simultaneously, separated by a semi coma with the smallest mask at start. The replacement occurs when the user is typing when the lowest amount of character exceeds.

Examples of Masks

Field	Mask	Informed Value	Formatted Value
Telephone Number	+99 99 9999 - 9999	123456789012	+12 34 5678 - 9012
Software Key (Only Numbers)	AAAA-AAAA-AAAA-AAAA	QWERTYUIASDFGHJK	QWER-TYUI-ASDF-GHJK
Software Key (Letters an Numbers)	**_--**	Q1W2E3R4T5Y6U7I8	Q1W2-E3R4-T5Y6-U7I8
License Plates	AAA - 9999	QWE1234	QWE - 1234
ScriptCase License	A999A999A999-**	D111H111G111DG2P	D111H111G111-DG2P
Multiple Masks (Telephone)	9999-9999;(99)9999-9999; 9999 999 9999		+99 99 9999-9999

- **Hidden Field** : This option makes the field hidden, but still allows it is value to be processed through JavaScript or PHP.
- **Label Field** : This option make the field behave as a Read Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Display the data type of field in the database.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.

- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon ? beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Card Type Field

General Settings

Credit Card field configuration Interface.

Data Type

Define the field type to Credit Card. It sets a combo-box for selecting the credit card type.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Watermark

Create a placeholder to specify a short hint that describes the expected value of an input field

Save Variable

It allows saving the value of the field in a session variable to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the session variable that will receive the field value.

Field size in database

It determines the field size in bytes. It limits the max quantity of the allowed characters.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Label Field

It sets the field like a Read-Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

Disabled Field

Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values Interface.

Credit Card

It allows to define which cards will be listed and their internal value.

Use Title/Deny

It allows informing a new value if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen. It defines the label and value with the Negative Value and the Title.

Negative value

The value of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Title

Label of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Related Field

It allows informing which fields contain the values of Credit Card Number so that it can do the validations correctly.

Reload

It Reloads the form when modifying the value.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookups Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position

(left,right,center and justify).

- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon ? beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon ? beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard ? icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - E-mail Field

General Settings

Email field configuration Interface.

- **Data Type** : Defines the type of field for the application. When set to Email, the field applies validations for an email format.
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name is "Client Name".
- **Watermark** : Create a placeholder for the selected field.
- **Initial Value (type)** : Defines the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Amount of characters** : Defines the amount of characters allowed for the field.
- **Validation Image** : Displays an image next to the field when it is being validated.
- **Save Variable** : Saves a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Defines the name for the session variable that will receive the field value.
- **Hidden Field** : This option makes the field hidden, but still allows its value to be processed through Javascript or PHP.
- **Label Field** : This options make the field behave as a Read Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

- **Display Icon** : Displays the Email icon next to the field.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of field in the database.

Values Format

Format of Values Interface.

Credit Card

It allows to define which cards will be listed and their internal value.

Use Title/Deny

It allows informing a new value if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen. It defines the label and value with the Negative Value and the Title.

Negative value

The value of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Title

Label of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Related Field

It allows informing which fields contain the values of Credit Card Number so that it can do the validations correctly.

Reload

It Reloads the form when modifying the value.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the values from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - URL Field

General Settings

URL field configuration Interface.

Data Type

Define the type of field. When setting it to YouTube, it allows displaying an Youtube video on the field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Watermark

Create a placeholder to specify a short hint that describes the expected value of an input field

Initial Value (type)

It allows you to define the initial value for the field when in insert mode. The options are:

- **Defined Value:** The field receives the value informed into the input option.

Initial Value Configuration Interface.

- **System Date:** The field receives the current server time.

Amount of characters

Define the number of characters allowed for the field.

Validation Image

Allows displaying an image next to the field when validating it.

Save Variable

It allows saving the value of the field in a session variable to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the session variable that will receive the field value.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Label Field

It sets the field like a Read-Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

Display Icon

Displays an icon beside the field.

Disabled Field

Defines if the field will be disabled in “Insert Mode”, “Update Mode” or in “Insert and Update Mode”.

Show the URL as a clickable link

It sets the content of the field as a clickable link.

Target handling where the link will open

Target to open the link when clicking on it.

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values Interface.

Credit Card

It allows to define which cards will be listed and their internal value.

Use Title/Deny

It allows informing a new value if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen. It defines the label and value with the Negative Value and the Title.

Negative value

The value of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Title

Label of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Related Field

It allows informing which fields contain the values of Credit Card Number so that it can do the validations correctly.

Reload

It Reloads the form when modifying the value.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only

when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is be accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced buy the curly brackets { }. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - HTML Color Field

General Settings

HTML Color field configuration Interface.

- **Data Type** : Select the type of field for the application. When set to HTML Color, you can select a color to be used in the form.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Initial Value (type)** : Set the initial value to the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Amount of characters** : Defines the amount of characters allowed for the field.
- **Validation Image** : Displays an image next to the field when it is being validated.
- **Save Variable** : Save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Defines the name for the session variable that will receive the field value.
- **Hidden Field** : This option makes the field hidden, but still allows its value to be processed through JavaScript or PHP.
- **Label Field** : This options make the field behave as a Read Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of the field in the database.

Values Format

Format of Values Interface.

Credit Card

It allows to define which cards will be listed and their internal value.

Use Title/Deny

It allows informing a new value if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen. It defines the label and value with the Negative Value and the Title.

Negative value

The value of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Title

Label of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Related Field

It allows informing which fields contain the values of Credit Card Number so that it can do the validations correctly.

Reload

It Reloads the form when modifying the value.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the values from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - HTML Editor Field

General Settings

HTML Editor field configuration Interface.

- **Data Type** : Defines the type of field for the application. When set to HTML Editor, you can inform any type of character and they will be saved in HTML form.
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name is "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Height** : Set the Height in pixels to the HTML Editor field.
- **Hidden Field** : This option makes the field hidden, but still allows its value to be processed through Javascript or PHP.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **SQL Type** : Displays the data type of field in the database.

Toolbar

HTML Editor toolbar settings Interface.

- **Properties**
 - **Position** : Location of the HTML Editor toolbar.
 - **Alignment** : Toolbar button alignment.
 - **Status** : Status Bar Display (Do not Display, Top and Bottom).
 - **Amount** : The Amount of lines of the HTML Editor toolbar.
- **Button Organization** : Positions the toolbar buttons.
- **Preview** : You can visualize the toolbar according to the previous settings.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Localization Field

General Settings

Location field Configuration Interface.

Data Type

Define the type of field. When setting it to Location, you can see a Combobox with the Languages that are part of the Project.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Reload

It links the informed text to reload the form when clicking on it.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.

- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Theme Field

General Settings

Theme field configuration Interface.

Data Type

Define the field type to Theme. it shows a combobox with the list of themes set in your project.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Reload

It Reloads the form when modifying the value.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Youtube Field

General Settings

YouTube field Configuration Interface.

Data Type

Define the type of field. When setting it to YouTube, it allows displaying an Youtube video on the field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Watermark

Create a placeholder to specify a short hint that describes the expected value of an input field

Amount of characters

Define the number of characters allowed for the field.

Display Mode

Define the mode to display the video in the application.

Width

Video Width in pixels.

Height

Video Height in pixels.

Disabled Field

Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".

SQL Type

It informs the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.

- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon ? beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon `?` beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard `?` icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Google Maps Field

General Settings

Google Maps field Configuration Interface.

- **Data Type** : Select the type of field for the application. When it is defined as Google Maps, it will use the Google Maps API to display the map in the Form Applications
- **Label** : Set the title to the field in the application. For example: if the field is defined in the database as cmp_name_client, it will be easier to the user understand if the name is "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Home** : Defines what type of parameters will be used in the API.

Home Configuration Interface.

- **Display Mode** : Indicates the display mode of the map. It can be opened in a Modal or in a new Window.
- **Width** : Defines the width of the map that is going to be displayed.
- **Height** : Defines the height of the map that is going to be displayed.
- **Zoom** : Defines the initial Zoom (available from the Google API) of the Map location.
- **API Key** : API Key for authorization to use Google Maps in the Application. (Required only for the versions 2 or earlier of the Google API.)

The API Key is a unique key, composed by a string(text) alphanumeric, which is the license to use the service. When you subscribe to use the service, the key is tied to the domain and the directory of the server. All the pages that use the API needs to be in the same directory that was used for the subscription. In case you have a web server on your local machine, you just need to possess a key for testing, and to do this you only need to set http://localhost in the domain of the subscription.

To get your API Key access the site by [clicking here](#)

- **Link Type** : Defines how the link will be displayed.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.

- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard ? icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Image (Database) Field

General Settings

Image (Database) field Configuration Interface.

Data Type

Define the type of field. When setting it to an Image (Database), all the Images files are stored and loaded directly from the Database.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Image Border

Width of the Image border in Pixels.

Image Height

Image height size in Pixels.

Image Width

Image width size in Pixels.

Progress bar

It displays a progress bar when sending the files to the server.

Upload area

It displays a drag and drop area to upload the file.

Upload area icon

Font-awesome icon for viewing in the file upload zone.

Clickable upload area

Hides the upload button and turns the upload area responsible for the upload function.

Maintain Aspect

It maintains the original aspect ratio of the image when resizing it.

Display link only

It allows showing a link to open the image in another window with the original size. (with no re-dimensioning)

Open in Another Window

Allows to open the image in another window.

Extensions and upload size

This setting defines the extensions allowed for uploading and the maximum size of each one.

This setting is important for the security of your project, as it prevents unwanted files from being uploaded.

Note If no value is informed, all extensions will be allowed. The file size will be limited by your PHP configuration.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Disabled Field

Defines if the field will be disabled in “Insert Mode”, “Update Mode” or in “Insert and Update Mode”.

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Multi-upload

This option allows to upload multiple files and store them on a table referencing a record from another table.

To use this option you first need to create a virtual field. _

Multi-Upload Configuration.

Amount of columns

The number of columns to display the files in the Field.

Files sorting

It enables the files sorting after the upload.

Position of the delete

Set the position of the checkbox delete files option.

Position on the upload

Set the position of the checkbox delete files option.

Show status

Display the upload status.

Table

Select the table to stores the file information when uploading.

After selecting the table, you can see a field list of the chosen table to associate the parameters for each field when inserting a new record or updating an existing record.

Multi-Upload fields of the table Configuration.

- **File Name** It gets the name of the loaded file.
- **Upload** It gets the binary value of the file.
- **File Size** Field that will storage the file size in the Database.

- **Auto Increment** Use it only when the field in the database is an auto-increment.
- **Manual Increment** The form is responsible for managing the auto-increment, calculating the value of the field before inserting the record.
- **Foreign Key** It associates the file with a value of a field in the current form.
- **Defined** You can specify a constant value or use a global variable. [global_var]
- **Date of Insertion** It gets the data of the server when inserting the record.
- **Datetime of Insertion** It gets the data and time of the server when inserting the record.
- **User IP** It gets the IP of the computer that is accessing the application.
- **Calculated by the Database** The Database calculates the value of the field.
- **Calculated by the Database if empty** If the value is empty in the application, the Database calculates the value of the field.
- **Null** The field will the null value.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.

- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.

- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Image (File Name) Field

General Settings

Data Type

Define the type of field. When setting it to Image (File Name), all the Images files are stored and loaded directly from the Database.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Image Border

The width of the Image border in Pixels.

Image Height

Image height size in Pixels.

Image Width

Image width size in Pixels.

Maintain Aspect

It maintains the original aspect ratio of the image when resizing it.

Progress bar

It displays a progress bar when sending the files to the server.

Upload area

It displays a drag and drop area to upload the file.

Upload area icon

Font-awesome icon for viewing in the file upload zone.

Clickable upload area

Hides the upload button and turns the upload area responsible for the upload function.

Cloud storage API

Profile with the API information (Dropbox, Google Drive or Amazon S3) used to upload the file to the cloud created in Tools > API

Storage API directory

Directory name for upload to the Cloud Storage API. Eg.: files/docs/{id}. The file will be saved in the root folder if this field is empty.

Storage API cache directory

Local directory for caching files sent to the cloud via the storage API

Keep file after uploading via API

It also saves the file in the default folder for images or documents after uploading to a cloud storage API.

Deletion in the storage API

When deleted in the application, the file will also be removed from the folder in the cloud storage API.

Increment file

It inserts a number increment into the file name if there is already another one with the same name in the upload folder.

Subdirectory for local storage

It sets the Sub-folder name of the stored files. It is relative to the directory of Document upload (see the Settings). It is possible to use global variables or local variables to format the name of the sub-folder.

Create Subfolder

It creates the sub-folder if not already created.

Image Caching

Time in minutes to store the image in the cache.

Hide image name

It displays only the image, without the name.

Files Deletion

It Deletes the files from the directory when deleting a record from the database.

Display link only

It allows showing a link to open the image in another window with the original size. (with no re-dimensioning)

Open in Another Window

Allows to open the image in another window.

File Size

It allows defining the field to store the file size in the database.

Extensions and upload size

This setting defines the extensions allowed for uploading and the maximum size of each one.

This setting is important for the security of your project, as it prevents unwanted files from being uploaded.

Note If no value is informed, all extensions will be allowed. The file size will be limited by your PHP configuration.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Disabled Field

Defines if the field will be disabled in “Insert Mode”, “Update Mode” or in “Insert and Update Mode”.

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Multi-upload

This option allows to upload multiple files and store them on a table referencing a record from another table.

To use this option you first need to create a virtual field. _

Multi-Upload Configuration.

Amount of columns

The number of columns to display the files in the Field.

Files sorting

It enables the files sorting after the upload.

Position of the delete

Set the position of the checkbox delete files option.

Position on the upload

Set the position of the checkbox delete files option.

Show status

Display the upload status.

Table

Select the table to stores the file information when uploading.

After selecting the table, you can see a field list of the chosen table to associate the parameters for each field when inserting a new record or updating an existing record.

Multi-Upload fields of the table Configuration.

- **File Name** It gets the name of the loaded file.
- **Upload** It gets the binary value of the file.
- **File Size** Field that will storage the file size in the Database.
- **Auto Increment** Use it only when the field in the database is an auto-increment.
- **Manual Increment** The form is responsible for managing the auto-increment, calculating the value of the field before inserting the record.
- **Foreign Key** It associates the file with a value of a field in the current form.
- **Defined** You can specify a constant value or use a global variable. [global_var]

- **Datetime of Insertion** It gets the data and time of the server when inserting the record.

- **User IP** It gets the IP of the computer that is accessing the application.
- **Calculated by the Database** The Database calculates the value of the field.
- **Calculated by the Database if empty** If the value is empty in the application, the Database calculates the value of the field.
- **Null** The field will the null value.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Document (Database) Field

General Settings

Document (Database) field Configuration Interface.

Data Type

Define the type of field. When setting it to Document (Database), all the document files are stored and loaded directly from the Database.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Icon

It displays an icon beside the field to identify the document type.

Progress bar

It displays a progress bar when sending the files to the server.

Upload area

It displays a drag and drop area to upload the file.

Upload area icon

Font-awesome icon for viewing in the file upload zone.

Clickable upload area

Hides the upload button and turns the upload area responsible for the upload function.

File Name

It allows defining the field to store the file name in the database.

File Size

It allows defining the field to store the file size in the database.

Extensions and upload size

This setting defines the extensions allowed for uploading and the maximum size of each one.

This setting is important for the security of your project, as it prevents unwanted files from being uploaded.

Note If no value is informed, all extensions will be allowed. The file size will be limited by your PHP configuration.

Allow download in read only fields

Allow file download even when field is read-only.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Disabled Field

Defines if the field will be disabled in “Insert Mode”, “Update Mode” or in “Insert and Update Mode”.

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Multi-upload

This option allows to upload multiple files and store them on a table referencing a record from another table.

To use this option you first need to create a virtual field. _

Multi-Upload Configuration.

Amount of columns

The number of columns to display the files in the Field.

Files sorting

It enables the files sorting after the upload.

Position of the delete

Set the position of the checkbox delete files option.

Position on the upload

Set the position of the checkbox delete files option.

Show status

Display the upload status.

Table

Select the table to stores the file information when uploading.

After selecting the table, you can see a field list of the chosen table to associate the parameters for each field when inserting a new record or updating an existing record.

Multi-Upload fields of the table Configuration.

- **File Name** It gets the name of the loaded file.
- **Upload** It gets the binary value of the file.
- **File Size** Field that will storage the file size in the Database.
- **Auto Increment** Use it only when the field in the database is an auto-increment.
- **Manual Increment** The form is responsible for managing the auto-increment, calculating the value of the field before inserting the record.
- **Foreign Key** It associates the file with a value of a field in the current form.
- **Defined** You can specify a constant value or use a global variable. [global_var]

- **Date of Insertion** It gets the data of the server when inserting the record.
- **Datetime of Insertion** It gets the data and time of the server when inserting the record.
- **User IP** It gets the IP of the computer that is accessing the application.
- **Calculated by the Database** The Database calculates the value of the field.
- **Calculated by the Database if empty** If the value is empty in the application, the Database calculates the value of the field.
- **Null** The field will the null value.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.

- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Document (File Name) Field

General Settings

This option allows to upload multiple files and store them on a table referencing a record from another table.

To use this option you first need to create a virtual field. _

Multi-Upload Configuration.

Amount of columns

The number of columns to display the files in the Field.

 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Barcode Field

General Settings

Configuration Interface of the Barcode Field.

- **Data Type** : DataType of the field for the application.
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be easier to the user understand if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Disabled Field** : Defines if the field will be disabled in the "Insert Mode" , "Update Mode" or in "Insert and Update Mode".
- **SQL Type** : Database field type.

Values Format

Configuration Interface of the Barcode Field.

- **Type** : Type of Barcode.
- **Text** : Barcode Text for illustration purposes.
- There are **18 types of barcodes**, that are listed below:

Barcode configuration interface.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).

- **Width** : To define a width for the field.
- **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Select Field

General Settings

Select field configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Select, you can select multiple option from a combo box (Select Field).
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Watermark** : Create a placeholder for the selected field.
- **Initial Value (type)** : Allows you to define the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.
- **Use Select2** : Uses the new component for data selection, allowing searches within the select.
- **Display Select2 search area** : Sets whether to display the search field within Select2.

Initial Value Configuration Interface.

- **Save Variable** : Allows to save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Allows to define the name for the session variable that will receive the field value.
- **Field size in database** : Determines the field size in bytes. It is used to determine the max size of characters that is allowed to type in.
- **Hidden Field** : This option makes the field hidden, but still allows it's value to be processed through Javascript or PHP.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of field in the database.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

• Lookup Methods

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

Selecting the lookup type.

◦ Lookup Method - Automatic

Lookup used to list the values that will be displayed on the Checkbox field. These values will be recovered dynamically using the Select command.

Automatic Lookup Interface.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the key_field will be stored in the table field.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimitation.

- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Height** : Defines the height for the select object.
- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.
- **Link** : Allows to create a link to another form allowing to manipulate the list displayed on the select field. After the manipulation, the select object it updated automatically.

◦ **Lookup Method - Manual**

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

Manual Lookup Interface.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

Setting up Single Value Lookup

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Default** : With this option enabled, the selected item will be inserted to the table when committed.
- **Height** : Defines the height for the select object.

- **Multiple Values (delimiter)**

You can store various values for the select field. The values are separated by the informed delimiter. For example: the combination **Sport, Cinema** and **Tourism** selected in form will be stored like **E;C;T** in case the delimiter is ; (semi coma).

Setting up Multiple Values (delimiter)

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Height** : Defines the height for the select object.

▪ **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Martial Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in the database would be stored the following value **MSRD**.

Setting up Multiple Values (position)

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Negative** : Value to be saved in the table in case there is not any valued selected on the field.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.
- **Height** : Defines the height for the select object.

▪ **Multiple Values (binary)**

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
---	--------

Attribute Value Lookup Description

2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

Editing Lookup Configuration Multiple Values (Binary)

- **Label** : Text that will be displayed in the item list of the select field.
- **Height** : Defines the height for the select object.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

Displaying the original lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Lookup Method - Actual value

This lookup is used to list all the values in the selected field.

This lookup will apply a “distinct” to your SQL query.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Double Select Field

General Settings

Double Select field configuration Interface.

- **Data Type** : Select the type of field for the application. When set to Double Select you can have multiple options selected.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name is "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Initial Value (type)** : Defines the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Save Variable** : Saves a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Set the name for the session variable that will receive the field value.
- **Field size in database** : Determines the size in bytes of the fields. It is used to set the max amount of characters to be typed in.
- **Hidden Field** : This option makes the field hidden, but still allows its value to be processed through Javascript or PHP.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Displays the data type of field in the database.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or F can be presented like Male or Female or in a dynamic way, getting these values from the database.

Lookup Settings Display for the field.

Automatic Lookup Interface..

- **SQL Select Statement** : Defines the SQL command that will get the values displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the `key_field` will be stored in the table field.

- **Height** : Set the height(lines) of the field interface.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter than (;).
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Selects another specific connection existing in the project. The select command will be done on the second connection.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the

users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Checkbox Field

General Settings

CheckBox field configuration Interface.

- **Data Type** : Select the type of field for the application. When set to CheckBox, you can have multiple options selected.
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name is "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Initial Value (type)** : Defines the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Save Variable** : Saves a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Define the name for the session variable that will receive the field value.
- **Field size in database** : Determines the size in bytes of the fields. It is used to determine the max amount of characters to be typed in.
- **Hidden Field** : This option makes the field hidden, but still allows it's value to be processed through JavaScript or PHP. .
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of field in the database.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or F can be presented like Male or Female or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

• Lookup Methods

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query). *Selecting the lookup type.*

◦ Lookup Method - Automatic

Lookup used to list the values that will be displayed on the CheckBox field. These values will be recovered dynamically using the Select command.

Automatic Lookup Interface.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the `key_field` will be stored in the table field.

- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Reload form when value has changed** : With this option selected, the form will refresh if

there is a change to the selected object in the field.

- **Option check all** : Displays two options on the field to check and uncheck all.

- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Selects another specific connection existing in the project. The select command will be done on the second connection.

◦ **Lookup Method - Manual**

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

Manual Lookup Interface.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).

- **Single Value** :

Setting up Single Value Lookup

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Default** : With this option enabled, the selected item will be inserted to the table when committed.
- **Columns** : Set the amount of columns, for the list of items.

- **Multiple Values (delimiter)**

You can store various values for the checkBox field. The values are separated by the informed delimiter. For example: the combination **Sport, Cinema** and **Tourism** selected in form will be stored like **E;C;T** in case the delimiter is ; (semi coma).

Setting up Multiple Values (delimiter)

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Columns** : Set amount of columns, for the list of items.

- **Multiple Values (position)**

Stores a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Martial Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1

Label	Value	Start	Size
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in the database would be stored the following value **MSRD**.

Setting up Multiple Values (position)

- **Label** : Text that will be displayed in the item list of the checkBox.
 - **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
 - **Negative** : Value to be saved in the table in case there is not any valued selected on the field.
 - **Start** : Starting position of the string that is going to be stored. The first position is always 1.
 - **Size** : Amount of bytes that is going to occupy in the string.
 - **Columns** : Set the amount of columns, for the list of items.
- **Multiple Values (binary)**

Stores a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

Setting up Multiple Values (Binary)

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Columns** : Allows you to inform the amount of columns, for the list of items.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Saves all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Refreshes the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Option check all** : Displays two options on the field to check and uncheck all.

- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

• CSS of the Title

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

• CSS of the Field

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.

- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon ? beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon ? beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard ? icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Radio Field

General Settings

Radio field configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Radio, your allowed to select one of the options listed.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Initial Value (type)** : Allows you to define the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Save Variable** : Allows to save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Allows to define the name for the session variable that will receive the field value.
- **Field size in database** : Determines the size in bytes of the fields. It is used to determine the max amount of characters to be typed in.
- **Hidden Field** : This option makes the field hidden, but still allows it's value to be processed through Javascript or PHP. .
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of field in the database.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

• Lookup Methods

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query). *Selecting the lookup type.*

◦ Lookup Method - Automatic

Lookup used to list the values that will be displayed on the Checkbox field. These values will be recovered dynamically using the Select command.

Automatic Lookup Interface.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the key_field will be stored in the table field.

- **Columns** : Allows you to inform the amount of columns, for the list of items.

- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

◦ Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

Manual Lookup Interface.

- **Label** : Text that will be displayed in the item list of the radio.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Default** : With this option enabled, the selected item will be inserted to the table when committed.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

Displaying the original lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Ajax Settings

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Text Auto-Complete Field

General Settings

Text auto complete field configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Text auto complete, you can inform a value based on the select statement of the lookup settings and it will manipulate an internal Text for the data.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Watermark** : Create a placeholder for the selected field.
- **Initial Value (type)** : Allows you to define the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You'll inform the Defined Value here.
- **Use Select2**: Uses the new component for data selection, allowing searches within the select.
- **Amount of characters for the Select2** : Sets the number of characters to start the search in Select2.
- **Amount of lines for the Select2** : Sets the maximum number of rows to list the search result in Select2.
- **Width for the Select2** : Sets a width for the area for the Select2.

Initial Value Configuration Interface.

- **Amount of characters** : Define the amount of characters allowed for the field.
- **Save Variable** : Allows to save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Allows to define the name for the session variable that will receive the field value.
- **Complete to the Left** : Allows to define the character that will be used to complete the value to the left that the user typed in to the max size of the field defined in the Field size in database option.
- **Field size in database** : Determines the field size in bytes. it is used to determine the max size of characters that is allowed to type in.
- **Hidden Field** : This option makes the field hidden, but still allows its value to be processed through JavaScript or PHP.
- **Label Field** : This options make the field behave as a Read Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

- **Validate on submit** : Validate the field only when the form is submitted.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of field in the database.

Values Format

Format of Values Interface

Case Settings

Allows converting the letters of the field when it loses focus. The options are: **Uppercase**, **Lowercase**, **Capitalize the first word**, **Capitalize all words**.

Minimum Length

Determines the minimum number of characters a user must enter in the field.

Integer values greater than or equal to 0 must be provided.

Maximum Length

Determines the maximum number of characters a user can enter in the field.

Integer values greater than or equal to 0 must be provided.

Allowed Characters

Allows to select a set of characters that can be typed into the field. The options are:

- **All** : Allows any type of character to be typed into the field
- **Selected** : Defines a set of characters allowed. Using the configuration below, will be allowed to type letters, numbers and other characters (defined in the attribute More). The letters a, b and c (defined in the Less Attribute) are not allowed.

Regular expression

Regular expression used to validate field content.

Regular expression modifier

Modifiers used in the field content validation regular expression.

Error message

Message to be displayed if the regular expression is not valid.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field.
- **Rows** : Allows to define the amount of records displayed in the field.
- **Width** : Defines the width the size of capture box (Capture Text).
- **Search options** : Allows to define the search settings of the field(Start equal to, Any part and End equals to).
- **Capture Text** : When not enabled, you will only view the field to inform the data. See an example below. *lookup Settings configuration Interface.*
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

lookup Settings validation configuration Interface.

- **Show label with the description** : Displays a label with the description.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Number Auto-Complete Field

General Settings

Number auto complete field configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Number auto complete, you can inform a value based on the select statement of the lookup settings and it will manipulate an internal number for the data.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Watermark** : Create a placeholder for the selected field.
- **Initial Value (type)** : Allows you to define the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Amount of characters** : Define the amount of characters allowed for the field.
- **Save Variable** : Allows to save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Allows to define the name for the session variable that will receive the field value.
- **Complete to the Left** : Allows to define the character that will be used to complete the value to the left that the user typed in to the max size of the field defined in the Field size in database option.
- **Field size in database** : Determines the field size in bytes. It is used to determine the max size of characters that is allowed to type in.
- **Hidden Field** : This option makes the field hidden, but still allows its value to be processed through JavaScript or PHP.
- **Label Field** : This options make the field behave as a Read Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

- **Validate on submit** : Validate the field only when the form is submitted.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of field in the database.

Values Format

Format of Values Interface

Case Settings

Allows converting the letters of the field when it loses focus. The options are: **Uppercase**, **Lowercase**, **Capitalize the first word**, **Capitalize all words**.

- **Search options** : Allows to define the search settings of the field(Start equal to, Any part and End equals to).
- **Capture Text** : When not enabled, you will only view the field to inform the data. See an example below. *lookup Settings configuration Interface.*
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

lookup Settings validation configuration Interface.

- **Show label with the description** : Displays a label with the description.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Signature Field

General Settings

Configuration Interface of the Signature Field.

The signature field will help you creating more sophisticated forms and making it possible to store signatures in your database. Inside our development environment we have specific settings that will help you to customize your field, those options are:

- **Data Type** : You can define the type of field for the application. When it is defined as a text, it accepts letters, numbers and special characters.
- **Label** : Lets you define a label to the field in the application. For example: if the field is defined in the database as cmp_name_client, it will be easier to the user understand if the name is "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Background color** : Defines a color to the field background by using a valid hexadecimal color value or by choosing a color from the color palette.
- **Pen color**: Set a color to the pen by using a valid hexadecimal color value or by choosing a color from the color palette.
- **Width** : Lets you define a width to the field.
- **Height** : Set a height to the field.
- **Subtitle** : Defines the subtitle that will be displayed beside the field.
- **Initial Value** : Lets you define the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
- **Save Variable** : Save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Set the name for the session variable that will receive the field value.
- **Disabled Field** : Define if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : Displays the HTML Object that will be used to display the field in the form.
- **SQL Type** : Displays the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of ScriptCase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **CSS of the Title**
 - **Font** : Select the font type, that will be applied to the application field title.
 - **Font Size** : Defines the font size, that will be applied to the application field title.
 - **Font Color** : Choose a color to the font by using a valid hexadecimal color value or from the color picker.
 - **Background Color** : You can define the color for the field by using a valid hexadecimal color value or from the color picker.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Set the underline style to the font.
 - **Border style** : Choose a style for the border.
 - **Collapse** : Defines the collapse for the border.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Choose a color for the border, using a color palette to apply to the title.
 - **Horizontal Alignment** : Position the label of the field in the wanted position (left,right,center and justify).
 - **Vertical Alignment** : Position the label of the field in the wanted position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : Defines a width for the title of the field.
 - **Height** : Set a height for the title of the field.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Rating Field

General Settings

This field allows the developer to create a field for rating using stars (or any other image), where the final user can select a rate option.

Attribute descriptions

Data Type

Define the field type to **Rating**.

Label

The Label option lets you define the title of a field. Example: If the database field name is "**Stars**", You can display a different name for the user, like "**Stars**".

Besides use a fixed text, the **Label** attribute allows the use of **Langs** to define the field title, allowing the [internationalization of your application](#).

Label below field

Defines the message to be displayed below the field.

Subtitle

Define the subtitle of the field, below the ratings. **Example:** "Thank you for your feedback!".

As in the **Label**, the **subtitle** attribute also allows the use of **Langs** for the [internationalization of your application](#).

Amount of icons

It defines how many icons it will display in the field. The value set in this attribute must be according to the evaluation rules.

Initial Value (type)

Allow the definition of an initial value for the field when the form application is in insert mode. The only option available in this field is **Defined**. Selecting this option the attribute **Initial Value** will be showed for set the value.

Example: The initial value is 3 when inserting a new record, the rate field will initiate with 3 stars already selected.

The value defined in this attribute will overlap any value defined previously.

Save variable

It allows saving the value of the field in a session variable([Global variable](#)) to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the **session variable** that will receive the field value.

We must inform only the variable name, - **var_rating**.

We can get the value as a [global variable](#).

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of ScriptCase, there are the same attributes available in Interface.

Display Settings configuration Interface.

• CSS of the Title

- **Font** : Select the font type, that will be applied to the application field title.
- **Font Size** : Defines the font size, that will be applied to the application field title.
- **Font Color** : Choose a color to the font by using a valid hexadecimal color value or from the color picker.
- **Background Color** : You can define the color for the field by using a valid hexadecimal color value or from the color picker.
- **Bold** : Applies the bold style to the font.
- **Underline** : Set the underline style to the font.
- **Border style** : Choose a style for the border.
- **Collapse** : Defines the collapse for the border.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Choose a color for the border, using a color palette to apply to the title.
- **Horizontal Alignment** : Position the label of the field in the wanted position (left,right,center and justify).
- **Vertical Alignment** : Position the label of the field in the wanted position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : Defines a width for the title of the field.
- **Height** : Set a height for the title of the field.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon ? beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Rating Smile Field

General settings

This field type allows the final user evaluate with an emoji that goes from **Very Bad** to **Excellent**.

Defines the data type of the field in the application. In this case we should select **Rating Smile**.

Label

Defines the title that will be shown in the field when the application is running. The used terms in the interface are essential to the system has good usability, we should use comum name and terms for the final user, instead of the default values of the system.

For example, for the rating smile field, the client would have a better understanding of the field function when the label is **Product evaluation**.

Besides a fixed text, the **Label** allow to use of lang to define the field title, this way is possible to use the [application internationalization](#).

Label below field

Allows you to define a message that will be displayed under the field, which can serve as a help or caption for example.

Subtitle

Define a subtitle that will be shown beside the field. Ex.: Thank you for the feedback!

Below is one example of an application subtitle:

Values and hints

Allow to the developer to define the values to each emoji taht will be saved at the data base and allow to define a hint (**It is show passing the mouse above the emoji**)

Display format

Allows the developer to define the format that the emojis will be shown.

In case the first option is defined, the emojis will be shown like this:

In case the second option is defined, the emojis will be shown like this:

Icon size

Allows defining the icon size in pixels.

Rating padding

Allows for defining the padding value between the emojis.

Icon colors

Allows the icon colors to be defined in each emoji.

Initial value (type)

Allows defining a default value to the field when the application will be in insert mode. Is possible to choose between two options:

Default value: Selecting this option, the default value will be available, where we should input the field's default value. For example, my default value is **Allan**, inserting a new register, the field **Seller Name** will start with Allan.

Save variable

It allows saving a session variable ([global variable](#)) with the field value, to be used in other applications.

For example, in the login form the username can be saved in session and displayed in the header of other applications.

Variable name

In this one we should define the variable's name in session, available at the last item, which will receive the field value.

We should inform only the variable's name, **var_seller**.

The recovery of the value is done in the form of a [global variable](#).

Disable field

Allow to Disable field, impossible to change the defined value.

Available options are:

No - Default value, this option don't disable the field.

Update mode - This option disable the field only at update. **Insert mode** -This option disable the field only at insert. **Insert/Update mode** -This option disable the field in both insert and update.

HTML type

HTML object used to show the form field.

SQL type

Infomrs the field type at the data base.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).

- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon ? beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Calendar - Rating Thumbs Field

General settings

This field type allows the final user to save data with the icons like or dislike.

Data type

Defines the data type of the field in the application. In this case we should select **Rating Thumbs**.

Label

Defines the title that will be shown in the field when the application is running. The used terms in the interface are essential to the system has good usability, we should use common name and terms for the final user, instead of the default values of the system.

For example, for the rating thumbs field, the client would have a better understanding of the field function when the label is **Product evaluation**.

Besides a fixed text, the **Label** allow to use of lang to define the field title, this way is possible to use the [application internationalization](#).

Label below field

Allows you to define a message that will be displayed under the field, which can serve as a help or caption for example.

Subtitle

Define a subtitle that will be shown beside the field. Ex.: Welcome to help us with your feedback!

Below is one example of an application subtitle:

Values and hints

Allow to the developer to define the values to each icon that will be saved at the database and allow to define a hint (**It is shown passing the mouse above the icon**)

Display format

Allows the developer to define the format that the emojis will be shown.

In case the first option is defined, the emojis will be shown like this:

In case the second option is defined, the emojis will be shown like this:

Icon size

Allows defining the icon size in pixels.

Rating padding

Allows for defining the padding value between the emojis.

Icon colors

Allows the icon colors to be defined in each emoji.

Initial value (type)

Allows defining a default value to the field when the application will be in insert mode. Is possible to choose between two options:

Default value: Selecting this option, the default value will be available, where we should input the field's default value. For example, my default value is **Allan**, inserting a new register, the field **Seller Name** will start with Allan.

Save variable

It allows saving a session variable ([global variable](#)) with the field value, to be used in other applications.

For example, in the login form the username can be saved in session and displayed in the header of other applications.

Variable name

In this one we should define the variable's name in session, available at the last item, which will receive the field value.

We should inform only the variable's name, **var_seller**.

The recovery of the value is done in the form of a [global variable](#).

Disable field

Allow to Disable field, impossible to change the defined value.

Available options are:

No - Default value, this option don't disable the field.

Update mode - This option disable the field only at update. **Insert mode** -This option disable the field only at insert. **Insert/Update mode** -This option disable the field in both insert and update.

HTML type

HTML object used to show the form field.

SQL type

Infomrs the field type at the data base.

Display Sttings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.

Form Application using Pages

feature.

Pages Settings

The form application already comes with a default page, identified as "Pag1", but it is possible to rename it. Use the pages when you have an application that contains many fields. A form with more than 20 fields in a vertical way is challenging to use. So you could arrange the fields into the blocks and the blocks into the pages.

Pages Configuration

Interface.

Including a new page,

To include a new page, enter the information about the name and the label of the new page, select an image if you wish, then click on the button "Include".

Deleting a page

To delete a page, click on the Trash icon corresponding to the page line.

Common Settings

Font

Set the font-family of the pages titles. By clicking on the right side icon, you can select the font-family from a list.

Font Size

Set the font size of the pages titles.

Selected Font Color

Set the font color of the selected page.

Selected Background Color

Set the Background Color of the selected page.

Non Selected Font Color

Set the font color of the non selected pages.

Non Selected Background Color

Set the Background Color of the non selected pages.

Blocks

Blocks are “containers” where you can position the application fieldSlides of Forms, Controls, or Grids.

Scriptcase creates applications with one block by default. You can add more blocks as you wish, to organize it in the best way.

See below, the Columns Organization, and where you can define the position of the next block: beside or below the current one.

Block		Title	Label			Fields		Organization				
Op	Name	Label	Display	Display	Position	Columns	Position	Next	Width	Collapse		
Pag1												
			form_orders	form_orders	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Pag2												
			Block 2	Block 2	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Blocks not shown												

Application Block configuration

On the left side of each block, there are two icons, the first one to edit the information of the block and the second one to delete the block.

Organizing the position of the Blocks

See below how to modify the display order of the Blocks in one Page.

Click and drag the block that you desire to modify to its new position.

Block		Title	Label			Fields		Organization				
Op	Name	Label	Display	Display	Position	Columns	Position	Next	Width	Collapse		
Pag1												
			form_orders	form_orders	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Pag2												
			Block 2	Block 2	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Blocks not shown												

Application Block Display configuration

- See how to remove a block from the display

Click on the block desired and drag it to the item “Blocks not Shown”. This way, you can also drag the block to another page if desired. See the images below.

Block		Title	Label			Fields		Organization				
Op	Name	Label	Display	Display	Position	Columns	Position	Next	Width	Collapse		
Pag1												
			form_orders	form_orders	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼

Application Block Display configuration

Block

- **Name:** The name that identifier the Block.
- **Label:** Title of the block to display in the application.

Title

- **Display:** It controls the display of the block title.

Label

- **Display:** It controls the display of the field labels of the block.
- **Position:** Options to display label :
 1. **Above:** Display the label above the field.
 2. **Beside:** Display the label beside the field.
 3. **Below:** Display the label below the field.

Fields

- **Columns:** Amount of columns side by side in the block.
- **Position:** The way to display the fields in the block:
 1. **Below:** Display the fields one below the other respecting the number of columns.
 2. **Beside:** Display the fields one beside the other respecting the number of columns.
 3. **Line:** Display the fields one beside the other with no tabulation.

Organization

- **Next:** The way to display the blocks in the page:
 1. **Below:** Set to show the following block below the current one.
 2. **Beside:** Set to show the following block beside the current one.
 3. **Tabs:** Set to show the following block in a different tab then the current one.
- **Width:** Set the block width in pixels or percentages. Use the symbol “%” to indicates the value in percentage.
- **Collapse:** Enables the option to close the block.

Create a New Block

To include new blocks in an Application, click on the button . Then, enter the name and label of the block in the following interface and finish by click on Create.

Add New Block

NAME

LABEL

Create

Creating application blocks configuration

Name

Name of the Block.

Label

Title of the block to display in the application.

Edit Blocks

To edit a block, click on the icon , that is on the left side of the block. Then you can see the following interface to define the parameters of the blocks. Click on Save to finish.

EDIT BLOCKS

Application Block editing interface

Name

Name of the block. ##### Title

Block title for display. ##### Display Title

This option, when active, allows displaying the block title. ##### Title Font

Set the font family of the block title. ##### Font Size

Set the font size of the block title. ##### Font Color

Set the font color of the block title. ##### Background Color

Set the Background Color of the block title. ##### Background image

Set a Background image for the block title. ##### Title Height

Height in pixels of the block title line. ##### Horizontal Alignment

Horizontal Alignment of the block title (Left, Center, and Right). ##### Vertical Alignment

Vertical Alignment of the block title (Top, Middle, and Bottom). ##### Display Label

Display the labels of the fields in the block. ##### Columns

Amount of field columns in a block. ##### Columns Width

Set the field column width of the block. ##### Label Color

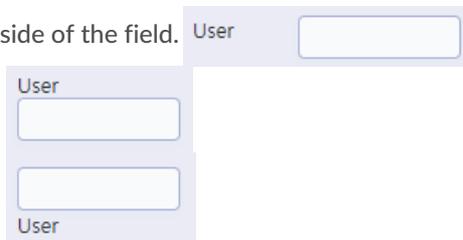

Color of the field labels. ##### Fields Organization

The way to display the fields in the block. ##### Label Position

Set the position of the field labels of the block.

The options are:

- **Beside** - This option positions the label on the right side of the field.
- **Above** - This option places the label above the field.
- **Below** - This option places the label below the field.

Next Block

Set the position of the following block relating to the current one. ##### Border Color

The border Color for the block. ##### Border Width

The border Width for the block. ##### Block Width

The width for the block. ##### Block Height

The Height for the block. ##### Cell Spacing

The Cell Spacing in the block. ##### Collapse

It enables the option to close the block.

Layout Settings

ScriptCase creates an app by using default values defined per project, but you can change those values for a specific application on this interface.

LAYOUT SETTINGS		
Header Template	<input type="text" value="Flat"/>	Template name used for the application header.
Footer Template	<input type="text" value="Default"/>	Template name used for the application footer.
Button	<input type="text"/>	Use different buttons than what was defined in the color scheme.
Themes	<input type="text" value="Sc9_Rhino"/>	Use different themes from the one defined for the color scheme

Application Layout

Settings

Header Template

Allows choosing the look of the application Header.

Footer Template

Allows choosing the look of the application Footer.

Button

Allows choosing the button theme for the application.

Themes

Choose one of the selected themes in the project properties. It defines the look of the application, like colors, fonts, and others.

Header

Here we can define if we want to display the header or not, the application title, and fill the header variables. The header looks

according to the selected template in the Layout settings interface.

▲ HEADER	
ATTRIBUTE	VALUE
Display Header	<input checked="" type="checkbox"/>
Insertion Title	<input type="text" value="{lang_othr_frmi_tit} - orders"/>
Update Title	<input type="text" value="{lang_othr_frmu_tit} - orders"/>
Header Variables	
SC_HEADER	<input type="text" value="Title"/>
SC_VALUE	<input type="text" value="Date"/> <input type="text" value=""/> ?

Application Header Configuration

Display Header

This option determines if we want to display the header or not.

Title

Allows informing the title of the application.

Header Variables

We must fill the variable fields with one of the types available in the Combobox. Depending on the type, you need to associate content with it. Those are the types:

- **Field:** When you choose the option “**Field**”, it opens a Combobox to choose a field to associate the field value with the header. This option will be enabled in the applications that you can create a fields
- **Title:** It displays the value of “**Application Title**” in the header.
- **Date:** It displays the system’s date in “yyyy/mm/dd” format in the header. There are several display formats available, and you can change it by using the text field beside it. To access existing formats, click on the hint to see an explanation.
- **Image:** It displays a field to inform the name of an existing image in the server. You can select an image by clicking on the icon “**Choose Image**”, and you still can upload new images by using the button “**Upload**”. .
- **Value:** It displays the content of the text input. You can inform static texts and “**Global Variables**”. e.g. “Employee Name: [v_name]”.

Depending on the Application, you may have more than one title option.

Footer

FOOTER	
ATTRIBUTE	VALUE
Display Footer	<input type="checkbox"/>
Footer Variables	
NM_FOOTER_DATA	<input type="text"/>
NM_FOOTER_LOGO	<input type="text"/>
NM_FOOTER_TITLE	<input type="text"/>

Application Footer Settings

This page may change depending on the footer template chosen in the Layout Settings.

Display Footer

This option determines if we want to display the footer or not.

Footer Variables

We must fill the variable fields with one of the types available in the Combobox. Depending on the type, you need to associate content with it. Those are the types:

- **Field:** When you choose the option "**Field**", it opens a Combobox to choose a field to associate the field value with the header. This option will be enabled in the applications that you can create a fields
- **Date:** It displays the system's date in "yyyy/mm/dd" format in the header. There are several display formats available, and you can change it by using the text field beside it. To access existing formats, click on the hint to see an explanation.
- **Image:** It displays a field to inform the name of an existing image in the server. You can select an image by clicking on the icon "**Choose Image**", and you still can upload new images by using the button "**Upload**". 
- **Value:** It displays the content of the text input. You can inform static texts and "**Global Variables**". e.g. "Employee Name: [v_name]".

Calendar Events Overview

Most Scriptcase applications, with the exception of Tabs and Dashboard applications, have events that can be used to create business rules, validations and changes to the application's CSS, among other things.

When events are executed?

Each event is executed at a certain moment in the application and has an execution order, for this reason, they have different functions within the creation of a business rule and validations.

They can be triggered automatically, as in the case of the **onApplicationInit** and **onScriptInit** events, where they are executed when the application starts. Also, they can be triggered through user interaction, as with the **onNavigate** and **onValidate** events, which are executed when browsing the application or submitting a form, respectively.

For information about the timing of events execution or other information, access the documentation of the desired event.

how they work?

By default, the events already have handle for opening `<?php` and closing `?>` of PHP tags, so they are ready to receive PHP code and macros from Scriptcase.

However, it is possible to use other languages in the event, such as **JQuery**, **JavaScript**, **CSS** and **HTML**. For this, it is necessary to close the PHP tag `?>` of the event, so that the code can be added.

Remembering that it is necessary to reopen the event's PHP tag `<?php`, otherwise the application will not run correctly.

When closing the PHP tag in a Scriptcase event, the executed language is HTML.

Example of using other languages:

onCalendarApplicationInit - Calendar

This event occurs before the application execute the SQL, and is executed only once.

onApplicationInit - Calendar

This event occurs before the application execute the SQL, and execute only once. It's used to do verification of variables, and security verification. Ex: `if ([glo_var_department] != 'financial'){ sc_redir(app_x.php); }`

onCalendarScriptInit - Calendar

These formulas are executed before the application starts. At this moment, the application local variables are not available.

onScriptInit - Calendar

These formulas are executed before the application starts. At this moment, the application local variables are not available.

onLoad - Calendar

This event its executed before the form is loaded. In this moment all the applications variables are available.

onRefresh - Calendar

This event occurs when the form application is reloaded, is possible to reload the form based on fields (select , radio, checkbox)

onValidate - Calendar

This event is executed when the form is submitted to the server through the buttons: "include", "change" or "delete"

onValidateFailure - Calendar

This event occurs when submitting the application to onValidate there is an error generated by the macros `sc_error_exit`, `sc_error_message`, or by an error verified by Scriptcase (errors related to Database).

onValidateSuccess - Calendar

This event occurs when submitting the application to onValidate, there is no error generated by the macros `sc_error_exit`, `sc_error_message`, or by an error verified by Scriptcase (errors related to Database).

onBeforeInsert - Calendar

This event occurs before adding a new row, it is possible to create or call sophisticated data validations on this event.

onAfterInsert - Calendar

This event occurs after clicking the Insert button on the form. The form will execute the onValidate, onValidateSuccess and onBeforeInsert events, and right after executing the SQL command to insert the database record, it will execute the onAfterInsert event.

Example: After the inclusion of a record in the database, we want to store the inserting operation in a log table.

```
sc_exec_sql(" insert into log values ([glo_user],'target table','insert',{key_field}) "); //insert the user id that was stored in a session variable [glo_user] and the newly added registry key {key_field}.
```

onBeforeUpdate - Calendar

This event occurs after form validation (onValidate and onValidateSuccess), when clicking the Save button, and before executing the SQL command to Update the record in the database.

Example: We are checking the user privileges table before updating the record, if it does not have such privilege, we send an error message.

```
sc_lookup(priv_upd ," select priv_upd from tb_privileges where login = [var_login] ");
```

```
if( {priv_upd [0][0]} != 'YES'){
```

```
    sc_error_message("You do not have privileges to perform this operation");
```

```
}
```

onAfterUpdate - Calendar

This event occurs after clicking on the Form's Save button. The form will then execute the onValidate, onValidateSuccess and onBeforeUpdate events, and right after executing the SQL command to insert the database record, it will execute the onAfterUpdate event.

Example: After updating a record in the database, we want to store the update operation in a log table.

```
sc_exec_sql(" insert into log values ([glo_user],'target table','update',{key_field}) "); //insert the user id that was stored in a session variable [glo_user] and the newly added registry key {key_field}.
```

onBeforeDelete - Calendar

This event occurs before deleting rows on form applications. Ex: Before delete a row it is possible to verify the users privileges, if the user has no delete privilege the transaction is cancelled automatically.

```
sc_lookup(priv_del," select priv_del from tb_privileges where login = [var_login] "); if({priv_del[0][0]} != 'Y')  
{ sc_erro_mensage(" você nao tem privilégios para executar esta operação "); }
```

onAfterDelete - Calendar

This event occurs after clicking the form's Delete button. The form will then execute the events onValidate, onValidateSuccess and onBeforeDelete, and then, right after executing the SQL command to delete the record in the database, it will execute the event onAfterDelete.

Example: After deleting the record we can easily create logs, according to the code below:

```
sc_exec_sql(" insert into tb_log values([glo_user],'exclusion','customer_table',{code}); //we are storing the literals 'exclusion' and 'customer_table', the session variable [glo_user] and the field variable {code} containing the deleted content of the code field.
```

onFooter - Calendar

This event is used when in the footer we need to display some calculated value, it is in this event that we write the calculation necessary to assemble some value that we want to display.

Code Editor

Scriptcase has Events to allow the developers to customize the application code. By using the events, the developers can program custom actions at a specific execution time (e.g. After a record is inserted, when it is loaded, upon submitting a Form, ...) and for a specific application type. In the events area you can use global and local variables, JavaScript, CSS, HTML, PHP codes and also Scriptcase macros.

Scriptcase code editor is used within events and has a series of shortcuts to help in the applications development.

At the top section of the editor, there are some options that allows us to change the editor theme or expand it, for example. These options can also be activated using the hotkeys.

- - Increases the area occupied by your code editor.
- - Expand the sides of the code editor.
- - Activates the search in the code editor.
- - Enables replace in the code editor.
- - Defines the code editor theme.

The hotkeys are available in all browsers compatible with Scriptcase.

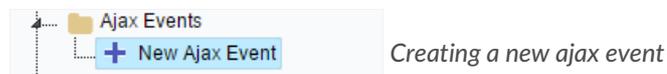

[Click Here](#) to view the Scriptcase hotkeys documentation.

Calendar Ajax events

OnClick

The ajax event OnClick is executed when the field that it's based on is clicked.

- Creating a new ajax event

Setting up the Link

- Selecting the applications

Link between applications - Application List

Select the application that will be called:

Application All By folder By type

-  calendar_events
-  chart_customers
-  dashboard
-  form_customers
-  form_employees
-  form_orders
-  form_sec_users
-  grid_categories

« Back Next » Help

Choosing the application for the button link.

You should select an application to be called from the button link.

- Link Parameters

Link between applications - Parameters Definition

Select values to pass as parameters

PARAMETERS VALUE

customerid Variable Fixed Empty

« Back Save Help

Choosing the parameters for the button link.

Field Allows you to use an existing field from the current application as a parameter for the link.

Variable Allows you to use a global variable from the current application as a parameter for the link.

Fixed Allows you to inform a fixed value as a parameter for the link.

Empty No value will be passed as a parameter for the link.

- Link Properties (Grid)

Link properties

Link Operation Mode display mode for the application called

Exit URL for the target application Output URL of the application. When not defined, output link (Back button) will be the Grid itself.

Hint of the link Message to be displayed when the mouse is over the field with the link

Form properties

Enable insert button on target application Enables the buttons New and Include within the Form

Enable update button on target application Enables the Update button within the form

Enable delete button on target application Enables the Delete button within the Form

Enable navigation button on target application Enables the navigation buttons (first, previous, next, and last) on the Form.

Enable button to edit a grid record Enables the button for the records edit

Save Help

Configuring the properties for the link button when the destined application is a Grid.

Link Operation Mode How the link will open (Open in the same Window, Open in another Window, Modal).

Exit URL for the target application URL or an application that be redirect to when exiting the Grid application.

Initial Mode Allows you to define the initial mode of the grid application (Search or Grid).

Number of Lines Allows you to define the amount of lines displayed in the Grid.

Number of Columns Allows you to define the amount of columns displayed in the Grid.

Paging Enable the paging in the Grid.

Display Header Enable the Grid Header.

Active Navigation Buttons Enable the navigation button (First, Back, Next and Last) in the Grid.

Application Settings (Calendar)

Settings

With this interface, you can set the common attributes of the app.

Settings ?		
ATTRIBUTE	VALUE	DESCRIPTION
Application Code	calendar_calendar (9.00.0036)	Application code for ScriptCase internal use.
Description	<input type="text"/>	Application description.
Documents Path	<input type="text" value="/opt/NetMake/v9/wwwroot/scrip"/>	Absolute path where the application documents are stored.
Image Directory	<input type="text" value="/scriptcase/file/lala"/>	Base directory for the application images.
Application images	<input type="text"/>	Upload here the images that will be used dynamically within the application. Those images will be stored within the images folder and can be used within the events, eliminating the use of the macro sc_image.
Language	<input type="text" value="English (United States)"/>	Language of the generated application.
Share Location Variable	<input checked="" type="checkbox"/>	If you choose the option YES this application will inherit the locale (Language and Regional Settings) from a global variable, otherwise this application will always load its default locale.
Charset	<input type="text"/>	Application specific charset.
Share Theme Variable	<input checked="" type="checkbox"/>	If you choose the option YES this application will inherit the theme from a global variable, otherwise this application will always load its default schema.
Folder	<input type="text" value="root"/>	Folder that will store the application on the working project.
Edit by Project	<input checked="" type="checkbox"/>	Allow other users of the same project to edit the application.
Timeout	<input type="text" value="0"/>	Script execution timeout in seconds. Zero uses the PHP default timeout.
Timeout Message	<input type="text" value="2"/>	Timeout message ajax update.
HelpCase Link	<input type="text"/>	Associate a HelpCase manual to your application.
Maximum file size	<input type="text"/>	Set the upload maximum file size. Same from upload policy: exemple: upload_max_filesize=512M
Message title	<input type="text" value="{lang_usr_lang_othr_msgs_titl}"/>	Message box title.

Application Settings Interface

• Attributes

- **Application Code** : It is the name that defines an application. An app can be renamed at the [List of Application](#).
- **Description** : This field contains a brief description of the application objectives.
- **Documents Path** : The absolute path to store uploaded documents in the application.
- **Image Directory** : The filesystem directory to store the application images.
- **Application images** : Import images into the application to allows using them in the application.
- **Language** : Set the default language of the application. Display all the application hints and messages in the selected language.
- **Share Location Variable** : Define if the app shares the regional settings with other applications through a session variable.
- **Charset** : Define a specific charset to use in the application.
- **Share Theme Variable** : Define if the app shares the Theme settings with other applications through a session variable.
- **Folder** : Define the project folder that contains the app.
- **Edit by Project** : Define if other project developers can edit the application.
- **Timeout** : Set the session runtime timeout in seconds. If the value is Zero, it assumes the default timeout of the PHP.
- **HelpCase Link** : It allows to associate a [HelpCase](#) file with the application.

- **Maximum file size** : Set the max size of uploaded files in the application.
- **Message title** : Message box title.

Notification settings

Error Settings ### {#id-2}

It groups the notification options of the app.

Error Settings ?		
ATTRIBUTE	VALUE	DESCRIPTION
Error position	<input type="text" value="Center"/>	Error position in the application
Error Position on the field	<input type="text" value="Right"/>	Error position when criticizing a field.
Show the Error Title in the Application	<input checked="" type="checkbox"/>	Show the title line of the error message in the application.
Show the Error Title in the Field	<input type="checkbox"/>	Show the title line of the error message in the field.
Error Title	<input type="text" value="{lang_errm_errt}"/>	Title message of the error
Script Error	<input type="checkbox"/>	Display information about the script and line where the error occurred.
SQL Error	<input checked="" type="checkbox"/>	Display the SQL Select Statement that originated the error.
Debug Mode	<input type="checkbox"/>	Run Application on debug mode, showing SQL commands.
Ajax Error Output	<input checked="" type="checkbox"/>	Window with ajax output, for debug

Error Settings Interface.

• Attributes

- **Use SweetAlert**: Use the SweetAlert to display messages from the application. When this option is active, it will replace the browser's "confirm" and "alert".
- **SweetAlert position using Toast** : The position to display error messages on the application.
- **Error Position on the field** : The position to display error messages when criticizing the field.
- **Show the Error Title in the Application** : Define to display the title line of the error message or not.
- **Show the Error Title in the Field** : Define to display the title line of the error message in the field or not.
- **Script Error** : Allows displaying the line code where there is an error..
- **SQL Error** : Allows displaying the SQL statement if it got an error.
- **Debug Mode** : Runs the application in Debug mode, showing all SQL statements the application is executing.
- **Ajax Error Output** : Enables the Ajax alert for debugging errors.

Navigation

This interface allows defining the navigating behavior of the application

Navigation ?		
ATTRIBUTE	VALUE	DESCRIPTION
Exit URL	<input type="text"/> 	URL to redirect the user when exiting the application.
Close on Exit	<input type="checkbox"/>	Close the browser window after exiting the application.
Redirect URL	<input type="text"/> 	URL to redirect the user if an application variable is missing.
Redirect Variable	<input type="text"/>	Name of the variable that will contain the URL of the current application upon redirection.
Return After Inserting	<input type="checkbox"/>	Dont open a new blank record after an insert, instead go to edit mode.
Exit Application	<input type="checkbox"/>	Exit the application after processing the form.

Navigation Interface.

Exit URL

URL to where the user goes when he clicks on the “exit” button.

Close on Exit

Close the browser window when the user clicks on the “exit” button.

Redirect URL

Redirect to another URL in case there aren’t any global variables available.

Redirect Variable

Creates a variable with the application name and sends it to the redirected application.

Return After Inserting

It opens the inserted record in edit mode instead of to open a new blank form.

Exit Application

It redirects to another application after inserting, updating, or deleting a record.

Messages

On this screen, you can redefine the default application messages to the end-user by customizing the validation messages for Insert, Update, and Delete. You can also define messages for SQL errors and the confirmation outputs.

Messages

Messages		
ATTRIBUTE	VALUE	DESCRIPTION
No Records Message	<input type="text"/>	When the application has no records, it will display this customized text.
Primary key violation	<input type="text"/>	Message to display when the primary key constraint is violated
Unique key violation	<input type="text"/>	Message to display when the unique constraint is violated

No Records Message

The message displayed when the application has no records.

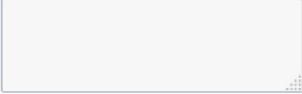

Primary key violation

The message displayed when there is a violation in the database’s primary key constraint.

Unique key violation

The message displayed when there is a violation in the database’s unique constraint.

Insertion Messages

▲ Insertion messages		
ATTRIBUTE	VALUE	DESCRIPTION
Message After Insert		Message to display after inserting a record.
Message to Confirm Insert		Message to display to confirm inserting of a record.

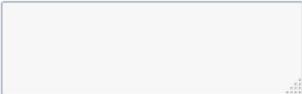

Message After Insert

The message displayed when inserting a new record.

Message to Confirm Insert

The message displayed if the end-user wants to confirm the inserting of a new record.

Update Messages

▲ Update messages		
ATTRIBUTE	VALUE	DESCRIPTION
Message After Update		Message to display after updating a record.
Message to Confirm Update		Message to display on the update confirmation

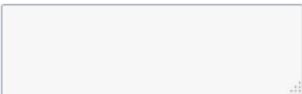

Message After Update

The message displayed when updating a record.

Message to Confirm Update

The message displayed if the end-user wants to confirm the changes of a record.

Messages of delete

▲ Messages of Delete.		
ATTRIBUTE	VALUE	DESCRIPTION
Message After Delete		Message to display after delete a record.
Message to confirm Delete		Message to display on the delete confirmation

Message After Delete

The message displayed when deleting a record.

Message to confirm Delete

Displays a customized message asking to confirm the record deletion.

If you make no changes, the application will use the default values for the messages. Those values can be configured in [Locales - > Application Language](#).

Global Variables

This screen shows all global variables used in the application

The global variable is an external parameter required for running the application. The application can include global variables in the WHERE clause, field definitions and names, event programming, and so on.

You can define global variables by using square brackets ([variable]). You can pass the parameters to the application through one of the methods: Session, Post, and Get

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(") instead of the brackets([]) because of the conflict with the of Global Variables syntax{:target="_blank"} Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

Global variables Interface.

Example:

```
Select CustomerID, CustomerName from Customers WHERE CustomerID = '[v_customerid]'
```

We do not recommend using session variables (global variables) with the same name as the table fields.

In this case, the variable **v_customerid** is displaying in the global variables configuration.

 A screenshot of a configuration window titled 'VARIABLE SETTINGS'. It has two columns: 'ATTRIBUTE' and 'VALUE'. The 'ATTRIBUTE' column contains the text 'global'. The 'VALUE' column contains three sections: 'Scope' with radio buttons for 'SESSION' (unchecked), 'POST' (checked), and 'GET' (checked); 'Settings' with a radio button for 'Optional' (unchecked); and 'Type' with radio buttons for 'Out' (unchecked) and 'In' (checked).

Global variables configuration Interface.

Attribute

It shows the variable's name in the application.

Value

Defines the behavior of the variables, divided into three blocks, they are:

Scope

Defines how the application receives the variable. A variable defined as the POST method in the app does not receive value if it comes with the GET method. Those are the methods available:

- **Session:** Defines that the variable must be created as a PHP session variable by another application.
- **GET:** Defines that the variable must be passed by the URL, that is, visible by the browser.
- **POST:** Defines that the variable must be passed through the POST method of an HTML form.

Settings

- **Optional:** Check it to don't validate the variable at runtime.

Type (In / Out)

Defines whether the variable comes from another application (In), or it is starting in the current app (Out).

Description

Indicates where the application is using the variable.

Synchronize table

This process will performs a comparison between the definitions of application fields and the connected database fields. If there is any change within the connected table, such as adding a new field, exclusion, or a change in the data type, the changes will appear visible like in the image below:

Application Fields	Table Fields
customerid	customerid
companyname	companyname
contactname	contactname
contacttitle	contacttitle
birthdate	birthdate
country	country
regionid	regionid
stateid	stateid
city	city
address	address
postalcode	postalcode
phone	phone
fax	fax
cityid	cityid
creditlimit	creditlimit
cardtype	cardtype
cardnumber	cardnumber
	Files
notes	

Confirm Help

■ Fields that will be created
■ Fields that will be updated
■ Fields that will be removed

Table synchronization interface.

After accessing the function from the link "Synchronize table" you will see a comparison table between the application fields (left table) and the database table fields (right table), like the image above, the fields highlighted in "red" will be deleted of the application, the highlighted fields in "Green" will be inserted in the form, and the highlighted fields in "orange" will be updated, so data type will be updated.

To rename a field in the database table, the table synchronization effect, by comparison, will be the same as deleting a field that existed in the application and the inclusion of a new field.

Calendar Links Overview

This feature allows the developer to create links between applications of the same project, expanding the integration of applications. All link options are grouped under the Application Links menu.

Application Links

In the first access to the menu, we can see the list of existing connections in the application.

If the application does not have a configured link, the application list screen will be displayed with the message: **This application does not have any link. Click here to create one now.**

ID

Link identification ID.

Type

The type of link created, some links such as Edit Link allow only one link per application. In this case, the developer will be able to check the connection types that already exist in the application

Target Application

This info show the target application name.

Actions

This column has edit options for the links.

Properties

It allows accessing the binding properties where it is possible to configure the binding behavior.

Link

Displays the links screen, where it is possible to configure the link that was made with the application informed in the target application column. In this option it is possible to change the parameter passed in the connection as well as the target application.

Delete

Permanently deletes the connection in the applications.

Through the option [Restore Applications](#), it is possible to get a previous version of the application, making it possible to recover the link deleted.

Links Type

The Calendar application has the following links options

- [Field Link](#): Allows you to create a link through the application fields to any application in the project.
- [Capture Link](#): It allows the creation of links from the filter fields of the Grid application, in order to enable the recovery of the value to fill in the field, with another Grid application of the project.
- [Button Link](#): It allows creating a link through the buttons created by the developer in the query application, to any application in the project.

Calendar Applications Link Types x Target Application available to link

Check the links types of the Calendar application and the target applications available for each link types.

Only **Capture link** have some restrictions in the target application use, allowing only to use of Grid application.

	Field Link	Capture Link	Button Link
Grid	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Calendar Field Link Settings

Creating a field link

Allows to create a link, represented through a link, from a grid's column to any project's existing application. All the links are displayed in a dropdown if there are more than one link to the same field.

In the types of link option, we will choose the **Field link**.

Applications list

After we select this option, will be displayed the applications list to what you want to create the link.

This screen can be viewed from the following ways:

All:

In which is possible to see all the project's applications. **Example:**

By folder:

In which is possible to see the applications according to the folders in which each of them are.

By type:

In which is possible to see the applications grouped by its respective types.

Definition of Parameters

In this setting we are going to define the type of parameter that will be passed to the next application.

We have two options at **Type of Parameters**, they are:

Fixed value:

This option allows the user to define a fixed value that will be used to the call of the next application.

No value:

This option allows to create the link without the need to send any parameter to the next application.

It is also possible to see a refresh button at its right side.

This button should be used when a new parameter is added to the target application, so the new parameter can be loaded in the current application to make the link.

Link properties

In this screen we will set the application display mode that will be called in the link.

There are five display options, they are:

Open in the same window:

When we use this option the target application will be displayed in the same window of the application, and the target application will have a back button so we can return to the previous application.

Open in another window:

When we use this option the target application will be displayed in other browser window, and the target application will have a exit button so we can close this window.

Modal:

When we use this option the target application will be displayed in the same window of our application, however it will be displayed in a small window above the current application.

Open in the same window

When we use this option the target application will be displayed in the same window of the application, and the target application will have a back button so we can return to the previous application.

When we select this option, we can set the following options:

![Same window][mesma_janela]

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Open in another window

When we use this option the target application will be displayed in another browser window.

When we select this option, we can set the following options:

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Close the form after an update:

Choosing the option **Yes**, the window will be closed after doing the update of a register.

Close the form after an insert:

Choosing the option **Yes**, the window will be closed after doing the insert of a register.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Open the application in a tab inside the menu:

Choosing the option **Yes**, the application will be open in a **menu tab**, when executed from a menu application, instead of opened in another browser window.

Open in an iframe

When we use this option the target application will be displayed in the same window of our application, and the target application will have a back button so we can return to the previous application.

When we select this option, we can set the following options:

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Iframe properties

In this settings, we can define some iframe details that will display the target application.

Iframe position in relation to the main application:

In this option, we will define in which position in relation to the main application the iframe will be displayed, there are four options:

Below: The iframe will be displayed below the main application.

Above: The iframe will be displayed above the main application.

Right: The iframe will be displayed on the right of the main application.

Left: The iframe will be displayed on the left the main application.

Iframe height:

Allows to set the iframe height.

Iframe width:

Allows to set the iframe width.

Modal

When we use this option the target application will be displayed in the same window of the application, however she will be displayed in a small window above the current application.

When we select this option, we can set the following options:

Height:

Allows to set the Modal height.

Width:

Allows to set the Modal width.

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Close the form after an update:

Choosing the option **Yes**, the window will be closed after doing the update of a register.

Close the form after an insert:

Choosing the option **Yes**, the window will be closed after doing the insert of a register.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Grid's Properties

In those settings we can define how our target grid will be displayed. We initially have six options, that are:

![Form proprieties][propiedades_consulta]

Initial module:

We can define how our application will be executed in those two options:

Grid: The application will be executed as a grid.

Search: The application will be executed as a search.

Quantity of rows:

In this option we can define the quantity of rows that will be displayed in the target application.

Quantity of Columns:

In this option we can define the quantity of columns that will be displayed in the target application.

Pagination:

In this option we can define if the target application's pagination will be total or partial, in case partial is the selected option the quantity of rows will be the informed previously.

Enable header:

In this option we can define if the target application's header will be displayed.

Enable Navigation buttons:

In this option we can define if the buttons **first, previous, next and last** will be available in the target application.

Calendar Capture link Settings

Creating a Capture Link

The capture link is used to return a value from a **Grid** to a **Form** field.

In the types of links options, we will choose the **Capture Link**. After selection this option, we should also choose which field we want to return the value of.

Applications list

After we select this option, will be displayed the applications list to what you want to create the link.

This screen can be viewed from the following ways:

All:

In which is possible to see all the project's applications. **Example:**

By folder:

In which is possible to see the applications according to the folders in which each of them are.

By type:

In which is possible to see the applications grouped by its respective types.

Definition of Parameters

In this setting we are going to define the type of parameter that will be passed to the next application.

We have two options at **Type of Parameters**, they are:

Fixed value:

This option allows the user to define a fixed value that will be used to the call of the next application.

No value:

This option allows to create the link without the need to send any parameter to the next application.

It is also possible to see a refresh button at its right side.

This button should be used when a new parameter is added to the target application, so the new parameter can be loaded in the current application to make the link.

Application with no parameters

However, when the target application does not have any defined parameters, the following screen is displayed:

Clicking in the button, you will be taken to the target application to create a parameter, so you can use the update button in the **parameters definitions** to refresh them.

Link properties

In this screen we will set the application display mode that will be called in the link.

In this type of link there is only one display option:

Modal:

When we use this option the target application will be displayed in the same window of our application, however it will be displayed in a small window above the current application.

Modal

When we use this option the target application will be displayed in the same window of the application, however she will be displayed in a small window above the current application.

When we select this option, we can set the following options:

Modal:

In this option we are going to define if the target application will be opened in a Modal.

Yes: This option will make the target application be opened in a modal. **No:** This option will make the target application be opened in a new window.

If **Yes** is selected in the previous option, the Modal **Height** and **Width** will be available.

![Modal with yes][modal2]

Height:

Allows to set the Modal height.

Width:

Allows to set the Modal width.

If **No** is selected in the previous option, only those options will be available.

Allows to modify manually in the update:

When we select the option **Yes**, the button **New** is created in the grid to insert new registers.

Allows to modify manually in the insert:

Indicates which shortcut key to the button add new register.

Allows to modify automatically in the update:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Allows to modify automatically in the insert:

Choosing the option **Yes**, the window will be closed after doing the insert of a register.

Calendar Button link Settings

Creating a Button Link

Allows the developer to create a link where the call to the other application will be done through a button.

In the type of links options, we will choose the **Button Link**. Choosing this option it will be possible to create a link to any other application.

List of applications

After selecting this option, The list of applications to what you want to create a link will be displayed.

This screen can be viewed in the following ways:

All:

In which is possible to see all the project's applications. **Example:**

By folder:

In which is possible to see the applications according to the folders in which each of them are.

By type:

In which is possible to see the applications grouped by its respective types.

Definition of Parameters

In this setting we are going to define the type of parameter that will be passed to the next application.

We have two options at **Type of Parameters**, they are:

Fixed value:

This option allows the user to define a fixed value that will be used to the call of the next application.

No value:

This option allows to create the link without the need to send any parameter to the next application.

It is also possible to see a refresh button at its right side.

This button should be used when a new parameter is added to the target application, so the new parameter can be loaded in the current application to make the link.

Link properties

In this screen we will set the application display mode that will be called in the link.

There are five display options, they are:

Open in the same window:

When we use this option the target application will be displayed in the same window of the application, and the target application will have a back button so we can return to the previous application.

Open in another window:

When we use this option the target application will be displayed in other browser window, and the target application will have a exit button so we can close this window.

Modal:

When we use this option the target application will be displayed in the same window of our application, however it will be displayed in a small window above the current application.

Open in the same window

When we use this option the target application will be displayed in the same window of the application, and the target application will have a back button so we can return to the previous application.

When we select this option, we can set the following options:

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Open in another window

When we use this option the target application will be displayed in another browser window.

When we select this option, we can set the following options:

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Close the form after an update:

Choosing the option **Yes**, the window will be closed after doing the update of a register.

Close the form after an insert:

Choosing the option **Yes**, the window will be closed after doing the insert of a register.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Open the application in a tab inside the menu:

Choosing the option **Yes**, the application will be open in a **menu tab**, when executed from a menu application, instead of opened in another browser window.

Choosing the option **Yes**, there are also some other settings to be displayed:

Title to the tab:

This option allows the developer to set a title to the tab that will be opened when used in a Menu application.

Hint to the tab:

This option allows the developer to set a message to be displayed when the mouse cursor is over the tab Menu.

Active tab icon:

This option allows the developer to set an icon to be displayed in the tab when used in a menu application.

Modal

When we use this option the target application will be displayed in the same window of the application, however she will be displayed in a small window above the current application.

When we select this option, we can set the following options:

Height:

Allows to set the Modal's height.

Width:

Allows to set the Modal's width.

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Close the form after an update:

Choosing the option **Yes**, the window will be closed after doing the update of a register.

Close the form after an insert:

Choosing the option **Yes**, the window will be closed after doing the insert of a register.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Calendar Programming

The concept of programming is incorporated in this ScriptCase version. With the use of resources of attributes, methods and libraries. In the previous version was already possible create business rules in the applications, using this concept. The biggest difference is that now this can be realized in a more organized way, making it easier to be developed and comprehended by another developer.

Attributes

The attributes are variables that has the global scope declared in the application. An attribute that can be referenced in all the methods and the application's events.

The screenshot shows a web interface titled 'ATTRIBUTES SETTINGS'. It features a table with two columns: 'ATTRIBUTE' and 'VALUE'. Below the table, there is a section labeled 'Attributes' containing an input field for 'Attribute Name'. To the right of the input field is a vertical list of attributes, and further right are four blue buttons: 'Include', 'Update', 'Delete', and 'Clean'.

Attributes configuration Interface.

Attribute Name : This field allows to inform the attributes name, after typing the name just click on **include**. In case you want to **update** click on the attributes name (located on the buttons' right side), do the necessary modifications and click on update. In case it is necessary to **delete** an attribute, it is necessary to do same process as the update, but when selecting the attribute, it is necessary to click on the delete button. The **clear** button, as the name suggests, it clears the list of all the attributes listed on the right.

Internal Libraries

To use the internal libraries just select the correspondent (Project Libraries for example). This process allows the methods existing in the library, to be visible in all the application's Events and Methods.

See how to manage the libraries by [clicking here](#).

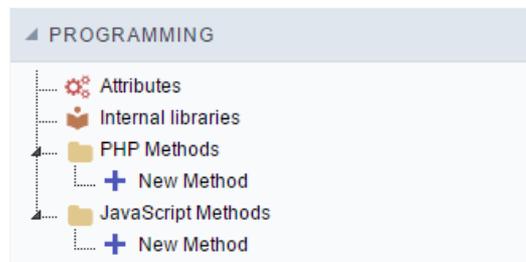

The screenshot displays a list of internal libraries. The categories are: 'INTERNAL LIBRARIES - SCRIPTCASE' (containing 'sc_ssn.php'), 'INTERNAL LIBRARIES - PUBLIC' (with 'No library found for this session.'), 'INTERNAL LIBRARIES - PROJECT: PROJECT1' (with 'No library found for this session.'), and 'INTERNAL LIBRARIES - USER: ADMIN' (with 'No library found for this session.').

Internal Libraries management Interface

PHP Methods

Methods are function or procedures declared by the developer, that helps when applying the routines. Using methods in the applications allows to reuse your code throughout the application, optimizing the development experience.

Creating a new method

- Give the method a name and click Create. As in the image below.

PHP methods are incorporated into the same class, so it is not possible to use two functions with the same name even when used in different methods.

A dialog box titled 'New Method - PHP' with a question mark icon. It has a text input field labeled 'Name' containing the text 'new_method'. Below the input field is a blue button labeled 'Create'.

- Methods can receive parameters.

A code editor window showing a function definition. The title bar says 'function new_method'. The code area contains the following code: `1 echo "Hello World!!!";`. The editor has a toolbar with icons for function, search, and refresh, and a 'Theme' dropdown menu set to 'default'.

- Add the amount of variables:

A dialog box titled 'Definition of the parameters of the method:'. It shows the method name 'new_method' in a box. Below that, it says '• No defined parameter.' At the bottom, there is an 'Add' button, a text input field containing '1', the text 'Parameter(s)', a 'Cancel' button, and a 'Save' button.

- Defining the variables:

A dialog box titled 'Insertion of Parameters'. It has a table with three columns: 'Name', 'Type', and 'Value Standard'. The 'Type' column has a dropdown menu open with three options: 'For Value', 'For Value', and 'For References'. Below the table are three buttons: 'Save', 'Back', and 'Cancel'.

Name	Type	Value Standard
	For Value	

- **Name** : Type in the variable's name.

- **Type** : Selecting the type of variables: For Value or For Reference.
- **Value Standard** : The parameter's value used to initialize when calling the method.

References allows to create a second name for a variable that you can use to read and modify the variable's original information.

- Editing a parameter:

- : Checking all the parameters in the parameter list.
- : Uncheck all the parameters in the parameter list.
- : Edit the selected parameter of the list.
- : Deletes the selected variable of the list.

JavaScript Methods

Methods are function or procedures declared by the developer, that helps when applying the routines. Using methods in the applications allows to reuse of the your code throughout the application, optimizing the development experience.

Creating a new method

JavaScript method creation Interface

- Define a name for the method and click on Create. Like the image below.

Include Method.

Calendar Settings

The **Calendar Settings** screen allows you to customize various aspects of the application, ensuring better adaptation to project needs.

Through these settings, the developer can adjust the calendar's behavior, choose which fields will be displayed, define rules for event creation and editing, and configure colors and styles for better visualization.

Settings

Settings	
ATTRIBUTE	VALUE
Margins	<input type="text" value="100"/> Top <input type="text"/> Bottom <input type="text"/> Right <input type="text"/> Left
Form iframe width	<input type="text" value="0"/>
Form iframe height	<input type="text" value="0"/>
Time format	<input type="text" value="1:00pm"/>
Start Mode	<input type="text" value="Year"/>
Available modes	<input checked="" type="checkbox"/> Agenda <input checked="" type="checkbox"/> Day <input checked="" type="checkbox"/> Week <input checked="" type="checkbox"/> Month <input checked="" type="checkbox"/> Multi month <input checked="" type="checkbox"/> Year
Disable Drag & Drop	<input type="checkbox"/>
Disable option 'Full day'	<input type="checkbox"/>
Minimum time limit	<input type="text" value="08:00"/>
Maximum time limit	<input type="text"/>
Mini calendar and category position	<input type="text" value="Left"/>
Display mini calendar	<input checked="" type="checkbox"/>
Full day - hide time fields	<input checked="" type="checkbox"/>
Recurrence - hide fields	<input checked="" type="checkbox"/>
Recurrence - Add watermark in date format	<input checked="" type="checkbox"/>
Hide the field filter category	<input checked="" type="checkbox"/>
Line break on the title	<input type="checkbox"/>
Time interval	<input type="text" value="30"/>
Time range to drag	<input type="text" value="30"/>

Calendar Settings Screen

Margins

Allows the developer to set the application's margin values in pixels. If no value is specified, the application will use the default values from the configured theme.

Attention:

When configuring the **Vertical Alignment** attribute, the defined margin values will be ignored.

Example of how to use the attribute

Margins	<input type="text" value="100"/>	Top
	<input type="text"/>	Bottom
	<input type="text"/>	Right
	<input type="text"/>	Left

Form Iframe Width

Sets the width, in pixels, of the form used to insert events in the **Calendar**.

Form Iframe Height

Sets the height, in pixels, of the form used to insert events in the **Calendar**.

Time Format

Defines whether the time display will follow the **12-hour** (AM/PM) or **24-hour** format, affecting how events are viewed and entered.

- **13:00** - Uses the **24-hour** format.
- **1:00 PM** - Uses the **12-hour** format (AM/PM).

Initial Mode

Defines the default display mode of the calendar, which can be set to: **Agenda**, **Day**, **Week**, **Month**, **Multi-Month**, or **Year**.

Example of Multi-Month View

2025							Year	Multi month	Month	Week	Day	Schedule	
January							February						
Sun	Mon	Tue	Wed	Thu	Fri	Sat	Sun	Mon	Tue	Wed	Thu	Fri	Sat
			1 <small>+1 more</small>	2	3	4							1 <small>+1 more</small>
5	6	7	8	9	10	11 <small>Hobbie time</small>	2	3	4	5	6	7	8
12 <small>Hobbie time</small>	13	14	15	16 <small>Resting...</small>	17	18	9	10	11 <small>Hobbie time</small>	12	13	14	15
19	20	21	22	23	24 <small>Training</small>	25	16 <small>Resting...</small>	17	18	19	20	21	22
26	27	28 <small>Yellow day</small>	29	30	31		23 <small>Training</small>	24	25	26	27	28 <small>Yellow day</small>	
March							April						
Sun	Mon	Tue	Wed	Thu	Fri	Sat	Sun	Mon	Tue	Wed	Thu	Fri	Sat
						1 <small>+2 more</small>			1 <small>+1 more</small>	2	3	4	5

Example of Agenda View

February 2025		Year	Multi month	Month	Week	Day	Schedule
February 1, 2025		Saturday					
10:00am - 3:30pm	Day 1						
February 11, 2025		Tuesday					
Complete day	Hobbie time						
February 12, 2025		Wednesday					
Complete day	Hobbie time						
February 13, 2025		Thursday					
Complete day	Hobbie time						
February 16, 2025		Sunday					
Complete day	Resting...						
February 17, 2025		Monday					
Complete day	Resting...						

Available Modes

The developer must specify which viewing modes will be available to the end user by deselecting those they do not wish to offer.

Disable Drag & Drop

Disables the Drag & Drop feature for calendar events. Drag & Drop allows updating event dates and times without accessing the edit form.

Example of Drag & Drop Usage

dom.	seg.	ter.	qua.	qui.	sex.	sáb.
26	27	28	29	30	31	1
		Yellow day Are you ready?			10:00 Day 1 Starting activities...	
2	3	4	5	6	7	8
9	10	11	12	13	14	15
		Hobbie time shhhh...it's a secret!				
16	17	18	19	20	21	22
Resting... I'm...nevermind				Yellow day Are you ready?		

Disable 'All Day' Option

Disables the option to set an event as "All Day," removing the field from the event creation form.

Minimum Time Limit

Minimum time limit	<input type="text" value="08:00"/>
--------------------	------------------------------------

Sets the earliest time displayed in the **Week** and **Day** views of the calendar.

Important:

The specified time must follow the **hh:mm** format, as shown in the image; otherwise, it will not be considered.

Example Using Initial Time Limit

	dom. 09/02	seg. 10/02
Dia inteiro		
8:00	08:00 - 11:30 Day 1 Starting activities.	
9:00		
10:00		
11:00		
12:00		
13:00		
14:00		
15:00		
16:00		

Maximum Time Limit

Sets the latest time displayed in the **Week** and **Day** views, limiting the time available for event creation.

Important:

The specified time must follow the **hh:mm** format, as shown in the image; otherwise, it will not be considered.

Mini Calendar and Category Position

Determines the position of the **Mini Calendar** and **Categories** display column, which can be placed on the left or right side of the main calendar.

The column is displayed when the mini calendar or event categories are in use.

Display Mini Calendar

Enables the Mini Calendar, which allows independent navigation from the main calendar.

All Day - Hide Time Fields

Hides the start and end time fields when marking an event as “All Day” in the event creation form.

If this option is disabled, any values entered in the time fields will be ignored when marking an event as “All Day.”

Recurrence - Hide Fields

Hides the recurrence period and information fields in the event creation form of the **Calendar**.

Recurrence - Add Date Format Watermark

Displays a **watermark** in the recurrence date field, helping users identify the expected date format.

Hide Category Field Filter

Hides the **Category** field filter, preventing users from selecting specific categories for display in the **Calendar**.

Line Break in Title

Enables automatic line breaks in event titles when the text exceeds the available space.

Time Interval

Defines the time interval, in minutes, used to structure events in the **Week** and **Day** views.

Time Interval for Dragging

Specifies the time interval applied when creating or moving events in the **Day** and **Week** views. If this value is greater than the one set in the **Time Interval** attribute, it will automatically adjust to the lower value.

Calendar Fields

This interface displays the fields relationship that will be used in the application.

You need to relate the table fields to the form application fields.

Fields Settings Screen

Google API

The Google Calendar API will allow you to synchronize your Google calendar with the application developed in Scriptcase.

First you must activate the Google Calendar API by clicking on <https://console.developers.google.com/apis/api/calendar-json.googleapis.com/overview>.

After activation you need to configure the "OAuth consent screen" by clicking on

<https://console.developers.google.com/apis/credentials/consent>

Application type

Web application

Android [Learn more](#)

Chrome App [Learn more](#)

iOS [Learn more](#)

PlayStation 4

Other

Name

Web client 1

Restrictions

Enter JavaScript origins, redirect URIs, or both

Authorized JavaScript origins

For use with requests from a browser. This is the origin URI of the client application. It can't contain a wildcard (http://*.example.com) or a path (http://example.com/subdir). If you're using a nonstandard port, you must include it in the origin URI.

http://www.example.com

Authorized redirect URIs

For use with requests from a web server. This is the path in your application that users are redirected to after they have authenticated with Google. The path will be appended with the authorization code for access. Must have a protocol. Cannot contain URL fragments or relative paths. Cannot be a public IP address.

http://www.example.com/oauth2callback

Create **Cancel**

OAuth consent screen

- **E-mail Address** : Select the email that will be used as the source for the google calendar. The application will use this data for synchronization.
- **Product name shown to users** : Allows you to enter the consent name that will be displayed to the clients. Make sure the name accurately describes your product and be careful not to use names that suggest that the product is from Google or another company.
- **Home URL** : Allows you to enter a URL to homepage. (optional)
- **Product Logo URL** : Lets you enter a URL that contains an image that will serve as the product logo. (optional)
- **Privacy Policy URL** : Lets you enter the URL of the product privacy policy. (optional)
- **Terms of Service URL** : Lets you inform the URL of the terms of service of the product. (optional)

Note: You only need to inform the e-mail address and the product name. All other items are optional.

Now you need to create a

[Credential](#)> OAuth client ID

Select the "Web Application" option and follow the setup below.

Calendar fields

Integrate with Google Calendar

OAuth Json client

Google OAuth login Request only once

Integrate form

Insert

Update

Delete

OAuth Client ID Configuration Screen

- **Name:** Enter a name for the OAuth client ID.
- **Authorized JavaScripts Origins :** Insert the root URL of your system. For example: `http://yourdomain.com` or `http://localhost`
- **Authorized redirect URLs :** Enter the full URL until your calendar application.

After entering the above data, click "Save."

Now let's configure the Scriptcase application.

Credentials OAuth consent screen Domain verification

Email address [?]

@gmail.com

Product name shown to users [?]

SCRIPTCASE CALENDAR

Homepage URL (Optional)

https:// or http://

Product logo URL (Optional) [?]

http://www.example.com/logo.png

 This is how your logo will look to end users
Max size: 120x120 px

Privacy policy URL

Optional until you deploy your app

https:// or http://

Terms of service URL (Optional)

https:// or http://

The consent screen will be shown to users whenever you request access to their private data using your client ID. It will be shown for all applications registered in this project.

You must provide an email address and product name for OAuth to work.

Google Calendar API Settings Screen

- **Integrate with Google Calendar:** Synchronize with Google calendar events, allowing you to import or export events.
- **OAuth Client Json :** Json from Google OAuth with the credential to access the project. To get this content, open the **OAuth Client ID** of the previously configured OAuth__ client and download the JSON.
- **Login on Google OAuth :** Choose if you want to store the login made in the application to not ask again or if you will request session authentication.
- **Integrate form :** Enables the form to insert, delete or update events in Google Calendar.
- **Insert :** When inserting an event in the form, it also inserts in google calendar.
- **Update:** When updating an event on the form, it also updates in google calendar. * **Delete:** When deleting an event in the form, it also excludes in the google calendar.

Procedure Modules

Initial Module

Allows you to set in which mode the application will start when executed.

INITIAL MODULE

Select the Grid module that will be displayed when running the application:

- Search
- Grid
- Summary
- Chart
- Print
- PDF
- Word
- Excel
- RTF
- XML
- CSV

Grid Application Modules

- **Filter** : Application will be started by the filter view, so you can filter the records before the next application, that can be a Grid, PDF, Summary... you can configure that options within the Filter's settings.
- **Grid** : Application will be started by the Grid itself, this is the default option.
- **Summary** : Application will be started by the Summary. To use the Summary as initial application it's mandatory to create at least one Group, using the Static Group By settings.
- **Chart** : Application will be started by the Chart. To use the Chart as initial application it's mandatory to create at least one Group, using the Static Group By settings.
- **Print** : Application will be started by the print mode, according to the select command.
- **PDF** : Application will be started with the option to view or download a PDF file.
- **Word** : Application will be started with the option to view or download a Word file(.doc or .docx).
- **Excel** : Application will be started with the option to view or download an Excel file (.xls or .xlsx).
- **RTF** : Application will be started with the option to view or download a RTF file (.rtf).
- **XML** : Application will be started with the option to view or download a XML file.
- **CSV** : Application will be started with the option to view or download a CSV file.

Filter

APPLICATION MODULES

Select the modules that will be part of the Grid and set its parameters:

 <input checked="" type="checkbox"/> Search	 <input checked="" type="checkbox"/> Grid	 <input checked="" type="checkbox"/> Detail	 <input checked="" type="checkbox"/> Summary	 <input checked="" type="checkbox"/> Chart
Filter module	<input type="text" value="Grid"/>	Application module where search is applied.		
Use Iframe	<input type="text" value="No"/>	Use iframes to display the Search and the Grid on the same page.		
Show Results	<input type="text" value="Yes"/>	Display the search results on the same page when loading the application for the first time using iframes.		
Iframe Height	<input type="text" value="1500"/>	Iframe height in pixels where the grid will be displayed.		
Search Modal	<input type="text" value="No"/>	Display the search in a modal window.		
Search Modal Height	<input type="text" value="0"/>	Height search modal.		
Search Modal Width	<input type="text" value="0"/>	Search modal width.		
Table Width	<input type="text" value="0"/>	Width value for the application table.		
Table Width Unit	<input type="text" value="Automatic"/>	Measure unit for the width.		
Advanced Settings				

Grid

Filter Settings

- **Filter Module** : This option configures which application will be called after the Filter.
- **Use Iframe** : This option configures the filter to be displayed within an Iframe (displaying the Filter itself and the search results on the same page). This option is available only when the initial module is set to be the Filter.
- **Show Results** : Display the search results on the same page when loading the application for the first time when the “Use Iframe” option is set as “Yes”, otherwise, the results will be displayed only after the search.
- **Iframe Height** : Iframe height, in pixels, used to display the search results.
- **Search Modal** : This option configures the Filter Application to open in a modal window.
- **Search Modal Height** : Search Modal box height (in pixels). Option available only when the Search Modal box is enabled.
- **Search Modal Width** : Search Modal box Width (in pixels). Option available only when the Search Modal box is enabled
- **Table Width** : Filter application table width. This value can be in percent, pixel or automatic (set by Scriptcase). If you change the value you will also need to set the “Table Width Unit”
- **Table Width Unit** : This option configures the unit for the table width (percent, pixel or automatic). The value itself must to be set within the option “Table Width”.

Grid

APPLICATION MODULES

Select the modules that will be part of the Grid and set its parameters:

 <input checked="" type="checkbox"/> Search	 <input checked="" type="checkbox"/> Grid	 <input checked="" type="checkbox"/> Detail
Orientation	<input type="text" value="Horizontal"/>	Grid records' orientation (Horizontal, Vertical, Slide or User Defined).
Fixed label	<input type="text" value="Yes"/>	This option will freeze the column labels on top of the screen during the page scroll.
Fixed columns	<input type="text" value="Yes"/>	Allows the choice of grid columns that will be fixed in the left corner of the screen in case of horizontal orientation.
Fixed column hover	<input type="text" value="Yes"/>	Display pinned column icon only on field label cell hover. Hover works only when the column is fixed.
Fixed options' column	<input type="text" value="Yes"/>	Pin the options column icons displayed in the row of the record regardless of having a fixed column.
Fixed group by	<input type="text" value="Yes"/>	Allows the information of a grid's group by line to be fixed on the screen when scrolling.
Pagination	<input type="text" value="Partial"/>	Pagination method for the grid records.
Lines Per Page	<input type="text" value="10"/>	Number of record lines per page.
Infinite Scroll Increment	<input type="text" value="5"/>	Number of rows to load when loading new records
Open windows using modal	<input type="text" value="Yes"/>	For Grids apps with the Infinite Scroll pagination enabled, this option will set the links to open using a modal instead.
Maintain records	<input type="text" value="Yes"/>	When you navigate to another window and go back, it will keep the amount records displayed.
Grid height	<input type="text"/>	It defines the height of the Grid in pixels, for when "Infinite Scroll" option is activated.
Table Width	<input type="text" value="90"/>	Set the application width.
Table Width Unit	<input type="text" value="Percent"/>	Measure unit used for the application width.

Grid Settings

- **Orientation** : This option configures the Grid records' orientation (Horizontal, Vertical, Slide or User Defined). When using the "User Defined" option you can design the HTML manually inside the option "Layout » HTML templates" and select within the Layout settings.
- **Fixed Label** : This option will fix the columns' label at the top of the page (it is only available when the Grid records' orientation is set as Horizontal).
- **Pagination** : This option sets the Grid paging type: Partial (pagination according to the amount of records set per page), Total (displays all records) or Infinite Scroll (automatic strolling according to the increment)
- **Lines Per Page** : This option sets the amount of records per page for the Grid
- **Infinite Scroll Increment** : This option sets the number of rows displayed on each increment of new records. It is available only when paging is configured with Infinite Scroll.
- **Open windows using modal** : For Grids Applications with the Infinite Scroll paging enabled, this option will set the links between applications and details of the Grid, that are configured to open in iframe, to open using a modal instead.
- **Maintain records** : It configures if the amount of records displayed will be preserved when the application navigates to another window and go back.
- **Grid height** : It sets the height of the query in pixels. If it is empty

- **Table Width** : Grid application table width. This value can be in percent, pixel or automatic (set by Scriptcase). If you change the value you will also need to set the “Table Width Unit”
- **Table Width Unit** : This option configures the unit for the Grid table width (percent, pixel or automatic). The value itself must to be set within the option “Table Width”.

Detail

APPLICATION MODULES

Select the modules that will be part of the Grid and set its parameters:

 <input checked="" type="checkbox"/> Search	 <input checked="" type="checkbox"/> Grid	 <input checked="" type="checkbox"/> Detail	 <input checked="" type="checkbox"/> Summary	 <input checked="" type="checkbox"/> Chart
--	---	---	---	--

Display Detail	<input type="text" value="In another page"/>	Detail record display mode
Alignment	<input type="text" value="Left"/>	Field alignment for detail page.
Detail Width	<input type="text" value="0"/>	Width value for the application detail
Width of the modal	<input type="text"/>	Width of the modal window in pixels.
Height of the modal	<input type="text"/>	Height of the modal window in pixel
Detail Width Unit	<input type="text" value="Automatic"/>	Measure unit used in the width.

[Advanced Settings](#)

Grid

Detail settings

- **Display Detail** : Allows you to set where the detail will open within the Grid Application * **Beside the Grid** : Displays the Grid Details to the right of the record, in the same window where Grid is being displayed. * **Below the Grid** : Displays the Grid Details below the Grid records, in the same window where Grid is being displayed. * **In another page** : Displays the Grid Details in another page, replacing the Grid view. * **In another window** : Displays the Grid Details in a separated browser window. * **Modal** : Opens a pop-up window to the display of the Grid Detail.
 - **Alignment** : Using this option you can set an alignment (center, right or left) for the Grid Detail when it's using the “Display Detail” setting as “Beside the Grid” or “Below the Grid”.
 - **Detail Width** : This option sets the Grid Detail width when it's using the “Display Detail” setting as “Beside the Grid”, “Below the Grid”, “In another page” or “In another window”.
 - **Width of the modal** : Allows you to customize the Grid Detail width when it's using the “Display Detail” option as “Modal”.
 - **Height of the modal** : Allows you to customize the Grid Detail height when it's using the “Display Detail” option as “Modal”.
 - **Detail Width Unit** : This option configures the unit for the “Detail Width” (percent, pixel or automatic).

Summary

APPLICATION MODULES

Select the modules that will be part of the Grid and set its parameters:

Grid application advanced

settings

- **Friendly URL** : This field allows you to change the URL that will be called by the application. Allowed characters are the same available on URLs: a-z, A-Z, 0-9, -_. This option can also be changed on the home screen, on the “Friendly URL” column at the applications list.
- **Display Line Number** : This option sets whether to display or not the sequence number of each Grid row.
- **Display Titles** : This option sets if the column title (column label) will be displayed or not.
- **Line break in title** : This option sets if the column line title will break or not.
- **Horizontal Alignment**: It allows to define the horizontal alignment of the application (Centered, Left, Right).
- **Vertical Alignment**: Allows you to define the initial vertical alignment of the application (Above, Centered and Below).
- **Margins** : Sets the application margins in pixels (up, down, right and left).
- **Alignment** : Allows you to set the fields alignment for when the Grid orientation is set as Vertical or Slide.
- **Table Columns** : Sets the column widths type: Provides (It will assume the informed width values at field level in the configuration of the visualization), Calculated (Calculate size according to type and the field size) and Automatic (The alignment will be according to the browser criteria).
- **Refresh Interval** : Allows you to set a reload interval for the page, in seconds. When is set as zero, there will be no page reload.

Procedure Edit Fields

This interface is useful for editing the field settings and their position to display.

Fields	Label	Datatype	Line Break	Line Break PDF	Title Horizontal Alignment	Text Alignment	Font Color
PAGE: PAG1							
BLOCK: GRID_ORDERS							
 orderid	<input type="text" value="Orderid"/>	Integer ▼	<input type="checkbox"/>	<input type="checkbox"/>	Right ▼	Right ▼	<input type="text"/>
 customerid	<input type="text" value="Customer Name"/>	Text ▼	<input checked="" type="checkbox"/>	<input type="checkbox"/>	Left ▼	Left ▼	<input type="text"/>
 employeedid	<input type="text" value="Employeedid"/>	Integer ▼	<input type="checkbox"/>	<input type="checkbox"/>	Right ▼	Right ▼	<input type="text"/>
 orderdate	<input type="text" value="Orderdate"/>	Date ▼	<input type="checkbox"/>	<input type="checkbox"/>	Center ▼	Center ▼	<input type="text"/>
 requireddate	<input type="text" value="Requireddate"/>	Date ▼	<input type="checkbox"/>	<input type="checkbox"/>	Center ▼	Center ▼	<input type="text"/>
 shippeddate	<input type="text" value="Shippeddate"/>	Date ▼	<input type="checkbox"/>	<input type="checkbox"/>	Center ▼	Center ▼	<input type="text"/>

Fields

Allows accessing the field settings (pencil icon on the left). You can change the field position by dragging them to the desired position. Drag a field to “fields not displayed” if you don’t want it in the app.

Label

Defines the title of a field in the app. For example: if the field name in the database is fld_txt_customer_name, you can display the label “Customer Name”.

Data Type

It informs the data type of the field.

Line Break

Allows the Line Break in the records when the field text is greater than the column width.

Line Break PDF

Allows the Line Break when the user exports the app as a PDF.

Title Horizontal Alignment

Defines the horizontal alignment of the field label.

Text Alignment

Defines the horizontal alignment of the field text.

Font Color

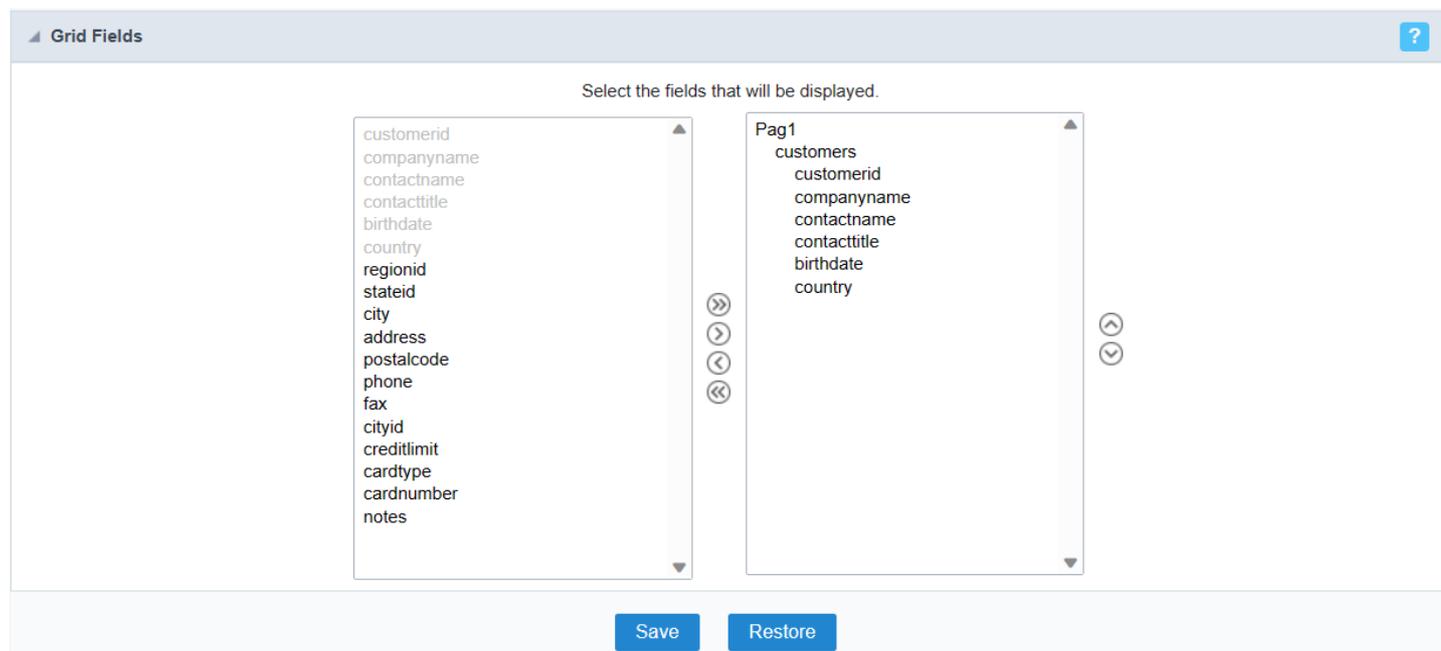

Configure the text color for the field.

Procedure Fields positioning

In this configuration screen we have a list of all the fields available in the application, whether they are fields mapped from the table or virtual fields (Created only in the Scriptcase interface).

It is also possible to allow the end user to manipulate the application's fields in the way they prefer, for that we must add the **columns button** in the application's toolbar.

In the **left column**, we have a list with all the fields available for use and in the **right column** we have a list of the fields that were selected to be displayed in the running application.

Adding and Removing Application Fields

The fields must be configured using the selection buttons, located between the columns.

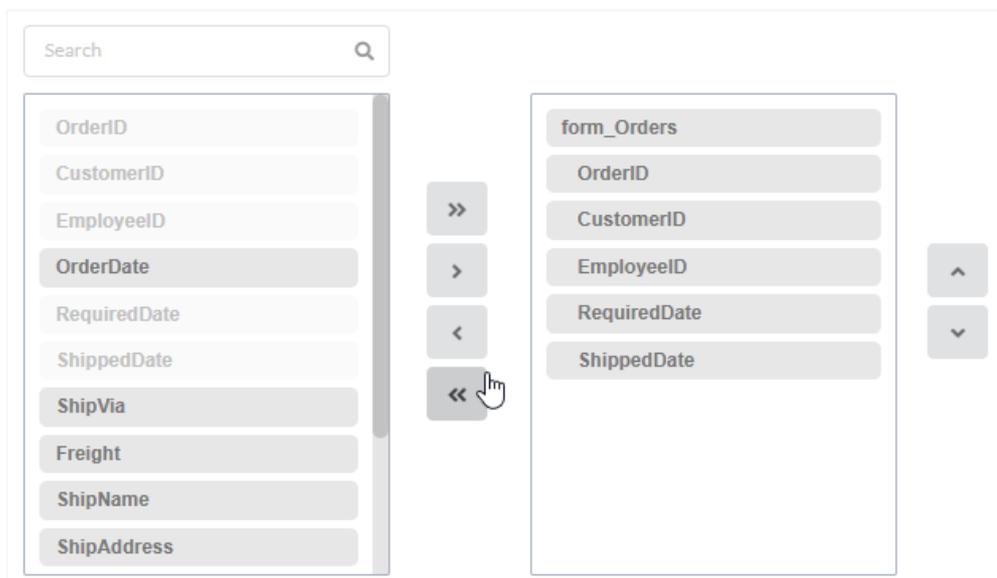

- **>>** - Move all fields to the right.
- **>** - Moves only selected fields to the right
- **<** - Moves only the selected fields to the left.
- **<<** - Move all fields to the left.

In the left column, there are the application fields that are not in use in the filter, while the right column shows all the selected fields and the order in which they will be displayed.

To add fields to the filter, select the fields you want in the filter and click the **>** button.

To select fields in sequence, simply click on a field and drag. Pressing control (Ctrl) allows you to select multiple alternate fields.

Search and positioning

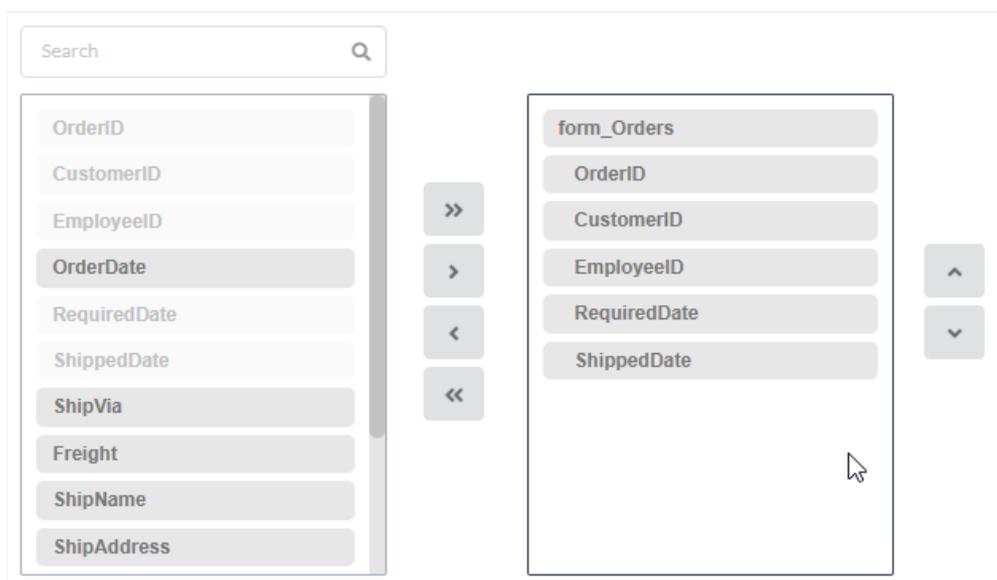

Field display order

The fields will be displayed in the application respecting the order defined in the right column.

The display order must be defined using the sort buttons  and  which will move the selected fields in the column.

Remembering that the fields must be positioned inside a block (**customers**) which must be inside a page (**Pag1**).

Check below the use of the buttons to order the fields

Save and Restore

Below the columns are two buttons:

- **Save** which records the current placement of fields in columns.
- **Restore** which reorganizes the fields returning to the last position saved.

Restoring the positioning of the fields to the last saved definition.

Search

OrderID		form_Orders	
CustomerID		OrderID	
EmployeeID	>>	CustomerID	
OrderDate	>	EmployeeID	^
RequiredDate	<	RequiredDate	v
ShippedDate	<<	ShippedDate

Password

Select columns

It allows the user has the option to choose the columns he wants to export at runtime.

PDF settings **Select Columns**

Accountid

Accountdescription

Accountorder

Open JSON Directly

It allows the end-user to configure the JSON export parameters on the fly.

JSON Settings

▲ Configurações Gerais	
ATRIBUTO	VALOR
Exportar com senha	<input type="checkbox"/>
Selecionar colunas	<input checked="" type="checkbox"/>
Gerar JSON Diretamente	<input type="checkbox"/>

Configurable JSON

It allows the user to configure the XML creation parameters during the execution of the application. If this option is disabled, the end user will only have access to the settings defined by the developer.

Export Modules of Grid

This option allows the developer to choose which modules are available in the grid export. The user can select the modules at runtime.

Example:

Disabling the Summary option in the development environment.

Grid Export modules	<input checked="" type="checkbox"/>	Grid
	<input type="checkbox"/>	Summary
	<input checked="" type="checkbox"/>	Chart

You can see the Summary option disabled at running time.

GENERAL	
Select the modules	<input checked="" type="checkbox"/> Grid <input type="checkbox"/> Summary <input checked="" type="checkbox"/> Chart

Summary Export Modules

This option allows the developer to choose which modules are available in the summary export. The user can select the modules at runtime.

Example:

Disabling the Summary option in the development environment.

Grid Export modules	<input checked="" type="checkbox"/>	Grid
	<input type="checkbox"/>	Summary
	<input checked="" type="checkbox"/>	Chart

You can see the Summary option disabled at running time.

GENERAL	
Select the modules	<input checked="" type="checkbox"/> Grid <input type="checkbox"/> Summary <input checked="" type="checkbox"/> Chart

Use Label

It allows the label used in the application field to be sent in the JSON attribute.

Formatted value

It allows displaying the formatted numeric value or the value displayed in the database.

Print Settings

General settings	
ATTRIBUTE	VALUE
Configurable Print HTML	<input type="checkbox"/>
Grid Export modules	<input checked="" type="checkbox"/> Grid <input checked="" type="checkbox"/> Summary <input checked="" type="checkbox"/> Chart
Summary export modules	<input type="checkbox"/> Grid <input checked="" type="checkbox"/> Summary <input checked="" type="checkbox"/> Chart
Select columns	<input type="checkbox"/>

Configurable Print HTML

It allows the end-user to configure the HTML Printing parameters on the fly.

Export Modules of Grid

This option allows the developer to choose which modules are available in the grid export. The user can select the modules at runtime.

Example:

Disabling the Summary option in the development environment.

Grid Export modules	<input checked="" type="checkbox"/> Grid <input type="checkbox"/> Summary <input checked="" type="checkbox"/> Chart
---------------------	---

You can see the Summary option disabled at running time.

GENERAL	
Select the modules	<input checked="" type="checkbox"/> Grid <input type="checkbox"/> Summary <input checked="" type="checkbox"/> Chart

Summary Export Modules

This option allows the developer to choose which modules are available in the summary export. The user can select the modules at runtime.

Example:

Disabling the Summary option in the development environment.

Grid Export modules	<input checked="" type="checkbox"/>	Grid
	<input type="checkbox"/>	Summary
	<input checked="" type="checkbox"/>	Chart

You can see the Summary option disabled at running time.

GENERAL	
Select the modules	<input checked="" type="checkbox"/> Grid <input type="checkbox"/> Summary <input checked="" type="checkbox"/> Chart

Export with password

This option allows the developer to set a password to export the file.

Export with password	<input checked="" type="checkbox"/>
Export with password	<input type="text"/>

Password

It allows the developer to set the requested password when exporting the file.

Runtime Example:

PDF settings	
GENERAL	
Select the modules	<input checked="" type="checkbox"/> Grid <input type="checkbox"/> Summary <input checked="" type="checkbox"/> Chart
Print settings	<input type="text" value="Color"/>
Page Layout	<input type="text" value="A4 (210 X 297 mm)"/>
Orientation	<input type="text" value="Portrait"/>
Other options	<input checked="" type="checkbox"/> Generate Bookmarks <input checked="" type="checkbox"/> Displays the header on all pages <input checked="" type="checkbox"/> Displays the title on all pages
Password	<input type="text" value="....."/>

Select columns

It allows the user has the option to choose the columns he wants to export at runtime.

RTF Settings

General settings	
ATTRIBUTE	VALUE
Select columns	<input type="checkbox"/>
Open RTF Directly	<input type="checkbox"/>

Select columns

This option allows the end-user to select which fields he wants to export to the file.

Open RTF Directly

Opens the generated RTF file without the need to display an intermediate page with a link to download it.

Word Settings

WORD Settings	
ATTRIBUTE	VALUE
Print Type	Color
Rows per Page in the Grid	0
Rows per Page in Summary	0

Word export settings

Print Type

Allows you to set the print mode for the word file (Both, Black & White, Color).

Rows per Page in Grid

Allows you to set the number of lines per page of the query will be displayed in the file.

Rows per Page in Summary

Allows you to set the number of lines per page in the Summary that be displayed in the file.

Open Word Directly

Allows you to set whether the document will be generated directly or if an intermediate page will be displayed.

CSV Settings

CSV Settings	
ATTRIBUTE	VALUE
Lines Separator	CRLF
Columns Separator	:
Text Delimiter	'
Add Label	<input type="checkbox"/>

CSV export settings

- Lines Separator** Allows you to set the separator for character.
- Columns Separator** Allows you to set the column separator for character and records.
- Text Delimiter** Allows you to define the character used to delimit the text columns.
- Open CSV Directly** Allows you to set whether the document will be generated directly or if an intermediate page will be displayed.
- Add Label** Allows you to define if the columns label will be added to the file.

XLS Settings

Default values settings and itens to end-user export interface		
ATTRIBUTE	VALUE	DESCRIPTION
Excel Configurable	<input checked="" type="checkbox"/>	Allows the user to configure the parameters of creation of Excel during the execution of the application.
Excel settings available to the end-user.		
<div style="display: flex; justify-content: space-between;"> <div style="border: 1px solid #ccc; padding: 5px; width: 45%;"> <p>Grid Export modules</p> <p>Summary export modules</p> <p>Format</p> <p>Export with totals</p> </div> <div style="border: 1px solid #ccc; padding: 5px; width: 45%;"> <p>Options</p> <p>Grid Export modules</p> <p>Summary export modules</p> <p>Format</p> <p>Export with totals</p> </div> </div>		
Grid Export modules	<input checked="" type="checkbox"/> Grid <input checked="" type="checkbox"/> Summary	Defines which modules will be exported in the Grid.
Summary export modules	<input checked="" type="checkbox"/> Grid <input checked="" type="checkbox"/> Summary	Defines which modules will be exported in the Summary.
Format	xlsx	Excel format.
Export with totals	<input checked="" type="checkbox"/>	Enables the display of the totals when exporting to Excel.

XLS export settings

- Open XLS Directly** Allows you to set whether the document will be generated directly or if an intermediate page will be displayed.
- Format** Allows you to define the format of the generated document (xls or xlsx).

Print Settings

PRINT SETTINGS	
ATTRIBUTE	VALUE
Print Mode	Both ▼
Print Type	Both ▼
Rows per Page	0
Rows per Page in Summary	0
Print Background	<input checked="" type="checkbox"/>

Print export settings

Print Mode Allows you to define the contents of the file printing (Both, Current Page or Full Report).

Print Type Allows you to set the print mode for the file (Both, Black & White, Color).

Rows per Page Allows you to set the number of lines per page of the query will be displayed in the file.

Rows per Page in Summary Allows you to set the number of lines per page in the Summary that be displayed in the file.

Print Background Allows you to define whether the background will appear for printing.

Other Formats

General settings	
ATTRIBUTE	VALUE
Select columns	<input type="checkbox"/>
Open RTF Directly	<input type="checkbox"/>

XML and RTF export settings

Generate XML directly Allows you to set whether the document will be generated directly or if an intermediate page will be displayed.

Generate RTF directly Allows you to set whether the document will be generated directly or if an intermediate page will be displayed.

Procedure SQL Settings

SQL Settings

This interface allows configuring the related database settings, such as the SQL statement, the used database connection, case sensitive, and others.

ATTRIBUTE	VALUE	DESCRIPTION
SQL Select Statement	<pre>SELECT customerid, companyname, contactname, contacttitle, birthdate, country, regionid, stateid, city,</pre>	
Limit	<input type="text"/>	It sets the number of records to be retrieved from the SQL statement.
SQL Preparation	<input type="text"/>	
Connection	<input type="text" value="conn_example"/>	Connection name to access the database.
Use Customized Message	<input type="checkbox"/>	Use a customized error message when the application has no records.
No Records Message	<input type="text"/>	When the application has no records, it will display this customized text.
Font	<input type="text" value="Aa"/>	Font face of the error message.
Font Size	<input type="text" value="12"/>	Font size of the error message.
Font Color	<input type="text" value="#000000"/>	Font color of the error message.
Variable for Table	<input type="text"/>	Variable name used for replacing the table name. Please indicate the name of the table that will be replaced by the variable value.
Fields Variables	<div style="border: 1px solid black; padding: 5px;"> <p>Variable</p> <input type="text"/> <p>customerid</p> </div>	Variables for substitution of the field names on the application. For each dynamically determined field, inform the name of the variable and the field that will be substituted.
Case Sensitive	<input checked="" type="checkbox"/>	Use case sensitive.

Grid

SQL configuration

SQL Select Statement

It allows you to define the primary SQL of the application. You can edit this SQL to add or delete fields.

Limit

Lets you limit the display in the number of records retrieved by SQL query.

SQL Preparation

You can enter SQL commands or procedure names to execute them before the primary SQL of the application.

Connection

It allows defining the database connection of the application. You can change the connection to another one that has the same table.

Use Customized Message

Lets you define to display the “no records” message or not.

No Records Message

Lets you set the message when the application has no records.

Font

This option is available when using the “Use Customized Message” option. It lets you set the font for the message.

Font Size

This option is available when using the “Use Customized Message” option. It lets you to set the font size.

Font Color

This option is available when using the “Use Customized Message” option. It lets you to set the font color.

Variable for Table

It allows to use a variable to change a part of the string containing the table name.

Fill the first input with the name of the variable (replace to). The second input you should fill with the part of the name of the table you want to replace (replace from).

Fields Variables

It allows to use a variable to change a part of the string containing the field name.

Fill the first input with the name of the variable (replace to). The second input you should fill with the part of the name of the field you want to replace (replace from).

Case sensitive

It defines if the database connection uses case sensitive or not.

Security

Use security

With this option enabled, when accessing the application, an “unauthorized user” message will be displayed, preventing access to the application.

When enabled, application access is only possible through the macro **sc_apl_status** or through **security module**.

[Click here](#) to access the macro documentation sc_apl_status.

In the development environment, the use of the above options for testing purposes may be suppressed, preventing the password being requested or access being blocked at each execution of the applications. To do this, disable the options “Enable security usage” and “Enable password usage” in the menu **Configuration > My Scriptcase**.

Security exit url

Defines which application the user will be redirected to after the “unauthorized user” warning.

Use password

When enabling the option, you will be asked to define a password for accessing the application.

When running the application using the active password, you will be asked for the password before accessing the application.

The password will be requested regardless of the “use security” setting or the use of the security module.

Request password only once

This option defines the behavior of the use password option.

When this option is enabled, the password will be requested only once per session.

When disabling, the password will be requested every time the application will be accessed.

Allow direct calling by URL

Allows an application to be called by typing the URL directly into browsers.

When disabled, when accessing the application by typing the URL directly, the invalid data error will be displayed. With this configuration, the application can only be accessed through a menu application, for example.

Cookies

HttpOnly

These are cookies that can be set by the server or by javascript but cannot be accessed in any way by javascript.

With the HTTPOnly parameter enabled, it is very difficult to steal a session through XSS because the javascript cannot read the content of these cookies.

A widely exploited attack in XSS is the theft of user session cookies. Theft of cookies is carried out through a javascript command that sends cookies to an external URL where the attacking user has control.

This option is enabled by default in all applications.

Session ID

Enables the session id that will be stored in cookies on the client side. This option embeds the session id directly in the URLs

This option is enabled by default in all applications.

Cookie Secure

With this option enabled, cookies are protected and can only be transmitted via secure communication. Therefore, they cannot be accessed through Javascript.

The HttpOnly option must also be enabled.

Headers

Desabilitar o Auditor XSS

XSS is short for Cross-Site Scripting, which is an attack that consists of sending HTML with malicious JavaScript to a website.

It is a security attack that consists of sending HTML with malicious JavaScript to a website. If the website displays this HTML with JavaScript without filtering the malicious JavaScript code, the cookies sent by the website can be stolen and sent to an attacking website, so that it can be used to forge user sessions and access the website's user account without permissions.

Strict-Transport-Security

HSTS forces browsers to use HTTPS in the domain where it is enabled, instead of using HTTP.

When enabled, the default value is "max-age = 31536000".

The HSTS policy is set for one year (31536000 seconds). This period specifies the time the browser will access the server via HTTP

X-Frame-Options

The HTTP X-Frame-Options response header can be used to indicate whether or not the browser should render the page in a `<frame>`, `<iframe>`, `<embed>` " or '". This header provides protection against clickjacking, known as 'click swipe' - this vulnerability can steal relevant information and data from the user.

X-Frame-Options does not allow the rendering of a page in a frame, ensuring that the content of your page is not embedded in other sites

- **SAMEORIGIN:** The SAMEORIGIN directive allows the page to be loaded in a frame from the same source as the page itself. This option must be used so that the application with clickjacking protection can be used in the menu application.
- **DENY:** This directive completely disables page loading in a frame.

If no option is selected, the application can be used on any `<frame>`, `<iframe>`,

or `<object>`, allowing the application to be incorporated into another website.

X-Content-Type-Options

X-Content-Type-Options is used to protect against MIME detection vulnerabilities. With this option enabled, it prevents browsers from interpreting the page content (sniffing) and executing the data as code / tag. These vulnerabilities can occur when uploading a text file with a javascript code and the browser reading the content that is in the file and executing, even though it is just text and not part of the code.

With this enabled, the HTTP X-Content-Type-Options header is defined, by default, as "no detection".

Referrer-Policy

no-referrer.

The Referer header will be omitted completely. No reference information will be sent with requests.

no-referrer-when-downgrade.

This is the default behavior when no policy is specified, or if the value provided is invalid.

origin.

Only send the origin of the document as a reference. For example, a document at `https://example.com/page.html` will send the reference `https://example.com/`.

origin-when-cross-origin.

Sends the origin, path and query string when performing a same-origin request, but only sends the origin of the document in other cases.

same-origin.

The reference will be sent to sources on the same site, but requests between sources will not send reference information.

strict-origin.

Only send the document source as a reference when the security protocol level remains the same (HTTPS → HTTPS), but do not send it to a less secure recipient (HTTPS → HTTP).

strict-origin-when-cross-origin.

Sends the source, path and query string when performing a request from the same source, only sends the source when the security protocol level remains the same during an inter-source request (HTTPS → HTTPS), and sends no header to recipients less secure (HTTPS → HTTP)

unsafe-url.

Sends the source, path and query chain when performing any request, regardless of security.

Feature-Policy

The value of this header is a policy or set of policies that you want the browser to respect for a particular source.

The source whitelist can take on several different values:

- ``*:`` The feature is allowed in top-level navigation contexts and in nested navigation contexts (iframes).
- ``self:`` The feature is allowed in top-level navigation contexts and nested navigation contexts from the same source. It is not allowed in documents of cross origin in nested browsing contexts.
- ``none:`` The feature is not allowed in top-level browsing contexts and is not allowed in nested browsing contexts.
- ``<origin (s)>:`` specific sources for which to enable the policy (for example `https://example.com`).

Example 1 - Using only one directive Let's say you want to prevent all content from using the geolocation API on your site. You can do this by submitting a restricted 'none' whitelist to the geolocation resource:

Feature-Policy: ``geolocation 'none'``

Example 2 - Using more than one directive Functionalities within a policy are separated by semicolons.

Feature-Policy: `unsized-media 'none'; geolocation 'self' https://example.com; camera *;``

Directives

accelerometer

Controls whether the current document is allowed to collect information about the acceleration of the device

via the Accelerometer interface.

ambient-light-sensor

Controls whether the current document is allowed to collect information about the amount of light in the environment around the device through the AmbientLightSensor interface.

autoplay

Controls whether the current document is allowed to play the requested media automatically via the HTMLMediaElement interface. When this policy is disabled and there is no user action, the Promise returned by HTMLMediaElement.play () will reject it with a DOMException. The autoplay attribute on <audio> " and " elements will be ignored.

battery

Controls whether the use of the Battery Status API is allowed. When this policy is disabled, the Promise returned by Navigator.getBattery () will reject it with a NotAllowedError DOMException.

camera

Controls whether the current document is allowed to use inputs from video devices. When this policy is disabled, the Promise returned by getUserMedia () will reject it with a NotAllowedError DOMException.

display-capture

Controls whether or not the current document is allowed to use the getDisplayMedia () method to capture screen content. When this policy is disabled, the Promise returned by getDisplayMedia () will reject it with a NotAllowedError if permission is not obtained to capture the contents of the screen.

document-domain

Control whether the current document is allowed to place document.domain. When this policy is disabled, attempts to place document.domain will fail and cause a SecurityError DOMException to be thrown.

encrypted-media

Controls whether the current document is allowed to use the Encrypted Media Extensions (EME) API. When this policy is disabled, the Promise returned by Navigator.requestMediaKeySystemAccess () will reject it with a DOMException.

execution-while-not-rendered

Controls whether tasks should be performed in frames while they are not rendered (e.g. whether a frame is hidden or display: none).

execution-while-out-of-viewport

Controls whether tasks should be performed in frames while they are outside the visible viewing window.

fullscreen

Controls whether the current document is allowed to use Element.requestFullscreen (). When this policy is disabled, the returned Promise rejects it with a TypeError DOMException.

geolocation

Controls whether the current document is allowed to use the Geolocation interface. When the policy is disabled, calls to getCurrentPosition () and watchPosition () will cause function callbacks to be invoked with a PositionError of PERMISSION_DENIED.

gyroscope

Controls whether the current document is allowed to collect information about the orientation of the device through the Gyroscope interface.

layout-animations

Controls whether the current document is allowed to show layout animations.

legacy-image-formats

Controls whether the current document is allowed to show images in legacy formats.

magnetometer

Controls whether the current document is allowed to collect information about the orientation of the device through the Magnetometer interface.

microphone

Controls whether the current document is allowed to use inputs from audio devices. When this policy is disabled, the Promise returned by `MediaDevices.getUserMedia ()` will reject it with a `NotAllowedError`.

midi

Controls whether the current document is allowed to use the Web MIDI API. When this policy is disabled, the Promise returned by `Navigator.requestMIDIAccess ()` will reject it with a `DOMException`.

navigation-override

Controls the availability of mechanisms that enable the author of the page to take control over the behavior of spatial navigation, or to cancel completely.

oversized-images

Controls whether the current document is allowed to download and display large images.

payment

Controls whether the current document allows the use of the Payment Request API. When this policy is disabled, the `PaymentRequest ()` constructor will throw a `SecurityError DOMException`.

picture-in-picture

Controls whether the current document allows a video to be allowed to play in Picture-in-Picture mode via the corresponding API.

publickey-credentials-get

Controls whether the current document is allowed to use the Web Authentication API to retrieve already stored public key credentials, i.e. via `navigator.credentials.get ({publicKey: ..., ...})`.

sync-xhr

Controls whether the current document is allowed to make synchronous XMLHttpRequest requests.

usb

Controls whether the current document is allowed to use the WebUSB API.

vr

Controls whether the current document is allowed to use the WebVR API. When this policy is disabled, the Promise returned by `Navigator.getVRDisplays ()` will reject it with a `DOMException`. Keep in mind that the WebVR standard is in the process of being replaced by WebXR.

wake-lock

Controls whether the current document is allowed to use the Wake Lock API to indicate that the device should not go into a power saving mode.

screen-wake-lock

Controls whether the current document is allowed to use the Screen Wake Lock API to indicate whether or not the device should darken the screen.

xr-spatial-tracking

Controls whether or not the current document is allowed to use the WebXR Device API to interact with the WebXR session.

Content-Security-Policy

Content-Security-Policy is the name of an HTTP response header that modern browsers use to increase the security of the document (or web page).

The Content-Security-Policy header allows you to restrict resources such as JavaScript, CSS or just about anything the browser loads.

Directives**default-src**

The default-src directive defines the standard policy for fetching features such as JavaScript, Images, CSS, Fonts, AJAX requests, Frames, HTML5 Media. Not all directives go back to default-src. Refer to the Source List Reference for possible values.

DEFAULT-SRC Policy Example `default-src 'self' cdn.example.com;`

script-src

Defines valid JavaScript sources.

SCRIPT-SRC Policy Example `script-src 'self' js.example.com;`

style-src

Defines valid fonts for style sheets or CSS.

EXAMPLE__ STYLE-SRC POLICY `style-src 'self' css.example.com;`

img-src

Defines valid image sources.

Example of IMG-SRC Policy `img-src 'self' img.example.com;`

connect-src

Applies to XMLHttpRequest (AJAX), WebSocket, fetch (), `<a ping>` or EventSource. If not allowed, the browser emulates a 400 HTTP status code. `__Connect-SRC Policy Example__ connect-src 'self';``

font-src

Defines valid fonts for font resources (loaded via @ font-face).

FONT-SRC Policy Example `font-src font.example.com;``

object-src

Defines valid plug-in sources, for example `<object>` or `<applet>`.

Example OBJECT-SRC Policy `object-src 'self';`

media-src

Defines valid audio and video sources, for example `<audio>`, HTML5, `<video>` elements.

Example of MEDIA-SRC Policy `media-src media.example.com;`

frame-src

Defines valid fonts for loading frames. In CSP, Level 2 `frame-src` has been deprecated in favor of the `child-src` directive. CSP Level 3, has not been replaced with `frame-src` and will continue to postpone `child-src` if not present.

Example FRAME-SRC `frame-src 'self';`

sandbox

Enables a sandbox for the requested resource similar to the `iframe` `sandbox` attribute. The sandbox applies a policy of the same origin, avoids pop-ups, plug-ins and blocks the execution of scripts. You can keep the `sandbox` value empty to keep all restrictions in place, or add values: `allow-forms` `allow-same-origin` `allow-scripts` `allow-popups` `allow-modals` `allow-orientation-lock` `allow-pointer-lock` `allow-presentation` `allow-popups-to-escape-sandbox` `allow-top-navigation`

Example of SANDBOX policy `sandbox allow-forms allow-scripts;`

report-uri

Instructs the browser to POST policy crash reports to this URI. You can also use `Content-Security-Policy-Report-Only` as the HTTP header name to instruct the browser to send reports only (does not block anything). This directive was discontinued at CSP Level 3 in favor of the `report-to` directive.

Example REPORT-URI `report-uri / some-report-uri;`

child-src

Defines valid fonts for web workers and nested browsing contexts loaded using elements such as `<frame>` and `<iframe>`.

Example of FILHO-SRC Policy `child-src 'self'`

form-action

Defines valid fonts that can be used as an `<form>` HTML action.

Example action policy example `form-action 'self';`

frame-ancestors

Defines valid fonts for embedding the resource using `<frame>` `<iframe>` `<object>` `<embed>` `<applet>`. Setting this directive to `'none'` should be roughly equivalent to `X-Frame-Options: DENY FRAME-ANCESTORS`. **EXAMPLE POLICY** `frame-ancestors 'none';`

plugin-types

Defines valid MIME types for plug-ins called via `<object>` and `<embed>`. To load one, `<applet>` you must specify `application / x-java-applet`.

PLUG-IN TYPES Policy Example ``plugin-types application / pdf;``

base-uri

Defines a set of allowed URLs that can be used in the attribute of an HTML basetag.

URI-BASE Policy Example ``` base-uri 'self'; ```

report-to

Defines a report group name defined by an HTTP Response Report-Header. See the reporting API for more information.

Example Report for Policy `report-to groupName;`

worker-src

Restricts URLs that can be loaded as Worker, SharedWorker or ServiceWorker.

WORKER-SRC Policy Example `worker-src 'none';``

manifest-src

Restricts URLs where application manifests can be loaded.

Example of MANIFEST-SRC Policy `manifest-src 'none';``

prefetch-src

Defines valid sources for pre-fetching and pre-rendering of requests, for example, through the linktag with `rel = "prefetch"` or `rel = "prerender"`:

`__ PREFETCH-SRC Policy Example__ prefetch-src 'none'``

navigate-to

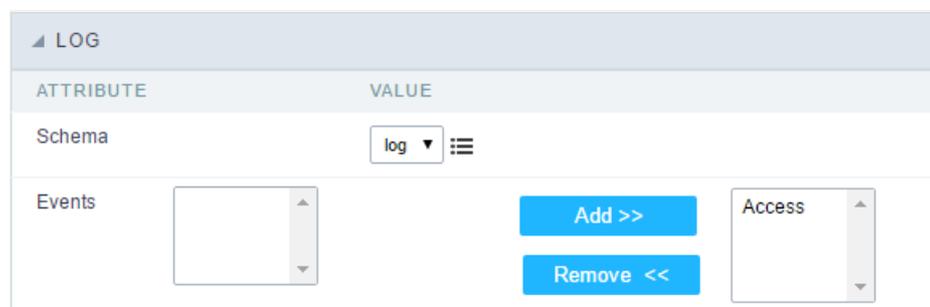

Restricts the URLs to which the document can navigate by any means. For example, when a link is clicked, a form is submitted or `window.location` is called. If `form-action` is present, this directive will be ignored for submitting forms. Implementation status

Navigation Policy Example ``navigate-to example.com``

Procedure Log Configuration

This interface allows you to define a Log schema to the app. The Log scheme tracks what the end-users are doing in the app. Those are the events it can tracks: Access, Insert, Update, and delete.

To learn how to create a Log schema [see here](#).

The screenshot shows a configuration interface for application logging. At the top, there is a header labeled 'LOG'. Below it is a table with two columns: 'ATTRIBUTE' and 'VALUE'. The 'Schema' attribute is set to 'log'. Below the table, there are two empty dropdown menus for selecting events. Between these dropdowns are two blue buttons: 'Add >>' and 'Remove <<'. The 'Access' event is already selected in the right dropdown menu.

Application Log configuration

Schema Select an existing log schema for the application.

Events You can select just specific events to save in the log.

Procedure - Fields Overview

The applications can have two types of fields.

Table Fields

Columns of the table connected to the application and their data types.

Example:

In a table with the following structure:

```
CREATE TABLE `orders` (
  `orderid` int(11) NOT NULL,
  `customerid` varchar(5) NULL DEFAULT NULL,
  `employeeid` int(11) NULL DEFAULT NULL,
  `orderdate` date NULL DEFAULT NULL,
  `requireddate` date NULL DEFAULT NULL,
  PRIMARY KEY (`orderid`) USING BTREE
);
```

These are the listed fields on left menu **Fields**:

Virtual Fields

Fields created inside application to assist in the development process.

How to create a virtual field

1. Inside an application, access the left menu **Fields** and click on **New Field** option.
2. Choose how many fields do you want to create:

1. Create the fields and define type, name and label for each one:

- **Type**: Data type of the field.
- **Name**: Internal name of the field. Used to identify the field on events and Scriptcase interface.
- **Label**: Title of the field displayed on the application.

Scriptcase **doesn't insert** virtual fields on the table after its creation.

Types of fields by applications

Application Table Fields Virtual Fields

Grid	<input type="text"/>	<input type="text"/>
Procedure	<input type="text"/>	<input type="text"/>
Chart	<input type="text"/>	<input type="text"/>
Form	<input type="text"/>	<input type="text"/>
Control	<input type="text"/>	<input type="text"/>
Calendar	<input type="text"/>	<input type="text"/>
Search	<input type="text"/>	<input type="text"/>
PDF Report	<input type="text"/>	<input type="text"/>

The applications **Menu**, **Tree Menu**, **Dashboard** and **Blank** were not listed because they haven't manage fields.

Procedure - Text Field

General Settings

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter than (;).
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML, CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.

- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.

- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Martial Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute	Value	Lookup	Description
1			Sports
2			Culture
4			Pleasure
8			Reading
16			Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
 - **Default value** : Defines the default value, used in the cases where the select command does not return any values.
 - **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
 - **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**
 - **Text Font** : Allows choosing the font type, which will be applied in the application field.
 - **Font Size** : Allows choosing the font size, which will be applied to the application object.
 - **Italic Text** : Allows to apply the italic type in the font.
 - **Bold Text** : Allows you to apply bold type to the font.
 - **Number of characters** : Number of characters to display.
 - **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
 - **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).

- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

//## PDF Configuration {#id-04}

Chart Settings

By using this option, you will see an icon on the Field Title, this icon displays a chart relating to the field.

On this type option you need to choose two columns to build the chart. The first one is the field its self that you are working with, and the second one is the you chose and is called "Column for Label".

Bar Chart Interface.

- **Group by Label** : Groups the values of the column by the label. Similar to the effect of the group by of the a Select.
- **Summary Function** : Function that summarizes the data applied to the column. The functions that can be used on the field are the following: Count, Sum, Max, Min and Avg.
- **Configurable Chart** : Allows the user to setup the parameters of the chart creation when the application is running.
- **Display Values** : Displays the values of the generated chart.
- **Column for Label** : Selecting the column that will be the label for the field.
- **Chart Width** : Width of the chart, in pixels.
- **Chart Height** : Height of the chart, in pixels.

Chart Layout

Chart layout settings interface.

Procedure - Multiple Lines Text Field

General Settings

Multiple Lines Text field Configuration Interface.

- **Data Type** : Define the type of field for the application. When it is defined as a Multiple Lines Text, it accepts letters, numbers and special characters in multiple lines.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Case Settings** : Convert the letter from the field when losing focus. The options are:
 - **Upper case** : All in Upper Case
 - **Lower case** : All in Lower case
 - **Capitalize first word** : Capitalizes the first letter of the first word
 - **Capitalize all words** : Capitalizes the first letter of all the the words
- **Show HTML content** : Determines if the HTML contained in the field will be displayed or not. If enabled, the HTML will be displayed, otherwise the HTML will be interpreted by the browser.
- **Grid Mask** : Defines the mask for the field display. There are two typed of masks described below:

Character	Description
X	Placeholder to any character. Replaced by any character. If number of characters entered are less then the mask size, the field value is completed with zeros (Filling full size field entry is required).
Z	Replaced by any character retrieved from database. Suppress zeros at field left (Complete field filling is optional). When used combined with the mask character X it should be placed at the mask left.

Mask Examples

Mask	Field Value	Formatted Value
(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
(zz) xxxx - xxxx	1234567890	(12) 3456 - 7890
(zz) xxxx - xxxx	12345678	() 1234 - 5678
(zz) xxxx - xxxx	0012345678	() 1234 - 5678

- **Do Not Repeat Value** : Do not repeat the value of the field in case it is the same as the previous record.

- **Run content in JavaScript** : If enabled, the JavaScript will be interpreted by the browser, otherwise the JavaScript will be displayed.
- **SQL Type** : Informs the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**
 - **Text Font** : Allows choosing the font type, which will be applied in the application field.
 - **Font Size** : Allows choosing the font size, which will be applied to the application object.
 - **Italic Text** : Allows to apply the italic type in the font.
 - **Bold Text** : Allows you to apply bold type to the font.
 - **Number of characters** : Number of characters to display.
 - **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
 - **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or

bottom).

- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

//## PDF Configuration {#id-03}

Chart Settings

By using this option, you will see an icon on the Field Title, this icon displays a chart relating to the field.

On this type option you need to choose two columns to build the chart. The first one is the field its self that you are working with, and the second one is the you chose and is called "Column for Label".

Bar Chart Interface.

- **Group by Label** : Groups the values of the column by the label. Similar to the effect of the group by of the a Select.
- **Summary Function** : Function that summarizes the data applied to the column. The functions that can be used on the field are the following: Count, Sum, Max, Min and Avg.
- **Configurable Chart** : Allows the user to setup the parameters of the chart creation when the application is running.
- **Display Values** : Displays the values of the generated chart.
- **Column for Label** : Selecting the column that will be the label for the field.
- **Chart Width** : Width of the chart, in pixels.
- **Chart Height** : Height of the chart, in pixels.

Chart Layout

Chart layout settings interface.

Procedure - Integer Field

On this page, you will learn how you can configure settings related to the Number field. From the use of specific symbols display to the mode in which they are displayed. And thus, boost the application.

Data type:

It sets the application field type. When the field is set as Number, it is permissible to define formatting rules of integers.

Label:

It sets the title that will be displayed in the field when you run the application. The terminology used in the interface is fundamental for your system has a good usability. In this case, we recommend you to use names and terms familiar to the end user of the application, instead of using terms originated in the system.

Field Mask Input:

It sets the mask input for the field. There are two types of mask as described in the table below:

Character Description

- X It is overridden by any characters returned by the database. Filled is required and the value will be completed with leading zeros when there are fewer characters than the size of the mask.
- Z It is overridden by any characters returned by the database. Its filling is optional and when there are fewer characters than the mask size, nothing will be done about the characters that are missing. In addition the leading zeros will be suppressed. When used in conjunction with the X necessarily the use of this character is to the left of the mask.
- 9 It represents any numeric character (from 0-9)
- A It represents an alpha numeric character (A-Z,a-z)
- * It represents any alpha-numeric character (A-Z,a-z,0-9)entered by the user.

Mask Input Examples:

Field	Mask Input	Typed Value	Formatted Value
Phone Number	+99 99 9999 - 9999	123456789012	+12 34 5678 - 9012
Phone Number	(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
Phone Number	(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
Phone Number	(zz) xxxx - xxxx	12345678	() 1234 - 5678
Software Key (Letters only)	AAAA-AAAA-AAAA-AAAA	QWERTYUIASDFGHJK	QWER-TYUI-ASDF-GHJK
Software Key (Letters and numbers)	xxxx-xxxx-xxxx-xxxx	Q1W2E3R4T5Y6U7I8	Q1W2-E3R4-T5Y6-U7I8
License Plate	AAA - 9999	QWE1234	QWE - 1234
Scriptcase Serial Key	A999A999A999- **	D111H111G111DG2P	D111H111G111-DG2P
Multiple masks (Phone Number)	9999-9999;(99)9999-9999;	9999 999 9999	+99 99 9999-9999

Repeat value:

This option when enabled will allows you to repeat the field value if it is equal to the value of the previous record in the database.

Example:

Tipo SQL:

Reports the SQL type of the field as it is configured in the database.

Use regional settings:

It allows you to apply regional settings to the number fields formatting. When this option is not selected it will be displayed the attributes group, minus sign and negative number format.

Grouping:

It allows you to define which character is used to separate thousands. This option is only available when the option to use regional settings is disabled.

Negative sign:

It allows you to define which character will be used for the display of negative numbers. This option is only available when the option to use regional settings is disabled.

Negative number format:

It allows you to define the placement of the negative sign in relation to value. This option is only available when the option to use regional settings is disabled.

Color for the negative values:

It allows you to define a color when the value is negative, improving the understanding of the end user about that kind of value.

Example:

Display the value in words:

The value of the field will be displayed in full on application. This feature can facilitate the comprehension and understanding of the user.

Example:

Line size:

Maximum size in characters to be displayed in the value cell, in full. When this value is exceeded the line will break within the cell.

Lookup Settings

The Lookup is a way used to provide the end user a list of values description/name where the items can be selected and used in the application. For example, for a field sex that in the database is represented with M or F values can be presented as male or female dynamically with the lookup. So you will be able to retrieve these values from a database table or manually, if the reference table does not exist.

Example:

Lookup Methods

There are two lookup methods available:

Manual: To use this method it is necessary to inform the selection conditions manually to the Lookup.

Automatic: To use this method it is necessary to use a lookup query from the database to access the reference table.

Editing-automatic lookup:

Select Command:

It sets the SQL command that will retrieve the value to display inside the Grid field. The command must have the following format

```
SELECT field_to_be_displayed FROM table WHERE key_field = {grid_field}
```

The Grid field must be always referenced between curly braces {}, So at run time, the field braces will be replaced by its value in the table.

Multiple Options:

When the Select command informed return multiple values, the option must be selected.

Delimiter:

It sets the tab of values returned by the Select command, this option should be filled when the "Yes" option is checked in the multiple attribute options.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

Use a specific connection:

This option allows you to select another existing connection in the project, other than the current connection, to select the values for the lookup.

Edit Lookup - Manual:

Lookup used to modify the display of the field with predefined values.

Lookup Types

It sets the operating mode of the lookup can be: single value, multiple values (delimiter), multiple values (position) and multiple values (binary).

Single value: it will be displayed only one value for the field. There is a direct replacement of the value stored in the Bank for a label defined in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value of “M” will be replaced by “Male”.

Multiple Values (Delimiter):

By using this option it will be displayed multiple values for the selected field. The values must be separated by a delimiter to be informed. A replacement of parts from a string stored in the field, separated by a delimiter for values contained in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value S;M will be replaced by Sports and Movies.

Delimiter: Character used to separate the values within the same string.

Multiple Values (Position)

Allows you to recover information stored in a single string of the selected field. In order for this information to be retrieved must be informed, in addition to the label, the starting position and the number of bytes that each information occupies within the string.

As an example we will use a string to store Sex, Marital status and Hobby respectively. Sex occupies one byte, Status one byte and Hobby two bytes .

For this purpose we define the list as:

Label	Value	Start	Size
Male	M	1	1
Female	F	1	1
Married	M	2	1
Single	S	2	1
Study	ST	3	2
Sportes	SP	3	2
Reading	LE	3	2

Example: the string MMST would be presented in the query as: Male Married Study

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value M will be replaced by Male.

Start: : Starting position in the string where the information is recorded. The first position is always 1.

Size: : Number of bytes that the information occupies in the string.

Multiple values (binary):

It allows you to retrieve several information stored in decimal form of the selected field.

As examples we will use the following list (although not informed in the interface of inclusion of values in the list, each item has a value assigned automatically according to the order):

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

To display the data, a decomposition of the decimal number stored in the bank is performed. For example, numbers 11 and 12 (written in the database) would be decomposed as follows:

$$11 = 1 + 2 + 8 = (\text{Sports} - \text{Culture} - \text{Reading})$$

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

12 = 4 + 8 = (Leisure - Reading)

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

Label:

Text that will be displayed in the Grid.

Include Button:

Includes in the list the values populated in the Label and value fields.

Alter Button:

It changes the attributes of the selected item.

Delete Button:

Deletes the selected item.

Clean Button:

It cleans the fields

Save Button:

Allows the user to save the entire list, for later use using the Load Lookup definition option.

Load Lookup definition:

Allows you to load a predefined value list for use as a lookup.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.
- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Line Chart

Using this guide, you can define ac chart for each line.

- **Line Chart Type** : There are two types of charts that can be used. Below you can see their description:
- **Bar Chart** : This option allows to display a bar chart relating to the column that you are working with. The size of the bars is done by math relating to the Grand Total of the column. The value informed in the width of the chart defines the size of the images that will be displayed.

In the example shown above, the width of the Chart is 200 pixels.

- **Line Chart** : This option allows to display a Line Chart relating to the column that you are working with . The amount of lines are done by dividing the value of a column by the value informed to the number of icons.

In the example above, the field Number of Icons, it was informed the value 1000, so the number of stars besides, it determined by dividing the displayed value by 1000.

- **Display Value** : It will display the value and the chart at the same time, the value being on the left or

right side of the bar or lines.

- **Number of Icons** : Determines the amount of icons (figures) that will appear for each value on this field. This value will be presented by the dividing the value of the column by the Number of Icons.
- **Chart width** : Width of the chart in pixels. This field is used by the option Bar Chart. In case it is not informed, the value used is 200 pixels.
- **Chart height** : Height of the chart in pixels. This field is used by the option Bar Chart.
- **Margin** : Charts margin. This option is only used by the bar chart.
- **Image / Positive Color** : The way that it is informed will variate depending on the options below:
 - **Bar Chart** : Inform a color for the field that will be used to form the chart image. Click the icon beside to choose the color.
 - **Line Chart** : Inform an image name for the field that will be used like an icon. Click the icon beside to choose the image "Icon".
- **Image / Negative Color** : The information passed to this field follows the same criteria as the Image / Positive Color field. This parameter will be used in the case the value is negative.

//## PDF Configuration {#id-06}

Charts Settings

By using this option, you will see an icon on the Field Title, this icon displays a chart relating to the field.

On this type option you need to choose two columns to build the chart. The first one is the field its self that you are working with, and the second one is the you chose and is called "Column for Label".

Bar Chart Interface.

- **Group by Label** : Groups the values of the column by the label. Similar to the effect of the group by of the a Select.
- **Summary Function** : Function that summarizes the data applied to the column. The functions that can be used on the field are the following: Count, Sum, Max, Min and Avg.
- **Configurable Chart** : Allows the user to setup the parameters of the chart creation when the application is running.
- **Display Values** : Displays the values of the generated chart.
- **Column for Label** : Selecting the column that will be the label for the field.
- **Chart Width** : Width of the chart, in pixels.
- **Chart Height** : Height of the chart, in pixels.

Chart Layout

Chart layout settings interface.

Procedure - Decimal Field

General Settings

Decimal field Configuration Interface.

Data Type

Define the field type to Decimal. It allows defining the Decimal number format.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Accumulated

It defines the field to accumulate values of another field. This option is only available for virtual fields.

Accumulator field

It is available when the option "Accumulated" is enabled. This configuration defines which field will accumulate the values. The field should be Integer, Currency, or Decimal.

Grid Mask

It defines a mask for the field value. There is two types of masks:

Character	Description
X	It sets the placeholder to any character for replacing. If the entered number of characters is less than the mask size, It completes the field value with zeros (Filling full-size field entry is required).
Z	It sets the placeholder to any character for replacing, but it suppresses zeros at field left (Complete field filling is optional). Use it on the left when combined with the X mask.

Mask Examples

Mask	Field Value	Formatted Value
(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
(zz) xxxx - xxxx	1234567890	(12) 3456 - 7890
(zz) xxxx - xxxx	12345678	() 1234 - 5678
(zz) xxxx - xxxx	0012345678	() 1234 - 5678

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Values format

Format of Values with Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the attributes Grouping, Negative Symbol and negative number format.

Digit Grouping Separator

It defines the character to separate the thousands.

Decimal Separator

It defines the decimal separator.

Negative sign

It defines the character to represent negative numbers.

Negative number format

It defines the position of the Negative sign.

Color of Negative

It defines a color for the field when the value is negative.

Decimal Precision

It defines the number of decimal places for the field.

Complete with zeros

Defines the decimal places that will or not be completed zeros to the right. Example: The value is 125,50, but the decimal precision is 3. If the option is enabled, then the value will 125,500.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the

select command separated by the character in the "Separated by" field.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Martial Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.

- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML, CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
 - **Default value** : Defines the default value, used in the cases where the select command does not return any values.
 - **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**
 - **Text Font** : Allows choosing the font type, which will be applied in the application field.
 - **Font Size** : Allows choosing the font size, which will be applied to the application object.
 - **Italic Text** : Allows to apply the italic type in the font.
 - **Bold Text** : Allows you to apply bold type to the font.
 - **Number of characters** : Number of characters to display.
 - **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
 - **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
 - **Background Image** : Allows you to add a background image to the field.
 - **Line Break** : Enables the possibility of a line break for the field.
 - **Content color** : Changes the content color of the query field and the grouped field, when available.
 - **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
 - **Width** : To define the width of the field.
 - **Height** : To set the height of the field.
 - **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
 - **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
 - **Title color** : Allows you to choose a color for the field title using a color palette.
 - **Title background color** : Allows choosing a color for the background of the field title using a color palette.
 - **Bold** : Displays the field title in bold

Line Chart

Using this guide, you can define ac chart for each line.

- **Line Chart Type** : There are two types of charts that can be used. Below you can see their description:
- **Bar Chart** : This option allows to display a bar chart relating to the column that you are working with. The size of the bars is done by math relating to the Grand Total of the column. The value informed in the width of the chart defines the size of the images that will be displayed.

In the example shown above, the width of the Chart is 200 pixels.

- **Line Chart** : This option allows to display a Line Chart relating to the column that you are working with . The amount of lines are done by dividing the value of a column by the value informed to the number of icons.

In the example above, the field Number of Icons, it was informed the value 1000, so the number of stars besides, it determined by dividing the displayed value by 1000.

- **Display Value** : It will display the value and the chart at the same time, the value being on the left or right side of the bar or lines.
- **Number of Icons** : Determines the amount of icons (figures) that will appear for each value on this

field. This value will be presented by the dividing the value of the column by the Number of Icons.

- **Chart width** : Width of the chart in pixels. This field is used by the option Bar Chart. In case it is not informed, the value used is 200 pixels.
- **Chart height** : Height of the chart in pixels. This field is used by the option Bar Chart.
- **Margin** : Charts margin. This option is only used by the bar chart.
- **Image / Positive Color** : The way that it is informed will variate depending on the options below:
 - **Bar Chart** : Inform a color for the field that will be used to form the chart image. Click the icon beside to choose the color.
 - **Line Chart** : Inform an image name for the field that will be used like an icon. Click the icon beside to choose the image "Icon".
- **Image / Negative Color** : The information passed to this field follows the same criteria as the Image / Positive Color field. This parameter will be used in the case the value is negative.

///
PDF Configuration {#id-06}

Chart Settings

By using this option, you will see an icon on the Field Title, this icon displays a chart relating to the field.

On this type option you need to choose two columns to build the chart. The first one is the field its self that you are working with, and the second one is the you chose and is called "Column for Label".

Bar Chart Interface.

- **Group by Label** : Groups the values of the column by the label. Similar to the effect of the group by of the a Select.
- **Summary Function** : Function that summarizes the data applied to the column. The functions that can be used on the field are the following: Count, Sum, Max, Min and Avg.
- **Configurable Chart** : Allows the user to setup the parameters of the chart creation when the application is running.
- **Display Values** : Displays the values of the generated chart.
- **Column for Label** : Selecting the column that will be the label for the field.
- **Chart Width** : Width of the chart, in pixels.
- **Chart Height** : Height of the chart, in pixels.

Chart Layout

Chart layout settings interface.

Procedure - Percent Field

General Settings

Percentage field Configuration Interface.

Data Type

Define the field type to Percentage.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Accumulated

It defines the field to accumulate values of another field. This option is only available for virtual fields.

Accumulator field

It is available when the option "Accumulated" is enabled. This configuration defines which field will accumulate the values. The field should be Integer, Currency, or Decimal.

Grid Mask

It defines a mask for the field value. There is two types of masks:

Character	Description
X	It sets the placeholder to any character for replacing. If the entered number of characters is less than the mask size, It completes the field value with zeros (Filling full-size field entry is required).
Z	It sets the placeholder to any character for replacing, but it suppresses zeros at field left (Complete field filling is optional). Use it on the left when combined with the X mask.

Mask Examples

Mask	Field Value	Formatted Value
(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
(zz) xxxx - xxxx	1234567890	(12) 3456 - 7890
(zz) xxxx - xxxx	12345678	() 1234 - 5678
(zz) xxxx - xxxx	0012345678	() 1234 - 5678

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the attributes Grouping, Negative Symbol and negative number format.

Digit Grouping Separator

It defines the character to separate the thousands.

Decimal Separator

It defines the decimal separator.

Negative sign

It defines the character to represent negative numbers.

Negative number format

It defines the position of the Negative sign.

Color of Negative

It defines a color for the field when the value is negative.

Decimal Precision

It defines the number of decimal places for the field.

Complete with zeros

Defines the decimal places that will or not be completed zeros to the right. Example: The value is 125,50, but the decimal precision is 3. If the option is enabled, then the value will 125,500.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value

returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.

- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
 - **Default value** : Defines the default value, used in the cases where the select command does not return any values.
 - **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
 - **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and

lookup value is enabled.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.
- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Line Chart

Using this guide, you can define ac chart for each line.

- **Line Chart Type** : There are two types of charts that can be used. Below you can see their description:
- **Bar Chart** : This option allows to display a bar chart relating to the column that you are working with. The size of the bars is done by math relating to the Grand Total of the column. The value informed in the width of the chart defines the size of the images that will be displayed.

In the example shown above, the width of the Chart is 200 pixels.

- **Line Chart** : This option allows to display a Line Chart relating to the column that you are working with . The amount of lines are done by dividing the value of a column by the value informed to the number of icons.

In the example above, the field Number of Icons, it was informed the value 1000, so the number of stars besides, it determined by dividing the displayed value by 1000.

- **Display Value** : It will display the value and the chart at the same time, the value being on the left or right side of the bar or lines.
- **Number of Icons** : Determines the amount of icons (figures) that will appear for each value on this field. This value will be presented by the dividing the value of the column by the Number of Icons.
- **Chart width** : Width of the chart in pixels. This field is used by the option Bar Chart. In case it is not

informed, the value used is 200 pixels.

- **Chart height** : Height of the chart in pixels. This field is used by the option Bar Chart.
- **Margin** : Charts margin. This option is only used by the bar chart.
- **Image / Positive Color** : The way that it is informed will variate depending on the options below:
 - **Bar Chart** : Inform a color for the field that will be used to form the chart image. Click the icon beside to choose the color.
 - **Line Chart** : Inform an image name for the field that will be used like an icon. Click the icon beside to choose the image "Icon".
- **Image / Negative Color** : The information passed to this field follows the same criteria as the Image / Positive Color field. This parameter will be used in the case the value is negative.

///
PDF Configuration {#id-06}

Chart Settings

By using this option, you will see an icon on the Field Title, this icon displays a chart relating to the field.

On this type option you need to choose two columns to build the chart. The first one is the field its self that you are working with, and the second one is the you chose and is called "Column for Label".

Bar Chart Interface.

- **Group by Label** : Groups the values of the column by the label. Similar to the effect of the group by of the a Select.
- **Summary Function** : Function that summarizes the data applied to the column. The functions that can be used on the field are the following: Count, Sum, Max, Min and Avg.
- **Configurable Chart** : Allows the user to setup the parameters of the chart creation when the application is running.
- **Display Values** : Displays the values of the generated chart.
- **Column for Label** : Selecting the column that will be the label for the field.
- **Chart Width** : Width of the chart, in pixels.
- **Chart Height** : Height of the chart, in pixels.

Chart Layout

Chart layout settings interface.

Procedure - Currency Field

General Settings

Currency field Configuration Interface.

Data Type

Define the field type to Currency. It allows defining the currency number format.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Accumulated

It defines the field to accumulate values of another field. This option is only available for virtual fields.

Accumulator field

It is available when the option "Accumulated" is enabled. This configuration defines which field will accumulate the values. The field should be Integer, Currency, or Decimal.

Grid Mask

It defines a mask for the field value. There is two types of masks:

Character	Description
X	Placeholder to any character. Replaced by any character. If number of characters entered are less then the mask size, the field value is completed with zeros (Filling full size field entry is required).
Z	Replaced by any character retrieved from database. Suppress zeros at field left (Complete field filling is optional). When used combined with the mask character X it should be placed at the mask left.

Mask Examples

Mask	Field Value	Formatted Value
(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
(zz) xxxx - xxxx	1234567890	(12) 3456 - 7890
(zz) xxxx - xxxx	12345678	() 1234 - 5678
(zz) xxxx - xxxx	0012345678	() 1234 - 5678

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

![Displaying repeated values.][cons_configuracao_geral_texto_nao_repetir_valor]

SQL Type

It informs the data type of field in the database.

Values Format

Interface of Values Format.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the attributes Grouping, Negative Symbol and negative number format.

Currency Format

It defines if the field displays the Currency Symbol of the Regional Settings.

Currency Symbol

It allows setting the character that represents the Currency Symbol.

Digit Grouping Separator

It defines the character to separate the thousands.

Decimal Separator

It defines the decimal separator.

Negative sign

It defines the character to represent negative numbers.

Negative number format

It defines the position of the Negative sign.

Color of Negative

It defines a color for the field when the value is negative.

Decimal Precision

It defines the number of decimal places for the field.

Complete with zeros

Defines the decimal places that will or not be completed zeros to the right. Example: The value is 125,50, but the decimal precision is 3. If the option is enabled, then the value will 125,500.

Display full value

It displays the full value. Example: 2018(Two thousand eighteen).

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter than (;).
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML, CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.

- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
 - **Default value** : Defines the default value, used in the cases where the select command does not return any values.
 - **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
 - **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**
 - **Text Font** : Allows choosing the font type, which will be applied in the application field.
 - **Font Size** : Allows choosing the font size, which will be applied to the application object.
 - **Italic Text** : Allows to apply the italic type in the font.
 - **Bold Text** : Allows you to apply bold type to the font.
 - **Number of characters** : Number of characters to display.
 - **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
 - **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
 - **Background Image** : Allows you to add a background image to the field.
 - **Line Break** : Enables the possibility of a line break for the field.
 - **Content color** : Changes the content color of the query field and the grouped field, when available.
 - **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
 - **Width** : To define the width of the field.
 - **Height** : To set the height of the field.
 - **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
 - **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
 - **Title color** : Allows you to choose a color for the field title using a color palette.
 - **Title background color** : Allows choosing a color for the background of the field title using a color palette.
 - **Bold** : Displays the field title in bold

Line Chart

Using this guide, you can define a chart for each line.

- **Line Chart Type** : There are two types of charts that can be used. Below you can see their description:
- **Bar Chart** : This option allows to display a bar chart relating to the column that you are working with. The size of the bars is done by math relating to the Grand Total of the column. The value informed in the width of the chart defines the size of the images that will be displayed.

In the example shown above, the width of the Chart is 200 pixels.

- **Line Chart** : This option allows to display a Line Chart relating to the column that you are working with . The amount of lines are done by dividing the value of a column by the value informed to the number of icons.

In the example above, the field Number of Icons, it was informed the value 1000, so the number of stars besides, it determined by dividing the displayed value by 1000.

- **Display Value** : It will display the value and the chart at the same time, the value being on the left or right side of the bar or lines.
- **Number of Icons** : Determines the amount of icons (figures) that will appear for each value on this field. This value will be presented by the dividing the value of the column by the Number of Icons.
- **Chart width** : Width of the chart in pixels. This field is used by the option Bar Chart. In case it is not informed, the value used is 200 pixels.
- **Chart height** : Height of the chart in pixels. This field is used by the option Bar Chart.
- **Margin** : Charts margin. This option is only used by the bar chart.
- **Image / Positive Color** : The way that it is informed will variate depending on the options below:
 - **Bar Chart** : Inform a color for the field that will be used to form the chart image. Click the icon beside to choose the color.
 - **Line Chart** : Inform an image name for the field that will be used like an icon. Click the icon beside to choose the image "Icon".
- **Image / Negative Color** : The information passed to this field follows the same criteria as the Image / Positive Color field. This parameter will be used in the case the value is negative.

//### PDF Configuration {#id-06}

Chart Settings

By using this option, you will see an icon on the Field Title, this icon displays a chart relating to the field.

On this type option you need to choose two columns to build the chart. The first one is the field its self that you are working with, and the second one is the you chose and is called "Column for Label".

Bar Chart Interface.

- **Group by Label** : Groups the values of the column by the label. Similar to the effect of the group by of the a Select.
- **Summary Function** : Function that summarizes the data applied to the column. The functions that can be used on the field are the following: Count, Sum, Max, Min and Avg.
- **Configurable Chart** : Allows the user to setup the parameters of the chart creation when the application is running.
- **Display Values** : Displays the values of the generated chart.
- **Column for Label** : Selecting the column that will be the label for the field.
- **Chart Width** : Width of the chart, in pixels.
- **Chart Height** : Height of the chart, in pixels.

Chart Layout

Chart layout settings interface.

Procedure - Percent (Calculated) Field

General Settings

Percentage field Configuration Interface.

Data Type

Define the field type to Percentage.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Accumulated

It defines the field to accumulate values of another field. This option is only available for virtual fields.

Accumulator field

It is available when the option "Accumulated" is enabled. This configuration defines which field will accumulate the values. The field should be Integer, Currency, or Decimal.

Grid Mask

It defines a mask for the field value. There is two types of masks:

Character	Description
X	It sets the placeholder to any character for replacing. If the entered number of characters is less than the mask size, It completes the field value with zeros (Filling full-size field entry is required).
Z	It sets the placeholder to any character for replacing, but it suppresses zeros at field left (Complete field filling is optional). Use it on the left when combined with the X mask.

Mask Examples

Mask	Field Value	Formatted Value
(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
(zz) xxxx - xxxx	1234567890	(12) 3456 - 7890
(zz) xxxx - xxxx	12345678	() 1234 - 5678
(zz) xxxx - xxxx	0012345678	() 1234 - 5678

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the attributes Grouping, Negative Symbol and negative number format.

Digit Grouping Separator

It defines the character to separate the thousands.

Decimal Separator

It defines the decimal separator.

Negative sign

It defines the character to represent negative numbers.

Negative number format

It defines the position of the Negative sign.

Color of Negative

It defines a color for the field when the value is negative.

Decimal Precision

It defines the number of decimal places for the field.

Complete with zeros

Defines the decimal places that will or not be completed zeros to the right. Example: The value is 125,50, but the decimal precision is 3. If the option is enabled, then the value will 125,500.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value

returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.

- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
 - **Default value** : Defines the default value, used in the cases where the select command does not return any values.
 - **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
 - **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and

lookup value is enabled.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**
 - **Text Font** : Allows choosing the font type, which will be applied in the application field.
 - **Font Size** : Allows choosing the font size, which will be applied to the application object.
 - **Italic Text** : Allows to apply the italic type in the font.
 - **Bold Text** : Allows you to apply bold type to the font.
 - **Number of characters** : Number of characters to display.
 - **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
 - **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
 - **Background Image** : Allows you to add a background image to the field.
 - **Line Break** : Enables the possibility of a line break for the field.
 - **Content color** : Changes the content color of the query field and the grouped field, when available.
 - **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
 - **Width** : To define the width of the field.
 - **Height** : To set the height of the field.
 - **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
 - **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
 - **Title color** : Allows you to choose a color for the field title using a color palette.
 - **Title background color** : Allows choosing a color for the background of the field title using a color palette.
 - **Bold** : Displays the field title in bold

Line Chart

Using this guide, you can define ac chart for each line.

- **Line Chart Type** : There are two types of charts that can be used. Below you can see their description:
- **Bar Chart** : This option allows to display a bar chart relating to the column that you are working with. The size of the bars is done by math relating to the Grand Total of the column. The value informed in the width of the chart defines the size of the images that will be displayed.

In the example shown above, the width of the Chart is 200 pixels.

- **Line Chart** : This option allows to display a Line Chart relating to the column that you are working with . The amount of lines are done by dividing the value of a column by the value informed to the number of icons.

In the example above, the field Number of Icons, it was informed the value 1000, so the number of stars besides, it determined by dividing the displayed value by 1000.

- **Display Value** : It will display the value and the chart at the same time, the value being on the left or right side of the bar or lines.
- **Number of Icons** : Determines the amount of icons (figures) that will appear for each value on this field. This value will be presented by the dividing the value of the column by the Number of Icons.
- **Chart width** : Width of the chart in pixels. This field is used by the option Bar Chart. In case it is not

informed, the value used is 200 pixels.

- **Chart height** : Height of the chart in pixels. This field is used by the option Bar Chart.
- **Margin** : Charts margin. This option is only used by the bar chart.
- **Image / Positive Color** : The way that it is informed will variate depending on the options below:
 - **Bar Chart** : Inform a color for the field that will be used to form the chart image. Click the icon beside to choose the color.
 - **Line Chart** : Inform an image name for the field that will be used like an icon. Click the icon beside to choose the image "Icon".
- **Image / Negative Color** : The information passed to this field follows the same criteria as the Image / Positive Color field. This parameter will be used in the case the value is negative.

//## PDF Configuration {#id-06

Chart Settings

By using this option, you will see an icon on the Field Title, this icon displays a chart relating to the field.

On this type option you need to choose two columns to build the chart. The first one is the field its self that you are working with, and the second one is the you chose and is called "Column for Label".

Bar Chart Interface.

- **Group by Label** : Groups the values of the column by the label. Similar to the effect of the group by of the a Select.
- **Summary Function** : Function that summarizes the data applied to the column. The functions that can be used on the field are the following: Count, Sum, Max, Min and Avg.
- **Configurable Chart** : Allows the user to setup the parameters of the chart creation when the application is running.
- **Display Values** : Displays the values of the generated chart.
- **Column for Label** : Selecting the column that will be the label for the field.
- **Chart Width** : Width of the chart, in pixels.
- **Chart Height** : Height of the chart, in pixels.

Chart Layout

Chart layout settings interface.

Procedure - HTML Image Field

General Settings

 *HTML Image field Configuration Interface.*

Data Type

Define the type of field. When setting it to HTML Image, it allows to display an image into the field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Image

Define an image to be displayed. The icon "Select Image" lists all images from Scriptcase and your uploaded images. The "Upload an image" option allows you to send a copy to the Scriptcase server.

New Link

This button allows the creation of a field link with some other application..

This way, it is possible, for example, to create a link with a blank to delete a record from the grid, passing the record ID as a parameter.

See more information about field binding by [clicking here](#).

Border

Define the width of the Image border in Pixels.

Width

Define the image width size in Pixels.

Height

Define the image height size in Pixels.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.
- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the

- background of the application field.
- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Procedure - Credit Card Number Field

General Settings

Credit Card Number Configuration Interface.

- **Data Type** : Select the type of field for the application. When it is defined as a Credit Card Number, you can define some rules for the display format of the Credit Card.
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name would be "Client Name".
- **Do Not Repeat Value** : Do not repeat the value of the field in the case it is the same as the previous record.

- **SQL Type** : Informs the data type of the field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**
 - **Text Font** : Allows choosing the font type, which will be applied in the application field.
 - **Font Size** : Allows choosing the font size, which will be applied to the application object.
 - **Italic Text** : Allows to apply the italic type in the font.
 - **Bold Text** : Allows you to apply bold type to the font.
 - **Number of characters** : Number of characters to display.
 - **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
 - **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
 - **Background Image** : Allows you to add a background image to the field.
 - **Line Break** : Enables the possibility of a line break for the field.
 - **Content color** : Changes the content color of the query field and the grouped field, when available.
 - **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
 - **Width** : To define the width of the field.
 - **Height** : To set the height of the field.
 - **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
 - **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
 - **Title color** : Allows you to choose a color for the field title using a color palette.
 - **Title background color** : Allows choosing a color for the background of the field title using a color palette.
 - **Bold** : Displays the field title in bold

`### PDF Configuration {#id-03}`

Chart Settings

By using this option, you will see an icon on the Field Title, this icon displays a chart relating to the field.

On this type option you need to choose two columns to build the chart. The first one is the field its self that you are working with, and the second one is the you chose and is called "Column for Label".

Bar Chart Interface.

- **Group by Label** : Groups the values of the column by the label. Similar to the effect of the group by of the a Select.

- **Summary Function** : Function that summarizes the data applied to the column. The functions that can be used on the field are the following: Count, Sum, Max, Min and Avg.
- **Configurable Chart** : Allows the user to setup the parameters of the chart creation when the application is running.
- **Display Values** : Displays the values of the generated chart.
- **Column for Label** : Selecting the column that will be the label for the field.
- **Chart Width** : Width of the chart, in pixels.
- **Chart Height** : Height of the chart, in pixels.

Chart Layout

Chart layout settings interface.

Procedure - E-mail Field

General Settings

Email field Configuration Interface.

- **Data Type** : Defines the type of field for the application. When it is defined as an Email, when you click on the field you be offered a choice for your email client and send an email to that specific email.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be easier to the user understand if the name is "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Do Not Repeat Value** : Do not repeat the value of the field in case it is the same as the previous record.

- **SQL Type** : Informs the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**
 - **Text Font** : Allows choosing the font type, which will be applied in the application field.
 - **Font Size** : Allows choosing the font size, which will be applied to the application object.
 - **Italic Text** : Allows to apply the italic type in the font.
 - **Bold Text** : Allows you to apply bold type to the font.
 - **Number of characters** : Number of characters to display.
 - **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
 - **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
 - **Background Image** : Allows you to add a background image to the field.
 - **Line Break** : Enables the possibility of a line break for the field.
 - **Content color** : Changes the content color of the query field and the grouped field, when available.
 - **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
 - **Width** : To define the width of the field.
 - **Height** : To set the height of the field.
 - **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
 - **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
 - **Title color** : Allows you to choose a color for the field title using a color palette.
 - **Title background color** : Allows choosing a color for the background of the field title using a color palette.
 - **Bold** : Displays the field title in bold

///
PDF Configuration {#id-03}

Chart Settings

By using this option, you will see an icon on the Field Title, this icon displays a chart relating to the field.

On this type option you need to choose two columns to build the chart. The first one is the field its self that you are working with, and the second one is the you chose and is called "Column for Label".

Bar Chart Interface.

- **Group by Label** : Groups the values of the column by the label. Similar to the effect of the group by of the a Select.
- **Summary Function** : Function that summarizes the data applied to the column. The functions that can be used on the field are the following: Count, Sum, Max, Min and Avg.
- **Configurable Chart** : Allows the user to setup the parameters of the chart creation when the application is running.
- **Display Values** : Displays the values of the generated chart.
- **Column for Label** : Selecting the column that will be the label for the field.
- **Chart Width** : Width of the chart, in pixels.
- **Chart Height** : Height of the chart, in pixels.

Chart Layout

 *Chart layout settings interface.*

Procedure - URL Field

General Settings

URL field Configuration Interface.

Data Type

Define the type of field. When setting it to YouTube, it allows displaying an Youtube video on the field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.
- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Procedure - YouTube Field

General Settings

 *YouTube field Configuration Interface.*

Data Type

Define the type of field. When setting it to YouTube, it allows displaying an Youtube video on the field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Display Mode

Define the mode to display the video in the application.

Width

Video Width in pixels.

Height

Video Height in pixels.

Link Type

The display settings of the link, if it is going to be a Text or a Button.

Link text

It displays a text to mask the video URL.

SQL Type

It informs the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

• Display Settings

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.
- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.

- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Procedure - Google Maps Field

General Settings

 *Google Maps field Configuration Interface.*

- **Data Type** : Define the type of field for the application. When it is defined as Google Maps, it will use the Google Maps API to display the map in the Grid Applications
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name is "Client Name".
- **Home** : Defines what type of parameters will be used in the API.

 *Home Configuration Interface.*

- **Display Mode** : Indicates the display mode of the map. It can be opened in a Modal or in a new Window.
- **Width** : Defines the width of the map that is going to be displayed.
- **Height** : Defines the height of the map that is going to be displayed.
- **Zoom** : Defines the initial Zoom (available from the Google API) of the Map location.
- **API Key** : API Key for authorization to use Google Maps in the Application. (Required only for the versions 2 or earlier of the Google API.)

The API Key is a unique key, composed by a string(text) alphanumeric, which is the license to use the service. When you subscribe to use the service, the key is tied to the domain and the directory of the server. All the pages that use the API needs to be in the same directory that was used for the subscription. In case you have a web server on your local machine, you just need to possess a key for testing, and to do this you only need to set `http://localhost` in the domain of the subscription.

To get your API Key access the site by [clicking here](#)

- **Link Type** : Defines how the link will be displayed.
- **Text Link** : Text to call the Map.
- **Marker Description** : Displays the description for each marker displayed on the map.
- **SQL Type** : Informs the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**
 - **Text Font** : Allows choosing the font type, which will be applied in the application field.
 - **Font Size** : Allows choosing the font size, which will be applied to the application object.
 - **Italic Text** : Allows to apply the italic type in the font.
 - **Bold Text** : Allows you to apply bold type to the font.
 - **Number of characters** : Number of characters to display.
 - **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
 - **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
 - **Background Image** : Allows you to add a background image to the field.
 - **Line Break** : Enables the possibility of a line break for the field.
 - **Content color** : Changes the content color of the query field and the grouped field, when available.
 - **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
 - **Width** : To define the width of the field.
 - **Height** : To set the height of the field.
 - **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
 - **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top,

middle or bottom).

- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Procedure - Date Field

General Settings

Date field Configuration Interface.

Data Type

Define the type of field. When setting it to Date, you can inform its format into this field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Format of Values without Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the date separator attribute (Check the Regional Settings).

Display

It offers predefined formats for displaying dates.

Detail Mask

Define the format of the field in the Grid. It uses the patterns of PHP function Date.

d-m-Y	25-09-2009
F/Y	September/2009
j/n/Y \a\s g:i:s A	25/9/2001 as 14:30:11 PM
l, d \d\e F \d\e Y	Thursday, 25 of January of 2009
h:i:s	11:33:20
#h:i:s	123:43:27 (accumulating the hours)

Internal Format

It allows defining the field format when the SQL type is different from **Date**. You must use the characters **Y**, **M** and **D** that correspond to **Year**, **Month** and **Day**.

- **Example 1** : If the field is storing the Date value in a **char(8)** where the positions **1** to **4** represents the year, the positions **5** and **6** is the month and the position **7** and **8** is the day, you must define the internal format as: **YYYYMMDD**
- **Example 2** : If the field is storing the Date value in a **char(6)** where the positions **1** and **2** represents the month and the positions **3** to **6** is the year, you must define the internal format as: **MMYYYY**

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**
 - **Text Font** : Allows choosing the font type, which will be applied in the application field.
 - **Font Size** : Allows choosing the font size, which will be applied to the application object.
 - **Italic Text** : Allows to apply the italic type in the font.
 - **Bold Text** : Allows you to apply bold type to the font.
 - **Number of characters** : Number of characters to display.
 - **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
 - **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
 - **Background Image** : Allows you to add a background image to the field.
 - **Line Break** : Enables the possibility of a line break for the field.
 - **Content color** : Changes the content color of the query field and the grouped field, when available.
 - **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
 - **Width** : To define the width of the field.
 - **Height** : To set the height of the field.
 - **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
 - **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
 - **Title color** : Allows you to choose a color for the field title using a color palette.
 - **Title background color** : Allows choosing a color for the background of the field title using a color palette.
 - **Bold** : Displays the field title in bold

PDF Configuration {#id-04}

- **Chart Height** : Height of the chart, in pixels.

Chart Layout

Chart layout settings interface.

Procedure - Time Field

General Settings

Time field Configuration Interface.

Data Type

Define the type of field. When setting it to Time, you can inform a time format into this field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Format of Values without Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the Time. When not enabled, it displays the Time separator attribute (Check the Regional Settings).

Display

It offers predefined formats for displaying Time.

Detail Mask

Define the format of the field in the Grid. It uses the patterns of PHP function Date.

h:i:s 11:33:20

#h:i:s 123:43:27 (accumulating the hours)

Internal Format

It allows defining the field format when the SQL type is different from **TIME**. You must use the characters **HH**, **II**, and **SS** that correspond to **Day**, **Hour**, **Minutes** and **Seconds**.

- **Example 1:** If the field is storing the Date value in a **char(8)** where the positions **1** to **4** represents the year, the positions **5** and **6** is the month and the position **7** and **8** is the day, you must define the internal format as **YYYYMMDD**
- **Example 2:** If the field is storing the Date value in a **char(6)** where the positions **1** and **2** represents the month and the positions **3** to **6** is the year, you must define the internal format as **MMYYYY**

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.
- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.

- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Procedure - Image (File Name) Field

General Settings

Upload field Configuration Interface.

Data Type

Define the type of field. When setting it to Image (File Name), all the Images files are stored and loaded directly from the Database.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Image Border

Width of the Image border in Pixels.

Image Height

Image height size in Pixels.

Image Width

Image width size in Pixels.

Maintain Aspect

It maintains the original aspect ratio of the image when resizing it.

Cloud storage API

Profile with the API information (Dropbox, Google Drive or Amazon S3) used to upload the file to the cloud created in Tools > API.

Storage API directory

Directory name for upload to the Cloud Storage API. Eg.: files/docs/{id}. The file will be saved in the root folder if this field is empty.

Storage API cache directory

Local directory for caching files sent to the cloud via the storage API.

Open in Another Window

Allows to open the image in another window.

Subdirectory for local storage

Local subdirectory or on the server where the files are stored. eg: {CustomerId} , [glo_var_seq]

Image Caching

Time in minutes the image cache will be kept in the server before being deleted.

Repeat value

Repeat the field value if it is equal to the previous record.

SQL Type

It informs the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.

- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Procedure - Document (Database) Field

General Settings

Upload field Configuration Interface.

Data Type

Define the type of field. When setting it to Document (Database), all the document files are stored and loaded directly from the Database.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Icon

Displays an icon beside the field to identify the type of document.

File Name

It allows defining the field to store the name of the document in the database.

SQL Type

It informs the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.
- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Procedure - Document (File Name) Field

General Settings

Upload field Configuration Interface.

Data Type

Define the type of field. When setting it to Document (File Name), all the document files are stored and loaded directly from the Database.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Sub-folder

Sub-folder name that the files are stored.

Icon

Displays an icon beside the field to identify the type of document.

File Name

It allows defining the field to store the name of the document in the database.

Cloud storage API

Profile with the API information (Dropbox, Google Drive or Amazon S3) used to upload the file to the cloud created in Tools > API.

Storage API directory

Directory name for upload to the Cloud Storage API. Eg.: files/docs/{id}. The file will be saved in the root folder if this field is empty.

Storage API cache directory

Local directory for caching files sent to the cloud via the storage API.

SQL Type

It informs the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.
- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or

bottom).

- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Procedure - Bar code Field

General Settings

 Configuration Interface of the Barcode Field.

- **Data Type** : DataType of the field for the application.
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name would be "Client Name".
- **SQL Type** : Database field type.

Watch below a video showing an example about the Barcode field:

Values Format

 Configuration Interface of the Barcode Field.

- **Type** : Type of Barcode.
- **Text** : Barcode Text for illustration purposes.
- There are **18 types of barcodes**, that are listed below:

 Barcode configuration interface.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**
 - **Text Font** : Allows choosing the font type, which will be applied in the application field.
 - **Font Size** : Allows choosing the font size, which will be applied to the application object.
 - **Italic Text** : Allows to apply the italic type in the font.
 - **Bold Text** : Allows you to apply bold type to the font.
 - **Number of characters** : Number of characters to display.
 - **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
 - **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
 - **Background Image** : Allows you to add a background image to the field.
 - **Line Break** : Enables the possibility of a line break for the field.
 - **Content color** : Changes the content color of the query field and the grouped field, when available.
 - **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
 - **Width** : To define the width of the field.
 - **Height** : To set the height of the field.
 - **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
 - **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
 - **Title color** : Allows you to choose a color for the field title using a color palette.

- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Procedure - QRCode Field

General Settings

 *QRCode field Configuration Interface.*

Data Type

Define the type of field. When setting it to QRCODE, it allows you to transform values into a QRCODE.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

SQL Type

It informs the data type of field in the database.

Watch below a video showing an example with QRCODE

Values Format

 *Interface of Values Format.*

Level of error correction

The Codewords are 8 bits long and use the Reed-Solomon error correction algorithm with four error correction levels. The higher the error correction level, the less storage capacity.

Image Size

Set the size of the QRCODE image.

Margin

Set the margins of the QRCODE.

 *Interface of Values Format.*

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of scriptcase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **Display Settings**

- **Text Font** : Allows choosing the font type, which will be applied in the application field.
- **Font Size** : Allows choosing the font size, which will be applied to the application object.
- **Italic Text** : Allows to apply the italic type in the font.
- **Bold Text** : Allows you to apply bold type to the font.
- **Number of characters** : Number of characters to display.

- **Text Alignment** : Allows you to position the field in the desired location (left, right, center and justified).
- **Vertical Alignment** : Allows you to position the field in the desired location (top, middle or bottom).
- **Background Image** : Allows you to add a background image to the field.
- **Line Break** : Enables the possibility of a line break for the field.
- **Content color** : Changes the content color of the query field and the grouped field, when available.
- **Background color** : Allows choosing the color, using a color palette to be applied as the background of the application field.
- **Width** : To define the width of the field.
- **Height** : To set the height of the field.
- **Title Horizontal Alignment** : Allows you to define the horizontal alignment for the field title (left, right or centered).
- **Title Vertical Alignment** : Allows you to define the vertical alignment for the field title (top, middle or bottom).
- **Title color** : Allows you to choose a color for the field title using a color palette.
- **Title background color** : Allows choosing a color for the background of the field title using a color palette.
- **Bold** : Displays the field title in bold

Procedure - Signature Field

General Settings

Configuration Interface of the Signature Field.

The signature field will help you creating more sophisticated forms and making it possible to store signatures in your database. Inside our development environment we have specific settings that will help you to customize your field, those options are:

- **Data Type** : You can define the type of field for the application. When it is defined as a text, it accepts letters, numbers and special characters.
- **Label** : Lets you define a label to the field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name is "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Background color** : Defines a color to the field background by using a valid hexadecimal color value or by choosing a color from the color palette.
- **Pen color**: Set a color to the pen by using a valid hexadecimal color value or by choosing a color from the color palette.
- **Width** : Lets you define a width to the field.
- **Height** : Set a height to the field.
- **Subtitle** : Defines the subtitle that will be displayed beside the field.
- **Initial Value** : Lets you define the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
- **Save Variable** : Save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Set the name for the session variable that will receive the field value.
- **Disabled Field** : Define if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : Displays the HTML Object that will be used to display the field in the form.
- **SQL Type** : Displays the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of ScriptCase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **CSS of the Title**
 - **Font** : Select the font type, that will be applied to the application field title.
 - **Font Size** : Defines the font size, that will be applied to the application field title.
 - **Font Color** : Choose a color to the font by using a valid hexadecimal color value or from the color picker.
 - **Background Color** : You can define the color for the field by using a valid hexadecimal color value or from the color picker.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Set the underline style to the font.
 - **Border style** : Choose a style for the border.
 - **Collapse** : Defines the collapse for the border.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Choose a color for the border, using a color palette to apply to the title.
 - **Horizontal Alignment** : Position the label of the field in the wanted position (left,right,center and justify).
 - **Vertical Alignment** : Position the label of the field in the wanted position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : Defines a width for the title of the field.
 - **Height** : Set a height for the title of the field.

Procedure - Rating Field

This field allows the developer to create a field to display the data previously added using stars (or any other image).

Attribute descriptions

Data Type

Define the field type to **Rating**.

Label

The Label option lets you define the title of a field. Example: If the database field name is "**Stars**", You can display a different name for the user, like "**Stars**".

Besides use a fixed text, the **Label** attribute allows the use of **Langs** to define the field title, allowing the [internationalization of your application](#).

Subtitle

Define the subtitle of the field, below the ratings. **Example:** "Thank you for your feedback!".

As in the **Label**, the **subtitle** attribute also allows the use of **Langs** for the [internationalization of your application](#).

Amount of icons

It defines how many icons it will display in the field. The value set in this attribute must be according to the evaluation rules.

Use in Group by and Sums

Allows the field to be used instead of the value when the field is selected in the **(static or dynamic)** group by or in the totalization of the summary. To do this, just add the fields in the dynamic or static group by column to be able to visualize the grouping performed in the query.

Example of the **Rating** field in the summary.

In the summary, when hovering the mouse over the field, a small window detailing the ratings that were carried out both in each record and in total will be displayed, as shown in the image below.

Display absolute value

Allows the exact number of ratings that each star received to be displayed in the detailing window, next to the percentage, when summing up the summary.

With this flag turned off, the grouping will only display the voting percentage, leaving out the exact number of ratings.

In the case of the result of the ratings, this result is calculated through the weighted average **(Sum/Total of Evaluations)** as in the example below:

For example: in the image above, we have a total of 4 ratings carried out, where:

0 rating for 5 stars
2 ratings for 4 stars

0 rating for 3 stars
 1 rating for 2 stars
 1 rating for 1 star

Considering that the number of stars refers to the weight each one has, we have the following:

5 stars = 0 rating x 5 (weight) = 0
 4 stars = 2 ratings x 4 (weight) = 8
 3 stars = 0 rating x 3 (weight) = 0
 2 stars = 1 rating x 2 (weight) = 2
 1 star = 1 rating x 1 (weight) = 1

Sum = 11

We took the result of the sum and divided it by the total number of evaluations, which was 4.

Sum/Total of Evaluations = 11/4 = 2.75 ≈ 2.8.

As only 1 value after the comma will always be displayed in the detail window, rounding will occur upwards when the values after the comma are above the central value, and downwards when it is less than the central value.

Ex.: 2.75 ≈ 2.8.

Use Font Awesome

Allows you to use Font Awesome icons to represent stars instead of images.

Rating Star Hints

Defines the hint for each star

Icon size

Sets the pixel size of star icons.

Rating Padding

Defines the padding value in pixels for separating each star.

Icons Color

Allows you to define the color of the stars; the color is passed in hexadecimal.

SQL Type

It informs the data type of field in the database.

Configuração da Visualização

You can set CSS values for the field individually. Thus, for example, you can highlight one field of the others in the application. As CSS field properties, when changed, they are added to a class created automatically by ScriptCase for each application field.

Individual field CSS settings, when inserted, override theme settings ([CSS of applications \(Themes\)](#)) selected for application.

The settings are divided into three property blocks, these blocks are:

CSS of Title

This makes it possible to change the CSS properties of the field's Label.

In the example below, You can see the difference of field title configurations. While the field **Contactname** have the same formatting, inherits the theme of the application, the field **Contacttitle** have a different formation of of others, from the changes made in the CSS of the field.

CSS of field

Changes the CSS properties of the <td> where the input object (where the user enters data for insertion into a form) is positioned. In the image below, you can see where the change is applied.

Field Contacttitle with changes to Field CSS properties, changing background color and horizontal alignment

CSS of Input object

Changes the CSS properties in the Input of field object, where the user type the data in a form.

Field with changes to CSS properties of Input Object, changing background color and input source color

CSS properties

The available configuration options are basically the same for each of the configuration blocks above.

description of available configuration attributes

Font

Changes the font of the text according to the fonts selected using the *font-family* property.

In this option, some types of fonts are provided to you (as shown below).

Font Size

Changes the font size of the text using the property *font-size* in the field class.

You need to select the available value from our list, the measure used for this property is the pixel.

Font Color

Define the font color used by the property *color* in the field class.

Background color

Define the background color using the property *background-color* in the field class.

The colors that will be used in the two color properties listed above, **Font color** and **Background color**, can be entered via the color palette - - available next to the field or manually entered values in the accepted formats that are: *Hexadecimal, RGB, RGBA, HSL, HSLA* or o *Color name*.

Color palette

By clicking on the color palette icon - - next to the field, a window will open with some default colors.

When you select one of the colors, a value in hexadecimal format (HEX) will be entered, representing the chosen color.

Hexadecimal

Acronym for hexadecimal, this code is composed of the pound sign (#) plus six digits. The first two define the intensity of the color red, the middle two are green and the last two are blue.

Bold

Applies bold style to the font.

Underline

Lets you apply the underlined style to the font.

Border style

Defines the border font style.

Border Collapse

Defines the border collapse.

Border size

Changes the size of the title border.

Border color

Chooses the border color , using a color palette to apply to the title.

Horizontal alignment

Position the filter label at desired location (left,rigth,center e justify).

Vertical alignment

Position the label of the filter in the wanted location baseline, sub, super, top, text-top, middle, bottom, text-bottom).

Not available in Input Object CSS

Width

To set the width of the title.

Height

To set the height of the title.

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.**Help Description**

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type**Hint**

Display a default icon ? beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Procedure Layout Setting

This module lets you editing display options for the application. You can apply visualization themes, organize blocks, define values, and the display format of the Header and Footer.

Blocks

Blocks are “containers” where you can position the application fieldSlides of Forms, Controls, or Grids.

Scriptcase creates applications with one block by default. You can add more blocks as you wish, to organize it in the best way.

See below, the Columns Organization, and where you can define the position of the next block: beside or below the current one.

		Block	Title	Label		Fields		Organization				
Op	Name	Label	Display	Display	Position	Columns	Position	Next	Width	Collapse		
Pag1												
			form_orders	form_orders	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Pag2												
			Block 2	Block 2	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Blocks not shown												

Application Block configuration

On the left side of each block, there are two icons, the first one to edit the information of the block and the second one to delete the block.

Organizing the position of the Blocks

See below how to modify the display order of the Blocks in one Page.

Click and drag the block that you desire to modify to its new position.

		Block	Title	Label		Fields		Organization				
Op	Name	Label	Display	Display	Position	Columns	Position	Next	Width	Collapse		
Pag1												
			form_orders	form_orders	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Pag2												
			Block 2	Block 2	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Blocks not shown												

Application Block Display configuration

- See how to remove a block from the display

Click on the block desired and drag it to the item “Blocks not Shown”. This way, you can also drag the block to another page if desired. See the images below.

Block		Title		Label		Fields		Organization				
Op	Name	Label	Display	Display	Position	Columns	Position	Next	Width	Collapse		
Pag1												
			form_orders	form_orders	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Pag2												
			Block 2	Block 2	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Blocks not shown												
			Block 3	Block 3	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼

Application Block Display configuration

Block

- **Name:** The name that identifier the Block.
- **Label:** Title of the block to display in the application.

Title

- **Display:** It controls the display of the block title.

Label

- **Display:** It controls the display of the field labels of the block.
- **Position:** Options to display label :
 1. **Above:** Display the label above the field.
 2. **Beside:** Display the label beside the field.
 3. **Below:** Display the label below the field.

Fields

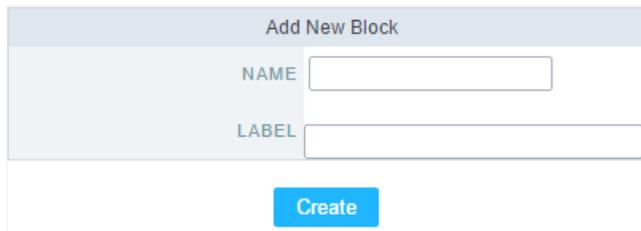

- **Columns:** Amount of columns side by side in the block.
- **Position:** The way to display the fields in the block:
 1. **Below:** Display the fields one below the other respecting the number of columns.
 2. **Beside:** Display the fields one beside the other respecting the number of columns.
 3. **Line:** Display the fields one beside the other with no tabulation.

Organization

- **Next:** The way to display the blocks in the page:
 1. **Below:** Set to show the following block below the current one.
 2. **Beside:** Set to show the following block beside the current one.
 3. **Tab:** Set to show the following block in a different tab then the current one.
- **Width:** Set the block width in pixels or percentages. Use the symbol “%” to indicates the value in percentage.
- **Collapse:** Enables the option to close the block.

Create a New Block

To include new blocks in an Application, click on the button **Create New Block**. Then, enter the name and label of the block in the following interface and finish by click on Create.

The screenshot shows a form titled "Add New Block". It contains two input fields: "NAME" and "LABEL". Below the fields is a blue "Create" button.

Creating application blocks configuration

Name

Name of the Block.

Label

Title of the block to display in the application.

Edit Blocks

To edit a block, click on the icon , that is on the left side of the block. Then you can see the following interface to define the parameters of the blocks. Click on Save to finish.

EDIT BLOCKS

Application Header Configuration

Display Header

This option determines if we want to display the header or not.

Title

Allows informing the title of the application.

Header Variables

We must fill the variable fields with one of the types available in the Combobox. Depending on the type, you need to associate content with it. Those are the types:

- **Field:** When you choose the option “**Field**”, it opens a Combobox to choose a field to associate the field value with the header. This option will be enabled in the applications that you can crate a fields
- **Title:** It displays the value of “**Application Title**” in the header.
- **Date:** It displays the system’s date in “yyyy/mm/dd” format in the header. There are several display formats available, and you can change it by using the text field beside it. To access existing formats, click on the hint to see an explanation.
- **Image:** It displays a field to inform the name of an existing image in the server. You can select an image by clicking on the

icon “**Choose Image**”, and you still can upload new images by using the button “**Upload**”. .

- **Value:** It displays the content of the text input. You can inform static texts and “**Global Variables**”. e.g. “Employee Name: [v_name]”.

Depending on the Application, you may have more than one title option.

Footer

FOOTER

NM_FOOTER_TITLE	<input type="text"/>

Application Footer Settings

This page may change depending on the footer template chosen in the Layout Settings.

Display Footer

This option determines if we want to display the footer or not.

Footer Variables

We must fill the variable fields with one of the types available in the Combobox. Depending on the type, you need to associate content with it. Those are the types:

- **Field:** When you choose the option “**Field**”, it opens a Combobox to choose a field to associate the field value with the header. This option will be enabled in the applications that you can crate a fields
- **Date:** It displays the system’s date in “yyyy/mm/dd” format in the header. There are several display formats available, and you can change it by using the text field beside it. To access existing formats, click on the hint to see an explanation.
- **Image:** It displays a field to inform the name of an existing image in the server. You can select an image by clicking on the icon “**Choose Image**”, and you still can upload new images by using the button “**Upload**”. .
- **Value:** It displays the content of the text input. You can inform static texts and “**Global Variables**”. e.g. “Employee Name: [v_name]”.

Procedure Events Overview

Most Scriptcase applications, with the exception of Tabs and Dashboard applications, have events that can be used to create business rules, validations and changes to the application's CSS, among other things.

When events are executed?

Each event is executed at a certain moment in the application and has an execution order, for this reason, they have different functions within the creation of a business rule and validations.

They can be triggered automatically, as in the case of the **onApplicationInit** and **onScriptInit** events, where they are executed when the application starts. Also, they can be triggered through user interaction, as with the **onNavigate** and **onValidate** events, which are executed when browsing the application or submitting a form, respectively.

For information about the timing of events execution or other information, access the documentation of the desired event.

how they work?

By default, the events already have handle for opening `<?php` and closing `?>` of PHP tags, so they are ready to receive PHP code and macros from Scriptcase.

However, it is possible to use other languages in the event, such as **JQuery**, **JavaScript**, **CSS** and **HTML**. For this, it is necessary to close the PHP tag `?>` of the event, so that the code can be added.

Remembering that it is necessary to reopen the event's PHP tag `<?php`, otherwise the application will not run correctly.

When closing the PHP tag in a Scriptcase event, the executed language is HTML.

Example of using other languages:

onApplicationInit - Stored Procedure

It is the first event executed in the application, being fired even before the SQL and HTML assembly.

It works as a preparation for the application, where it is possible, among other things, to manipulate variables, perform validations and change the connection with the `sc_change_connection` macro, for example.

In the example below, access to the edit form (`form_orders`) linked to the query will be limited, depending on the user who is accessing the application.

If the variable `[usr_login]` is equal to **admin**, the user will have access to the form with the possibility of inserting and deleting a record.

If the variable has some other value, the user will still have access to the form, but only with the possibility of changing a record.

Samples Code

```
if ( [usr_login] == 'admin' ) {  
  
    sc_apl_conf("form_orders", "insert", "on");  
    sc_apl_conf("form_orders", "delete", "on");  
  
} else {  
  
    sc_apl_conf("form_orders", "insert", "off");  
    sc_apl_conf("form_orders", "delete", "off");  
  
}
```

onNavigate - Stored Procedure

In the query application, this event runs in two situations:

- When configured with partial paging, the event is executed when navigating between pages using the **navigation buttons**, **navigation by page** or the **Jump to** option.
- When configuring the application with **Infinite Scroll**, it is executed every time records are loaded.

Unlike other events, this one depends on user interaction to be triggered, allowing, for example, that any validation or layout change is performed only after this interaction.

Note

The query navigation is performed by ajax, thus, it is not possible to use Javascript codes (jQuery, Ajax).

When using full paging in the application, the event is not executed.

onScriptInit - Stored Procedure

Second event to be executed, before the execution of the main select, it is triggered whenever the application is loaded. For example, after using the advanced filter.

In it, all application variables and libraries are available for use.

The manipulation of connections with `sc_connection_edit` and `sc_connection_new` macros, manipulation of the main select with `sc_select_order` and `sc_select_where(add)` macros and inclusion of libraries already incorporated into Scriptcase such as JQuery with `sc_include_lib` macro are some of the examples of using the event.

In the example below, access to the sales report will be limited to the user who performed them.

Access is limited if the user is not the admin.

Sample Code

```
if ( [usr_login] != 'admin' ) {  
    if ( empty({sc_where_atual})) {  
        sc_select_where(add) = "WHERE employeeid > [usr_login]";  
    } else {  
        sc_select_where(add) = "AND employeeid > [usr_login]";  
    }  
}
```

onRecord - Stored Procedure

This event is executed immediately before the display of each record displayed in the query, regardless of user interaction.

Thus, it is commonly used for data manipulation and validation, creating links with the `sc_link` macro or changing the layout with the `sc_field_style` macro, based on the displayed information.

In the example below, the style of the text in the `{priceorder}` field will change according to the value.

For values below 500 reais, the text will have a different color from values above 500 reais,

Samples Code

```
if ( {priceorder} < 500 ) {  
    sc_field_style({priceorder}, "Background-Color", "15", "#228B22", "", "bold");  
} else {  
    sc_field_style({priceorder}, "Background-Color", "15", "#006400", "", "bold");  
}
```

onHeader - Stored Procedure

The third event generated in the query occurs immediately before the application's header display, during the loading of the page's display HTML elements.

The onHeader is only obtained when the option to display the header is enabled in the application's layout settings.

In this event, it is possible to perform queries in the database, allowing you to read information about the application and the values of the Query's fields.

It is used, among other things, to change the application's CSS, javascript codes and display information linked to fields, such as a sales total or a legend for a line graph.

onFooter - Stored Procedure

This event occurs after the processing of the grid lines, during the display of the HTML elements of the page footer.

onFooter is used when we want to display some information in the footer, such as a sales total or a legend for a line graph.

onFooter runs only when the option to show footer is enabled in the application's layout settings.

E.g: We want at the bottom of the application to display the total value of orders displayed in the grid of an invoice, with a 10% discount:

```
sc_lookup(ret," select sum( valueitem ) from sales_item where sale_id={sale_id} ");
```

```
[v_footnote] = {ret[0][0]} * 0.1;
```

Code Editor

Scriptcase has Events to allow the developers to customize the application code. By using the events, the developers can program custom actions at a specific execution time (e.g. After a record is inserted, when it is loaded, upon submitting a Form, ...) and for a specific application type. In the events area you can use global and local variables, JavaScript, CSS, HTML, PHP codes and also Scriptcase macros.

Scriptcase code editor is used within events and has a series of shortcuts to help in the applications development.

At the top section of the editor, there are some options that allows us to change the editor theme or expand it, for example. These options can also be activated using the hotkeys.

- - Increases the area occupied by your code editor.
- - Expand the sides of the code editor.
- - Activates the search in the code editor.
- - Enables replace in the code editor.
- - Defines the code editor theme.

The hotkeys are available in all browsers compatible with Scriptcase.

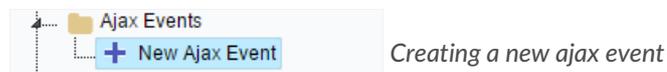

[Click Here](#) to view the Scriptcase hotkeys documentation.

Procedure Application Ajax Events

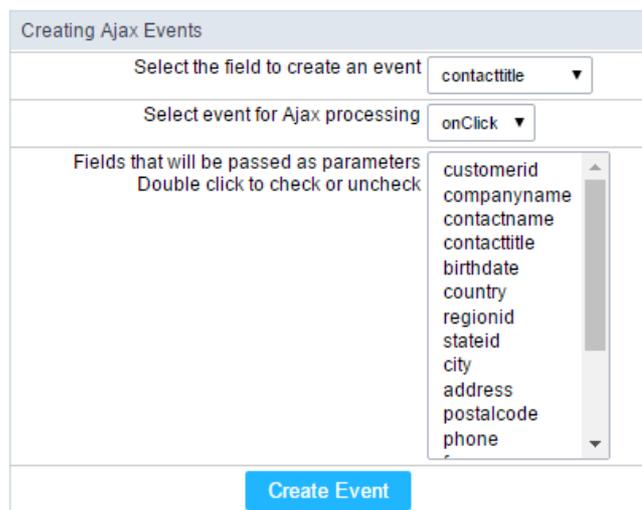

OnClick

The ajax event OnClick is executed when the field that it's based on is clicked.

- Creating a new ajax event

- Selecting a field

A screenshot of a form titled 'Creating Ajax Events'. The form has three main sections. The first section is 'Select the field to create an event' with a dropdown menu showing 'contacttitle'. The second section is 'Select event for Ajax processing' with a dropdown menu showing 'onClick'. The third section is 'Fields that will be passed as parameters' with a list of fields: 'customerid', 'companyname', 'contactname', 'contacttitle', 'birthdate', 'country', 'regionid', 'stateid', 'city', 'address', 'postalcode', and 'phone'. A blue 'Create Event' button is at the bottom of the form. To the right of the form, the text 'Selecting a field of the ajax event' is written in a light blue font.

Choose a field to create an event To define in which field the event will be add to.

Choose an event that run the ajax Defines which event will be added to the field.

Procedure Buttons Settings

In addition to the buttons that comes automatically with the applications, you can also create your own buttons. All the buttons are displayed within the application toolbar.

New buttons creation settings

Creating a new button

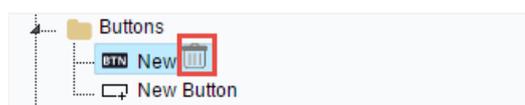

To create a new button, click on the “New Button” option and enter a name and a button type.

The button Types are: JavaScript, PHP, Link and Run.

Grid buttons type

Deleting a button

To delete a button click on Delete icon (represented by a recycle bin image) in the right of the button name, at the application menu under the Buttons option.

Deleting a button

JavaScript

Display Mode

You can configure the display mode of the javascript button in Image, Button or Link.

CSS Style	CSS class name, style created in the theme buttons editor .
Reload quantity of records	Option used to update the amount of application records.
Type	Button type description.
Target	This option allows you to set the target window where you will run the button code (the same window, other window, modal)

Coding Area

Grid's Run Button settings - Coding

area

- There are two types of events in the Run button
 - **OnRecord** : Runs after processing on each record selected.
 - **OnFinish** : Runs after processing all records selected.

In this coding area you can use Scriptcase Macros, PHP and JavaScript.

Procedure Application Nested Grids

Nested grids are used when you need to display hierarchical data, such as customers and their respective applications. The main Grid encapsulates other Grids, showing in each of its Nested grids additional data records. Note the image below in which for each customer is displayed a sub-query with the applications.

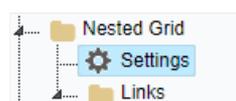

LIST - CUSTOMERS					01/30/2018	
Quick search <input type="text"/>					Export <input type="button" value="v"/>	Settings <input type="button" value="v"/>

Displaying the Nested Grid in a separate

row of the main Grid record.

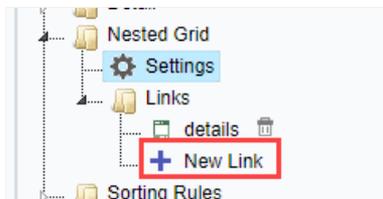

- **Alignment** : Allows you to set the Nested Grid alignment in the main Grid interface when "Position" is set set as Below the record. The options are: left, right and Center.

Set individually

Any of the attributes that use the value "Set individually" requires the property to be configured on each created link settings.

Links

To create a Nested Grid link click on the "New link" within the Link folder.

Creating a new Nested Grid

- **Adding a new Nested Grid** : Enter the name and the label for the link that will be created.

Adding a new Nested Grid

- **Application list** : All Grid applications from current project, that contain global variables, will be listed.

Grid application selection.

- For an application to be used as a Nested Grid, it must have within its SQL command (Grid > SQL) a WHERE clause with a global variable to receive the parameters from the main Grid.

ATTRIBUTE	VALUE
SQL Select Statement	<pre> SELECT orderid, customerid, employeeid, orderdate, requireddate, shippeddate, shipvia, freight, priceorder, shipcountry, shipregion, shipstate, shipcity, shipname, shipaddress, shippostalcode FROM orders where customerid = '[customer]' </pre>

SQL query configuration to the Grid be used as Nested

Grid.

- **Parameters setting** : Setting the value that will be passed to the variable(s) of the Nested Grid SQL statement.

Link between applications - Parameters Definition

Select values to pass as parameters

PARAMETERSVALUE

customer Field Fixed Empty

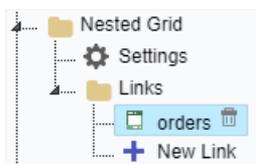

Informing the parameter to the variable

In the screen above, on the left side, it is displayed the Nested Grid input parameters (global variables created within the Nested Grid WHERE clause), on the right side, you must select the parameter option. The options are:

- **Attributes**
 - **Field** : Used to assign a Grid field value as a parameter.
 - **Fix** : Used to assign a fixed value as a parameter.
 - **Empty** : Choosing this option will not be assigned any value as a parameter.
- **Save button** : By clicking this button the Nested Grid creation will be completed and saved.

Editing an existing Nested Grid link

All Nested Grid links created will placed within its menu options, inside the folder "Links". By clicking on the Nested Grid name there will be an interface for settings editing.

Editing a Nested Grid

General settings

General Settings: orders		
ATTRIBUTE	VALUE	DESCRIPTION
Label	Orders	Field title.
Link	<div style="border: 1px solid black; padding: 5px;"> <p>Link data</p> <p>Linked to: orders</p> <p>Parameters: customer = {customerid}</p> <p>Edit link Save</p> </div>	Edit Embed Grid Link
Display	<input checked="" type="checkbox"/> Header <input checked="" type="checkbox"/> Sequential <input checked="" type="checkbox"/> Total	Defines which items of the embed application will be shown in the main application.
Visualization	<input checked="" type="checkbox"/>	Defines which embed application items will inherit the visual formatting of the main application

Nested

Grid general settings

This interface can be used to edit the following Nested Grid attributes:

- **Label** : Nested Grid title for the application
- **Link** : In this attribute are displayed the current Nested Grid connection data, showing the application and parameters used. To change any link attribute just click to edit Link.
- **Display** : This attribute allows you to set which Nested Grid items, if it uses any of these resources, will be displayed in the main Grid.

	Orderid	Employeeid	Orderdate	Priceorder
1	10,326	4	10/10/2008	R\$ 1.195,48
2	10,801	4	12/29/2008	R\$ 4.888,40
3	10,970	9	03/24/2008	R\$ 338,80
Grand Summary				R\$ 6.422,68

Display settings

- * **_1_** : Display Title.
- * **_2_** : Sequential display (number line).
- * **_3_** : Display Totals.

- **Inherit view** : When marked it sets that the Nested Grid view will be equal to that of the main Grid.

Set individually

If the value of one of the attributes in the Nested Grid settings has been selected as "Set Individually", these values must be configured in the Nested Grid editing screen for each called link.

General Settings: orders		
ATTRIBUTE	VALUE	DESCRIPTION
Label	<input type="text" value="Orders"/>	Field title.
Link	<div style="border: 1px solid black; padding: 5px;"> <p>Link data</p> <p>Linked to: orders</p> <p>Parameters customer = {customerid}</p> <p><input type="button" value="Edit link"/> <input type="button" value="Save"/></p> </div>	Edit Embed Grid Link
Display	<input checked="" type="checkbox"/> Header <input checked="" type="checkbox"/> Sequential <input checked="" type="checkbox"/> Total <input type="checkbox"/> Title in the same line	Defines which items of the embed application will be shown in the main application.
Position	<input type="text" value="In one column"/>	Position of the Nested Grid.
Enable TreeView	<input type="checkbox"/>	Show the Nested Grid in TreeView mode.
PDF	<input type="checkbox"/>	Defines if the Nested Grids will appear in the PDF report
Visualization	<input type="checkbox"/>	Defines which embed application items will inherit the visual formatting of the main application

Nested Grid

settings.

Display settings

These options will only appear if all of the following conditions are true:

Attribute	Value
Title in the same line	No
Enable Tree view	No
Position	In one column

Display Settings		
Horizontal Alignment	<input type="text"/>	Field horizontal alignment.
Vertical Alignment	<input type="text"/>	Field vertical alignment.
Background Color	<input type="text"/> 	Background Color
Title Horizontal Alignment	<input type="text"/>	Title horizontal alignment.
Title Vertical Alignment	<input type="text"/>	Title vertical alignment.
Bold	<input type="checkbox"/>	Display the field title in bold.

Nested Grid display settings

- Attributes

- Horizontal Alignment** : This option sets the Nested Grid horizontal alignment. It can be aligned left, right or Center.
 - Vertical Alignment** : This option sets the Nested Grid vertical alignment. It can be aligned to the top, middle, or End.
 - Background color** : Here you can set the background color. If it is not filled it will get the Grid default background color.
 - Title horizontal alignment** : This option sets the Nested Grid label horizontal alignment. It can be aligned Left, Right or

Center.

- **Title vertical alignment** : This option sets the Nested Grid label vertical alignment. It can be aligned to the top, middle, or End.
- **Bold** : This option sets the Nested Grid title (label) in bold.

Procedure Application totals

The total fields will be displayed only when the Grid application is using at least one Group By.

Settings

The settings below only can be applied for the Grid totals.

Summarization Functions ?		
ATTRIBUTE	VALUE	DESCRIPTION
Results in a single line.	<input checked="" type="checkbox"/>	Display the Main Total title and its value on a single line.
Display Total	On every page ▾	Pages where the total will be displayed.
Group Subtotal	Below ▾	Display the Group subtotal after the records of the Group By.
Record Count	<input checked="" type="checkbox"/>	Display the record count in the total.

- **Results in a single line.:** This option sets the display of the **General Total** title and its results in a single line.

- Example for this option **Enabled:**

Grand Summary(872) - Sum	R\$ 267.620,19
- Max	R\$ 4.791,60
- Min	R\$ 0,00

- Example for this option **Disabled:**

Grand Summary (872)	
Sum	R\$ 267.620,19
Max	R\$ 4.791,60
Min	R\$ 0,00

- **Display Total :** This option indicates in which pages the General Total will be displayed. The options are: **On every page**, **On the last page** or **Do not display**.
- **Group Subtotal :** This option defines where the subtotal group by will be displayed.
- **Record Count :** This option allows you to view the amount of records by the General Total title.

- Example for this option **Enabled:** **Grand Summary(872)** * Example for this option **Disabled:**

Grand Summary

Layout settings

Setting of display of the subtotal group.

Layout settings

GROUP BY FIELD	LABEL	DISPLAY
date_YYYYMMDD2	Group Subtotal	<input checked="" type="checkbox"/>

GROUP BY FIELD	LABEL	DISPLAY
region		<input checked="" type="checkbox"/>

- **Label** - This field sets the Label for the **Group Subtotal**.
- **Display** - This option sets if the **Group Subtotal** it will be display.

Select fields

Using the select fields area you can set the total fields and the total options for each field. The same field can be used more than once in the Grid totals area, just if they are using different summaries types.

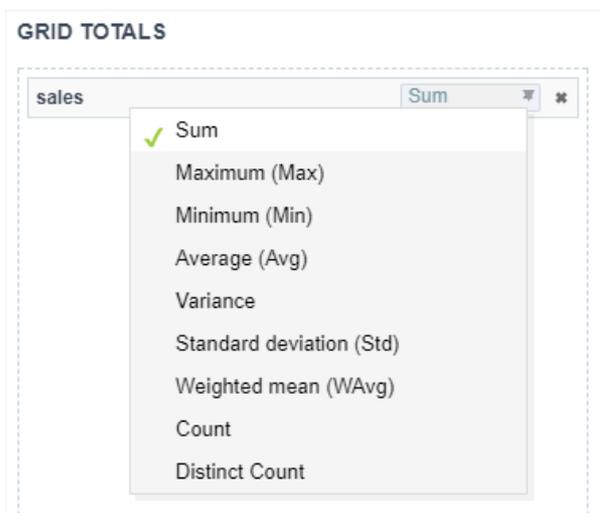

To define the fields that will be used for totals, drag them to the area, **Grid Totals**.

Group By

GRID FIELDS	GRID TOTALS
# id	sales Sum *
📅 date	sales Max *
T region	sales Min *
T product_category	sales Avg *
T product	
T customer_name	
# qty sold	
\$ cost	
\$ sales	
\$ profit	

Note: The total fields will only be displayed if they are also selected to be displayed within the Grid application module.

When positioning the fields, you must define what summarization will be used, to select that you must click in the combo box and select one of the available options, that will be according to the data type (integer, date, text...).

The summarization options available are:

- **Sum** : Sets a sum of the values for the selected field.
- **Maximum** : Displays the highest value identified in the selected field.
- **Minimum** : Displays the lowest value identified in the selected field.
- **Average (Avg)** : Calculates the arithmetic mean of the values for the selected field.
- **Variance** : Calculates the dispersion of the values related to the average.
- **Standard Deviation** : Measures the variability of values around the average, the minimum value of the standard deviation is 0 indicating that there is no variability, i.e. that all values are equal to the mean.
- **Weighted mean (WAVg)** : Calculates the weighted average for the selected field. To set the weight used in the calculation of the average access field settings selected in **Totals > Fields (select the field where you are using the Weighted mean) > Weighted average weight**.
 - **Weighted average weight** : Field that will be used as weighted average weight. In calculating the weighted average, each set value is multiplied by its “weight”, that is its relative importance.
- **Count** : Displays the total number of records for the selected field.
- **Distinct Count** : Displays the total number of records for the selected field, distinguishing the values.

Important note: The fields in the Grid totals are displayed only on Grids with no Group by or with empty Group by.

Positioning

Defines the positioning and the label used by Grid totals. There are three display formats,, **Default**, **Grouped** or **By field**

Default

To add the same field two or more times in the Totals or use different types of summaries in selected fields, this option will not be displayed.

The option **Default** returns the result below the column being summarized. When you use the total for more than one column of the Grid, using the same type of summarization, the results are displayed on the same line.

Summary Fields Order ?

Default
 Grouped
 By field

FIELD 1	FIELD 2	FIELD 3	FIELD 4	FIELD 5
001	Testing...	Testing...	\$ 7,552.96	\$ 1,759.83
002	Testing...	Testing...	\$ 97.16	\$ 22.63
003	Testing...	Testing...	\$ 5,568.00	\$ 1,297.34
Total			\$ 13,218.12	\$ 3,079.82

The line with **General Total** displaying the **Sales**.

Id	Date	Region	Product Category	Sales
1	01/01/2015	South Atlantic	SEAFOOD	R\$ 50,82
2	01/01/2016	South Atlantic	CONFECTIONS	R\$ 84,70
3	01/01/2013	South Atlantic	BEVERAGES	R\$ 90,75
4	01/02/2013	East South Central	CONFECTIONS	R\$ 163,35
5	01/02/2014	East South Central	DAIRY PRODUCTS	R\$ 251,68
Grand Summary				R\$ 267.620,19

Alignment

This option is available for display formats **Default** and **Grouped**.

Defines the placement of the label selected within the **Setting > Display total** option. The alignment can be in the **Center**, **Left** e **Right**:

- **Left :**

Grand Summary	R\$ 267.620,19
----------------------	-----------------------
- **Right :**

Grand Summary	R\$ 267.620,19
----------------------	-----------------------
- **Center :**

Grand Summary	R\$ 267.620,19
----------------------	-----------------------

Label settings (Default)

This option allow you to customize the total labels.

As default we are going to display Grant total

Label settings (Default) ?		
ATTRIBUTE	VALUE	DESCRIPTION
Total line message	<input style="width: 100%;" type="text" value="{lang_msgs_totl}"/>	Message displayed in the line of total

Grouped

The option **Grouped** returns the total result, separating each type per line.

It is possible to position the total lines by dragging to the desired position.

Summary Fields Order ?

Default
 Grouped
 By field
 Alignment Left ▼

FIELD 1	FIELD 2	FIELD 3	FIELD 4	FIELD 5
001	Testing...	Testing...	\$ 550.00	\$ 200.00
002	Testing...	Testing...	\$ 150.00	\$ 350.00
+	Sum		\$ 700.00	\$ 550.00
+	Average (Avg)		\$ 350.00	\$ 275.00
+	Maximum (Max)		\$ 550.00	\$ 350.00
+	Minimum (Min)		\$ 150.00	\$ 200.00
+	Count		\$ 250.00	\$ 470.00
+	Distinct Count		\$ 95.00	\$ 300.00
+	Variance		\$ 50.00	\$ 120.00
+	Standard deviation (Std)		\$ 200.00	\$ 900.00
+	Weighted mean (WAvg)		\$ 150.00	\$ 500.00

In this example, we are displaying the sum, average, maximum and minimum of column **Sales**.

Id	Date	Region	Product Category	Sales

Application Settings (Procedure)

Settings

Navigation

This interface allows defining the navigating behavior of the application

NAVIGATION	
ATTRIBUTE	VALUE
Exit URL	<input type="text"/> 
Close on Exit	<input type="checkbox"/>
Redirect URL	<input type="text"/> 
Redirect Variable	<input type="text"/>

Navigation Interface.

Exit URL

URL to where the user goes when he clicks on the “exit” button.

Close on Exit

Close the browser window when the user clicks on the “exit” button.

Redirect URL

Redirect to another URL in case there aren't any global variables available.

Redirect Variable

Creates a variable with the application name and sends it to the redirected application.

Global Variables

This screen shows all global variables used in the application

The global variable is an external parameter required for running the application. The application can include global variables in the WHERE clause, field definitions and names, event programming, and so on.

You can define global variables by using square brackets ([variable]). You can pass the parameters to the application through one of the methods: Session, Post, and Get

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(“) instead of the brackets([]) because of the conflict with the of Global Variables syntax{:target=”_blank”} Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

APPLICATION	
 Settings	
 Navigation	
 Messages	
 Global Variable	

Global variables Interface.

Example:

```
Select CustomerID, CustomerName from Customers WHERE CustomerID = '[v_customerid]'
```

We do not recommend using session variables (global variables) with the same name as the table fields.

In this case, the variable **v_customerid** is displaying in the global variables configuration.

VARIABLE SETTINGS	
ATTRIBUTE	VALUE
global	<div style="border: 1px solid black; padding: 5px;"> <p>Scope</p> <p><input type="checkbox"/> SESSION</p> <p><input checked="" type="checkbox"/> POST</p> <p><input checked="" type="checkbox"/> GET</p> </div> <div style="border: 1px solid black; padding: 5px; margin-top: 5px;"> <p>Settings</p> <p><input type="checkbox"/> Optional</p> </div> <div style="border: 1px solid black; padding: 5px; margin-top: 5px;"> <p>Type</p> <p><input type="radio"/> Out</p> <p><input checked="" type="radio"/> In</p> </div>

Global variables configuration Interface.

Attribute

It shows the variable's name in the application.

Value

Defines the behavior of the variables, divided into three blocks, they are:

Scope

Defines how the application receives the variable. A variable defined as the POST method in the app does not receive value if it comes with the GET method. Those are the methods available:

- **Session:** Defines that the variable must be created as a PHP session variable by another application.
- **GET:** Defines that the variable must be passed by the URL, that is, visible by the browser.
- **POST:** Defines that the variable must be passed through the POST method of an HTML form.

Settings

- **Optional:** Check it to don't validate the variable at runtime.

Type (In / Out)

Defines whether the variable comes from another application (In), or it is starting in the current app (Out).

Description

Indicates where the application is using the variable.

Procedure Links Overview

This feature allows the developer to create links between applications of the same project, expanding the integration of applications. All link options are grouped under the Application Links menu.

Application Links

In the first access to the menu, we can see the list of existing connections in the application.

If the application does not have a configured link, the application list screen will be displayed with the message: **This application does not have any link. Click here to create one now.**

ID

Link identification ID.

Type

The type of link created, some links such as Edit Link allow only one link per application. In this case, the developer will be able to check the connection types that already exist in the application

Target Application

This info show the target application name.

Actions

This column has edit options for the links.

Properties

It allows accessing the binding properties where it is possible to configure the binding behavior.

Link

Displays the links screen, where it is possible to configure the link that was made with the application informed in the target application column. In this option it is possible to change the parameter passed in the connection as well as the target application.

Delete

Permanently deletes the connection in the applications.

Through the option [Restore Applications](#), it is possible to get a previous version of the application, making it possible to recover the link deleted.

Links Type

The Procedure application has the following links options

- [Application Link](#) - Allows the creation of a link with Procedure application in order to edit the records listed in the Grid.
- [Capture Link](#): It allows the creation of links from the filter fields of the Grid application, in order to enable the recovery of the value to fill in the field, with another Grid application of the project.
- [Field Link](#): Allows you to create a link through the application fields to any application in the project.
- [Button Link](#): It allows creating a link through the buttons created by the developer in the query application, to any application in the project.

Grid Applications Link Types x Application available to link

Check the list of applications that can be associated with the available connection types.

The restrictions on the choice of applications are the **Edit Link** which only allows linking with a form and the **Capture Link** where it is possible to link the filter fields with only one other Procedure application.

	Application Link	Field Link	Capture Link	Button Link
Grid	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Chart	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Form	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Control	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

New link

![Links menu interface.][ligacao_nova] *Links menu interface.*

When you click the “New Link” item from ScriptCase application menu will, the screen below will be displayed.

![Interface for creating links][ligacao_criando] *Interface for creating links*

Application Link

Used to edit records of a Grid Application by using a Form Application. In the generated Grid you will view a link for each record to edit the records. Clicking on the link, the form selected can be displayed in various ways (in an iframe, in the same window or on another window).

List of Applications

Application: You need to select the form application that is going to be called by the Grid Application.

Parameters Definition

Parameters Definition Interface.

On the screen above, on the left side, are displayed the parameters that are expected for the form application (Primary Key, Global Variables), on the right side, you need to select the option that is going to be set to the parameter. The options are:

- **Field** : Used to pass a field value of a Grid as a parameter.
- **Value** : Used to pass a static value as a parameter.
- **Variable** : Used to pass a global variable value used in the Grid as a parameter.
- **Empty** : Choosing this option, no value will be passed as a parameter.

Fiels Link

Capture Link

Creating a Capture Link

The capture link is used to return a value from a **Grid** to a **Form** field.

In the types of links options, we will choose the **Capture Link**. After selection this option, we should also choose which field we want to return the value of.

Applications list

After we select this option, will be displayed the applications list to what you want to create the link.

This screen can be viewed from the following ways:

All:

In which is possible to see all the project's applications. **Example:**

By folder:

In which is possible to see the applications according to the folders in which each of them are.

By type:

In which is possible to see the applications grouped by its respective types.

Definition of Parameters

In this setting we are going to define the type of parameter that will be passed to the next application.

We have two options at **Type of Parameters**, they are:

Fixed value:

This option allows the user to define a fixed value that will be used to the call of the next application.

No value:

This option allows to create the link without the need to send any parameter to the next application.

It is also possible to see a refresh button at its right side.

This button should be used when a new parameter is added to the target application, so the new parameter can be loaded in the current application to make the link.

Application with no parameters

However, when the target application does not have any defined parameters, the following screen is displayed:

Clicking in the button, you will be taken to the target application to create a parameter, so you can use the update button in the **parameters definitions** to refresh them.

Link properties

In this screen we will set the application display mode that will be called in the link.

In this type of link there is only one display option:

Modal:

When we use this option the target application will be displayed in the same window of our application, however it will be displayed in a small window above the current application.

Modal

When we use this option the target application will be displayed in the same window of the application, however she will be displayed in a small window above the current application.

When we select this option, we can set the following options:

Modal:

In this option we are going to define if the target application will be opened in a Modal.

Yes: This option will make the target application be opened in a modal. **No:** This option will make the target application be opened in a new window.

If **Yes** is selected in the previous option, the Modal **Height** and **Width** will be available.

![Modal with yes][modal2]

Height:

Allows to set the Modal height.

Width:

Allows to set the Modal width.

If **No** is selected in the previous option, only those options will be available.

Allows to modify manually in the update:

When we select the option **Yes**, the button **New** is created in the grid to insert new registers.

Allows to modify manually in the insert:

Indicates which shortcut key to the button add new register.

Allows to modify automatically in the update:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Allows to modify automatically in the insert:

Choosing the option **Yes**, the window will be closed after doing the insert of a register.

Button Link

Links Edit

In the Link Folder of the Application Menu (Image Below) are displayed the links existing in the application and also the item New Link. When clicking on the existing link it is displayed the screen below that allows to manage the links.

 *Editing Links.*

Actions

Properties Change the link's behavior, position, and how the link opens.

Link Change the application that's being called in the link their parameters.

Delete Remove the existing link.

Link Properties

On the screen below, you can see the attributes relevant to the link behavior of that need to be informed.

Link properties Interface.

- **Link Operation Mode :**
 - **Open in the same Window** : Displays the Form in the same browser window.
 - **Open in another Window** : Displays the Form in another window of the browser.
 - **Open in Iframe** : The Form will be displayed in the same window, allowing to position below, above, to the left or right of the Grid.
 - **Open in Parent** : If the Grid is in a iframe, it displays the Form in the page's parent view port.
 - **Modal** : Opens the Form in modal, allowing to configure the modal size.
- **Display button (new row) on the grid toolbar** : This option, when enabled, adds a button to the toolbar that allows to add a New Record to the Form.
- **Label for the button New** : You can apply a Label for the button, if not informed the label will be "New".
- **Hint for the button New** : You can apply a Hint for the button, if not informed the hint will be "New".
- **Hotkey for the button "New"** : Indicates which key will be the shortcut for the New Record.
- **Exit URL for the target application** : The URL that is going to call after exiting the Form. In case no value is informed, the "back" button will redirect to the Grid.

- **Form Property**

Allows to select the buttons that are going to be displayed in the Form through the link.

Form properties configurations Interface.

- **Enable insert button on target application** : Enables the Insert Button in the Form.
- **Enable update button on target application** : Enables the Update Button in the Form.
- **Enable delete button on target application** : Enables the Delete Button in the Form.
- **Enable navigation button on target application** : Enables the navigation buttons (first, previous, next and last) in the Form.
- **Enable button to edit a grid record** : Enables the edit button for each record.
- **Iframe properties**

These options are displayed when the property Link Operation Mode is set to "Open in Iframe". *Iframe properties configurations Interface.*

- **Display the header of the called application** : Displays the Form's header.
- **Iframe position relative to the main application** : It can be: below, above, right or left.
- **Action After Insert** view the list below :
 - **Reload Grid** : Does a refresh on the current page.
 - **Move to the end of the grid** : Navigate to the Grid's last page.
- **Iframe height** : Iframe Height in pixels.
- **Iframe width** : Iframe Width in pixels.

Procedure Programming

The concept of programming is incorporated in this ScriptCase version. With the use of resources of attributes, methods and libraries. In the previous version was already possible create business rules in the applications, using this concept. The biggest difference is that now this can be realized in a more organized way, making it easier to be developed and comprehended by another developer.

Attributes

The attributes are variables that has the global scope declared in the application. An attribute that can be referenced in all the methods and the application's events.

Attributes configuration Interface.

Attribute Name : This field allows to inform the attributes name, after typing the name just click on **include**. In case you want to **update** click on the attributes name (located on the buttons' right side), do the necessary modifications and click on update. In case it is necessary to **delete** an attribute, it is necessary to do same process as the update, but when selecting the attribute, it is necessary to click on the delete button. The **clear** button, as the name suggests, it clears the list of all the attributes listed on the right.

Internal Libraries

To use the internal libraries just select the correspondent (Project Libraries for example). This process allows the methods existing in the library, to be visible in all the application's Events and Methods.

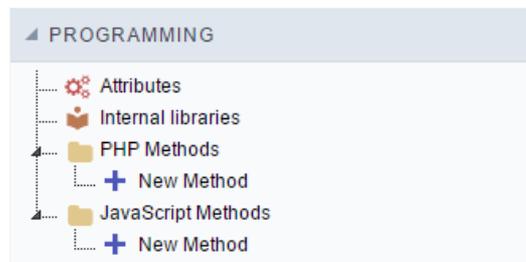

See how to manage the libraries by [clicking here](#).

Internal Libraries management Interface

PHP Methods

Methods are function or procedures declared by the developer, that helps when applying the routines. Using methods in the applications allows to reuse your code throughout the application, optimizing the development experience.

Creating a new method

- Give the method a name and click Create. As in the image below.

PHP methods are incorporated into the same class, so it is not possible to use two functions with the same name even when used in different methods.

A dialog box titled 'New Method - PHP' with a question mark icon. It has a text input field labeled 'Name' containing the text 'new_method'. Below the input field is a blue button labeled 'Create'.

- Methods can receive parameters.

A code editor window showing a function definition. The title bar says 'function new_method'. The code area contains the following code: `1 echo "Hello World!!!";`. The editor has a toolbar with icons for function, search, refresh, and help, and a 'Theme' dropdown menu set to 'default'.

- Add the amount of variables:

A dialog box titled 'Definition of the parameters of the method:'. It shows the method name 'new_method' in a box. Below that, it says '• No defined parameter.' At the bottom, there is an 'Add' button, a text input field containing '1', the text 'Parameter(s)', a 'Cancel' button, and a 'Save' button.

- Defining the variables:

A dialog box titled 'Insertion of Parameters'. It has a table with three columns: 'Name', 'Type', and 'Value Standard'. The 'Type' column has a dropdown menu open with three options: 'For Value', 'For Value', and 'For References'. Below the table are three buttons: 'Save', 'Back', and 'Cancel'.

Name	Type	Value Standard
	For Value	

- **Name** : Type in the variable's name.

- **Type** : Selecting the type of variables: For Value or For Reference.
- **Value Standard** : The parameter's value used to initialize when calling the method.

References allows to create a second name for a variable that you can use to read and modify the variable's original information.

- Editing a parameter:

The screenshot shows a dialog box titled "Definition of the parameters of the method:". The main area contains the text "new_method". Below this is a "Parameters" list box containing "\$test = test". To the right of the list box are two circular arrows (up and down) for navigation. Below the list box are three icons: a checked checkbox, an unchecked checkbox, a pencil icon, and a red X icon. At the bottom of the dialog, there is an "Add" button, a text input field containing "1", the label "Parameter(s)", a "Cancel" button, and a "Save" button.

- : Checking all the parameters in the parameter list.
- : Uncheck all the parameters in the parameter list.
-  : Edit the selected parameter of the list.
-  : Deletes the selected variable of the list.

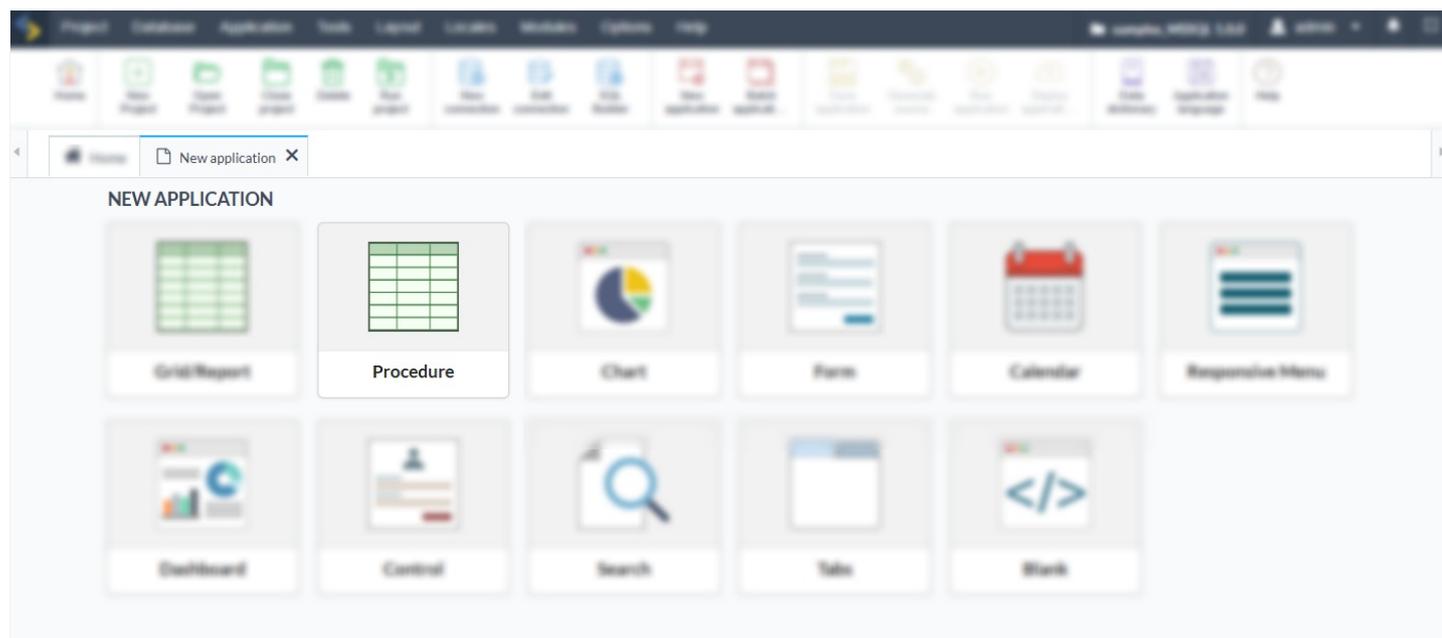

Creating a Procedure Application

New Application

The process of creating an application is quite simple and intuitive.

You only need to select the type of application you want to generate from the list of applications available in Scriptcase, and it will be generated automatically.

This application is available only for MSSQL Server, Oracle, and Db2 databases. It is compatible only when a connection to these types of databases is selected.

Application Data

PROCEDURE

APPLICATION DATA EDIT FIELDS THEME

Procedure name

Connection * **Name ***

Localization

Number of parameters

Procedure Name

In this attribute, the developer must specify the name of the stored procedure created in the database.

Connection

Defines the connection used for the creation of the application. The existing connections in the project will be listed.

Name

The name of the application being created. It cannot contain special characters.

Localization

The language of the application to be created. The project's default language is automatically selected.

Number of Parameters

In this attribute, the developer must indicate the number of input parameters to be used. It is important to note that all parameters specified at this stage become mandatory for the application's functionality.

After creation, it is possible to modify the parameters (add or remove) by accessing the SQL menu.

If the stored procedure has no input parameters, the developer must enter 0 in the **Number of Parameters** field.

Edit Fields

In this tab, we will configure the parameters specified during the application's creation so they can be correctly defined.

PROCEDURE

APPLICATION DATA
EDIT FIELDS
THEME

Parameter	Var Name	Type	Value
Param 1	<input type="text" value="@OrderID"/>	String ▼	<input type="text" value="10250"/>
Param 2	<input type="text" value="@CustomerID"/>	String ▼	<input type="text" value="HANAR"/>
Param 3	<input type="text" value="@ShipCountry"/>	String ▼	<input type="text"/>

Parameter

Displays the number of parameters specified in the **Application Data** section, under the **Number of Parameters** attribute.

Var Name

In this attribute, the developer must provide the name of the variables to be used in the application. These names should correspond to the parameter names defined in the database's stored procedure.

Type

Select the data type corresponding to the stored procedure's parameter: **INT** or **VARCHAR**.

Value

Specify a value to validate the stored procedure provided.

Theme

On this screen, you can select the theme that the application will use. The default project theme, which can be checked and

modified in **Project > Properties**, is automatically selected.

Email Export

It allows you to send the generated export file by email. For that, you may be using SMTP or integration with **Mandrill** and **SES**.

For more information about Mandrill [click here](#)

For more information about Amazon SES [click here](#)

Sending Options

We must configure how to send the email or select an API already set in Tools> API. [Click Here](#) and see how to configure.

SMTP

SMTP is the standard protocol for sending emails over the Internet, and each provider has its SMTP.

For more information about SMTP settings [click here](#)

Sending settings		
ATTRIBUTE	VALUE	DESCRIPTION
API	- Custom -  	API for sending e-mails.
Gateway	smtp	
SMTP server	smtp.example.com	SMTP server to send email.
SMTP port	465	SMTP server port (example: 25, 465, 587).
SMTP user	root	User to connect to the SMTP
SMTP password	SMTP server connection password.
SMTP protocol		Encryption protocol used by the SMTP server.
From email	default@example.com	Default shipping email.
From name	default	Default shipping name.

- **API:** Allows you to select an API that is already configured in **Tools> API** or set a new one here by selecting **- custom -**. In this case you will see some options according to the selected Gateway.

SMTP Server

SMTP server address for the used provider.

Port SMTP

Define the Port of the mail server. Use the port 465 for security with SSL, 587 for security with TLS, or port 25 for port without security. By default, Scriptcase uses port 25.

User SMTP

SMTP server user.

Enter SMTP

SMTP server user password.

Protocol SMTP

Select the security protocol. If no value is declared, Scriptcase uses the No Security protocol as default.

- **E-mail:** Sets the origin email, which will send the emails.
- **Name:** Name that will be displayed in the sent email.

Mandrill

Mandrill is a transactional email API for MailChimp users, ideal for sending data-driven emails.

Sending settings		
ATTRIBUTE	VALUE	DESCRIPTION
API	- Custom -  	API for sending e-mails.
Gateway	mandrill	
API key	Your API	API connection key.
From email	default@example.com	Default shipping email.
From name	default	Default shipping name.

- **API:** Allows you to select an API that is already configured in **Tools> API** or set a new one here by selecting - custom -. In this case you will see some options according to the selected Gateway.
- **API KEY:** Enter the key you obtained when setting up your API.
- **E-mail:** Sets the origin email, which will send the emails.
- **Name:** Name that will be displayed in the sent email.

Amazon SES

Amazon Simple Email Service ([Amazon SES](#)) is an email sending service designed to assist in sending marketing emails, notifications, and transactional messages.

Sending settings		
ATTRIBUTE	VALUE	DESCRIPTION
API	- Custom -  	API for sending e-mails.
Gateway	Amazon SES	
API key	Your Key API	API connection key.
API Secret	Your Secret API	API secret, obtained in association with API KEY.
Region	Region	API Connection Region.
From email	default@example.com	Default shipping email.
From name	default	Default shipping name.

- **API:** Allows you to select an API that is already configured in **Tools> API** or set a new one here by selecting - custom -. In this case you will see some options according to the selected Gateway.
- **API KEY:** Enter the key you obtained when setting up your API.

API Secret

Enter the secret access key of your Amazon SES account.

Region

Amazon SES has endpoints in several regions, to reduce network latency, inform the region of the endpoint closest to your application. [See the regions.](#)

- **E-mail:** Sets the origin email, which will send the emails.
- **Name:** Name that will be displayed in the sent email.

Export Settings

In these settings, we define the settings of the email sending interface when exporting, and we can define a default email subject and body.

Export settings		
ATTRIBUTE	VALUE	DESCRIPTION
To	<input type="text" value="[mail]"/>	Enter the default value for the field 'To'.
It has copy	<input type="button" value="Yes"/> ▼	Sets whether to display the field 'copy' within exporting options.
Copy (cc)	<input type="text" value="[mailcopy]"/>	Enter a default value for the field 'Copy'.
It has blind carbon copy (bcc)	<input type="button" value="Yes"/> ▼	Sets whether to display the blind carbon copy field in export option.
Blind carbon copy	<input type="text" value="[mailbcc]"/>	Enter the default value for the field 'blind carbon copy'.
Title	<input type="text" value="{lang_export_email_subject} sales"/>	Default email subject text. You can change the lang variable or add fixed text.
Search of sales		
Body	<input type="text" value="{lang_export_email_body}"/>	Default text for the body of the email. You can change the lang variable or add a fixed text.
Hello, Please find attached with this email the report in %s. Thank you and Have a Nice Day		

To

Enter the default destination email.

Use Copy (CC)

Defines whether or not to display the 'copy' field within the export options.

- **No:** There will be no possibility to send email with copies.
- **Yes:** The field will be displayed within the export options and we can define a default email for copying. The end user can view this email.
- **Hidden:** The field will not be displayed within export options and we can set a default email for copying.

Copy (CC)

Enter the default email for the copy field. This option can also be empty, or you can use a global variable containing an email list.

Using Hidden Copy (BCC)

Sets whether or not to display the 'hidden copy' field within the export options.

- **No:** There will be no possibility to send email with copies.
- **Yes:** The field will be displayed within the export options and we can define a default email for copying. The end user can view this email.
- **Hidden:** The field will not be displayed within export options and we can set a default email for copying.

Copy (BCC)

Enter the default email for the hidden copy field. This option can also be empty, or you can use a global variable containing an

email list.

Subject

Default email subject text. You can change the lang variable or add static text.

Color

Default body text for the email. You can change the lang variable or add static text.

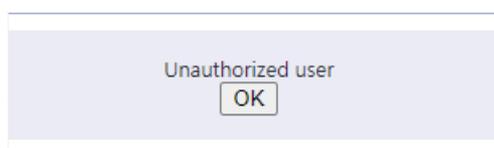

Security

Security	
ATTRIBUTE	VALUE
Use Security	<input checked="" type="checkbox"/>
Url output of the security	<input type="text" value="app_login"/>
Use Password	<input checked="" type="checkbox"/> <input type="text" value="password"/>
Request password just once	<input checked="" type="checkbox"/>
Enable direct call by URL	<input checked="" type="checkbox"/>
Enable CSRF	<input checked="" type="checkbox"/>

Use security

With this option enabled, when accessing the application, an “unauthorized user” message will be displayed, preventing access

to the application.

When enabled, application access is only possible through the macro `sc_apl_status` or through **security module**.

[Click here](#) to access the macro documentation `sc_apl_status`.

In the development environment, the use of the above options for testing purposes may be suppressed, preventing the password being requested or access being blocked at each execution of the applications. To do this, disable the options “Enable security usage” and “Enable password usage” in the menu **Configuration > My Scriptcase**.

Security exit url

Defines which application the user will be redirected to after the “unauthorized user” warning.

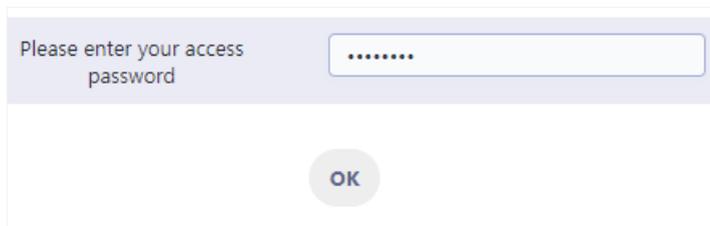

Url output of the security	<input type="text" value="app_login"/>
----------------------------	--

Use password

When enabling the option, you will be asked to define a password for accessing the application.

Use Password	<input checked="" type="checkbox"/> <input type="text" value="password"/>
--------------	---

When running the application using the active password, you will be asked for the password before accessing the application.

A screenshot of a password prompt dialog box. The dialog has a light blue header bar with the text "Please enter your access password" on the left. To the right of the text is a rectangular input field containing seven dots. Below the header bar is a white area with a circular button in the center containing the text "OK".

The password will be requested regardless of the “use security” setting or the use of the security module.

Request password only once

This option defines the behavior of the use password option.

When this option is enabled, the password will be requested only once per session.

When disabling, the password will be requested every time the application will be accessed.

Allow direct calling by URL

Allows an application to be called by typing the URL directly into browsers.

When disabled, when accessing the application by typing the URL directly, the invalid data error will be displayed. With this configuration, the application can only be accessed through a menu application, for example.

A screenshot of an error message box. The box has a white background and is framed by a double-line border. In the center, the text "Invalid data" is displayed in a bold, black, sans-serif font.

Responsive Menu Settings

Menu Settings

The menu settings allow to define the attributes of the application display, according to the following:

Menu Settings	
ATTRIBUTE	VALUE
Friendly URL	<input type="text" value="menu-application"/>
Hide menu items	<input type="checkbox"/>
Application Title	<input type="text" value="app name"/>

Menu configuration Interface.

Friendly URL

This attribute defines the application's friendly URL.

Friendly URL	<input type="text" value="order-clients"/>
--------------	--

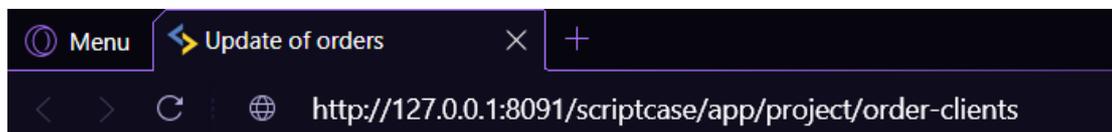

Alphanumeric characters and some special characters are allowed, such as: **hyphen** (-), **underscore** (_), **comma** (,), and **dot** (.).

The use of accents or spaces is not allowed.

Some recommendations for definition are:

- Use keywords for identification.
- Use hyphens to separate words.
- Use only lowercase letters.
- Avoid using dates.

Example of an application using a Friendly URL

The friendly URL can also be defined in the application list on the project's initial screen.

See the example below

APPLICATION	FRIENDLY URL	DESCRIPTION	CREATOR
grid_dbo_vwTarrafa	<input type="text" value="vwTask"/>		

Hide menu items

This attribute defines the behavior of menu items based on the configuration set in the URL.

When the attribute is enabled

Menu items will be hidden in the following situations:

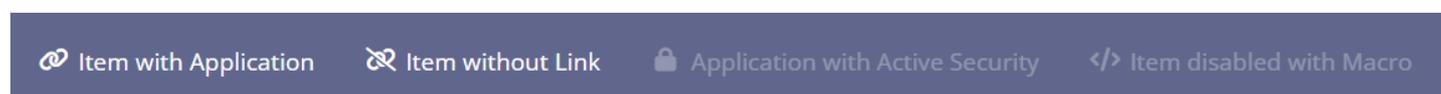

- **No link configured:** When the item does not have an associated link.
- **Link to an application with active security:** When the link points to an application with active security and the user does not have access permission.
- **Disabled by macro:** When the item is disabled using the `sc_menu_disable` macro.

When the attribute is disabled

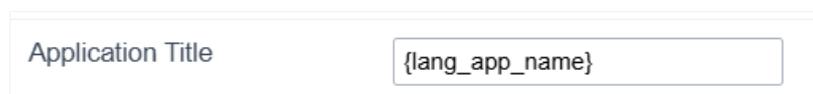

Menu items will always be displayed, but with different behaviors depending on the situation:

- **No link configured:** It will be displayed as a regular item without visual changes.
- **Link to an application with active security or Disabled by macro:** It will be displayed but in a disabled state.

Example of items with the attribute disabled

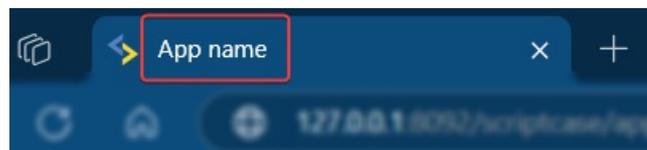

Application Title

Defines the application title, which can be set dynamically using langs or with a fixed text.

In this option it is also possible to use langs, for a system with multiple languages. [Click here](#) and see how to configure the langs

Example of the application title

Navigation

Defines some display options for the menu, such as using navigation paths (breadcrumb), tabs, and the initial application.

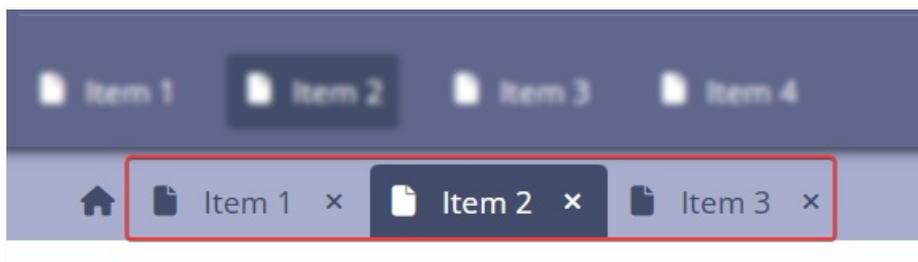

Navigation	
ATTRIBUTE	VALUE
Open items in a tab	<input checked="" type="checkbox"/>
Tab context menu	<input checked="" type="checkbox"/>
Show navigation breadcrumb	<input checked="" type="checkbox"/>
Default Application	One Application ▾
Application	grid_Products 

Menu Navigation Configuration Interface.

Open Items in Tabs

Defines the behavior of the menu when opening items.

When the attribute is enabled items will be opened in tabs, as shown in the image below.

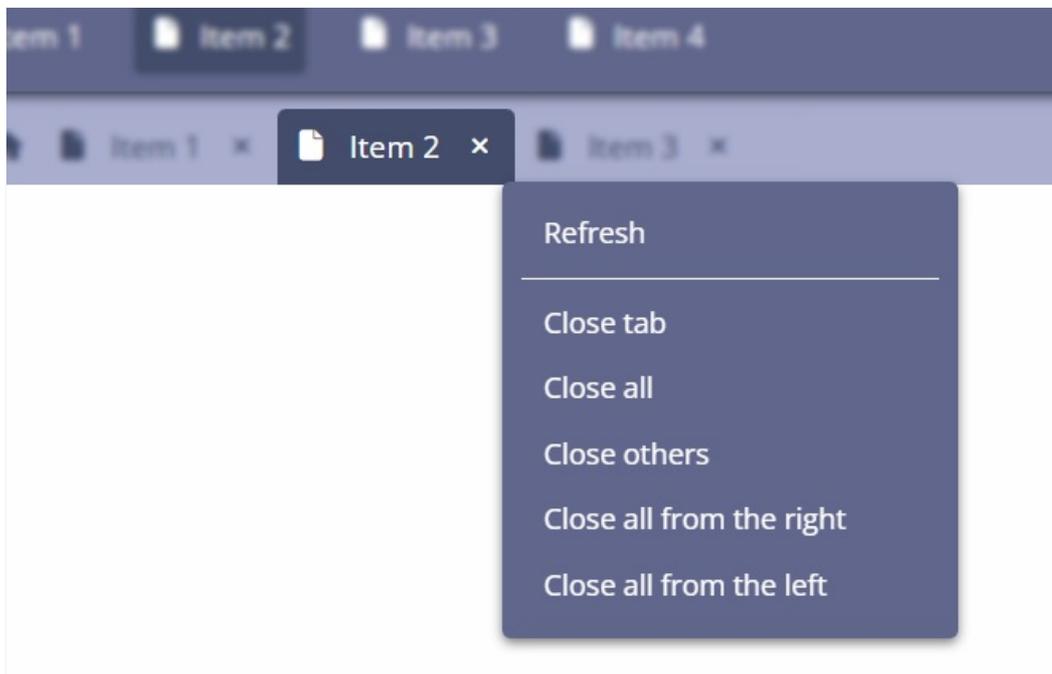

Application with tab navigation.

Tab Context Menu

Enables the display of a context menu when right-clicking on one of the open tabs in the menu application, making it easier for the user to interact with open tabs.

Example of the context menu

The displayed options are:

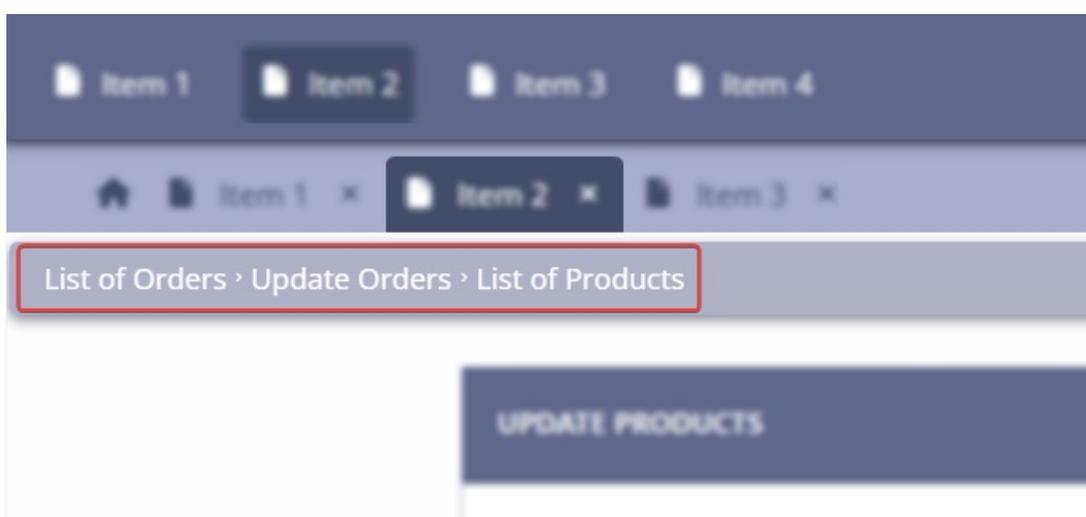

- **Reload** - Reloads the tab where the context menu was opened.
- **Close Tab** - Closes only the tab where the menu was opened.
- **Close all** - Closes all open tabs.
- **Close others** - Closes all other tabs, keeping only the tab where the menu was opened.
- **Close all to the right** - Closes all tabs positioned to the right of the tab where the menu was opened.
- **Close all to the left** - Closes all tabs positioned to the left of the tab where the menu was opened.

This attribute is displayed only when the menu is configured to open in tabs.

Show Navigation Path

This attribute enables the display of the navigation path (breadcrumb), which will be shown when navigating between links in an application.

Example of the breadcrumb

Default Application

Defines whether the menu will have an application or a default URL, always displayed when the menu is opened. This attribute can be set as:

- **Blank** - The menu will start with a blank screen.
- **An application** - The menu will open with an application already loaded.
- **URL (Web Address)** - The menu will display a web page as the initial screen.

If the option to use tabs is enabled, the initial application will be displayed in the home tab, which cannot be closed.

Responsive Menu SQL Settings

SQL Settings

SQL Settings	
ATTRIBUTE	VALUE
Connection	<input type="text" value=""/>

The Connection field defines the connection that will be used by the application. In Menu type application, it is not mandatory to select a connection.

By default, the connection field has no value after creating a menu type application.

In menu applications, it is only necessary to select a connection to use some code in the events, for example, to create a dynamic menu.

Menu Items

On this screen, the developer manages the entire structure of the menu application for the system. It is possible to define navigation with menu items and sub-items, choose whether to display the user menu, configure the components that will be shown in the toolbar, and adjust all layout settings.

Menu items

In the **Menu Items** tab, you can define the items and sub-items that make up the menu navigation structure, as well as their visual aspects, such as the **Label** and **Icon**.

On mobile devices, if a menu item has both a link and sub-items, the link will be ignored to display the sub-items.

The screenshot displays the 'MENU ITEMS' configuration interface. It features three tabs: 'MENU ITEMS' (active), 'USER MENU', and 'TOOLBAR ITEMS'. The 'MENU ITEMS' tab is divided into two main sections: a tree view on the left and a configuration panel on the right.

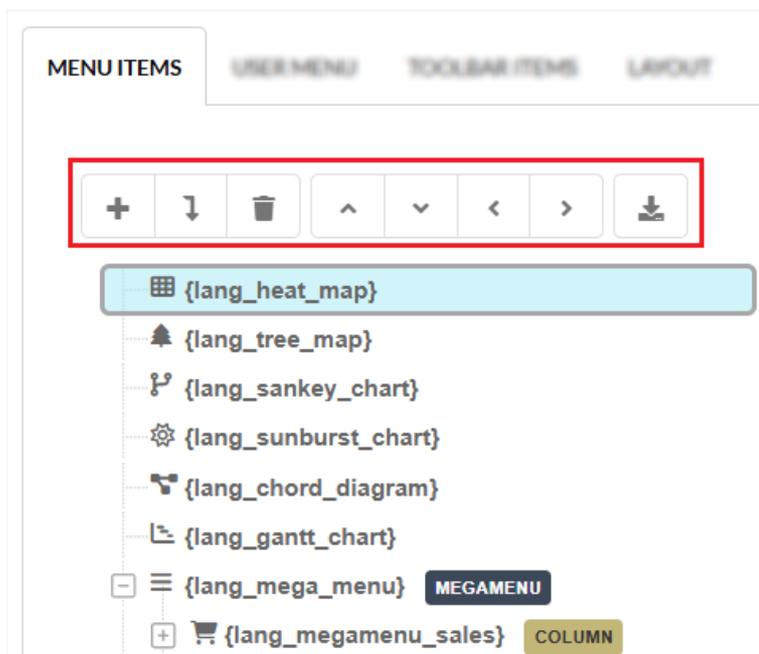

Tree View (Left): Shows a hierarchical structure of menu items. The root item is '{lang_mega_menu}' (MEGAMENU). Under it, there are several sub-items, including '{lang_megamenu_sales}' (COLUMN), '{lang_megamenu_finance}' (COLUMN), '{lang_megamenu_operations}' (COLUMN), and '{lang_megamenu_settings_users}' (COLUMN). The '{lang_megamenu_settings_users}' item has further sub-items: '{lang_megamenu_system_settings}', '{lang_megamenu_user_profiles}', '{lang_megamenu_integrations}', and '{lang_megamenu_activity_log}'.

Configuration Panel (Right): Shows the configuration for the selected item '{lang_heat_map}'. The fields are:

- Id:** item_3
- Label:** {lang_heat_map}
- Description:** (empty field)
- Link/Application:** chart_heatmap_students
- Target:** This Window
- Options:**
 - Define as Mega Menu
 - Define as shortcut
 - Text and Image
- Icon:** fas fa-th

Menu Structure

On the left column, the developer can organize the menu structure using the management buttons.

Add Item

Allows adding an application to the menu.

Add Sub-Item

Allows adding a sub-item to the menu.

Remove

Deletes a menu item. Select the item or sub-item and click the remove button.

Move Up

Moves a menu item or sub-item up in the menu structure.

Move Down

Moves a menu item or sub-item down in the menu structure.

Move Left

Moves a menu item or sub-item to the left, reducing its hierarchy level.

Move Right

Moves a menu item or sub-item to the right, increasing its hierarchy level.

Import Applications

Allows creating a link to an application. The user can click the search button to select an application.

Application import allows the user to select applications from a list to be added. After selection, the menu levels can be organized using the available structuring buttons.

Application List for Import

Select Applications

Import

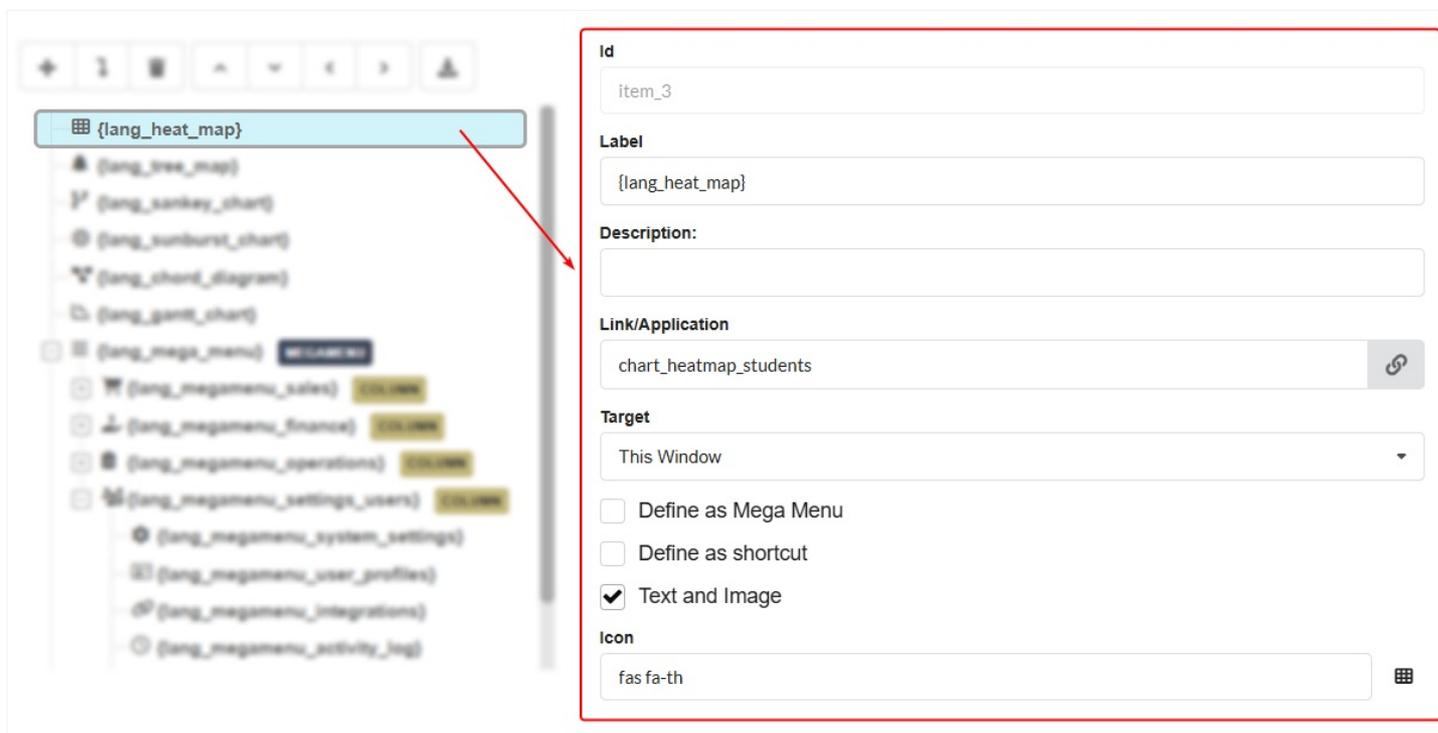

Cancel

Application

Import Interface.

Selected Item Configuration

On the right column, you can configure the properties of the selected item.

ID

Displays the item creation ID. This information is useful for managing items using compatible macros.

Label

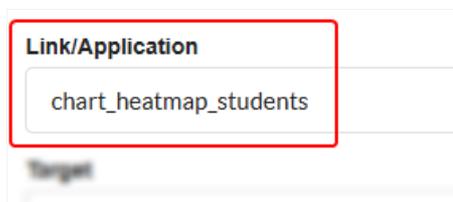

Defines the title of the item that will be displayed to the end user. The **Label** can be set as a fixed text or use a **lang** for internationalization.

Description

Allows adding a description to the menu item, making it easier to identify.

Link/Application

Defines the application or external link associated with the **Menu** item. The developer can use the search button to select an application from the project.

Application Import Interface.

Target

Defines how the application will open in the menu, either in the same window or a new one.

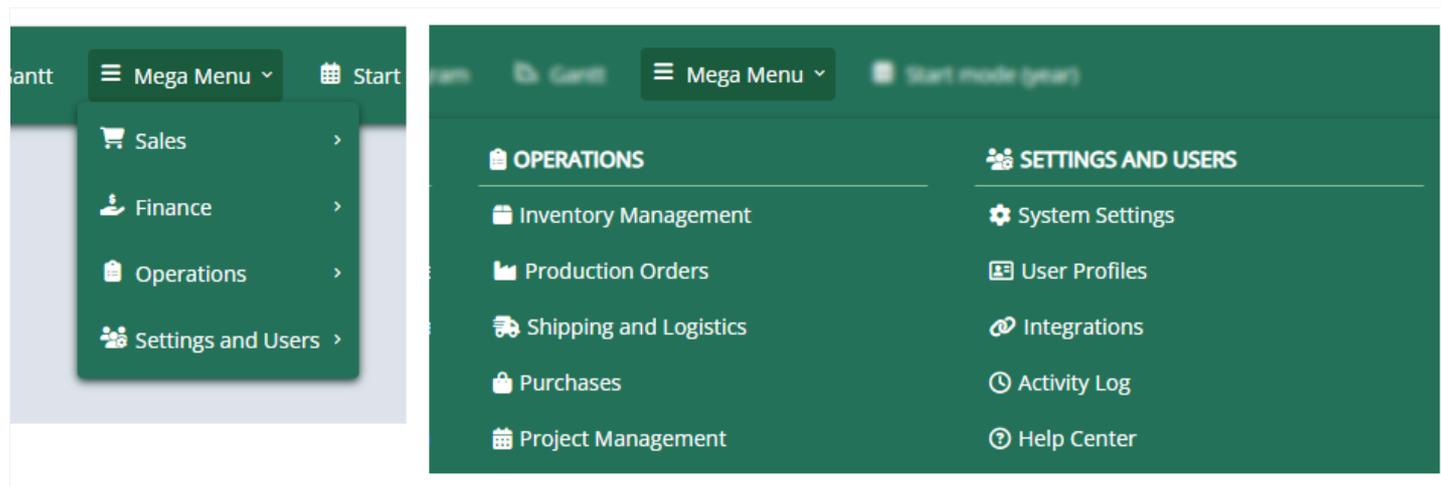

Define as Mega Menu

Enables the item as a **Mega Menu**, automatically organizing level 1 subfolders into columns.

Important: This option is only available for root-level items.

Display Comparison Mega Menu

On the left, the standard menu item; on the right, the same item configured as a Mega Menu.

Define as shortcut

Sets the icon as a shortcut.

Text and Image

Displays the text along with the image.

Icon

The image that will be displayed as the menu item icon. The user can click the search button to select the desired image. This field is optional.

Target

Text and Image

Icon

These settings concern the items that will be displayed when clicking on the user icon in the menu.

Enable User Menu

Enables or disables the user menu

Use picture

Picture that will be displayed.

Username

User name that will be displayed.

Description

Description for the menu user.

Insert item

Used for the user to include the application in the menu.

Remove

Removes an item from the menu. Select the item or sub-item, and then click the remove button.

Move up

Allows you to move a menu item or sub-item up.

Move down

Allows you to move a menu item or sub-item down.

Import Applications

Allows you to create a link with an application. User can click on search button to select application.

Label

Title of the item that will be displayed.

Link

Name of the application that will create the link. User can click on search button and select application.

Target

Defines how the application will be displayed in the menu, which can be: the same window or another window.

Text and image

Displays the text together with the image

Icon

Name of the image that will be displayed as an icon in the menu item. User can click on search button to select desired image.
Optional field.

Toolbar

It enables the standard menu items to be displayed.

The screenshot shows a configuration interface for toolbar items. At the top, there are four tabs: 'MENU ITEMS', 'USER MENU', 'TOOLBAR ITEMS' (which is active), and 'LAYOUT'. Below the tabs, there is a toolbar with a search icon and a dropdown menu. The dropdown menu is open, showing a list of items: 'Search' (highlighted), 'Languages', 'Themes', 'Shortcuts', and 'Notifications'. To the right of the toolbar, there is a 'Properties' section with two checked checkboxes: 'Enabled' and 'Display item path on search'.

Sorting the items

Move up

Allows moving a menu item up.

Move down

Allows moving a menu item down.

Properties

Search

- **Enabled** - Allows enabling or disabling the search item in the menu's toolbar.
- **Display item path in search** - Defines whether the path to the item will be displayed alongside the item's name after the search.

Languages

- **Enabled** - Allows enabling or disabling the languages item in the menu's toolbar.

Themes

- **Enabled** - Allows enabling or disabling the themes item in the menu's toolbar.
- **Available themes** - List of selected themes to be displayed in the application.
- **All** - Selects all themes.
- **None** - Removes all themes, eliminating the button from the running application.

Shortcuts

- **Enabled** - Allows enabling or disabling the shortcuts item in the menu's toolbar.
- **Show Shortcuts title** - Configures whether the title of the shortcuts list will be displayed in the running application.
- **Shortcuts order** - Allows sorting the shortcut items.

Notifications

- **Enabled** - Allows enabling or disabling the notifications item in the menu's toolbar.
- **Notification listing application** - Link to the application that will display the notification list in the menu item.
- **Notification refresh interval** - Time in milliseconds for the notification list to be updated.
- **Row limit** - Maximum number of notifications displayed on the icon.
- **Connection** - Defines the connection where the notification system tables are located.
- **User ID variable** - Name of the global variable that stores the user's login.
- **Table mapping** - For the notification module to function in the menu, it is necessary to link the **Notification**, **inbox**, and **users** tables for proper display of notifications on the icon.

When creating a notification module and selecting an already created menu, the fields should be automatically filled.

Logo

Compact logo

Layout

Defines how the menu will be displayed.

Clicking menu item reloads open tab

Specifies whether the open tab will be reloaded when the menu item is clicked.

Enable Loader

Enables the loading animation when a menu item is being loaded.

Orientation

Determines if the menu will be displayed horizontally or vertically.

User menu positioning

Specifies the position of the user menu when the main menu is set to vertical.

Enable toolbar

Enables the toolbar in the menu.

Start expanded

Specifies whether the menu will start in an expanded or collapsed state. Available only for vertical menus.

Header text

Sets the text to be displayed in the menu header.

Header text position

Specifies the position of the menu header text.

Menu font

Defines the font used in the menu.

Theme

Menu theme to be defined.

Logo

Logo that will be displayed.

Compact Logo

Compressed image that will be displayed as the logo in the menu

Security

Security

Use security

With this option enabled, when accessing the application, an “unauthorized user” message will be displayed, preventing access to the application.

When enabled, application access is only possible through the macro **sc_apl_status** or through **security module**.

[Click here](#) to access the macro documentation sc_apl_status.

In the development environment, the use of the above options for testing purposes may be suppressed, preventing the password being requested or access being blocked at each execution of the applications. To do this, disable the options “Enable security usage” and “Enable password usage” in the menu **Configuration > My Scriptcase**.

Security exit url

Defines which application the user will be redirected to after the “unauthorized user” warning.

Use password

When enabling the option, you will be asked to define a password for accessing the application.

When running the application using the active password, you will be asked for the password before accessing the application.

The password will be requested regardless of the “use security” setting or the use of the security module.

Request password only once

This option defines the behavior of the use password option.

When this option is enabled, the password will be requested only once per session.

When disabling, the password will be requested every time the application will be accessed.

Allow direct calling by URL

Allows an application to be called by typing the URL directly into browsers.

When disabled, when accessing the application by typing the URL directly, the invalid data error will be displayed. With this configuration, the application can only be accessed through a menu application, for example.

Cookies

Cookies

HttpOnly

These are cookies that can be set by the server or by javascript but cannot be accessed in any way by javascript.

With the HTTPOnly parameter enabled, it is very difficult to steal a session through XSS because the javascript cannot read the content of these cookies.

A widely exploited attack in XSS is the theft of user session cookies. Theft of cookies is carried out through a javascript command that sends cookies to an external URL where the attacking user has control.

This option is enabled by default in all applications.

Session ID

Enables the session id that will be stored in cookies on the client side. This option embeds the session id directly in the URLs

This option is enabled by default in all applications.

Cookie Secure

With this option enabled, cookies are protected and can only be transmitted via secure communication. Therefore, they cannot be accessed through Javascript.

The HttpOnly option must also be enabled.

Headers

Headers

Disable XSS Auditor

XSS is short for Cross-Site Scripting, which is an attack that consists of sending HTML with malicious JavaScript to a website.

It is a security attack that consists of sending HTML with malicious JavaScript to a website. If the website displays this HTML with JavaScript without filtering the malicious JavaScript code, the cookies sent by the website can be stolen and sent to an attacking website, so that it can be used to forge user sessions and access the website's user account without permissions.

Strict-Transport-Security

HSTS forces browsers to use HTTPS in the domain where it is enabled, instead of using HTTP.

When enabled, the default value is "max-age = 31536000".

The HSTS policy is set for one year (31536000 seconds). This period specifies the time the browser will access the server via HTTP

X-Frame-Options

The HTTP X-Frame-Options response header can be used to indicate whether or not the browser should render the page in a `<frame>`, `<iframe>`, `<embed>` " or ". This header provides protection against clickjacking, known as 'click swipe' - this vulnerability can steal relevant information and data from the user.

X-Frame-Options does not allow the rendering of a page in a frame, ensuring that the content of your page is not embedded in other sites

- **SAMEORIGIN:** The SAMEORIGIN directive allows the page to be loaded in a frame from the same source as the page itself. This option must be used so that the application with clickjacking protection can be used in the menu application.
- **DENY:** This directive completely disables page loading in a frame.

If no option is selected, the application can be used on any `<frame>`, `<iframe>`,

or `<object>`, allowing the application to be incorporated into another website.

X-Content-Type-Options

X-Content-Type-Options is used to protect against MIME detection vulnerabilities. With this option enabled, it prevents browsers from interpreting the page content (sniffing) and executing the data as code / tag. These vulnerabilities can occur when uploading a text file with a javascript code and the browser reading the content that is in the file and executing, even though it is just text and not part of the code.

With this enabled, the HTTP X-Content-Type-Options header is defined, by default, as "no detection".

Referrer-Policy

no-referrer.

The Referer header will be omitted completely. No reference information will be sent with requests.

no-referrer-when-downgrade.

This is the default behavior when no policy is specified, or if the value provided is invalid.

origin.

Only send the origin of the document as a reference. For example, a document at `https://example.com/page.html` will send the reference `https://example.com/`.

origin-when-cross-origin.

Sends the origin, path and query string when performing a same-origin request, but only sends the origin of the document in other cases.

same-origin.

The reference will be sent to sources on the same site, but requests between sources will not send reference information.

strict-origin.

Only send the document source as a reference when the security protocol level remains the same (HTTPS → HTTPS), but do not send it to a less secure recipient (HTTPS → HTTP).

strict-origin-when-cross-origin.

Sends the source, path and query string when performing a request from the same source, only sends the source when the security protocol level remains the same during an inter-source request (HTTPS → HTTPS), and sends no header to recipients less secure (HTTPS → HTTP)

unsafe-url.

Sends the source, path and query chain when performing any request, regardless of security.

Feature-Policy

The value of this header is a policy or set of policies that you want the browser to respect for a particular source.

The source whitelist can take on several different values:

- `*``: The feature is allowed in top-level navigation contexts and in nested navigation contexts (iframes).
- `'self'``: The feature is allowed in top-level navigation contexts and nested navigation contexts from the same source. It is not allowed in documents of cross origin in nested browsing contexts.
- `'none'``: The feature is not allowed in top-level browsing contexts and is not allowed in nested browsing contexts.
- `<origin (s)>``: specific sources for which to enable the policy (for example `https://example.com`).

Example 1 - Using only one directive Let's say you want to prevent all content from using the geolocation API on your site. You can do this by submitting a restricted 'none' whitelist to the geolocation resource:

Feature-Policy: `geolocation 'none'``

Example 2 - Using more than one directive Functionalities within a policy are separated by semicolons.

Feature-Policy: `unsized-media 'none'; geolocation 'self' https://example.com; camera *;``

Directives

accelerometer

Controls whether the current document is allowed to collect information about the acceleration of the device

via the Accelerometer interface.

ambient-light-sensor

Controls whether the current document is allowed to collect information about the amount of light in the environment around the device through the AmbientLightSensor interface.

autoplay

Controls whether the current document is allowed to play the requested media automatically via the HTMLMediaElement interface. When this policy is disabled and there is no user action, the Promise returned by HTMLMediaElement.play () will reject it with a DOMException. The autoplay attribute on <audio> " and " elements will be ignored.

battery

Controls whether the use of the Battery Status API is allowed. When this policy is disabled, the Promise returned by Navigator.getBattery () will reject it with a NotAllowedError DOMException.

camera

Controls whether the current document is allowed to use inputs from video devices. When this policy is disabled, the Promise returned by getUserMedia () will reject it with a NotAllowedError DOMException.

display-capture

Controls whether or not the current document is allowed to use the getDisplayMedia () method to capture screen content. When this policy is disabled, the Promise returned by getDisplayMedia () will reject it with a NotAllowedError if permission is not obtained to capture the contents of the screen.

document-domain

Control whether the current document is allowed to place document.domain. When this policy is disabled, attempts to place document.domain will fail and cause a SecurityError DOMException to be thrown.

encrypted-media

Controls whether the current document is allowed to use the Encrypted Media Extensions (EME) API. When this policy is disabled, the Promise returned by Navigator.requestMediaKeySystemAccess () will reject it with a DOMException.

execution-while-not-rendered

Controls whether tasks should be performed in frames while they are not rendered (e.g. whether a frame is hidden or display: none).

execution-while-out-of-viewport

Controls whether tasks should be performed in frames while they are outside the visible viewing window.

fullscreen

Controls whether the current document is allowed to use Element.requestFullscreen (). When this policy is disabled, the returned Promise rejects it with a TypeError DOMException.

geolocation

Controls whether the current document is allowed to use the Geolocation interface. When the policy is disabled, calls to getCurrentPosition () and watchPosition () will cause function callbacks to be invoked with a PositionError of PERMISSION_DENIED.

gyroscope

Controls whether the current document is allowed to collect information about the orientation of the device through the Gyroscope interface.

layout-animations

Controls whether the current document is allowed to show layout animations.

legacy-image-formats

Controls whether the current document is allowed to show images in legacy formats.

magnetometer

Controls whether the current document is allowed to collect information about the orientation of the device through the Magnetometer interface.

microphone

Controls whether the current document is allowed to use inputs from audio devices. When this policy is disabled, the Promise returned by `MediaDevices.getUserMedia ()` will reject it with a `NotAllowedError`.

midi

Controls whether the current document is allowed to use the Web MIDI API. When this policy is disabled, the Promise returned by `Navigator.requestMIDIAccess ()` will reject it with a `DOMException`.

navigation-override

Controls the availability of mechanisms that enable the author of the page to take control over the behavior of spatial navigation, or to cancel completely.

oversized-images

Controls whether the current document is allowed to download and display large images.

payment

Controls whether the current document allows the use of the Payment Request API. When this policy is disabled, the `PaymentRequest ()` constructor will throw a `SecurityError DOMException`.

picture-in-picture

Controls whether the current document allows a video to be allowed to play in Picture-in-Picture mode via the corresponding API.

publickey-credentials-get

Controls whether the current document is allowed to use the Web Authentication API to retrieve already stored public key credentials, i.e. via `navigator.credentials.get ({publicKey: ..., ...})`.

sync-xhr

Controls whether the current document is allowed to make synchronous XMLHttpRequest requests.

usb

Controls whether the current document is allowed to use the WebUSB API.

vr

Controls whether the current document is allowed to use the WebVR API. When this policy is disabled, the Promise returned by `Navigator.getVRDisplays ()` will reject it with a `DOMException`. Keep in mind that the WebVR standard is in the process of being replaced by WebXR.

wake-lock

Controls whether the current document is allowed to use the Wake Lock API to indicate that the device should not go into a power saving mode.

screen-wake-lock

Controls whether the current document is allowed to use the Screen Wake Lock API to indicate whether or not the device should darken the screen.

xr-spatial-tracking

Controls whether or not the current document is allowed to use the WebXR Device API to interact with the WebXR session.

Content-Security-Policy

Content-Security-Policy is the name of an HTTP response header that modern browsers use to increase the security of the document (or web page).

The Content-Security-Policy header allows you to restrict resources such as JavaScript, CSS or just about anything the browser loads.

Directives**default-src**

The default-src directive defines the standard policy for fetching features such as JavaScript, Images, CSS, Fonts, AJAX requests, Frames, HTML5 Media. Not all directives go back to default-src. Refer to the Source List Reference for possible values.

DFAULT-SRC Policy Example `default-src 'self' cdn.example.com;`

script-src

Defines valid JavaScript sources.

SCRIPT-SRC Policy Example `script-src 'self' js.example.com;`

style-src

Defines valid fonts for style sheets or CSS.

`EXAMPLE__ STYLE-SRC POLICY style-src 'self' css.example.com;`

img-src

Defines valid image sources.

Example of IMG-SRC Policy `img-src 'self' img.example.com;`

connect-src

Applies to XMLHttpRequest (AJAX), WebSocket, fetch (), `<a ping> ''` or EventSource. If not allowed, the browser emulates a 400 HTTP status code. `__Connect-SRC Policy Example__ connect-src 'self'; ''`

font-src

Defines valid fonts for font resources (loaded via `@ font-face`).

FONT-SRC Policy Example `font-src font.example.com; ``

object-src

Defines valid plug-in sources, for example `<object>` or `<applet>`.

Example OBJECT-SRC Policy `object-src 'self';`

media-src

Defines valid audio and video sources, for example `<audio>`, HTML5, `<video>` elements.

Example of MEDIA-SRC Policy `media-src media.example.com;`

frame-src

Defines valid fonts for loading frames. In CSP, Level 2 `frame-src` has been deprecated in favor of the `child-src` directive. CSP Level 3, has not been replaced with `frame-src` and will continue to postpone `child-src` if not present.

Example FRAME-SRC `frame-src 'self';`

sandbox

Enables a sandbox for the requested resource similar to the `iframe` `sandbox` attribute. The sandbox applies a policy of the same origin, avoids pop-ups, plug-ins and blocks the execution of scripts. You can keep the `sandbox` value empty to keep all restrictions in place, or add values: `allow-forms` `allow-same-origin` `allow-scripts` `allow-popups` `allow-modals` `allow-orientation-lock` `allow-pointer-lock` `allow-presentation` `allow-popups-to-escape-sandbox` `allow-top-navigation`

Example of SANDBOX policy `sandbox allow-forms allow-scripts;`

report-uri

Instructs the browser to POST policy crash reports to this URI. You can also use `Content-Security-Policy-Report-Only` as the HTTP header name to instruct the browser to send reports only (does not block anything). This directive was discontinued at CSP Level 3 in favor of the `report-to` directive.

Example REPORT-URI `report-uri / some-report-uri;`

child-src

Defines valid fonts for web workers and nested browsing contexts loaded using elements such as `<frame>` and `<iframe>`.

Example of FILHO-SRC Policy `child-src 'self'`

form-action

Defines valid fonts that can be used as an `<form>` HTML action.

Example action policy example `form-action 'self';`

frame-ancestors

Defines valid fonts for embedding the resource using `<frame>` `<iframe>` `<object>` `<embed>` `<applet>`. Setting this directive to `'none'` should be roughly equivalent to `X-Frame-Options: DENY FRAME-ANCESTORS`.
EXAMPLE POLICY `frame-ancestors 'none';`

plugin-types

Defines valid MIME types for plug-ins called via `<object>` and `<embed>`. To load one, `<applet>` you must specify `application / x-java-applet`.

PLUG-IN TYPES Policy Example ``plugin-types application / pdf;``

base-uri

Defines a set of allowed URLs that can be used in the attribute of an HTML basetag.

URI-BASE Policy Example ``` base-uri 'self'; ```

report-to

Defines a report group name defined by an HTTP Response Report-Header. See the reporting API for more information.

Example Report for Policy `report-to groupName;`

worker-src

Restricts URLs that can be loaded as Worker, SharedWorker or ServiceWorker.

WORKER-SRC Policy Example `worker-src 'none';``

manifest-src

Restricts URLs where application manifests can be loaded.

Example of MANIFEST-SRC Policy `manifest-src 'none';``

prefetch-src

Defines valid sources for pre-fetching and pre-rendering of requests, for example, through the linktag with `rel = "prefetch"` or `rel = "prerender"`:

`__ PREFETCH-SRC Policy Example__ prefetch-src 'none'``

navigate-to

Restricts the URLs to which the document can navigate by any means. For example, when a link is clicked, a form is submitted or `window.location` is called. If `form-action` is present, this directive will be ignored for submitting forms. Implementation status

Navigation Policy Example ``navigate-to example.com``

Responsive Menu Log

Log

This interface allows you to define a Log schema to the app. The Log schema tracks what the end-users are doing in the app. Those are the events it can tracks: Access, Insert, Update, and delete.

To learn how to create a Log schema [see here](#).

LOG	
ATTRIBUTE	VALUE
Schema	log ▾ ☰
Events	<div style="display: flex; align-items: center; gap: 10px;"><div style="border: 1px solid #ccc; width: 100px; height: 40px; display: flex; align-items: center; justify-content: center;">▴ ▾</div><div style="border: 1px solid #ccc; width: 100px; height: 40px; display: flex; align-items: center; justify-content: center;">Access ▴ ▾</div></div> <div style="display: flex; flex-direction: column; align-items: center; gap: 5px;">Add >>Remove <<</div>

Application Log configuration

Schema Select an existing log schema for the application.

Events You can select just specific events to save in the log.

Responsive Menu Events Overview

Most Scriptcase applications, with the exception of Tabs and Dashboard applications, have events that can be used to create business rules, validations and changes to the application's CSS, among other things.

When events are executed?

Each event is executed at a certain moment in the application and has an execution order, for this reason, they have different functions within the creation of a business rule and validations.

They can be triggered automatically, as in the case of the **onApplicationInit** and **onScriptInit** events, where they are executed when the application starts. Also, they can be triggered through user interaction, as with the **onNavigate** and **onValidate** events, which are executed when browsing the application or submitting a form, respectively.

For information about the timing of events execution or other information, access the documentation of the desired event.

how they work?

By default, the events already have handle for opening `<?php` and closing `?>` of PHP tags, so they are ready to receive PHP code and macros from Scriptcase.

However, it is possible to use other languages in the event, such as **JQuery**, **JavaScript**, **CSS** and **HTML**. For this, it is necessary to close the PHP tag `?>` of the event, so that the code can be added.

Remembering that it is necessary to reopen the event's PHP tag `<?php`, otherwise the application will not run correctly.

When closing the PHP tag in a Scriptcase event, the executed language is HTML.

Example of using other languages:

onApplicationInit - Responsive Menu

onApplicarionInit

This event occurred before the application execute the SQL, and execute only once. Is used to do verification of variables, and security verification.

onExecute - Responsive Menu

onExecute

This event works only in the "menu" applications and are executed when an application is called through a link of the menu. Normally are used to the decision taking before the application execution named `sc_script_name`.

onLoad - Responsive Menu

onLoad

This event occurs when loading a horizontal / vertical menu. In this event we can run some security policy, for example if there is an attempt to access the menu directly, without first going through a login form, we can test a session variable defined in the login form, redirect the flow to the initial application. `if(!isset([var_id_user]) or empty([var_id_user])) { sc_redirect("login.php"); }`

Code Editor

Code Editor

Scriptcase has Events to allow the developers to customize the application code. By using the events, the developers can program custom actions at a specific execution time (e.g. After a record is inserted, when it is loaded, upon submitting a Form, ...) and for a specific application type. In the events area you can use global and local variables, JavaScript, CSS, HTML, PHP codes and also Scriptcase macros.

Scriptcase code editor is used within events and has a series of shortcuts to help in the applications development.

At the top section of the editor, there are some options that allows us to change the editor theme or expand it, for example. These options can also be activated using the hotkeys.

-  - Increases the area occupied by your code editor.
-  - Expand the sides of the code editor.
-  - Activates the search in the code editor.
-  - Enables replace in the code editor.
-  - Defines the code editor theme.

The hotkeys are available in all browsers compatible with Scriptcase.

[Click Here](#) to view the Scriptcase hotkeys documentation.

Responsive Menu Settings

Settings

Application Code

Informs the current name of the application and the version in which it was created

Language

Defines a specific language for the application, overriding the default language defined in the project. If no language is selected, the application will inherit the project's default language.

The languages listed in the option are defined in the project properties

Editing by Project

By disabling this option, only the user who created the application will have access to its settings.

No other project users will be able to access the application.

In the image below, the menu application has the edit by project option disabled.

Session Location

Defines if the language of the applications will be stored

Charset

Defines an application-specific charset.

If no value is selected, the application inherits the project's default charset.

Ideally, this charset option, within the application's settings, does not have a defined value. Different usage of your base charset can cause problems saving information in your tables.

Schemes in Session

When active, this option allows the theme stored in the session to be used by the application.

For example, by selecting theme x at login, all applications in the project will use the selected theme.

If the option is unchecked, the application remains with its original theme.

Folder

Folder where the application is stored in [Project Explorer](#).

Description

Displays the description of the application.

You can edit or add a description also in the [Project Explorer](#) interface.

Extra Application Icons

It stores the images that will be used in the application through codes in the events, causing these images to be sent along with the application at the time of publication.

Only images used in codes, such as creating a dynamic menu with icons or creating a bill of exchange using

a blank, need to be added.

Images added in HTML Image fields or in the application header, for example, are already sent with the applications.

The added images will be stored in this directory: `../_lib/img/`

How to use the images

When inserting the image in the image manager, its name is changed according to the **scope** (public, project or user) and the **storage directory** (background, button, icon, menu or general) following the following pattern.

Scope: It refers to the level of access to the file within Scriptcase, in the development environment.

- Scriptcase__ - Contains preexisting images in the tool, where it is not possible to upload new images.
- Public__ - Images accessible for all projects.
- Project__ - Images accessible only in the project in which it was inserted.
- User__ - Images accessible only to the user who uploaded the image.

Each scope adds a prefix to the image name.

- Public - **sys__NM__**
- Project - **grp__NM__**
- User - **usr__NM__**

Storage Directory: Directory where the image will be added. Each directory adds one more prefix to the image name.

- background images - **bg__NM__**
- button images - **btn__NM__**
- general images - **img__NM__**
- icons - **ico__NM__**
- menu images - **menu_img__NM__**

This way, an image called `_001.jpg`, added in the public scope and in the icon directory will be named **sys__NM__ico__NM__001.jpg**

HelpCase Link

Associates HelpCase files to your application.

This configuration can be done expressly in the HelpCase settings, where it is possible to change this option for all project applications. [See how by clicking here.](#)

The HelpCase button must be selected in the toolbar to be able to access the selected page.

Notifications Settings

Use SweetAlert

Activate SweetAlert in the application, replacing the “confirm” and “alert” of the browser.

Confirm Example with SweetAlert Enabled

Confirm Example with SweetAlert Disabled

SweetAlert position using Toast

Sets the display position of the message window using toast.

Global Variables

Global Variables

This screen shows all global variables used in the application

The global variable is an external parameter required for running the application. The application can include global variables in the WHERE clause, field definitions and names, event programming, and so on.

You can define global variables by using square brackets ([variable]). You can pass the parameters to the application through one of the methods: Session, Post, and Get

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(") instead of the brackets([]) because of the conflict with the of Global Variables syntax{:target="_blank"} Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

Global variables Interface.

Example:

```
Select CustomerID, CustomerName from Customers WHERE CustomerID = '[v_customerid]'
```

We do not recommend using session variables (global variables) with the same name as the table fields.

In this case, the variable **v_customerid** is displaying in the global variables configuration.

Global variables configuration Interface.

Attribute

It shows the variable's name in the application.

Value

Defines the behavior of the variables, divided into three blocks, they are:

Scope

Defines how the application receives the variable. A variable defined as the POST method in the app does not receive value if it comes with the GET method. Those are the methods available:

- **Session:** Defines that the variable must be created as a PHP session variable by another application.
- **GET:** Defines that the variable must be passed by the URL, that is, visible by the browser.
- **POST:** Defines that the variable must be passed through the POST method of an HTML form.

Settings

- **Optional:** Check it to don't validate the variable at runtime.

Type (In / Out)

Defines whether the variable comes from another application (In), or it is starting in the current app (Out).

Description

Indicates where the application is using the variable.

Import Menu

Import Menu

Allows you to import items and events from an old menu application to the new menu application.

Attributes

ScriptCase has incorporated the concept of Object Oriented programming, using attributes, resources, methods and libraries. It is possible to create your own business rules in applications, and by using these concepts you can reap huge rewards in terms of better organization and improved development.

Attributes Settings

The attributes are variables that has the global scope declared in the application. An attribute that can be referenced in all the methods and the application's events.

Attributes configuration Interface.

Attribute Name : This field allows to inform the attributes name, after typing the name just click on **include**. In case you want to **update** click on the attributes name (located on the buttons' right side), do the necessary modifications and click on update. In case it is necessary to **delete** an attribute, it is necessary to do same process as the update, but when selecting the attribute, it is necessary to click on the delete button. The **clear** button, as the name suggests, it clears the list of all the attributes listed on the right.

Internal libraries

Internal libraries

To use the internal libraries just select the correspondent (Project Libraries for example). This process allows the methods existing in the library, to be visible in all the application's Events and Methods.

See how to manage the libraries by [clicking here](#).

Internal Libraries managment Interface

PHP Methods

PHP Methods

Methods are function or procedures declared by the developer, that helps when applying the routines. Using methods in the applications allows to reuse your code throughout the application, optimizing the development experience.

Creating a new method

- Give the method a name and click Create. As in the image below.

PHP methods are incorporated into the same class, so it is not possible to use two functions with the same name even when used in different methods.

- Methods can receive parameters.

- Add the amount of variables:

- Defining the variables:
- **Name** : Type in the variable's name.
- **Type** : Selecting the type of variables: For Value or For Reference.
- **Value Standard** : The parameter's value used to initialize when calling the method.

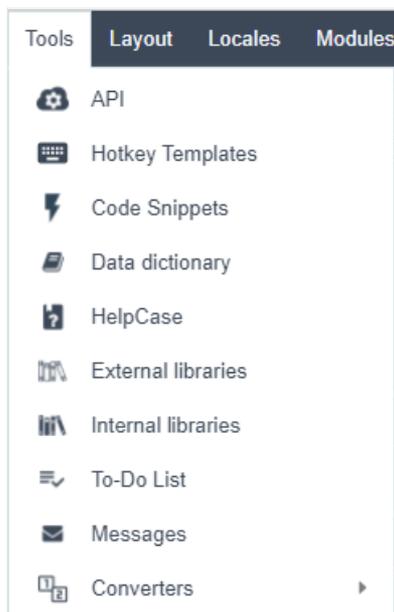

References allows to create a second name for a variable that you can use to read and modify the variable's original information.

- Editing a parameter:

- : Checking all the parameters in the parameter list.
- : Uncheck all the parameters in the parameter list.
- : Edit the selected parameter of the list.
- : Deletes the selected variable of the list.

Scriptcase Tools Overview

Scriptcase offers various tools that help you out on developing systems to optimize the time of development, making it easier to create and maintain your applications within Scriptcase. In this tutorial, you learn what the environment tools are.

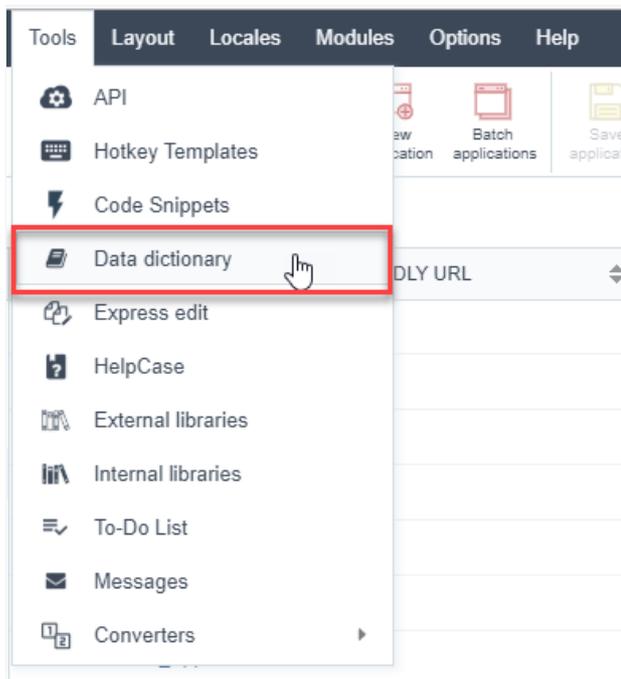

- **Data Dictionary** - You can use it to standardize the tables fields. It helps you to manage the language variables so you can translate the applications created within Scriptcase as well as model the fields to create the applications faster.
- **External Libraries** - This tool offers the option to include external libraries to your project like JavaScript, CSS, HTML, and other libraries. It allows you to integrate the various libraries to your applications.
- **Internal Libraries** - This tool offers the option to create PHP functions to be used in the applications.
- **To-Do List** - Allows you to create a To-Do List and assign Tasks to your developers.
- **Messages** - Allows the developers to exchange messages between themselves in the same ScriptCase.
- **Converters** - This tool offers the option to convert your projects from previous versions of ScriptCase to the current version.
- **Database Import** - This tool offers the option to import tables in the formats (XLS, CSV, and ACCESS) for the following databases: MySQL, PostgreSQL, SQLite, and SQL Server
- **SQL Builder** - This tool is an interface that provides some options to create a **SELECT** query to be used in your applications.
- **Database Builder** - This tool is an interface to manage your database directly from ScriptCase, without needing to use any other software. It supports the Databases: MySQL, SqlServer (not ODBC), SQLite, Oracle, PostgreSQL.

Data Dictionary

In this article, you learn how to use the Data Dictionary. It is a tool used to assist you with the application translation as well as to standardize the database fields. With the data dictionary, you can create a data repository and associate it to one or more tables.

WATCH TUTORIAL

You can access the data dictionary from the main menu **Tools > Data Dictionary**.

Creating a Data Dictionary

Inform the necessary data for the creation of the repository. The files with an asterisk are required.

DATA DICTIONARY ?

Data Dictionary Name *

Description

Use schema before the table ▼

Convert tables/fields to

Connection * ▼

Associate dictionary with connection * ▼

Main features:

- Analyze your table structures (reverse engineering) and store it in a Dictionary;
- Allows to change the name, size and type of table fields stored in the dictionary.

The option **Associate dictionary with connection**, define a connection to associate with the repository data, allowing that the new applications, created using the tables associated with the repository, have indexes in the language files with the field labels from the tables.

Add tables to the Data Repository

Here we need to select the tables to add to the repository. After selecting the desired tables, click on next.

ADD TABLES TO DICTIONARY

Select the database tables to add to dictionary and click Next to continue. Next

	LABEL
<input checked="" type="checkbox"/> account	<input type="text" value="account"/>
<input checked="" type="checkbox"/> application_logs	<input type="text" value="application_logs"/>
<input checked="" type="checkbox"/> bar_code	<input type="text" value="bar_code"/>
<input checked="" type="checkbox"/> categories	<input type="text" value="categories"/>
<input checked="" type="checkbox"/> city	<input type="text" value="city"/>
<input checked="" type="checkbox"/> <input type="checkbox"/>	

You should choose whether or not to create the indexes (langs) on the field labels of the existing applications of the project.

ADD TABLES TO DICTIONARY

If your applications use multiple languages, Scriptcase can automatically create indexes for the application fields labels in the language files.

Generate indexes in language files with table field labels?

Overwrite language files indexes ?

Add
Back

- Generate the indexes in the language files of the table fields - On this option, you replace the field labels with the indexes that can be edited in one place when accessing **Locales > Application Language**.

An example of an index created by the Data Dictionary:

Label	<input type="text" value="{lang_login_user}"/>
	User

- Overwriting the indexes in the language files - On this option, you replace the existing indexes with new data based on the database.

Next, we can view a list of tables added to the repository data, where we can view a couple of information about these tables, as the name of the table of the database and the index created for each table, on the label field, and the version of the Data Dictionary of each field.

Dictionary tables Database tables

TABLE	LABEL	VERSION	
<input type="checkbox"/> ● account	<input type="text" value="{lang_tbl_account}"/>	1	Edit
<input type="checkbox"/> ● application_logs	<input type="text" value="{lang_tbl_application_logs}"/>	1	Edit
<input type="checkbox"/> ● bar_code	<input type="text" value="{lang_tbl_bar_code}"/>	1	Edit
<input type="checkbox"/> ● categories	<input type="text" value="{lang_tbl_categories}"/>	1	Edit
<input type="checkbox"/> ● ...	<input type="text" value="..."/>	1	Edit

The tables that not added can be viewed when accessing the **Dictionary tables**; the process of including these tables to the repository of data is the same.

When doing a modification to the structure of the database tables, the same should be updated using the option **SYNCHRONIZE DICTIONARY**.

Table status

Next to the name of the tables, there's an icon that indicates the status of the tables.

- Green - Indicates that the tables and the repository are updated.
- Red - Indicates that the tables don't exist in the database. In this case, you should delete it from the repository.
- Yellow - Indicates that the tables are not updated because of some modification in its structure. In these cases, you should click on the link **edit** referring to the table and click on update, so that the data of the repository could update.

Edit Tables

You can find it on the right side, in the list of tables.

TABLE	LABEL	VERSION	
<input type="checkbox"/> ● bar_code	<input type="text" value="{lang_tbl_bar_code}"/>	1	Edit

This option allows you to edit the fields from the chosen table, like the data types and the indexes created by the repository, for example.

FIELD	DATA TYPE	LABEL	LENGTH (DB)	DECIMALS	
<input checked="" type="checkbox"/> id	Number	<input type="text" value="{lang_bar_code_fid_id}"/>	<input type="text" value="0"/>	<input type="text" value="0"/>	<input type="button" value="⊕"/>
<input checked="" type="checkbox"/> codabar	Text	<input type="text" value="{lang_bar_code_fid_codabar}"/>	<input type="text" value="128"/>	<input type="text" value="0"/>	<input type="button" value="⊕"/>
<input checked="" type="checkbox"/> code11	Text	<input type="text" value="{lang_bar_code_fid_code11}"/>	<input type="text" value="128"/>	<input type="text" value="0"/>	<input type="button" value="⊕"/>
<input checked="" type="checkbox"/> code39	Text	<input type="text" value="{lang_bar_code_fid_code39}"/>	<input type="text" value="128"/>	<input type="text" value="0"/>	<input type="button" value="⊕"/>
<input checked="" type="checkbox"/> code39_ext	Text	<input type="text" value="{lang_bar_code_fid_code39_ext}"/>	<input type="text" value="128"/>	<input type="text" value="0"/>	<input type="button" value="⊕"/>
<input checked="" type="checkbox"/> code93	Text	<input type="text" value="{lang_bar_code_fid_code93}"/>	<input type="text" value="128"/>	<input type="text" value="0"/>	<input type="button" value="⊕"/>
<input checked="" type="checkbox"/> code128	Text	<input type="text" value="{lang_bar_code_fid_code128}"/>	<input type="text" value="128"/>	<input type="text" value="0"/>	<input type="button" value="⊕"/>
<input checked="" type="checkbox"/> ...	Text	<input type="text" value="..."/>	<input type="text" value="128"/>	<input type="text" value="0"/>	<input type="button" value="⊕"/>

Table: bar_code Version: 1

Other properties of the fields can be accessed when clicking the plus icon on the right side of the field list.

Mask	Help			

Syncing Dictionary

This option is activated when selecting one or more tables; on this option, you update the data dictionary according to the database.

ADD TABLES TO DICTIONARY

If your applications use multiple languages, Scriptcase can automatically create indexes for the application fields labels in the language files.

Generate indexes in language files with table field labels?

Overwrite language files indexes ?

When synchronizing the tables, a yellow icon is displayed on the side of the updated tables, [See how to remove it](#). In case of changing the structure of the tables, then you need to re-sync them again.

Synchronizing Applications

After doing all the desired configurations on the tables and fields, you need to sync the changes to the existing applications, so that the changes can be applied.

First, you need to select the tables that are synchronized.

SYNCHRONIZE APPLICATIONS

Select tables from the dictionary to update application fields and click **Next** to continue.

<input checked="" type="checkbox"/>	● bar_code	{lang_tbl_bar_code}	1	Edit
<input checked="" type="checkbox"/>	● categories	{lang_tbl_categories}	1	Edit
<input type="checkbox"/>	● city	{lang_tbl_city}	1	Edit

Next, you can define what happens and which applications suffer the modifications – a list of applications that received the changes based on the tables that they used.

SYNCHRONIZE APPLICATIONS

Display log
Back

Clicking to show the log, you can view all the modifications done, where it displays the previous state (blue) and the result of the modification (red)

Table: bar_code

Application: grid51

Field		Label	Label (search)
id	Before	id	id
	After	{lang_bar_code_fld_id}	{lang_bar_code_fld_id}
codabar	Before	Codabar	codabar
	After	{lang_bar_code_fld_codabar}	{lang_bar_code_fld_codabar}
code11	Before	Code 11	code11
	After	{lang_bar_code_fld_code11}	{lang_bar_code_fld_code11}

Clicking on **Back** You return to the Page of the definition of modifications.

To finish the process, click on close.

Editing the Data Dictionary Properties

On the top part, we can view the dictionary properties, informed when created.

Edit Data Dictionary: webhelp_dictionary

Description

Use schema before the table

Convert tables/fields to

Connection

Associate dictionary with connection

You have three possible actions, Edit, Reload, and Close.

- Edit - Allows you to change the properties data of the dictionary, like the modification of the connection used to associated with a repository, for example.

Edit Data Dictionary: webhelp_dictionary

Description

Use schema before the table

Convert tables/fields to

Connection

Associate dictionary with connection

- Reload - Updates all the information of the Data Dictionary, like the status of the table, for example.
- Close - Closes the current data dictionary, and you go to the list of the dictionary.

Editing Indexes

To edit the created indexes in the repository, access **Locales > Application Language**.

On the side panel, it is possible to view all the lang from ScriptCase. The langs referring to the data dictionary is in the folder **Project Messages**.

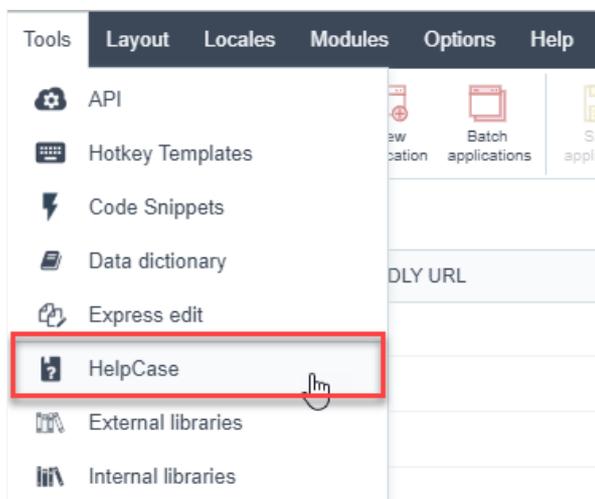

Index	 Portuguese/Português (Brasil)	 Spanish/Español	 English
 lang_balance	<input type="text" value="Saldo"/>	<input type="text" value="Saldo"/>	<input type="text" value="Balance"/>
 lang_birth	<input type="text" value="Nascimento"/>	<input type="text" value="Fecha de nacimiento"/>	<input type="text" value="Birth date"/>
 lang_code	<input type="text" value="Código"/>	<input type="text" value="Código"/>	<input type="text" value="Code"/>
 lang_contact	<input type="text" value="Contato"/>	<input type="text" value="Contacto"/>	<input type="text" value="Contact"/>
 lang_name	<input type="text" value="Nome"/>	<input type="text" value="Nombre"/>	<input type="text" value="Name"/>
 lang_pass	<input type="text" value="Senha"/>	<input type="text" value="Contraseña"/>	<input type="text" value="Password"/>

HelpCase

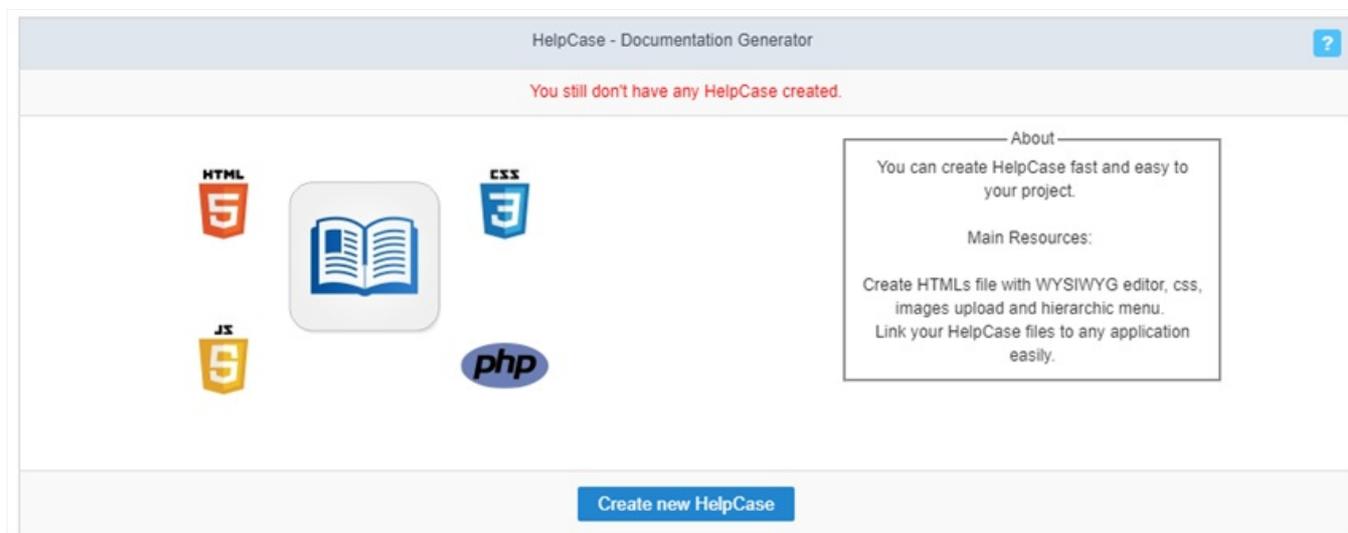

In this article, you learn how to create the documentation for your project using this integrated tool: HelpCase.

You find the HelpCase from the menu at **Tools > HelpCase**.

How to Create a HelpCase

The HelpCase creates HTML files with WYSIWYG editor, CSS, images upload, and hierarchic menu. You can also link HelpCase files to the applications you create within Scriptcase.

The first step to creating a document using the HelpCase is to enter a name and description.

 A screenshot of the 'HelpCase - Documentation Generator' form. The form has a light blue header with the title and a help icon. Below the header, there are two input fields: '* HelpCase Name' with the value 'webhelp' and 'Description' which is empty. At the bottom, there are two blue buttons: 'Create' and 'Cancel'.

After creating the HelpCase, you need to generate the content of the documented manual of the functionalities and description

of the project.

On the left side, in the block 'WebHelp,' you see the folder structure. Still, in this block, we can create the folders of the documentation.

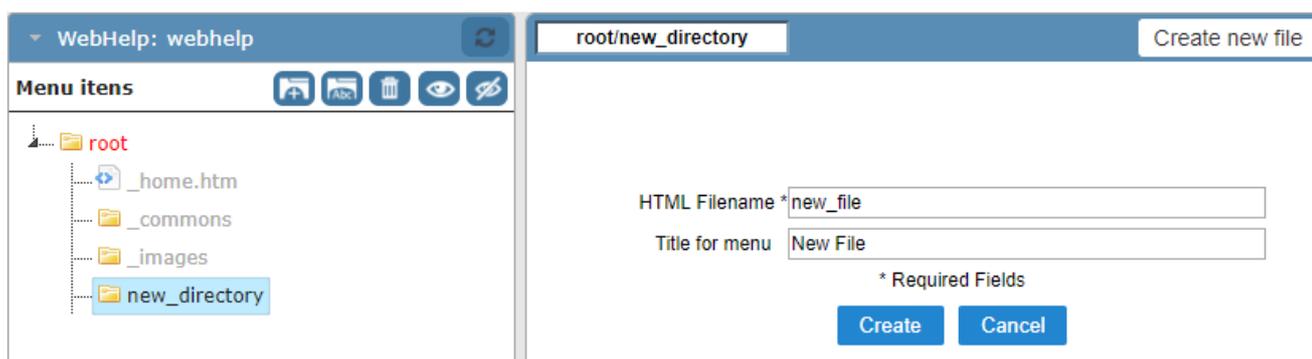

Select the root or any other folder on the side panel and click on the folder icon to create a folder in the select directory.

Inform the directory name (Special characters are not acceptable) and the display name in the documentation menu.

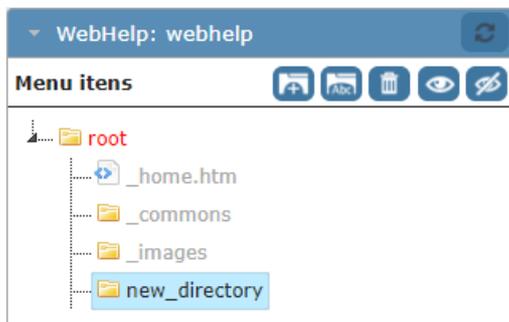

To create .html files, where you place your content, you need to select the directory where you place the files.

Inform the name of the file (Special characters are not acceptable) and the display name in the documentation menu.

Editing the HelpCase

When you select the folder, you see some options.

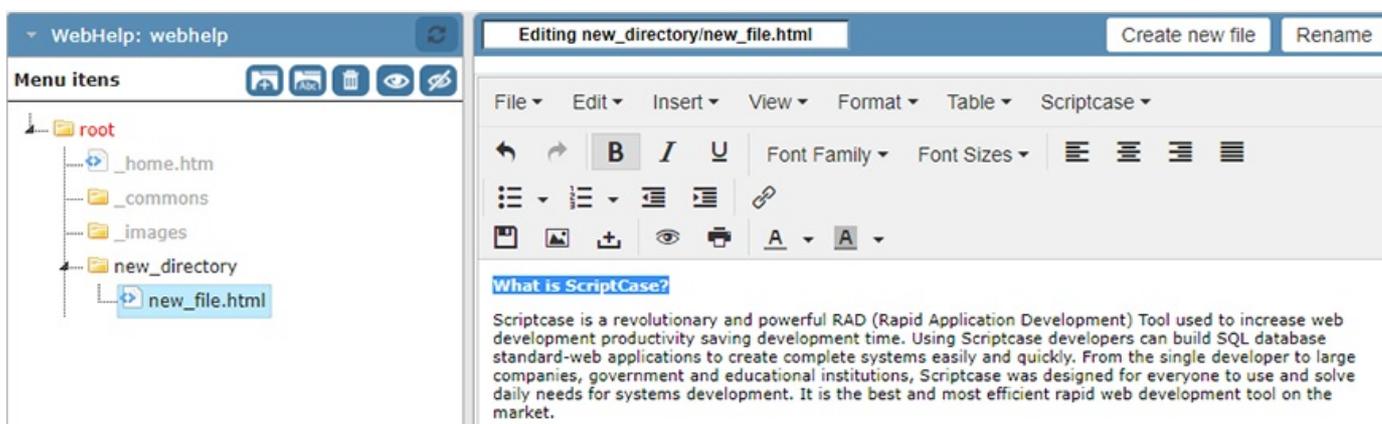

- **Icon (Folder with letters)** - Allows you to rename the archives and the display name for the menu.
- **Icon (Recycle Bin)** - Deletes the directory with all its content.
- **Icon (Eye)** - View the directory in the documentation menu.
- **Icon (Slashed Eye)** - Disable the view of the directory in the documentation menu.

After created, the files are displayed on the list when clicking on the created directory. Details about the files can be viewed, like the display title on the menu and its actual size, also other options like rename and delete.

- **View** - View the content of the file.
- **Edit** - Open the file to place your content in it.
- **Link** - Create a link between the file and the applications selected.
- **Copy** - Creates a copy of the file.
- **Rename** - Rename the file and it is display menu.
- **Delete** - Deletes the chosen file.

After the creation or clicking on edit a file, you can insert the content that will be displayed for the end user.

Upload

You can upload already created content or images to use in the manual. The upload of these files, can be done by clicking on the upload button, on the upload page you will see the supported formats and size limit of the files.

Upload File	
Allowed filetypes:	html, htm, shtml, shtm, jpg, jpeg, gif, png, bmp, txt, js
Upload Max Size:	512M (defined by PHP)
Select file:	<input type="button" value="Escolher arquivo"/> Nenhum arquivo selecionado
<input type="button" value="Ok"/> <input type="button" value="Cancel"/>	
*If this filename exists, it will be overwritten.	

General Settings

Settings

Allows you to setup some things, like the header display and the search tab.

Settings: Basic		
Settings	Value	Description
Use the new Helpcase generator	Yes ▾	It sets the style of the generated manual. The old helpcase settings does not support the new customization options. So once you switch to the new Helpcase you will overwrite your current style sheet and lose the changes you have made previously.
Display header	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled	It enables or disables the header display of the generated manual.
Display home button	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled	It enables or disables the Home button display in the generated manual.
Display search tab	<input checked="" type="radio"/> Enabled <input type="radio"/> Disabled	It enables or disables the search tab display of the generated manual.
Display breadcrumb navigation	<input type="radio"/> Enabled <input checked="" type="radio"/> Disabled	Enables or disables the function to show the breadcrumb navigation inside the manual
Navigation anchors	<input type="text"/>	Defines after which HTML tag the breadcrumb navigation will be created. The default is after the body tag, e.g. h1

Initial Page

Allows to write content of the initial page of the documentation. The modification can be done also when selecting the `_home.htm` file on the files panel.

View

Define a template to be used in the header of the manual, it is possible to edit or create new templates in the editor.

This editor can be accessed from the menu **Layout > HTML Templates**

Layout: View

Settings	Value
Header template	<div style="display: flex; align-items: center;"> <div style="border: 1px solid #ccc; padding: 2px 5px; margin-right: 5px;">default ▾</div> <div style="background-color: #4f81bd; color: white; padding: 2px 10px; border-radius: 3px; font-weight: bold; cursor: pointer;">Template editor</div> </div>
<div style="background-color: #4f81bd; color: white; padding: 5px 15px; border-radius: 3px; font-weight: bold; cursor: pointer; display: inline-block;">Save</div>	

Header

Allows to configure what will be displayed in the header.

Settings: Header

Description	Value	Description
Title	<input style="width: 80%;" type="text" value="WebHelp"/>	it sets the HTML "title" attribute value of the generated manual.
Logo	<input style="width: 80%;" type="text" value="scriptcase__NM__img__NM__sc_pure_trans.png"/>	It sets a logo image for the manual
Background color	<div style="background-color: black; width: 20px; height: 15px; display: inline-block;"></div>	It sets the background color of the generated manual, the default color is #333333
LIN1_COL1	<div style="border: 1px solid #ccc; padding: 2px 5px; display: inline-block;">Logo ▾</div>	It defines the value for header variables.
LIN1_COL2	<div style="border: 1px solid #ccc; padding: 2px 5px; display: inline-block;">▾</div>	It defines the value for header variables.
LIN1_COL3	<div style="border: 1px solid #ccc; padding: 2px 5px; display: inline-block;">▾</div>	It defines the value for header variables.

Save

CSS

Allows to modify the HelpCase CSS.

Theme default ▾

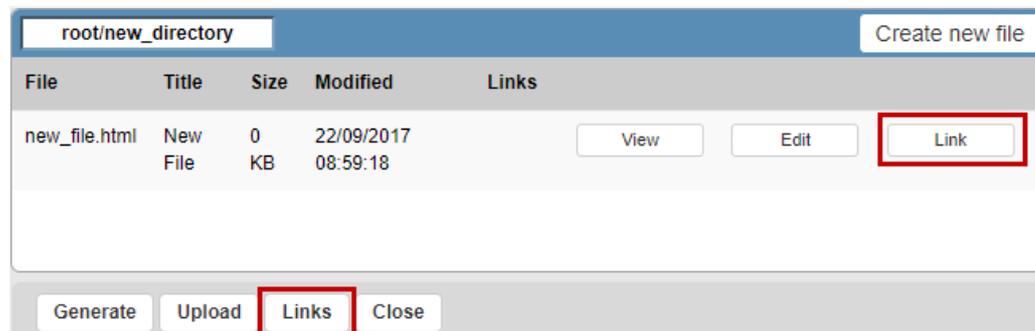

```

1 body{
2   background-color:#333;
3   margin:0;
4 }
5
6 a:hover { background: none; }
7
8 .btn_home {
9   position:absolute;
10  left:230px;
11  top:9px;
12 }
13
14 #abas{
15   font-family: Tahoma, Verdana, Geneva, Arial, Helvetica, sans-serif;
16   font-size: 13px; color:#000000;
17   vertical-align:text-top;
18 }
19 #id_bodyContent{
20   width:100%;
21   height:100%;
22   border-width:0;
23 }
```

After creating all the content and the configuration of the layout, you need to associate the create files with the applications, so that the end user can have access to the information that he needs in a quick way.

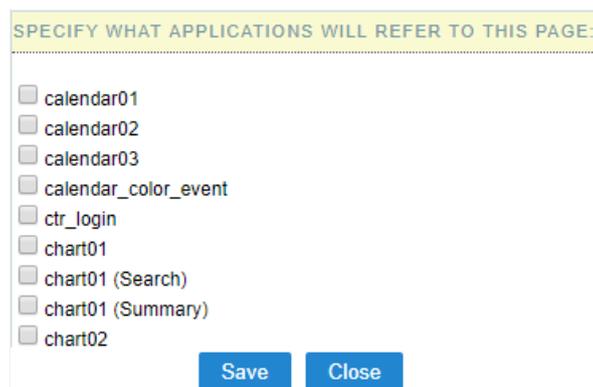

Associating Applications

You can start associating all the applications at once by clicking on **links**, or clicking on **link**, where you can associate only the chosen file to various applications.

Links

On this option, you will see a list of the applications, where you should select the applications that will be associated.

Link

Clicking on **link**, you will be presented a list of all the applications, in this case you need to select the files that will be associated for each application.

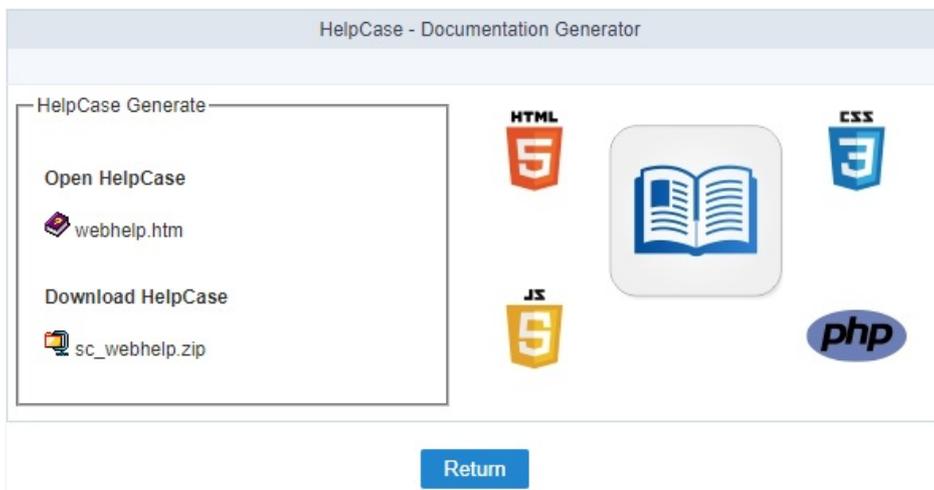

APPLICATION	DIRECTORY	DT. CREATING

			Summary: ▼

Generating Manual

Generating the manual is the last step of its creation, after doing all the configurations, click on **generate**.

After generating the manual, you can download or access it.

For you to have access to the manual from the applications, you need to click on the button **WebHelp** on the toolbar of the applications that have a link to the manual.

External Libraries

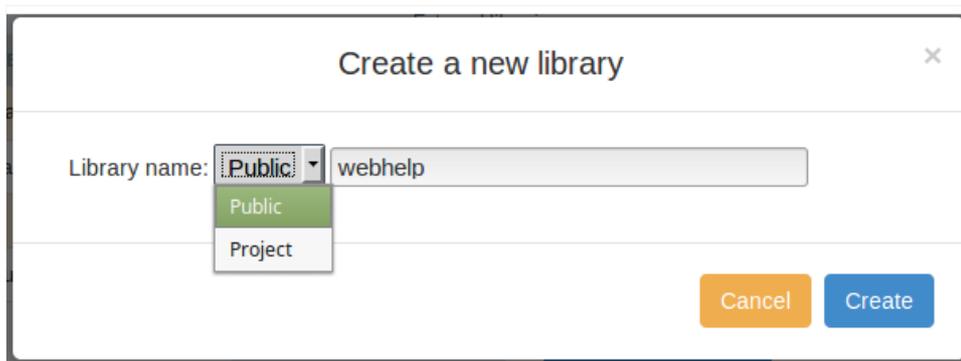

In this article, you learn how to use the External Library. This feature allows us to import complete libraries and create files of any extension (.JS, .CSS, .PHP...) to use in your projects, making it easier to reuse some of the source code and to bring external codes libraries to implement features to your applications.

You can find this option within the menu **Tools > External Libraries**, where you can manage the libraries of your project.

To use this functionality, you need to use the macro, `sc_url_library()` and the `sc_include_library()` (Only for PHP files) to import the library to the applications.

Creating a new library

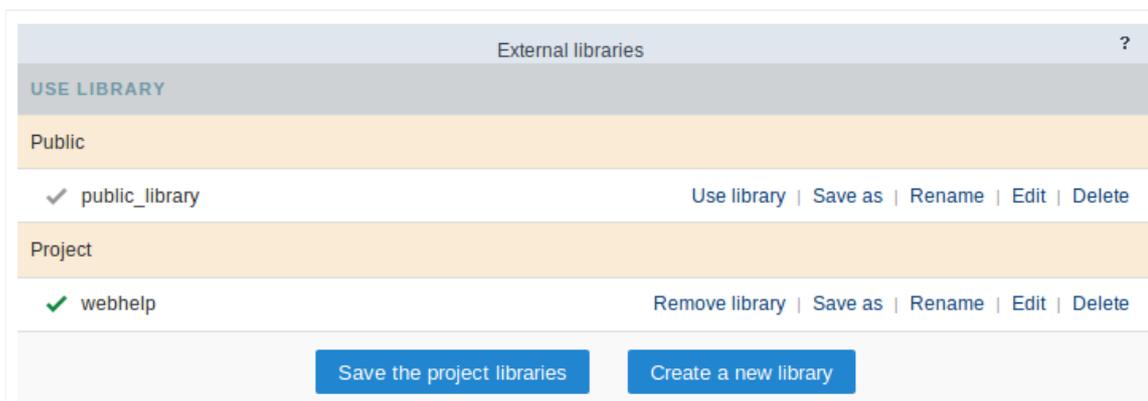

To create a library, click on **Create a new library**. Next, inform the library name and the access level of the library.

- **Public** - Available for all the ScriptCase projects.
- **Project** - Available only within the current project.

Managing the Libraries

All the public and project libraries are listed here. This page allows you to select the libraries that is part of the project, delete the unnecessary libraries, rename, or edit them.

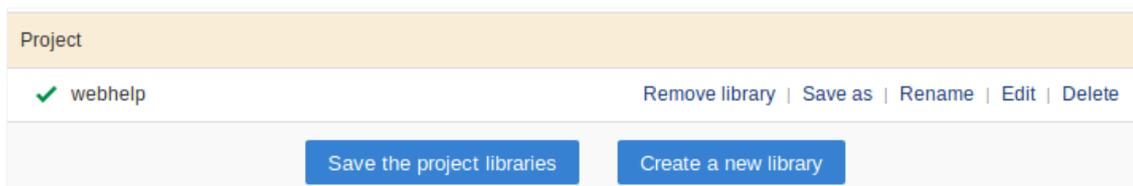

Using a Library

This option defines a library used in the current project. The enabled libraries, for this project, can be differentiated by the checkmark next to the name of the library.

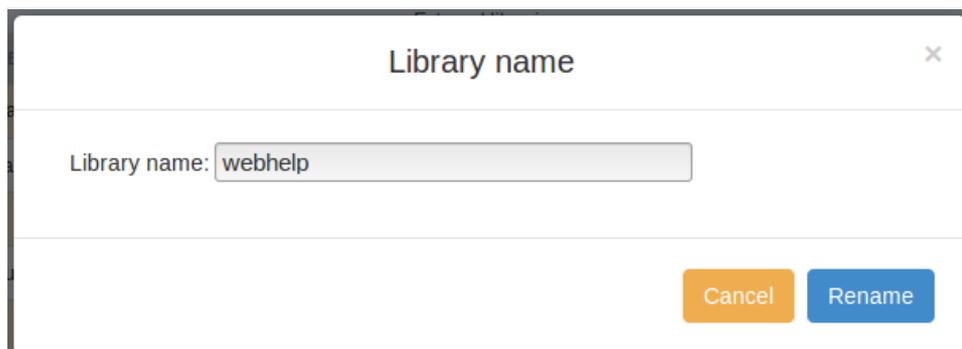

When you select a library to the project, the icon changes color when you click on the button “Save the library to the project” and enabled, you need to click on the button to save the modifications.

Rename

To rename a library, just click on “rename” and then inform the new name for the library.

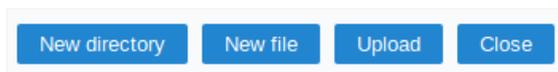

To rename a library, you will need to change all the includes of the library in the events of the applications.

Editing a Library

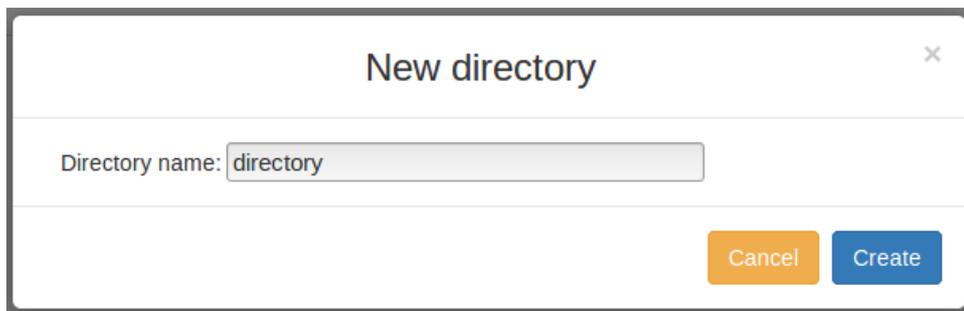

Clicking on “Editing”, you can create or upload files to the libraries. You can create files in a folder, with the goal to organize your files.

On Footer of the page, you can view the options to create or upload the files.

New Directory

To create a directory, click on “New Directory” and inform the name of the directory.

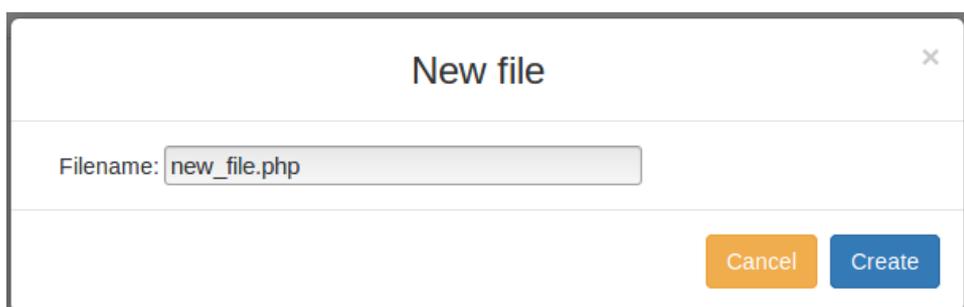

New directory

Directory name:

Cancel Create

New File

To create a file, click on “New File” and inform the name and extension (it is indispensable to inform the file extension).

New file

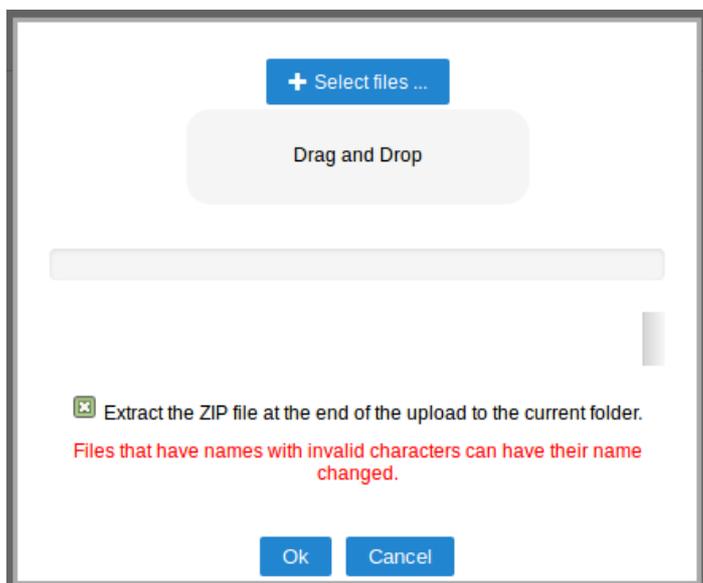

Filename:

Cancel Create

Upload Files

This tool allows to upload files and external libraries and used them in the project.

Clicking on upload, select the desired file.

+ Select files ...

Drag and Drop

Extract the ZIP file at the end of the upload to the current folder.

Files that have names with invalid characters can have their name changed.

Ok Cancel

Delete

Delete the libraries and all the files contained in them.

Before deleting the library, be sure that it is not being used, you will not be able to recover deleted libraries.

Importing libraries into the applications

Like mentioned before, to use the libraries, you need to use the macro `sc_url_library()` and the `sc_include_library()` (Only for PHP files).

The macro `sc_url_library()` returns the path to the file in the library and the `sc_include_library()` is used to include php files into applications from the external library:

```
onScriptInit
Theme default
1 ?>
2 <link rel="stylesheet" type="text/css" href="<?php echo sc_url_library('prj', 'webhelp',
3 'directory/style.css');?>">
4 <?PHP
```

This example changes the background color of a grid application, if the code in the style.css file

```
1 .scGridPage
2 {
3     background-color: #1c6f16 !important;
4 }
```

Internal Libraries

This tool allows to create or upload PHP routines that can be reused in various applications of the project or other projects, depending on the level of access that they were saved.

There are three types of access levels that can be used.

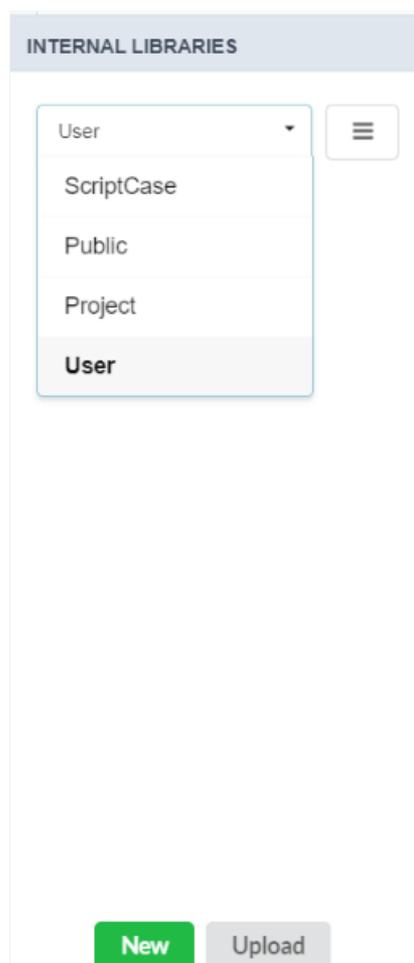

- **User** - Only for the user that created the script will have access.
- **Project** - All the users linked to the project will have access to the script.
- **Public** - All the users from ScriptCase will have access to the script.

You can't create or modify scriptcase that are in the Scriptcase Level, the scripts from this level are available to be used but not modified.

Creating a Script

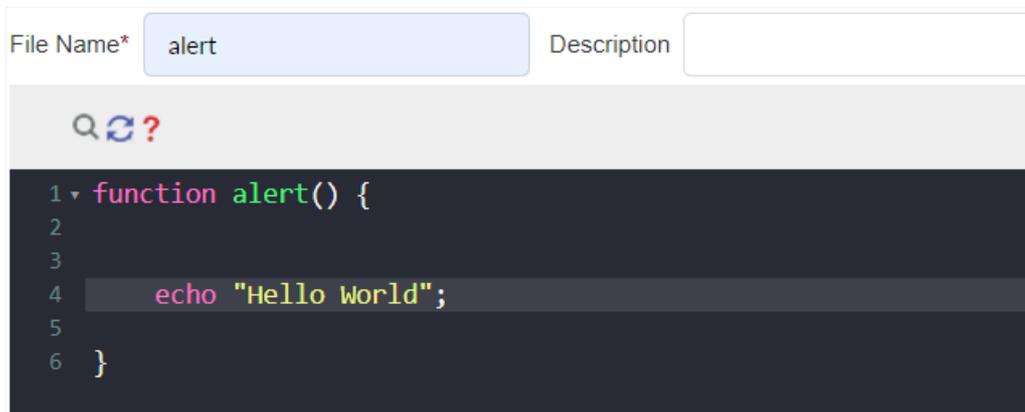

The item **Internal Libraries** are accessed from the tools menu.

Select the level that the script is being saved, in this example the user level was used.

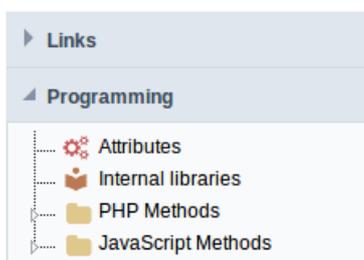

The screenshot shows a web interface titled "INTERNAL LIBRARIES". At the top left, there is a dropdown menu currently displaying "User". Below the dropdown, a list of options is visible: "ScriptCase", "Public", "Project", and "User". The "User" option is highlighted with a grey background. To the right of the dropdown is a hamburger menu icon. At the bottom of the interface, there are two buttons: a green "New" button and a grey "Upload" button.

Next, inform a name for the file, place your code and save it.

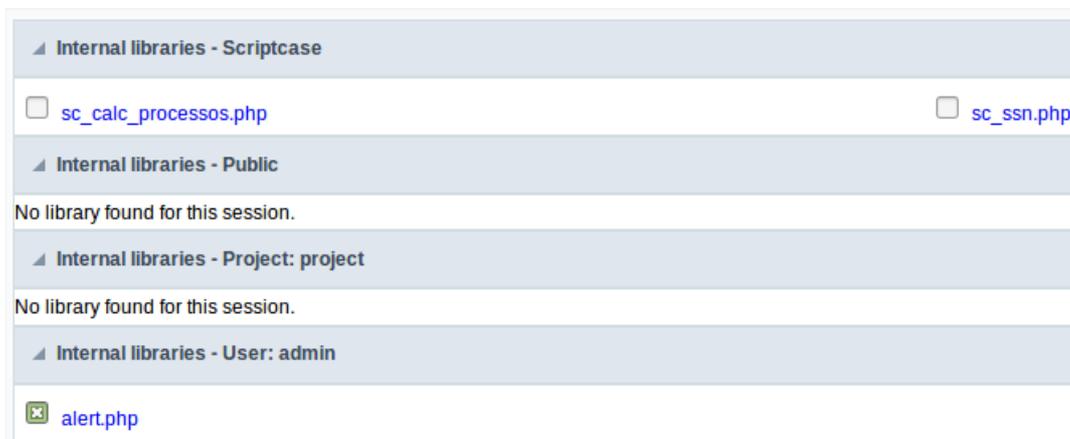

Using the Script

To use the Scripts, firstly you need to enable them in the applications that you want to use.

All the libraries that you have access will be listed, just select the the ones you desire to enable and use them.

To use the libraries, you need to import them by using the macro `sc_include`.

Example of using the macro: `sc_include("File", "Origin");`

To-Do List

Tool that allows the creation of a list of tasks for the users registered in the same ScriptCase, with a progress control for the task.

A message that will always be displayed when the users that possess a task pending login.

To access the feature, go to the menu **Tools > To-Do List**

Accessing it, you will see all the registered tasks with the information about each one of them.

Task list	Application	Owner	Responsible	Percentage done	Deadline	Options
Task 3 - Project		admin	admin	0%	01/31/2018 00:00	Edit Delete
Task 2		admin	admin	0%	01/31/2018 00:00	Edit Delete
Task 1		admin	admin	0%	01/31/2018 00:00	Edit Delete

Creating a Task

The tasks can be created in four levels.

- **Public List** - All the ScriptCase users can view the tasks of the this level.
- **My List** - Only the Creator and the user responsible for the task can view.
- **Project: Public List** - All the users of ScriptCase, linked to the project that the task was created can view them. (This option is available only when a project is opened)
- **Project: My List** - Only the Creator and the Responsible user can view this task, they need to have access to the project where the task was created. (This option is available only when a project is opened)

Firstly, you need to select where you are going to create the task. Selecting the folder, the “New Task” button will be enabled.

NEW TASK

*Task list

Percentage done

*Deadline

Responsible

Who can change

Application

Changes in the dashboard application

Next, after clicking on “New Task”, you need to fill up the required fields.

- **Task list** - Name of the task, which will be displayed in the Task list.
- **Percentage done** - Inform the percentage of the task conclusion.

- **Deadline** - Define the date and time that the task need to be concluded.
- **Responsible** - Define which of the ScriptCase users are responsible for the task.
- **Who can change** - Defines who can modify the current task:
 - **Owner** - Only the user that created the task.
 - **Responsible** - Only the user responsible for the task.
 - **All** - All the ScriptCase users can modify the task.
- **Application** - Inform the application of the project that the responsible user needs to edit. (This option will only be available for task created in a project.)
- **Description** - Task Description.

Task Status

This tool is used to inform the status of the task, using colors to symbolize the progress.

- Open tasks - Tasks recently created within the deadline, are represented in yellow.
- Completed tasks - Tasks that finished completely, are represented in blue.
- Expired tasks - Tasks that passed the deadline, are represented in red.

The screenshot displays a task management interface. On the left, there is a sidebar with navigation options: 'All' (highlighted in blue), 'Public List', 'My List', 'Project: Public List', and 'Project: My List'. Below these are three checkboxes: 'Open tasks' (unchecked), 'Completed tasks' (checked), and 'Expired tasks' (unchecked). On the right, a 'Task list' panel shows a list of tasks: 'New Task', 'Task 3 - Project' (highlighted in blue with a checkmark icon), 'Task 1', and 'Task 2' (highlighted in red).

Messages

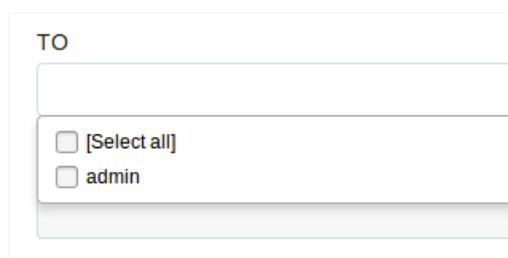

The message system allows the communication between the registered developers on the same ScriptCase.

You can access this feature. **Tools > Messages**.

New Message

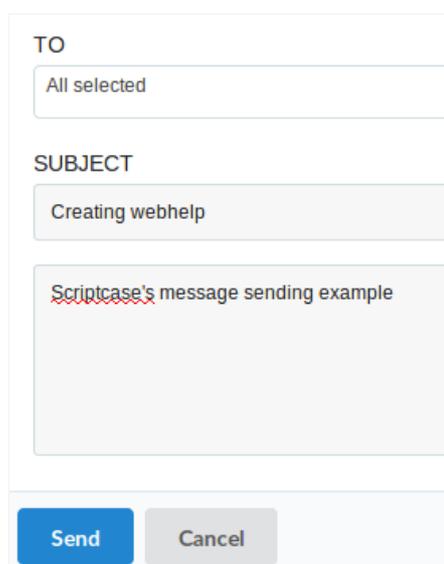

After clicking on the New Message button, you need to select the user that is going to receive the message.

One message can be sent to many users.

The screenshot shows the 'TO' field of a message creation form. It contains a text input field with a dropdown menu open below it. The dropdown menu has two options: '[Select all]' and 'admin', each with an unchecked checkbox to its left.

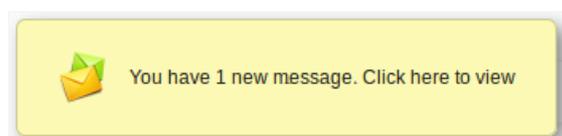

After typing the message, click on send.

The screenshot shows the complete message creation form. It has three main sections: 'TO', 'SUBJECT', and a message body. The 'TO' field contains 'All selected'. The 'SUBJECT' field contains 'Creating webhelp'. The message body contains 'Scriptcase's message sending example'. At the bottom, there are two buttons: 'Send' (blue) and 'Cancel' (grey).

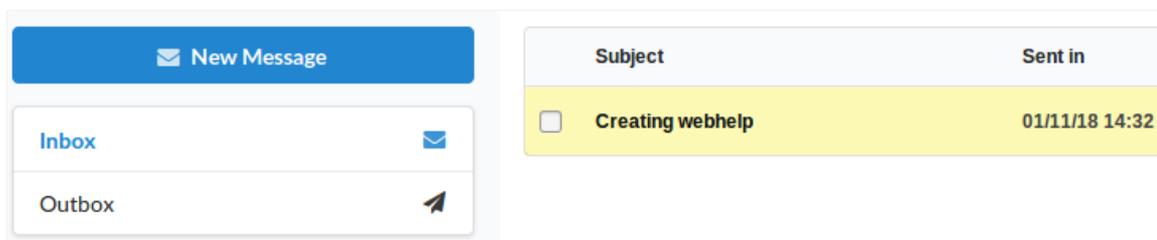

Inbox

Receiving the message, the users will be notified by an alert.

You can click on the notification bell or access **Tools > Message** to view the received messages.

Accessing the inbox where all the received messages are stored and ordered by the date.

Outbox

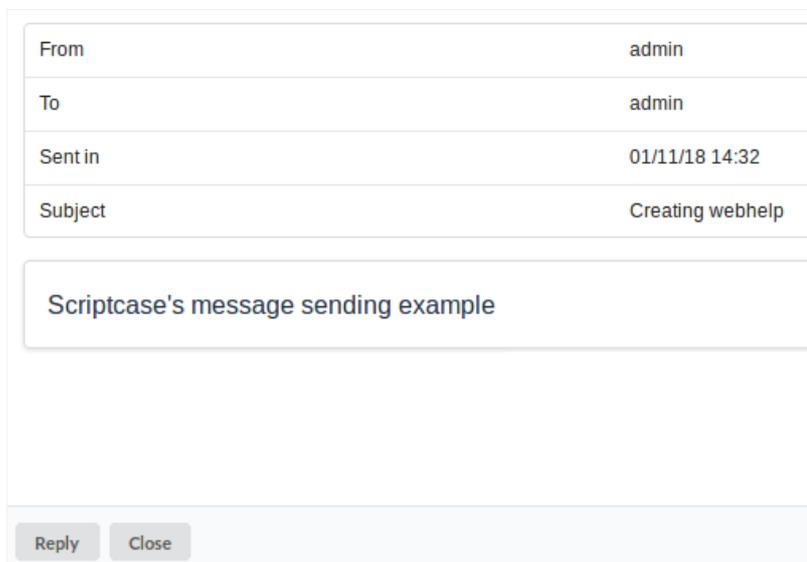

The sent messages are stored in the outbox.

By sending a message to various users, it will be registered a message for each user in the outbox.

	Subject	Sent in	From	To

Converters

Project Converters

The Project Converter allows to convert the projects developed in previous versions of Scriptcase to the current version of Scriptcase.

Basically it is an import of the projects from different versions of Scriptcase.

The process of conversion does not modify any of the information of your project.

To prevent eventual problems, it is recommend to create a backup of your projects.

The project's conversion works the same way for all Scriptcase versions.

Coping Scriptcase

If your Scriptcase is not installed in the same place of your Scriptcase 9 you need to copy the Scriptcase folder, of the previous version, nexto to the current ScriptCase folder that will receive the projects.

In this example:

- **Scriptcase 8 folder** - Old version of the tool.
- **Scriptcase 9 folder** - Version that will receive all the projects.

scriptcase	15/01/2018 16:07
scriptcase8	15/01/2018 16:15
favicon.ico	05/11/2013 12:25
index.php	05/11/2013 12:25
robots.txt	05/11/2013 12:25

Coping the Scriptcase 8 folder to the same place

Path to Scriptcase

In Scriptcase select the converter (compatible to the version that you want to convert), and inform the complete path to the folder of the old version.

If your Scriptcase 9 is installed in the same place of your old version you can inform the complete path where your old version is installed.

- **Ex1:** /opt/NetMake/v9/wwwroot/scriptcase
- **Ex2:** C:\Program Files(x86)\NetMake\v81\wwwroot\scriptcase

Migrating Scriptcase projects to version 9

SCRIPTCASE VERSION 8 PATH

Scriptcase 8 Path

Next
Exit

Important!

- If the Scriptcase 8 is installed on the same computer you just inform the complete directory path, if not, you will need to copy the folder Scriptcase 8 to Scriptcase 9 wwwroot folder. Remember to change the folder name to scriptcase8, for example.
- The conversion process will copy and convert all projects, applications, schema, data dictionary, languages, and etc, to work fully in version 9. This process does not change in any moment the previous version projects.

Check out the tutorial for project conversion:

Database Convert

Allows you to convert one or more data sources to one structured database. You can convert the stored tables in .XLS, .CSV, .accdb and .mdb files to the following databases: **MySQL**, **PostgreSQL**, **SQLite** and **SQL Server**.

You can find all the options to import databases in the menu **Database**.

Access Import

Selecting Files

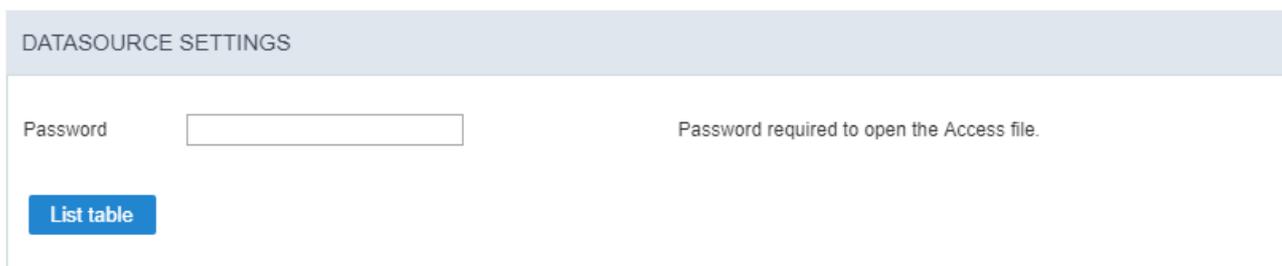

First, select the files that will be converted. You can inform the absolute path to the file, drag and drop the file or select the file in the option **Select Files**.

!m[Selecting an access file to convert the tables](#)

Configuring the tables

After selecting the file, you will need to access the configuration page.

On this page, you will see the password field, that is only used with **Access** files that were selected and require a password to list the tables. In these cases, after informing the password, click on **list tables**.

A screenshot of a web form titled 'DATASOURCE SETTINGS'. It features a 'Password' label followed by an empty text input field. To the right of the input field, there is a note: 'Password required to open the Access file.' Below the input field, there is a blue button labeled 'List table'.

Still in the same page, you can view the tabs **Tables** and **Advanced**.

Tables	Options
C:/Program Files/NetMake/v9/wwwroot/scriptcase/tmp/sc_tmp_upload_05h3q410cibflok12vcvb4t77/sc_finances.mdb	
<input checked="" type="checkbox"/> accounts	Edit Preview
<input checked="" type="checkbox"/> categories	Edit Preview
<input checked="" type="checkbox"/> planning_goals	Edit Preview
<input checked="" type="checkbox"/> planning_goals_type	Edit Preview
<input checked="" type="checkbox"/> sec_users	Edit Preview
<input checked="" type="checkbox"/> transaction_types	Edit Preview
<input checked="" type="checkbox"/> transactions_account	Edit Preview
<input checked="" type="checkbox"/> user_account	Edit Preview

Table Tabs

We can view a list of the tables that can be converted. Beside the name of the tables, are two options: Edit and Preview.

On the option **Edit**, you can modify the table structure that will be created, like the name, field size, and the data type and other options.

Table Definition: accounts									
			Foreign Keys		Unique Keys				
Table Name <input type="text" value="accounts"/>									
Source				Target					
Field	SQL Type	Size	Field	SQL Type	Size	Not null	PK	AI	
<input checked="" type="checkbox"/> account_id	integer	4	<input type="text" value="account_id"/>	integer ▾	<input type="text" value="4"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
<input checked="" type="checkbox"/> account_desc	varchar	45	<input type="text" value="account_desc"/>	varchar ▾	<input type="text" value="45"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	
<input type="button" value="Cancel"/> <input type="button" value="Save"/>									

in **Preview** you will see a preview of how the table will be imported.

Preview: **accounts**

Open SQL Builder Open Database Builder Close

SQL Builder

This tool helps the construction of Queries in a Wizard form. These queries can be saved for later use. Any SQL can run directly on the [Run](#) tab that is displayed after the database is chosen.

Database

Firstly you need to select the connection(Database) that you want to use. **It is important that you must have a [connection](#) created in the project for it to be listed in SQL Builder.**

The screenshot shows the 'SQL BUILDER' interface. At the top, there are three tabs: 'Database', 'Tables', and 'Fields'. The 'Database' tab is selected. Below the tabs, the text 'Choose the database:' is displayed. Underneath, there is a radio button next to the text 'conn_mysql'. At the bottom of the form, there is a blue button labeled 'Confirm'.

After selecting the desired connection, click the **Confirm** button to use this connection.

WARNING: The SQL Builder does not parse SQL, only receives the SQL Query informed by the user and executes it. So, if you use PDO drivers, only these are enabled: **PDO_DBLIB, PDO_MYSQL, PDO_PGSQL, PDO_SQLITE**. If you use a driver other than one of these listed, you may be returned with the “**BAD GETCOLUMNMETA()**” error in the column titles.

Go to

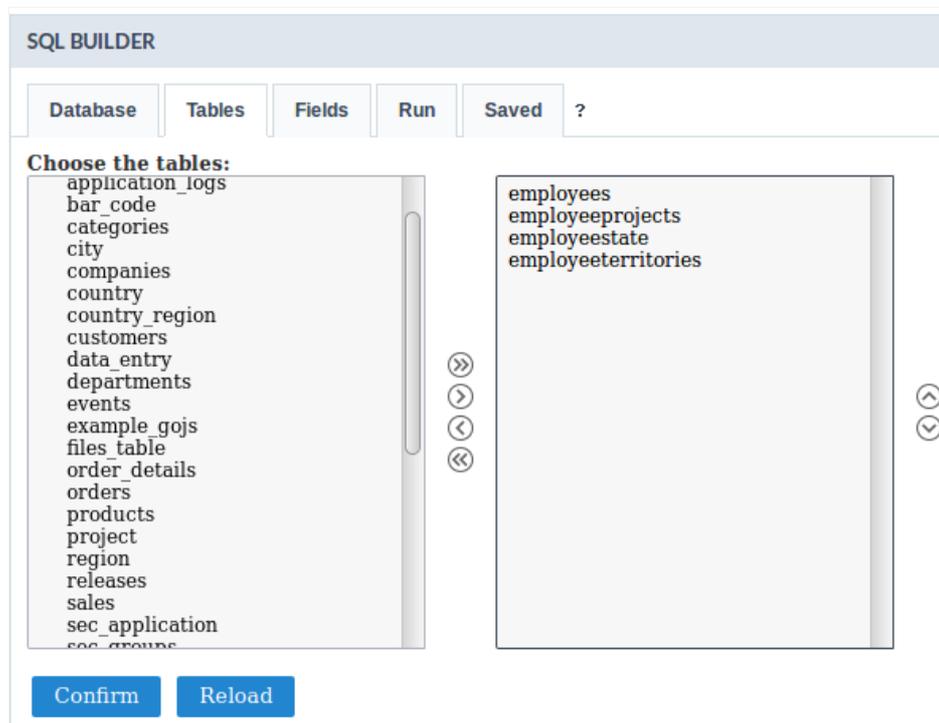

[PHP page](#)

for more information.

Tables

All the existing tables in the database are listed in the **Tables** tab. You can select various tables, although they need to have a relationship between them.

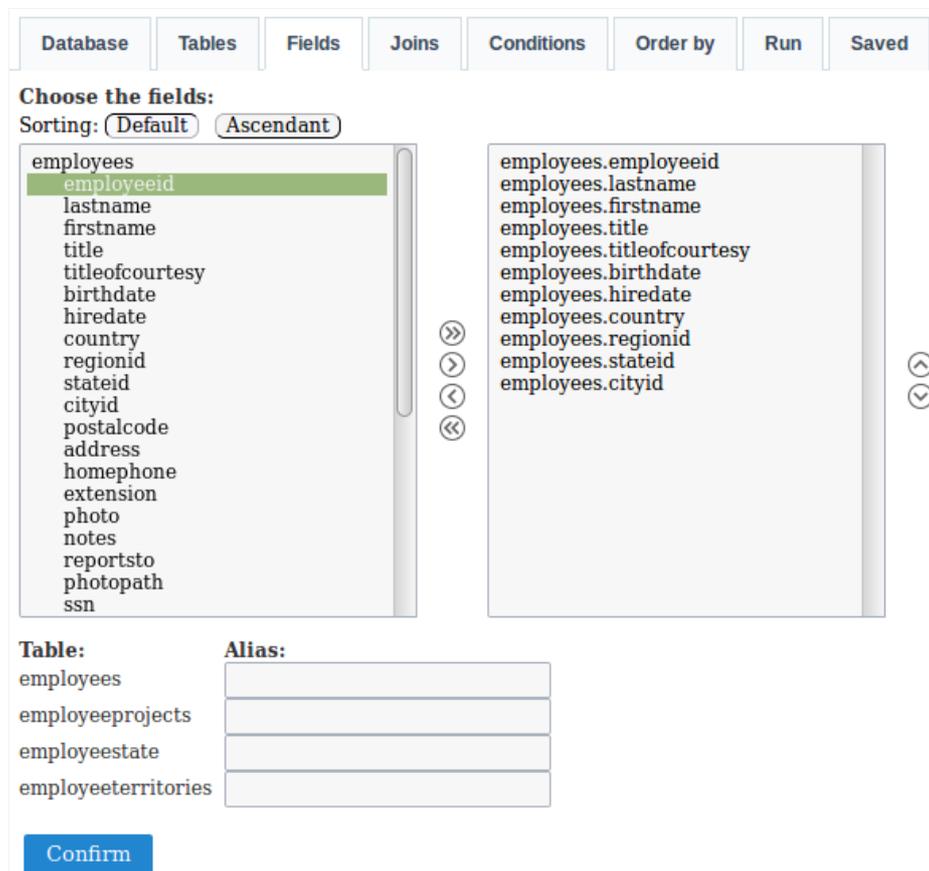

Select the desired tables to create the query.

After selecting the tables, click the **Confirm** button to use this connection.

Fields

Select the fields that will be part of the query. The fields can be ordered alphabetically (Ascendant) or in the order that they were created (Default)

It is possible to create an **alias** for the selected tables, this option can be found below the field list were also all the selected tables will be listed.

Joins

Defining the fields, it is necessary to configure the join. To do that, you need to select the tables that have a relationship, next you will select the type of join that will be used in the field **Type** then click on Add.

Table 1	Type	Table 2
employees employeeprojects employeeestate employeeeterritories		employees employeeprojects employeeestate employeeeterritories

employees Inner (=) employeeprojec
 employees Inner (=) employeeestate

After clicking on add, click on **Confirm**, so that you can inform the fields that do the relationship between the tables.

Database	Tables	Fields	Joins	Conditions
Relationships				
employees	employeeprojects			
<input checked="" type="checkbox"/>	employeeid	employeeid		
<input type="checkbox"/>				
Relationships				
employees	employeeestate			
<input checked="" type="checkbox"/>	employeeid	employeeid		
<input type="checkbox"/>	extension			

Defining the fields, you will be redirected to the run tab.

To add a "WHERE" clause to the SQL, click on the tab **Conditions**

Conditions

You can add the "WHERE" clauses where the query was created.

Database	Tables	Fields	Joins	Conditions
Conditions:				
<input checked="" type="checkbox"/>		employeeid	>	5
<input type="checkbox"/>	AND		=	
<input type="checkbox"/>	AND		=	
<input type="checkbox"/>	AND		=	
<input type="checkbox"/>	AND		=	
<input type="button" value="Confirm"/>				

Order By

Define the sorting of the query result display.

Database	Tables	Fields	Joins
Order by:			
<input checked="" type="checkbox"/>	employeeid	ASC	
<input type="checkbox"/>		ASC	
<input type="button" value="Confirm"/>			

Run

This is where you can run the SQL commands. The result of the query configuration wizard will be displayed on this tab. You can run DML (Data Manipulation Language) commands here and also DDL (Definition Data Language) commands.

```

1 SELECT
2     employees.employeeid,
3     employees.lastname,
4     employees.firstname,
5     employees.title,
6     employees.titleofcourtesy,
7     employees.birthdate,
8     employees.hiredate,
9     employees.country,
10    employees.regionid,
11    employees.stateid,
12    employees.cityid
13 FROM
14     employeeterritories,
15     employees INNER JOIN employeeprojects ON employees.employeeid = employeeprojects.employeeid
16     INNER JOIN employeestate ON employees.employeeid = employeestate.employeeid
17 WHERE
18     (employees.employeeid > '5')
19 ORDER BY
20     employees.employeeid

```

Position:	Ln 1, Ch 1	Total:	Ln 20, Ch 518
-----------	------------	--------	---------------

Record limit per page (100 max)

You can define a total of records per page.

employeeid	lastname	firstname	title
1	Davolio	Nancy	Sales Representative
2	Fuller	Andrew	Vice President, Sales

Save statement as: [Save](#)

Database Builder

This is a tool that allows the management of your database into ScriptCase. This tool is available to connections with: MySQL, SQLServer(Cannot be ODBC), SQLite, Oracle and PostgreSQL.

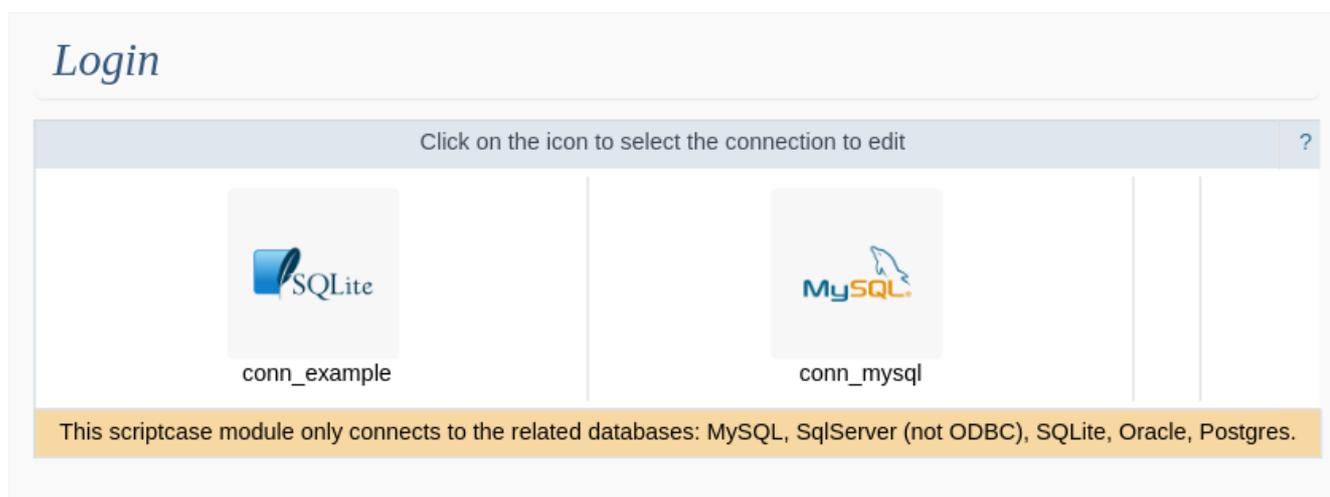

In the beginning we must select an existing connection in the project.

This tool can be accessed in the menu **Database**.

The options and settings on the Database Builder depends of the user database privileges and the used database.

Accessing the Database Builder

First, select the database connection that we wish to display.

Next step, we will go to the home screen from Database Builder, where we can access all the available functionalities.

Database: samples

[Alter database](#) [Database schema](#) [Privileges](#)

Tables and views

Search data in tables (61)

<input type="checkbox"/>	Table	Engine [?]	Collation	Data Length [?]	Index Length [?]	Data Free [?]	Auto Increment [?]	Rows [?]
<input type="checkbox"/>	account	InnoDB	utf8_general_ci	16,384	0	0	16	~ 14
<input type="checkbox"/>	application_logs	InnoDB	utf8_general_ci	81,920	0	0	925	~ 924
<input type="checkbox"/>	assinatura	InnoDB	utf8_general_ci	16,384	0	0	5	~ 4
<input type="checkbox"/>	bar_code	InnoDB	utf8_general_ci	16,384	0	0	2	0

At the screen left corner, we will see a few functionalities and the table list, to a quickly access of the selected database.

DB

Allows see the database that is being accessed in the moment. Here we can change the database.

To the databases which possess user access restriction, it is necessary that the user set in the connection creation has access to all the databases

SQL Commands

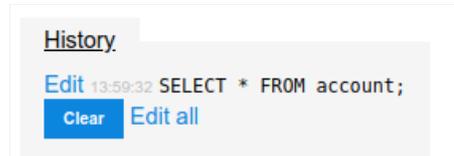

Allows to execute any SQL command, from a select command to procedure commands of creation and execution, for example.

In this case, we will execute a simple SELECT.

The screenshot shows a web interface for executing SQL commands. At the top, there is a breadcrumb trail: [MySQL](#) » [192.168.254.84:3357](#) » [samples](#) » [SQL command](#). Below this, the title "SQL command" is displayed in a large, bold, blue font. Underneath the title is a text input field containing the SQL command: `SELECT * FROM account`. Below the input field, there is a blue "Execute" button, a "Limit rows:" label followed by an empty input field, and two checkboxes: "Stop on error" and "Show only errors", both of which are currently unchecked.

Below the code insertion area, we can see a history of commands that were executed.

The screenshot shows a "History" section with a light gray background. At the top, the word "History" is underlined. Below it, there is a blue "Edit" button followed by the text "13:59:32 SELECT * FROM account;". At the bottom of the history entry, there are two blue buttons: "Clear" and "Edit all".

If everything goes well, when runs the command, will be showed the consult result, with the [edição dos registros](#) possibility.

```
SELECT * FROM account
```

accountid	accountdescription
1	OFFICE EQUIPMENT
2	FIXED TELEPHONY
3	MOBILE TELEPHONE
4	SOFTWARE
5	SERVICE ADVISOR
6	MAIL
7	CROSSING AIR
8	TAXI
9	TIKET MEAL
10	ELECTRICAL ENERGY
11	WATER
12	RENTAL
13	LODGING
14	HARDWARE

-1 rows (0.005 s) [Edit](#), [Explain](#), [Export](#)

Below of the displayed result, we will see a summary of the used tables in the SQL, informing the number of lines, the quantity of id fields and other informations, even the executed SQL.

17 rows (0.001 s) [Edit](#), [Explain](#), [Export](#)

id?	select_type?	table?	partitions?	type?
1	SIMPLE	account	NULL	ALL

```
SELECT * FROM account
```

To return to the database builder home screen, select the table in the 'breadcrumb' in the page top.

Import Files

Allows you to execute .SQL files.

Import

File upload

SQL (< 2MB): No file chosen

From server

Webserver file adminer.sql [.gz]

Stop on error Show only errors

Export Tables

Enables the creation of a dump in the database.

Export: samples

Output open save gzip

Format SQL CSV CSV; TSV

Database Routines Events

Tables Auto Increment Triggers

Data

Export

<input checked="" type="checkbox"/> Tables	Data <input checked="" type="checkbox"/>
<input checked="" type="checkbox"/> account	~ 17 <input checked="" type="checkbox"/>
<input checked="" type="checkbox"/> application_logs	~ 114 <input checked="" type="checkbox"/>
<input checked="" type="checkbox"/> bar_code	0 <input checked="" type="checkbox"/>
<input checked="" type="checkbox"/> categories	~ 8 <input checked="" type="checkbox"/>
<input checked="" type="checkbox"/> city	~ 2,207 <input checked="" type="checkbox"/>

We must review the default settings of the exportation, for that we can change them and format according with our necessities.

- Output - Actions around the exportation.
 - Open - Display all the generated SQL inside the ScriptCase.
 - Save - Generates a `.sql` file.
 - gzip - Generates a `.sql.gz` file.
- Format - Format of the created file.
- Database - Defines the commands utilization referring at the database creation.
- Tables - Defines the commands utilization referring at the database creation.
- Data - Defines the commands utilization at the data insertion.

Create Tables

Enables the tables creation through of a simple and intuitive interface, where we can create them quickly.

MySQL » 192.168.254.84:3357 » samples » Create table

Create table

Table name: (engine) (collation)

Column name	Type	Length	Options	NULL	AI?	+
<input type="text" value="id"/>	int	<input type="text"/>		<input type="checkbox"/>	<input checked="" type="radio"/>	+ ↑ ↓ ×
<input type="text" value="name"/>	varchar	255	(collation)	<input type="checkbox"/>	<input type="radio"/>	+ ↑ ↓ ×
<input type="text"/>	int	<input type="text"/>		<input type="checkbox"/>	<input type="radio"/>	+ ↑ ↓ ×

Auto Increment: Default values Comment

Database Change

Enables change the database name, your default collation or delete the database.

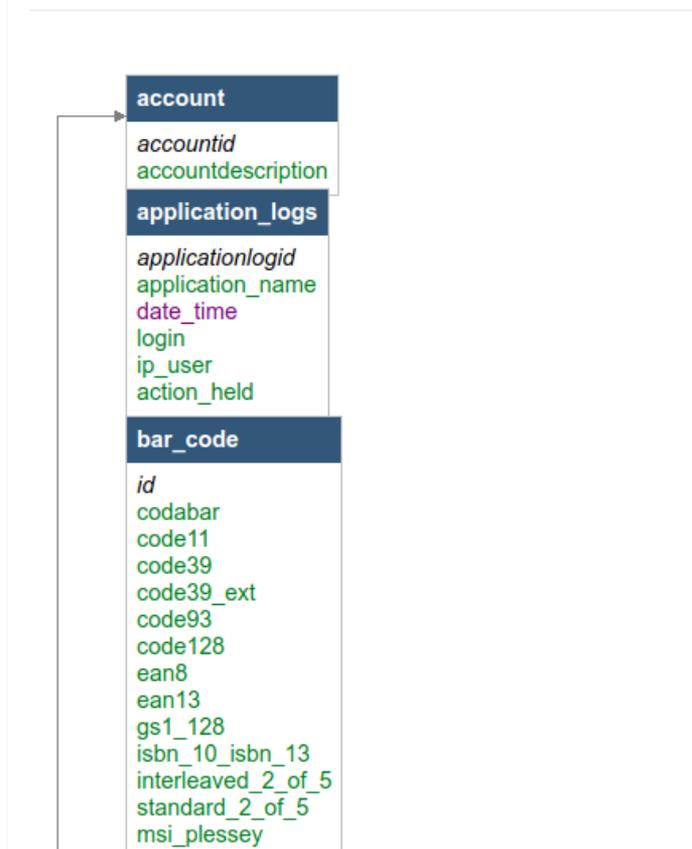

Alter database: samples

utf8_general_ci

Database Schema

Display a relationship diagram of the database tables.

Database schema: samples

Privileges

Edit the users privileges to the current database.

Server:

Username:

Password: Hashed

Privileges?

All privileges	<input type="checkbox"/>
Grant option	<input type="checkbox"/>
Server Create user	
Server Event	
Server Process	
Server Proxy	
Server Reload	
Server Replication client	
Server Replication slave	
Server Show databases	
Server Shutdown	

Create View

Enables a quickly creation of a view, where we must inform only the name and the select that will be used in the view.

Create view

Name:

```
SELECT
accountid,
accountdescription
FROM
account
```

[Save](#)

After save, we can see the command executed and the structure of the created view.

View: view_webhelp

View has been created. 15:06:48 [SQL command](#)

[Select data](#)
[Show structure](#)
[Alter view](#)
[New item](#)

Column	Type	Comment
accountid	int(11) [0]	
accountdescription	varchar(100) NULL	

All the created views can be displayed together the database tables.

<input type="checkbox"/>	tasks	MyISAM	utf8_general_ci
<input type="checkbox"/>	territories	InnoDB	utf8_general_ci
<input type="checkbox"/>	view_webhelp	View	

Create Procedure

This functionality makes the procedure creation more easily. The parameters must be informed like in the example below, where we obligatory must inform the parameter type (input and/or output), your name, the data type that will receive or return and your size.

Name: [Save](#)

	Parameter name	Type	Length
IN ▼	<input type="text" value="id"/>	int ▼	<input type="text"/>
IN ▼	<input type="text"/>	tinyint ▼	<input type="text"/>

```
SELECT * FROM view_webhelp LIMIT id
```

[Save](#)

The executed command will be displayed.

MySQL » 192.168.254.84:3357 » Database: samples

Database: samples

Routine has been created. 15:19:30 [SQL command](#)

[Alter database](#) [Database schema](#) [Privileges](#)

All the created procedures can be visualized below the table and view list.

Routines

Name	Type	Return type
procedure_webhelp	PROCEDURE	Alter

[Create procedure](#) [Create function](#)

Executing a Procedure

There are two ways to execute a procedure inside the database builder.

At visualize the procedure and functions list, we can click in their name. We will be redirect to the procedure call, where we must inform the input parameter(in case that procedure possess).

MySQL » 192.168.254.84:3357 » samples » Call: procedure_webhelp

Call: procedure_webhelp

id

After that, will be displayed the result of the procedure execution and the used SQL for that.

CALL `procedure_webhelp` ('3')

(0.001 s) [Edit](#)

accountid	accountdescription
1	OFFICE EQUIPMENT
2	FIXED TELEPHONY
3	MOBILE TELEPHONE

Routine has been called, -1 rows affected.

id

The second way is using the [SQL command](#) functionality that allow us to execute any SQL command.

In this case, we must use the command to call a procedure: 'CALL procedure_name(parameter)'.

MySQL » 192.168.254.84:3357 » samples » SQL command

SQL command

CALL 'procedure_webhelp' ('3')

Limit rows: Stop on error Show only errors

[History](#)

Creating Functions

The parameters must be informed like in the example below, where we obligatory must inform your name, the data type that will receive and the size.

We must define the datatype of the function return too.

Create function

Name:

Parameter name	Type	Length	Options	
<input type="text" value="text"/>	<input type="text" value="varchar"/>	<input type="text" value="50"/>	<input type="text" value="(collation)"/>	<input type="button" value="+"/> <input type="button" value="↑"/> <input type="button" value="↓"/> <input type="button" value="×"/>
Return type	<input type="text" value="varchar"/>	<input type="text" value="50"/>	<input type="text" value="(collation)"/>	

```
RETURN CONCAT('you said: ',text,'!!!')
```

The executed command will be displayed.

MySQL » 192.168.254.84:3357 » Database: samples

Database: samples

[Alter database](#) [Database schema](#) [Privileges](#)

Executing a Function

There are two ways to execute a function inside the database builder.

At visualize the procedure and functions list, we can click in their name. We will be redirect to the function call, where we must inform the input parameters(in case that possess).

MySQL » 192.168.254.84:3357 » samples » Call: webhelp_function

Call: webhelp_function

text

After that, will be displayed the result of the execution and the used SQL for that.

MySQL » 192.168.254.84:3357 » samples » Call: webhelp_function

Call: webhelp_function

```
SELECT `webhelp_function`('webhelp')
```

(0.001 s) [Edit](#)

```
`webhelp_function`('webhelp')  
you said: webhelp!!!
```

text

The second way is using the [SQL command](#) functionality that allow us to execute any SQL command.

In this case, we must use the command to call a function: 'CALL function_name(parameter)'.

MySQL » 192.168.254.84:3357 » samples » SQL command

SQL command

```
SELECT 'webhelp_function' ('webhelp')
```

Limit rows: Stop on error Show only errors

API

API settings let you integrate the various APIs available into the Scriptcase. Through this interface it is possible to configure email sending, SMS and Online Payment APIs.

APIs List

On access you can view a list of all the APIs already configured.

#	Name	Gateway	Actions
1	yahoo	smtp	Edit Delete
2	gmail	smtp	Edit Delete

[Add new](#)

- **Name:** Configured API Name.
- **Getaway:** Getaway used to send the email.

Email APIs

Scriptcase connects to three different APIs for sending emails: SMTP, Mandrill, and Amazon SES.

SMTP Configuration

SMTP is the standard protocol for sending e-mails over the Internet, and each provider has its SMTP.

For more information about SMTP settings [click here](#)

Name	<input type="text" value="Name"/>
Gateway	<input type="text" value="smtp"/>
SMTP server	<input type="text" value="smtp.example.com"/>
SMTP port	<input type="text" value="465"/>
SMTP user	<input type="text" value="default@example.com"/>
SMTP password	<input type="password" value="*****"/>
SMTP protocol	<input type="text" value="SSL"/>
From email	<input type="text" value="default@example.com"/>
From name	<input type="text" value="default"/>

API

It allows you to select an API already configured in **Tools > API** or set a new one here by selecting - **custom** -. In this case, you see some options according to the selected Gateway.

To use an API in a published project, it is necessary to perform the [Configuration of this API in the production environment](#), in

the API menu.

Gateway

Select the way to send the email. The SMTP is the default protocol for sending e-mails over the Internet, and each provider has its SMTP.

SMTP Server

SMTP server address for the provider.

Port SMTP

Port used by the mail server. Use port 465 for security with SSL, port 587 for security with TLS, or port 25 as port without security. By omitting the value, Scriptcase defaults to 25.

User SMTP

SMTP server user.

Enter SMTP

SMTP server user password.

Protocol SMTP

Defines the security protocol. By omitting the value, Scriptcase uses the default value.

E-mail

Enter the origin email, that is the email sender.

Name

The sender's name displayed in the email.

Mandrill Configurations

[Mandrill](#) is a transactional email API for MailChimp users, ideal for sending data-driven emails.

Name	<input type="text" value="Name"/>
Gateway	<input type="text" value="mandrill"/>
API key	<input type="text" value="Your API"/>
From email	<input type="text" value="default@example.com"/>
From name	<input type="text" value="default"/>

API

It allows you to select an API already configured in **Tools > API** or set a new one here by selecting - **custom** -. In this case, you see some options according to the selected Gateway.

To use an API in a published project, it is necessary to perform the [Configuration of this API in the production environment](#), in the API menu.

Gateway

Select the way to send the email. **Mandrill** is a transactional email API for MailChimp users, ideal for sending data-driven emails.

API KEY

Enter the key obtained from the origin site of your API.

E-mail

Enter the origin email, that is the email sender.

Name

The sender's name displayed in the email.

For more information about [mandrill](#)

Amazon SES Configurations

Amazon Simple Email Service [Amazon SES](#) is an email sending service designed to assist in sending marketing emails, notifications, and transactional messages.

Name	<input type="text" value="Name"/>
Gateway	<input type="text" value="Amazon SES"/>
API key	<input type="text" value="Your Key API"/>
API Secret	<input type="text" value="Your Secret API"/>
Region	<input type="text" value="Region"/>
From email	<input type="text" value="default@example.com"/>
From name	<input type="text" value="default"/>

To use an API in a published project, it is necessary to perform the [Configuration of this API in the production environment](#), in the API menu.

API KEY

Enter the key obtained from the origin site of your API.

API Secret

Enter the secret access key of your account.

Region

Amazon SES has endpoints in many countries, to reduce network latency, inform the region of the endpoint closest to your application. [See the regions](#).

E-mail

Enter the origin email, that is the email sender.

Name

The sender's name displayed in the email.

For more information about [Amazon SES](#)

SMS APIs

Scriptcase connects to different APIs for sending SMS text messages:

- [Twilio](#)
- [Plivo](#)
- [Clickatell](#)

Watch a video of how [Sending SMS notifications](#)

Setting up Twilio API

Twilio is a set of libraries that enables SMS communication on a global scale. For correct configuration, we need to enter the data of **Authentication ID**, **Authentication Token**, and **Sender**, as shown below:

Name	<input type="text" value="Name"/>
Gateway	<input type="text" value="twilio"/>
Auth ID	<input type="text" value="Your Auth ID"/>
Auth Token	<input type="text" value="Your Auth Token"/>
From	<input type="text" value="From number"/>

To use an API in a published project, it is necessary to perform the [Configuration of this API in the production environment](#), in the API menu.

Name

Enter a name for your API;

Gateway

The Gateway we want to use. (in this case, Twilio);

Auth ID

Enter the authentication ID for your Twilio account;

Auth Token

Enter the authentication Token for your Twilio account;

From

Enter the sender's number to send the SMS;

Setting up Plivo API

Name	<input type="text" value="Name"/>
Gateway	<input type="text" value="plivo"/>
Auth ID	<input type="text" value="Your Auth ID"/>
Auth Token	<input type="text" value="Your Auth Token"/>
From	<input type="text" value="From number"/>

To use an API in a published project, it is necessary to perform the [Configuration of this API in the production environment](#), in the API menu.

Name

Enter a name for your API;

Gateway

The Gateway we want to use. (in this case,Plivo);

Auth ID

Enter the authentication ID of your Plivo account;

Token ID

Enter the authentication Token of your Plivo account;

From

Enter the sender number to send the SMS;

Setting up Clickatell API

Name	<input type="text" value="Name"/>
Gateway	<input type="text" value="clickatell"/>
Auth Token	<input type="text" value="Your Auth Token"/>

To use an API in a published project, it is necessary to perform the [Configuration of this API in the production environment](#), in the API menu.

Name

Enter a name for your API;

Gateway

The Gateway we want to use. (in this case, Clickatell);

Auth Token

Enter the authentication Token of your Clickatell account;

Payment APIs

Scriptcase allows using APIs for online payment processing. The following API integrations are available:

- [paypal](#)
- [Mercado Pago](#)
- Braintree
- Stripe

Setting up PayPal

Name	<input type="text" value="Name"/>
Gateway	<input type="text" value="paypal_express"/>
Username	<input type="text" value="Username"/>
Password	<input type="text" value="Password"/>
Signature	<input type="text" value="Signature"/>
Test Mode	<input type="text" value="FALSE"/>

To use an API in a published project, it is necessary to perform the [Configuration of this API in the production environment](#), in the API menu.

Name

Enter a name for your API;

Gateway

Enter the Gateway to use (For example, paypal_express);

Username

Enter the user of PayPal account for authentication;

Password

Enter the password of PayPal account for authentication;

Signature

Enter the signature of PayPal account for authentication;

Test Mode

It allows you to use the API as a test mode.

Configuring MercadoPago payment

API

Name	<input type="text" value="Name"/>
Mode	<input type="text" value="Project"/>
Gateway	<input type="text" value="Mercadopago"/>
Auth Token	<input type="text" value="Auth Token"/>

Available in the following countries:

- Argentina
- Brazil
- Chile
- Colombia
- Mexico
- Peru
- Uruguay

To use an API in a published project, it is necessary to perform the [Configuration of this API in the production environment](#), in the API menu.

Mercadopago;

- **Name:** Name given to the API;
- **Modo:** Defines whether the API created will be at the Project, User or Public level;
- **Gateway:** The **Mercadopago**;
- **Auth Token:** Application authentication token.

To learn how to create Mercado Pago credentials, follow this tutorial: [\[Creating your Mercado Pago credentials\]](#)
[\[Mercadopagotutorial\]](#)

Configuring payment by Braintree

API

Name	<input type="text" value="Name"/>
Mode	<input style="border-bottom: 1px solid #ccc;" type="text" value="Project"/> ▼
Gateway	<input style="border-bottom: 1px solid #ccc;" type="text" value="Braintree"/> ▼
Merchant ID	<input type="text" value="Merchant ID"/>
Public Key	<input type="text" value="Public Key"/>
Private Key	<input type="text" value="Private Key"/>
Test Mode	<input style="border-bottom: 1px solid #ccc;" type="text" value="FALSE"/> ▼

To use an API in a published project, it is necessary to perform the [Configuration of this API in the production environment](#), in the API menu.

- **Name:** Defines the name that will identify the configured API.
- **Modo:** Defines the access level of this API, which are: Public, where all users of all projects have access to this API; Project, where all users of this project will have access to this API; User, where only the API creator user will have access in any project. (Advisable for this API at the project level).
- **Gateway:** Defines the API that will be used. We must select Braintree.
- **Marchant ID** - Your Merchant ID is the unique identifier for your entire gateway account, including the various merchant accounts that may be on your gateway. Often called a public ID or production ID, your Merchant ID will be different for your production and sandbox gateways.
- **Public Key** - This is your user-specific Public Id. Each user associated with your Braintree gateway will have its own public key.
- **Private Key** - This is your user-specific Private Key. Each user associated with your Braintree gateway will have its own private key. Your private key must not be shared outside of using an API call – even with us.
- **Test Mode** - Enables or disables the API test mode.

Example informing the profile of the API created in the interface as a parameter in the macro

```
$gateway = sc_call_api('braintree');
```

```
$response = $gateway->transaction()->sale([
  'amount' => '10.00',
  'paymentMethodNonce' => $nonceFromTheClient,
  'deviceData' => $deviceDataFromTheClient,
  'options' => [
    'submitForSettlement' => True
  ]
]);
echo '<pre>';
print_r($response);
```

Configuring payment by Stripe

API

Name	<input type="text" value="Name"/>
Mode	<input style="border-bottom: 1px solid #ccc;" type="text" value="Project"/> ▼
Gateway	<input style="border-bottom: 1px solid #ccc;" type="text" value="Stripe"/> ▼
API key	<input type="text" value="Auth API key"/>

To use an API in a published project, it is necessary to perform the [Configuration of this API in the production environment](#), in the API menu.

- **Name:** Defines the name that will identify the configured API.
- **Modo:** Defines the access level of this API, which are: Public, where all users of all projects have access to this API; Project, where all users of this project will have access to this API; User, where only the API creator user will have access in any project. (Advisable for this API at the project level).
- **Gateway:** Defines the API that will be used. We must select Braintree.
- **API key** - Enter the API key.

Example informing the profile of the API created in the interface as a parameter in the macro

```
$gateway = sc_call_api('stripe');
```

```
$gateway->charges->create([
  'amount' => 2000,
  'currency' => 'brl',
  'source' => 'tok_mastercard',
  'description' => 'My First Test Charge with Scriptcase',
]);
```

Storage APIs

The scriptcase provides 3 APIs for this type of service. It only works in fields of type: image (image file name) and document (document file name).

- **Dropbox**
- **Google Drive**
- **S3**

Configuring the dropbox API

Dropbox is a service for storing and sharing files. It is based on the concept of “cloud computing”. It belongs to Dropbox Inc., based in San Francisco, California, USA. The company that developed the program provides computer centers that store its customers' files.

To learn how to configure your API key [click here](#)

API

Name	<input type="text" value="Name"/>
Mode	<input type="text" value="Public"/> ▼
Gateway	<input type="text" value="dropbox"/> ▼
API key	<input type="text" value="Your API"/>
API Secret	<input type="text" value="Your Secret API"/>
Access Token	<input type="text" value="Access Token"/>

To use an API in a published project, it is necessary to perform the [Configuration of this API in the production environment](#), in the API menu.

- **Name:** Defines the name that will identify the configured API. We recommend that the name be defined in a way that allows identifying the data used in the configuration, since it is possible to create more than one API with this Gateway, this way it will be simpler to identify the API at the time of the call.
- **Mode:** Defines the access level of this API, which are: Public, where all users of all projects have access to this API; Project, where all users of this project will have access to this API; User, where only the user who created the API will have access to any project. (Advisable for this API the project level).
- **Gateway:** Defines the API to be used. We must select Dropbox.
- **API Key:** Enter the key obtained when configuring your API.
- **API Secret:** Enter the secret access key for your account.
- **Access Token:** Enter the access Token generated in your Dropbox account.

Google Drive

Google Drive is a virtual disk service launched by Google. The service allows the storage of files in the Google cloud.

To learn how to configure your API key [click here](#)

API

Name	<input type="text" value="Name"/>
Mode	<input type="text" value="Public"/> ▼
Gateway	<input type="text" value="google_drive"/> ▼
App Name	<input type="text" value="App Name"/>
JSON OAUTH	<input type="text" value="JSON OAUTH"/>
Auth Code	<input type="text" value="Auth Code"/>

To use an API in a published project, it is necessary to perform the [Configuration of this API in the production environment](#), in the API menu.

- **Name:** Defines the name that will identify the configured API. We recommend that the name be defined in a way that allows identifying the data used in the configuration, since it is possible to create more than one API with this Gateway, this way it will be simpler to identify the API at the time of the call.
- **Mode:** Defines the access level of this API, which are: Public, where all users of all projects have access to this API; Project, where all users of this project will have access to this API; User, where only the user who created the API will have access to any project. (Advisable for this API the project level).
- **Gateway:** Defines the API to be used. We must select Google drive.
- **Application Name:** Name of the application to be used.
- **Json OAuth:** Enter the contents of the generated user authentication file.
- **authentication code:** Enter the identification code obtained when configuring your API.

Amazon S3

Amazon Simple Storage Service (Amazon S3) is an object storage service that offers industry-leading scalability, data availability, security and performance. This means that customers of all sizes and sectors can use it to store any amount of data in a wide variety of use cases, such as websites, mobile applications, backup and restore, archiving, business applications, IoT devices and analytics of big data.

To learn how to configure your API key [click here](#)

API

Name	<input type="text" value="Name"/>
Mode	<input type="text" value="Public"/> ▼
Gateway	<input type="text" value="S3"/> ▼
API key	<input type="text" value="Your API"/>
API Secret	<input type="text" value="Your Secret API"/>
Region	<input type="text" value="Region"/>
Bucket	<input type="text" value="Bucket"/>

To use an API in a published project, it is necessary to perform the [Configuration of this API in the production environment](#), in the API menu.

- **API Key:** Enter the key obtained when configuring your API.
- **API Secret:** Enter the secret access key for your account.
- **Region:** Amazon SES has endpoints in several regions, in order to reduce network latency, inform the endpoint region closest to your application.
- **Bucket:** Inform the bucket to store files on Amazon S3.

Google Authenticator API

This google authentication API allows you to create more secure systems using two-factor authentication.

To use this API it is necessary to install the **Google Authenticator** application on your mobile device.

- [Google Store](#)
- [Apple Store](#)

API

Name	<input type="text" value="Google auth"/>
Mode	<input type="text" value="Project"/> ▼
Gateway	<input type="text" value="Google_authenticator"/> ▼
Domain	<input type="text" value="127.0.0.1"/>

To use an API in a published project, it is necessary to perform the [Configuration of this API in the production environment](#), in

the API menu.

For API configuration We must inform:

Name

Used only for API identification within the tool.

Mode

This option defines the availability of the API within Scriptcase. The configuration options are:

- **Public** - With this option all projects and users of the tool will have access to this API for use.
- **Project** - When saving the API at the project level, all users of the project will have access to this API for use.
- **User** - Only the user who performed the API configuration will have access to its use in any project.

The resource can only be adopted in the project where it was created, regardless of the chosen save mode.

Gateway

Defines the authentication API that will be used.

Domain

Defines the domain enabled to use two-factor authentication.

Examples:

- myscriptcase.com.br
- 127.0.0.1

We must inform only one domain to use the API.

Google Sheets API

Scriptcase allows using google sheets API for integration with your projects.

Google Sheets

Google Sheets is a spreadsheet program included as part of the free web-based Google Doc Editor suite offered by Google.

To learn how to create and configure your credentials [click here](#)

This API has the functionality of just inserting data in the spreadsheet. There is no possibility of deleting or editing spreadsheet records.

API ?

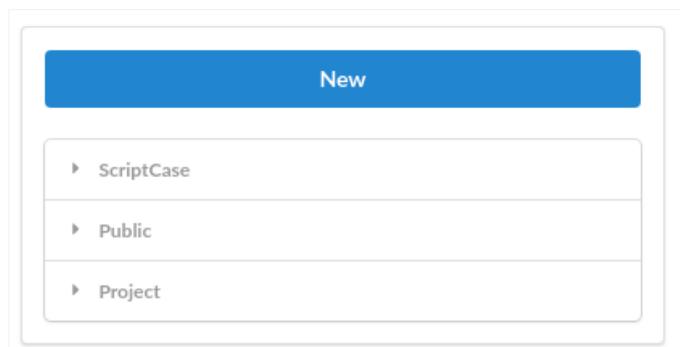

Name	<input type="text" value="planilhas"/>
Mode	<input style="border-bottom: 1px solid #ccc;" type="text" value="Project"/>
Gateway	<input style="border-bottom: 1px solid #ccc;" type="text" value="Google_sheets"/>
App Name	<input type="text" value="glt"/>
JSON OAUTH	<pre> {"installed":{"client_id":"219751481666- u9fc3lolh8imhbj9l72gr74sb9ueph3b.apps.googleuser content.com","project_id":"myspreadsheet- 368300","auth_uri":"https://accounts.google.com/o/o auth2/auth","token_uri":"https://oauth2.googleapis.co m/token","auth_provider_x509_cert_url":"https://www .googleapis.com/oauth2/v1/certs","client_secret":"G OCSPX-grrOkkgCi5MRb9JG9T8- 2mYDFpoL","redirect_uris":["http://localhost"]}} </pre>
Auth Code	<input style="width: 80%;" type="text" value="Auth Code"/> <input style="background-color: #0070c0; color: white; padding: 5px 15px;" type="button" value="Auth"/>

To use an API in a published project, it is necessary to perform the [Configuration of this API in the production environment](#), in the API menu.

- **Name:** Defines the name that will identify the configured API. We recommend that the name be defined in a way that allows identifying the data used in the configuration, since it is possible to create more than one API with this Gateway, this way it will be simpler to identify the API at the time of the call.
- **Mode:** Defines the access level of this API, which are: Public, where all users of all projects have access to this API; Project, where all users of this project will have access to this API; User, where only the user who created the API will have access to any project. (Advisable for this API the project level).
- **Gateway:** Defines the API to be used. We must select Google drive.
- **Application Name:** Name of the application to be used.
- **Json OAuth:** Enter the contents of the generated user authentication file.
- **authentication code:** Enter the identification code obtained when configuring your API.

Hotkey Templates

This tool allows that the user manage templates to the application hotkeys. Can be possible create a new hotkeys set or use an existing setting and change then to improve your development environment.

Home screen to the template and scopes managements available.

Available Scopes:

- **Scriptcase:** Here is the default Scriptcase template. This template cannot be edited or erased, only can visualized or a copy can be made to utilize the already defined hotkeys.
- **Public:** Here is the created and edited templates at public level by user.
- **Project:** Here is the created and edited templates at project level by user.

In “New” the user will can create a new template with all the configurable hotkeys.

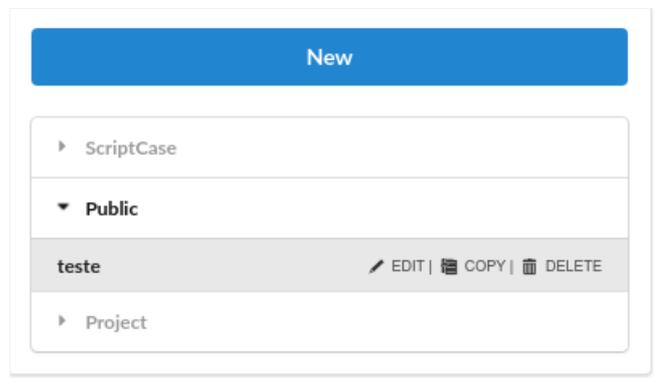

Then, will come the creation screen, when the user will can select the name and the scope of the template that will be created.

Creation screen of Hotkey Templates

- **Mode:** Allows the user to select the scope that the template will be created.

- **Name:** Allows the user to select the name to the template that will be created.
- **Action:** Selects the action that will be made when press the selected keybind.
- **Keybinding:** Selects the keybinds that will be responsible for execute the chosen action.
- **Add "+":** Adds a new action in the keybind list.
- **Clear:** Clears all predefined settings by Scriptcase or by user.

When selecting one of the categories that possess created templates, the user will have some setting options. All the applications will come with the Scriptcase default template configured.

Options to Template configuration.

- **Edit:** Allows the user to edit the name, mode and the defined hotkeys in the template.
- **Copy:** Creates a copy of the selected template allowing to use the same configurations, change the name and hotkeys settings that the user desires.
- **Delete:** Realizes the exclusion of the selected template.

When editing the name or the scope of a template, automatically all the related applications to them will lose your own configurations. Will be necessary configure the edited template again as in use in the application.

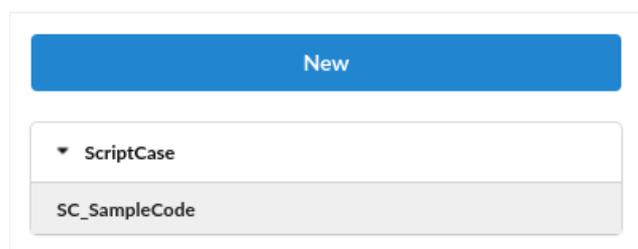

Code Snippets

This tool allows the developer to perform the creation of blocks of code and also to use these codes easily in Scriptcase applications. In this way, streamlining and facilitating the use of programming within the tool.

The created codes can be used in all events present in Scriptcase applications. Through the **Snippets** tab.

Creating a Code Snippet

To create a Code Snippet, simply click the **New** button available in the interface.

View:

It allows the user to view all the code, but without the possibility to make edits.

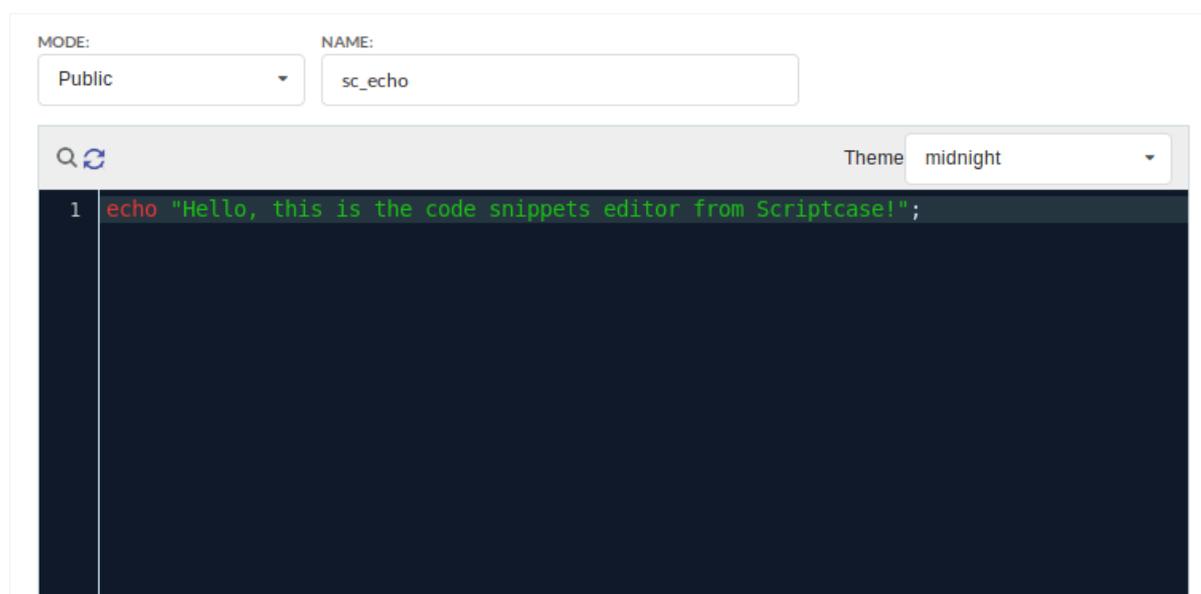

Copy:

It makes a copy of the code snippet for a new one, allowing the user to change where it will be located and the usage name.

Edit:

It allows the complete editing of the selected code, as well as where it is located and its name of use. This option is only available for the code snippets located in Public, Project, and User.

After that, the code edit screen will open, where you can create the code desired by the developer. See the image below:

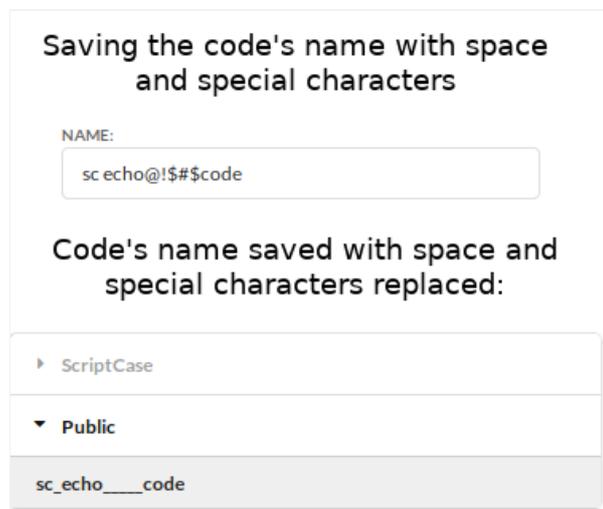

Mode:

Lets you select where the code will be created. As available options there are: Public, Project and User.

Name:

Lets you define the name that will be used to call the code in the event.

Any special character and/or space that is entered in the name is automatically replaced by the symbol (_).

Example:**Themes:**

Allows you to select the theme used in the code editor. If you already have a previously selected theme for editing an event, the same theme is applied to the code snippet editor.

Search:

The search icon  allows the user to search for one or more terms within the code.

Replace:

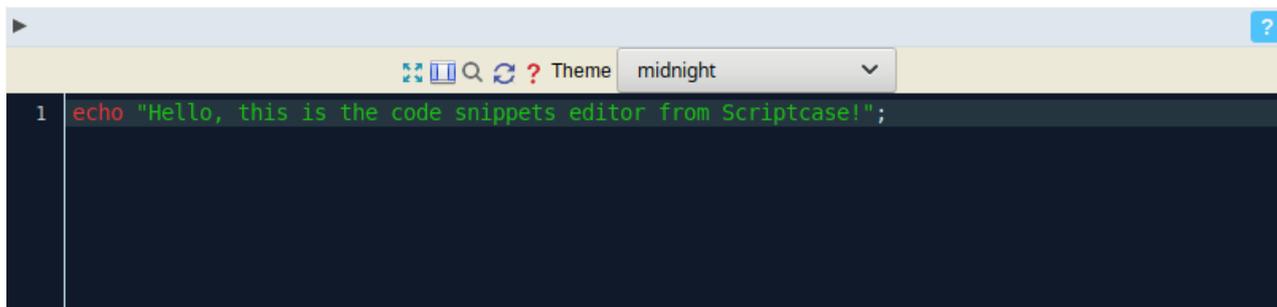

The replace icon  allows you to replace snippets of code with another. Thus, facilitating the editing of several terms within the code.

Using a Code Snippet

To use a code snippet you must have access to any event present in the Scriptcase. By accessing the **Snippets** tab, you can view the list of code snippets created by Scriptcase and the user.

When you click on the usage name, the code is automatically added to the event.

The image shows a screenshot of a code editor window. The window has a light gray title bar with a blue question mark icon on the right. Below the title bar is a yellowish toolbar containing icons for home, search, refresh, and a theme selector. The theme selector is currently set to "midnight". The main editing area has a dark background and contains a single line of code on line 1: `echo "Hello, this is the code snippets editor from Scriptcase!";`

SMTP Settings

To proceed with the password recovery, it is necessary that has the SMTP server configured for a successful process. Look [here](#) how to realize this procedure.

Yahoo

For more information about these settings [Click Here](#).

Some email applications uses older, less secure technologies to sign in to your email account, and Google will block these requests by default. To solve this, sign in to your Google account and enable access through less secure apps through this [link](#). See also:

Layout Overview

In the **Layout** menu of Scriptcase, you have various options to customize the appearance and behavior of your applications. Below is an overview of each available item:

- **Application Themes:** Allows you to create or edit themes that define the color schemes, fonts, and other visual styles of the applications.
- **Button Themes:** Enables the customization of the styles of buttons used in the applications, including colors, sizes, and icons.
- **HTML Templates:** Offers the option to create or modify HTML templates to be used in the applications, allowing for more advanced layout customization.
- **CSS Menus (For older menus):** Intended for editing the CSS style of traditional menus, allowing adjustments to the appearance of classic menus.
- **Responsive Menu Themes:** Facilitates the creation and editing of specific themes for responsive menus, adjusting the color palette and styles for better adaptation on mobile devices.
- **Tooltip Themes:** Allows customization of the appearance of tooltips displayed in the applications, adjusting colors and styles as needed.
- **Image Manager:** A tool to manage the images used in the applications, including uploading, organizing, and deleting image files.
- **Chart Themes:** Enables the creation and editing of specific themes for charts, allowing customization of colors, fonts, and other visual elements of the charts generated in the applications.
- **HTML Editor Templates:** Offers the option to create or edit templates for the integrated HTML editor, allowing customization of the editable content in the applications.

These tools provide flexibility in customizing the layout and style of your applications in Scriptcase, allowing you to adapt the interface to the specific needs of your project.

Scriptcase Applications themes

In the Applications themes section, it's possible to create layouts for the applications using the editor. It's possible to create new themes or edit existing ones.

The screenshot shows the 'Theme gallery' interface. On the left, a list of themes is displayed under the 'ScriptCase' category. The 'Sc8_BlueWood' theme is highlighted. The main area shows a preview of the selected theme, which includes a header with navigation buttons (First, Previous, Next, Last, Add, Save), an error field, and two data blocks. The first block, 'Block 1.1', contains a text input field and a dropdown menu. The second block, 'Block 2.1', is a table with three columns and four rows of data.

Title 1	Title 2	Title 3
11111111	22222222	33333333
11111111	22222222	33333333
11111111	22222222	33333333
11111111	22222222	33333333

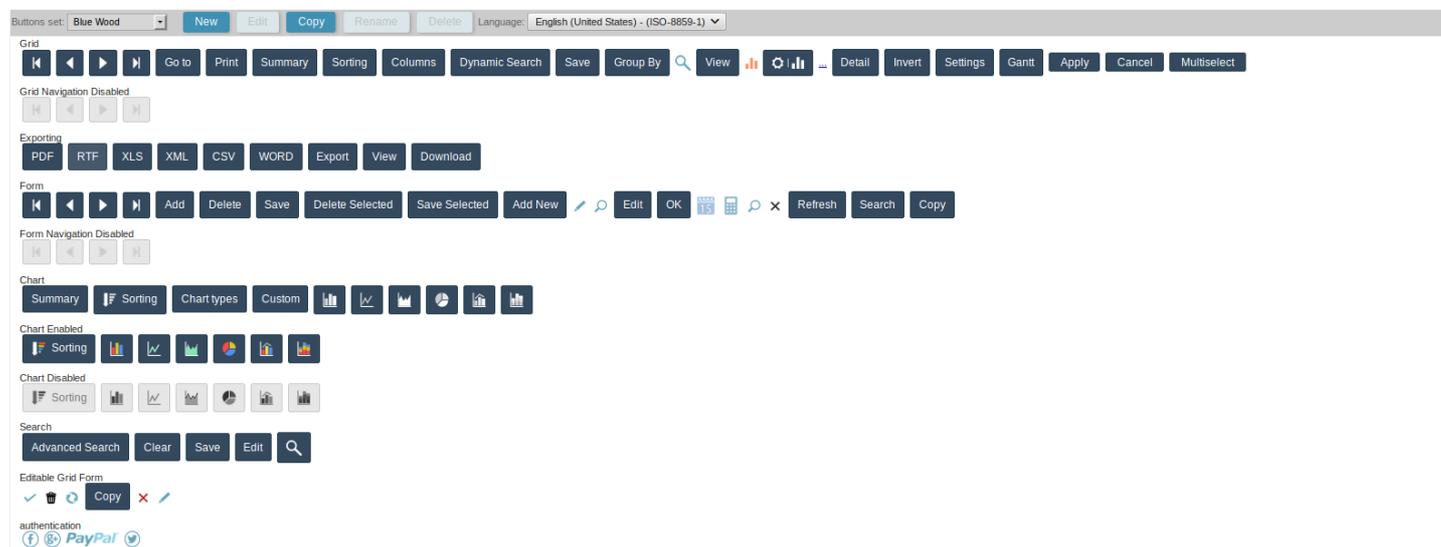

To create new themes, click on "Create New Theme". And the modifications done to the theme, will be displayed on the preview in real-time.

The screenshot shows the 'Theme editor' interface. On the left, a 'Theme settings' panel is visible, with options for 'Page', 'Font', 'Corner', 'Content', 'Header', 'Toolbar', 'Table', 'Block', 'Object', and 'Label'. The 'Page' settings are expanded, showing 'Button' set to 'Blue Wood', 'Menu Icon Schema' set to 'default', and 'Background color' set to '#E7E7E7'. The main area shows a preview of the 'asd' theme, which is identical to the 'Sc8_BlueWood' theme shown in the previous screenshot.

CSS Buttons Overview

General Overview

In Button Editing we can create new sets of buttons to associate them with themes. We can create or edit sets of text and image buttons.

Creating a New Button Scheme

Click the “New” button on the Button Scheme toolbar.

Preview	Type	Display	Image position	Label	Hint	CSS Style
First page First	Button	Only text		{lang_btms_frst}	{lang_btms_frst_hint}	default
Previous page Previous	Button	Only text		{lang_btms_prev}	{lang_btms_prev_hint}	default
Next page Next	Button	Only text		{lang_btms_next}	{lang_btms_next_hint}	default
Last page Last	Button	Only text		{lang_btms_last}	{lang_btms_last_hint}	default
Go to line Go to	Button	Only text		{lang_btms_jump}	{lang_btms_jump_hint}	default
Printable Version Print	Button	Only text		{lang_btms_prnt}	{lang_btms_prnt_hint}	default
Display Summary Summary	Button	Only text		{lang_btms_smry}	{lang_btms_smry_hint}	default
Sorting Sorting	Button	Only text		{lang_btms_sort}	{lang_btms_sort_hint}	default
Column Columns	Button	Only text		{lang_btms_clmn}	{lang_btms_clmn_hint}	default
Dynamic Search Dynamic Search	Button	Only text		{lang_btms_dynamicsearc}	{lang_btms_dynamicsearc}	default

In the first tab (Buttons) the buttons used in Scriptcase are displayed. Each button can have a different characteristic, being possible to choose between image, text button or link. If you use the image type button, a field will be displayed to upload the image. For text and link button types use the tabs: Button Style and Link Styles to edit their appearances.

Link Styles

In this option, it is possible to edit the styles that will be used in the buttons links.

[Link Styles](#)

RTL Flag

This option allows that be defined the writing orientation used by the theme. Can be defined if the option **RTL(Right to Left)** will be used.

Grid

In this option we can configure the layout of the buttons that will be displayed in the applications used in the project.

Below you can see the list of buttons you can configure.

Type

In this option you can define how the button will appear in the application.

The available options are:

[Image](#)

If you select Image, the button appears as an icon in the application.

[Button](#)

If you select the button type you can perform the button configuration that will be displayed in the applications.

[Link](#)

If you select the Link Type the button in the application will be displayed as a link.

Image

Option Preview

It shows a preview of how the button will appear in the application according to the settings made.

Icon

Option that allows the upload of own icons to the Scriptcase image manager, in order to be used in the buttons.

Hint

Option to enter text configured in [Translate Applications][translate_applications] or text entered by the user that will be shown when the mouse is over the button.

Button

Display

Option to set what will be displayed on the button, the options are:

Only Text

Only the text defined by the user will be displayed.

Only Image

Only the image defined by the user will be displayed.

Text and Image

Both text and images defined by the user will be displayed.

Only Font-awesome icon

The image selected by the user will be displayed.

Display text and icon Font-awesome

Both text and images defined by the user will be displayed.

Icon

Option that allows the upload of own icons to the Scriptcase image manager, in order to be used in the buttons.

Image Position

Sets where the image will be placed on the button, the options are:

Image on the right

The image will be displayed on the right and the text will be displayed on the left.

Text on the right

The text will be displayed on the right and the image will be displayed on the left.

Label

Option to enter text configured in [Translate Applications][translate_applications] or text entered by the user that will be shown when the mouse is over the button.

Hint

Option to enter text configured in [Translate Applications][translate_applications] or text entered by the user that will be shown when the mouse is over the button.

CSS Style

Option to set which style will be used by buttons. Layouts are created in the Button Styles or Link Styles options.

Link

Label

Option to enter text configured in [Translate Applications][translate_applications] or text entered by the user that will be shown when the mouse is over the button.

This option allows you to configure the button opacity.

Padding

This option allows you to configure the button padding element.

Margin

This option allows you to configure the button margin.

Cursor

This option allows you to select the cursor type that will be shown when you pass the mouse over the button.

Link Styles

CSS Link Settings

Here we can configure the links that will be shown as Buttons in Scriptcase. Handling various visuals aspects related to these links.

Also is allowed to create new CSS Link Styles clicking in the button **New**.

Link

Font

This option allows you to configure the font type that will be used in the link.

Font Size

This option allows you to configure the font size that will be used in the link.

Font Color

This option allows you to configure the link color for the exhibition.

Text-decoration

This option allows you to configure the line personalization type that the link will have.

Cursor

This option allows you to configure the cursor type that will be shown when passing the mouse through the link.

Visited

Font

This option allows you to configure the font type that will be used in the link.

Font Size

This option allows you to configure the font size that will be used in the link.

Font Color

This option allows you to configure the link color for the exhibition.

Text-decoration

This option allows you to configure the line personalization type that the link will have.

Cursor

This option allows you to configure the cursor type that will be shown when passing the mouse through the link.

Active

Font

This option allows you to configure the font type that will be used in the link.

Font Size

This option allows you to configure the font size that will be used in the link.

Font Color

This option allows you to configure the link color for the exhibition.

Text-decoration

This option allows you to configure the line personalization type that the link will have.

Cursor

This option allows you to configure the cursor type that will be shown when passing the mouse through the link.

Hover

Font

This option allows you to configure the font type that will be used in the link.

Font Size

This option allows you to configure the font size that will be used in the link.

Font Color

This option allows you to configure the link color for the exhibition.

Text-decoration

This option allows you to configure the line personalization type that the link will have.

Cursor

This option allows you to configure the cursor type that will be shown when passing the mouse through the link.

Editing CSS Buttons Overview

Creating new buttons set, make possible to edit each component from the Buttons theme so the user can change directly all the sets of buttons, links, and their styles.

Buttons

Here is allowed to configure the default buttons to the applications and components.

See below the available items:

[Grid](#) [Authentication](#)
[Export Email](#) [Menu](#)
[Exporting](#) [Others](#)
[Form](#) [Panels And Modals](#)
[Chart](#) [Calendar](#)
[Chart Enabled](#) [SweetAlert](#)
[Search](#) [Editable Grid Form](#)

Button Styles

In this option it is possible to edit the styles that will be used in the buttons set, being available to the user with the following settings:

Button

[Button](#) [Button](#)
 [Disabled](#)
[Button Hover](#) [Button Selected](#)
[Button](#)
[Onclick](#)

Dropdown

[Container](#)
[Line](#)
[Button Hover](#)

Link Styles

In this option, it is possible to edit the styles that will be used in the buttons links.

[Link Styles](#)

RTL Flag

This option allows that be defined the writing orientation used by the theme. Can be defined if the option **RTL(Right to Left)** will be used.

Grid

In this option we can configure the layout of the buttons that will be displayed in the applications used in the project.

Below you can see the list of buttons you can configure.

Type

In this option you can define how the button will appear in the application.

The available options are:

[Image](#)

If you select Image, the button appears as an icon in the application.

[Button](#)

If you select the button type you can perform the button configuration that will be displayed in the applications.

[Link](#)

If you select the Link Type the button in the application will be displayed as a link.

Image

Option Preview

It shows a preview of how the button will appear in the application according to the settings made.

Icon

Option that allows the upload of own icons to the Scriptcase image manager, in order to be used in the buttons.

Hint

Option to enter text configured in [Translate Applications][translate_applications] or text entered by the user that will be shown when the mouse is over the button.

Button

Display

Option to set what will be displayed on the button, the options are:

Only Text

Only the text defined by the user will be displayed.

Only Image

Only the image defined by the user will be displayed.

Text and Image

Both text and images defined by the user will be displayed.

Only Font-awesome icon

The image selected by the user will be displayed.

Display text and icon Font-awesome

Both text and images defined by the user will be displayed.

Icon

Option that allows the upload of own icons to the Scriptcase image manager, in order to be used in the buttons.

Image Position

Sets where the image will be placed on the button, the options are:

Image on the right

The image will be displayed on the right and the text will be displayed on the left.

Text on the right

The text will be displayed on the right and the image will be displayed on the left.

Label

Option to enter text configured in [Translate Applications][translate_applications] or text entered by the user that will be shown when the mouse is over the button.

Hint

Option to enter text configured in [Translate Applications][translate_applications] or text entered by the user that will be shown when the mouse is over the button.

CSS Style

Option to set which style will be used by buttons. Layouts are created in the Button Styles or Link Styles options.

Link

Label

Option to enter text configured in [Translate Applications][translate_applications] or text entered by the user that will be shown when the mouse is over the button.

Hint

Option to enter text configured in [Translate Applications][translate_applications] or text entered by the user that will be shown when the mouse is over the button.

Copy

Copying a Button Set

To copy a Button set, it is necessary to click on the button **“Copy”** available between the buttons CSS settings toolbar.

After that, will be displayed the copy settings options to the buttons, see below:

New Name

This field allows the user to define the buttons set copy name.

Set Level

This option allows selecting the level that the buttons set will have. Can choose between: **Scriptcase, Public, Project and User**.

Related Video ▷

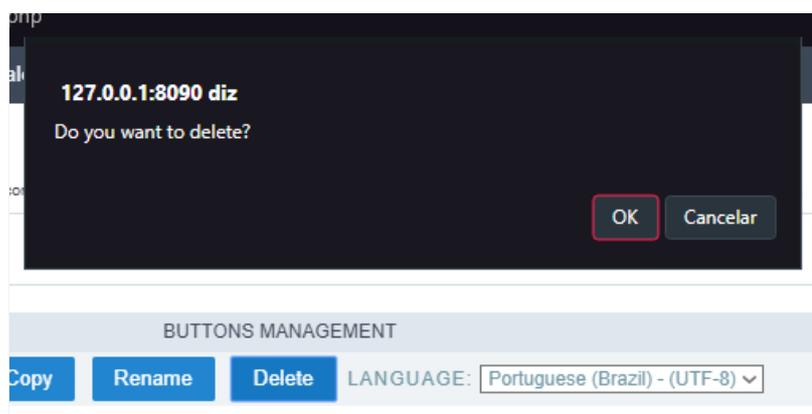

Delete

Deleting a Buttons Set

To delete a specific button set, you need just to select the desired set and click on the delete button, as the image:

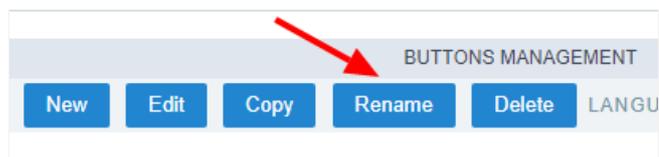

After that, will be displayed a confirmation pop-up for deleting, you will need just click on the button **OK** and the set will be deleted.

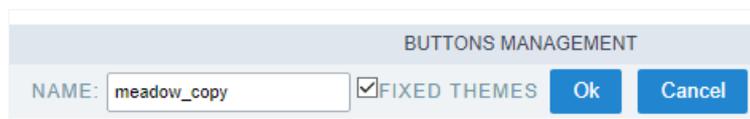

Rename

Renaming a Buttons Set

To rename a specific button set, you will need just select the desired set and click on the button **Rename**, as the image:

After that, will be displayed some options, so you can rename the set.

Name

This field allows you to inform the name that will be used in the renamed set.

Fixed Themes

Marked as default, this option allows that when changes the set name, this change will be applied in the projects that use the button set.

HTML Templates

In the Templates, it's possible to edit and create models for the Headers, Footers or the User HTML (Grid and Control). These models define the interface structure of the applications. You can create a HTML file and define where the entry data will be, by use curly brackets {} to specify a variable. The User Defined HTML option is used in Grid and Control applications, where it's possible to define all the structure of the report in HTML and associate the fields of the applications with the variables created on the body of the HTML file. With this it's possible to create Control and Grid applications with a different layout, being able to place the fields anywhere on the page.

The screenshot shows the 'HTML Editor' interface. On the left, a list of templates is displayed under the 'SCRIPTCASE' section. The 'light' template is selected, and a 'Copy' button is visible next to it. On the right, the 'HTML Editor' shows a preview of the HTML code for the selected template. The code includes CSS styles for columns and a table structure with variables like {NM_CSS_CAB} and {LIN1_COL1}.

Header and Footer

In the editor for the Header and Footer, you need to create or edit existing models.

To create a new model, there's a standard code to use as a base of all the HTML.

The screenshot shows a dialog box for creating a new model. The dialog has fields for 'Template of' (Applications), 'Type' (Header), and 'Target' (Public). There is an empty 'Template' field and an 'Upload' section with a 'Browse...' button and the text 'No file selected.' At the bottom, there are 'Save' and 'Cancel' buttons.

The creation of fields in the HTML needs to be done with curly brackets, for example: {variable}.

Code example:

```

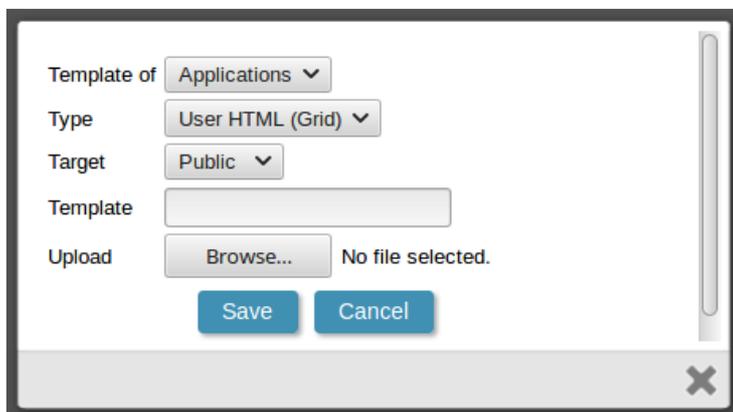

<div style="width: 100%">
<div {NM_CSS_FUN_CAB} style="height:11px; display: block; border-width:0px; "></div>
<div style="height:37px; background-color:#FFFFFF; border-width:0px 0px 1px 0px; border-style: dashed; border-color:#ddd; c
  <table style="width:100%; border-collapse:collapse; padding:0;">
    <tr>
      <td id="lin1_col1" {NM_CSS_CAB}><span>{LIN1_COL1}</span></td>
      <td id="lin1_col2" {NM_CSS_CAB}><span>{LIN1_COL2}</span></td>
    </tr>
  </table>
</div>
</div>

```

These fields are displayed in the application where the template is going to be used.

After saving the template, you need to open the application that you're going to use the template in and go to "Layout > Settings", choose the model for the Header and Footer that you'll use and in "Layout > Header & Footer" you'll associate the created fields in the template with the desired information available by ScriptCase.

User Defined HTML

In the User Defined HTML we can specify where the fields of the applications will be displayed in the HTML file by using curly brackets {variable}. Like the example below:

```

<table border="0" cellspacing="0" cellpadding="0">
  <tr>
    <td width="247" height="96" align="left" valign="center">
      <font face="verdana" style="font-size:11px">
        <b>{Name}</b><br>{Address}<br>{City} - {State}<br>
        {ZIP}
      </font>
    </td>
  </tr>
</table>

```

The preview of the code above will be like the following: {Name} {Address} {City}-{State} {ZIP}

Remember that all the content that has curly brackets are considered a field of the application, this is why when you have {Name}, it'll be referencing a field called 'Name' in your application.

In the template we can define a delimiter by using `{}|`:

```
<table border="0" cellspacing="0" cellpadding="0">
  <tr>
    <!-- BEGIN bl2 -->
      <td width="247" height="96" align="left" valign="center">
        <font face="verdana" style="font-size:11px">
          <b>{Name}</b><br>{Address}<br>{City}- {State}<br>
          {ZIP}
        </font>
      </td>
    <!-- END bl2 -->
  </tr>
</table>
```

These parts are defined where the loop is going to start and end. The quantity of delimiters are defined as the “Columns per page” on the Grid application.

e.g.: If within the Grid application the option “Lines Per Page” is set to 3, you’ll see the following result.

```
<table border="0" cellspacing="0" cellpadding="0">
  <tr>
    <td width="247" height="96" align="left" valign="center">
      <font face="verdana" style="font-size:11px">
        <b>{Name}</b><br>{Address}<br>{City}- {State}<br>
        {ZIP}
      </font>
    </td>
    <td width="247" height="96" align="left" valign="center">
      <font face="verdana" style="font-size:11px">
        <b>{Name}</b><br>{Address}<br>{City}- {State}<br>
        {ZIP}
      </font>
    </td>
    <td width="247" height="96" align="left" valign="center">
      <font face="verdana" style="font-size:11px">
        <b>{Name}</b><br>{Address}<br>{City}- {State}<br>
        {ZIP}
      </font>
    </td>
  </tr>
</table>
```

The preview of the code above will be the following:

```
{Name}      {Name}      {Name}
{Address}   {Address}  {Address}
{City}-{State}{City}-{State}{City}-{State}
{ZIP}       {ZIP}       {ZIP}
```

If you have a HTML File created in the standards above, you can include it in ScriptCase by accessing “Layout > HTML Templates > User HTML > New Template”. On “New Template” you’ll inform the file that you want to import or create a new template by writing the code in the ScriptCase editor.

After having the User Defined HTML, the next step is open the application that supports the Template (Control or Grid) and go to “Position of Fields” and associate the fields with the application fields.

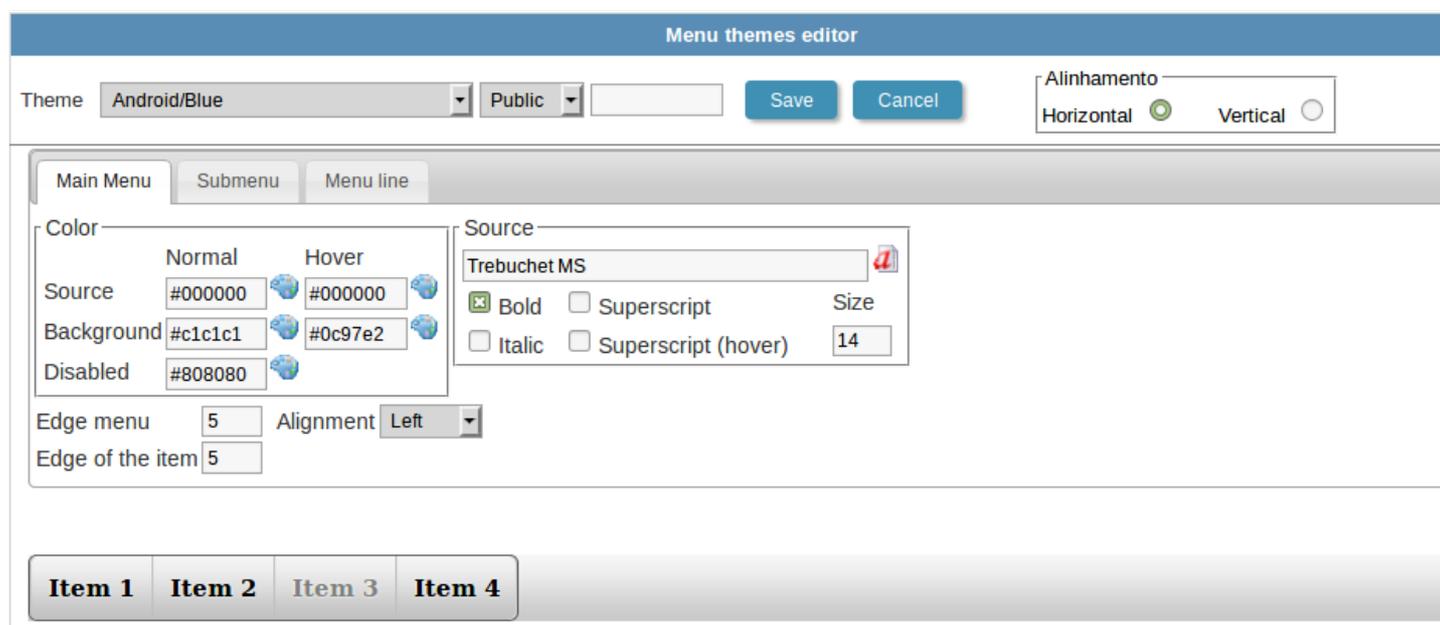

CSS Menu

The CSS Menu section is used to create and/or edit layout styles to be applied in Menu Applications.

To create a new theme for the menu it's necessary to first select a theme to be used as base of the new theme.

After clicking on "New", to create a new theme for the Menu, you'll have many options to change the colors that are part of the Menu you chosen. Also, you can change the font size of the items.

Before saving the theme that you created, you need to select the access level as Public, Project or User levels.

- **Public** the theme is available for everyone that uses your Scriptcase installation.
- **Project** the theme is available for the project that it was created in.
- **User** the theme is available only for the user that created the theme.

After selecting the access level, inform the name of the theme and click on "Save".

Menu Icons

While editing the menu icons, you can change the icons of the active and inactive tabs that will be opened in the menu. These icons are linked to the opened applications.

On the page below, we can view the icons divided in blocks for each type of application, so each icon corresponds to an application from ScriptCase.

Select the icons that you desire for each state for the menu tabs, being active or inactive.

Menu tabs icons

Images Manager

The Images Manager is where you'll organize and upload new images that'll be used in your project.

To upload new images, you need to select the scope of which the image will be part, after selecting the folder where the image will be stored at and after that click on File > Upload.

When the image is uploaded, the image's name is modified depending on the scope of which it's part of (public, project or user) and the type of image (background, button, icons, menu or general) following the pattern below:

- sys__NM__ (Public)
- grp__NM__ (Project)
- usr__NM__ (User)

Image Type:

- bg__NM__ (background images)
- btn__NM__ (button images)
- img__NM__ (general images)
- ico__NM__ (icons)
- menu_img__NM__ (menu images)

This way, the image called 001.jpg that was added to the public and icon scope will receive the name sys__NM__ico__NM__001.jpg

The image will be in the folder "app/project_name/_lib/img" in the development environment and in the production, will be "/project_name/_lib/img".

After uploading the image to the project, you need to insert the image in the applications that you desire, to do that in the applications desired, go to Applications > Settings > Application images and click on the icon next to the garbage icon to add an image.

Chart Themes

The chart themes tool offers the option for you to create different themes for the chart applications of your project. The chart theme allows you to modify some options, such as the background color, font, margin, data, border and shadow.

To create new themes, you need to select an existing theme so that you can use it as a base and on top of it you'll customize it to the way you feel satisfied.

HTML Editor Templates

The HTML editor tool offers you the option to modify the toolbar of the html editor field present in the applications.

You can create a new template theme and/or edit an existing one.

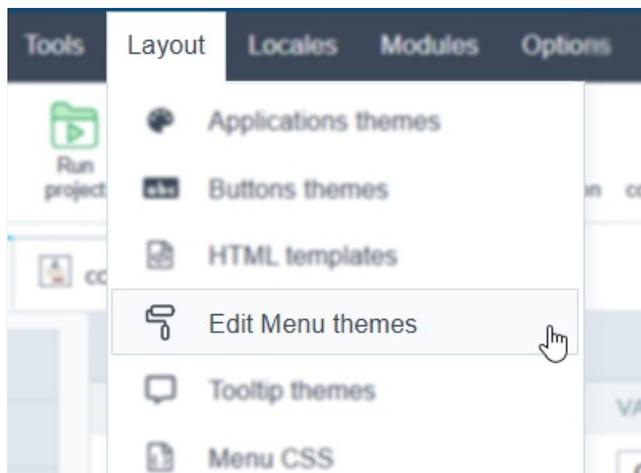

To create a new theme, just select an existing one and click on “Save As”, to edit an existing theme just select the theme and click on “Save”.

The screenshot displays the 'Template' configuration window for an HTML editor. At the top, there is a dropdown menu set to 'basic' and three buttons: 'Save', 'Save as', and 'Delete'. Below this, three settings are shown: 'Status bar' set to 'No', 'Buttons Alignment' set to 'Left', and 'Top menu' set to 'Yes'. The main area is divided into two sections: 'Available buttons' and 'Buttons in use'. The 'Available buttons' section contains a row of icons for various functions like file operations, undo/redo, text formatting (bold, italic, underline, strikethrough), alignment, lists, and links. The 'Buttons in use' section shows a subset of these icons currently active in the editor, including a minus sign, undo, redo, 'Style', bold, italic, alignment, lists, and link icons. A '+ Adicionar Linha' button is also present. At the bottom, a 'Preview' section shows a menu bar with 'File', 'Edit', 'Insert', 'View', 'Format', 'Table', and 'Tools' menus, and a toolbar with 'Formats', bold, italic, alignment, lists, and link icons.

Edit Menu themes

The theme editor allows developers to easily create new themes for the responsive menu, changing the application's color palette to match the system's visual design.

To access the theme editor, go to **Layout > Edit Menu Themes**.

Theme List

When accessing the editor, the existing themes in Scriptcase are displayed, sorted by the saving mode (scope).

<input type="button" value="+ New Theme"/> <input type="button" value="Preview theme"/> <input type="button" value="Copy theme"/> <input type="button" value="Delete theme"/> <input type="button" value="Clear selection"/>			
	Theme name	Theme colors	Mode ^
<input type="radio"/>	samples		Project
<input checked="" type="radio"/>	Dark Cobalt		Scriptcase
<input type="radio"/>	Dark Coffee		Scriptcase
<input type="radio"/>	Dark Sunset		Scriptcase

- **Theme name** - Displays the theme names.
- **Theme colors** - Displays the colors that make up the theme.
- **Mode** - Indicates the scope in which the theme was saved.
 - **Scriptcase**: Default themes provided by Scriptcase. These themes cannot be edited or deleted but can be copied to create new themes.
 - **Public**: Themes available for all projects.
 - **Project**: Themes available only for the current project.
- - Removes the selected theme. This icon is displayed only for themes created by the developer.

Creating Themes

Menu themes can be created from scratch by clicking on **New Theme**, or based on one of the themes provided by Scriptcase, by selecting the desired theme and clicking **Copy Theme**.

Scriptcase provides some themes that can serve as a foundation for creating new ones.

	Theme name
<input type="radio"/>	samples
<input checked="" type="radio"/>	Dark Cobalt
<input type="radio"/>	Dark Coffee

- **New theme** - Opens the theme creation screen with no predefined colors.
- **Preview theme** - Allows previewing the selected theme.
- **Copy theme** - Creates a copy of the selected theme if it is one provided by Scriptcase.
- **Clear selection** - Deselects the selected theme.

The **Copy theme** button changes to **Edit theme** when selecting a theme created by the developer.

Copying a Theme (Copy Theme Button)

The **Copy theme** button is enabled when selecting one of the themes provided by the tool. After selecting and clicking the button, the **Create new theme** screen will open with the color palette filled in from the base theme.

Tooltip themes

This theme editing tool allows developers to modify the default TippyJS themes provided by Scriptcase. Creating a custom CSS theme for TippyJS lets you adjust the appearance of tooltips to match the visual style you want to apply, offering greater control and customization of the interface.

To access the theme editor, go to **Layout > Tooltip Themes**.

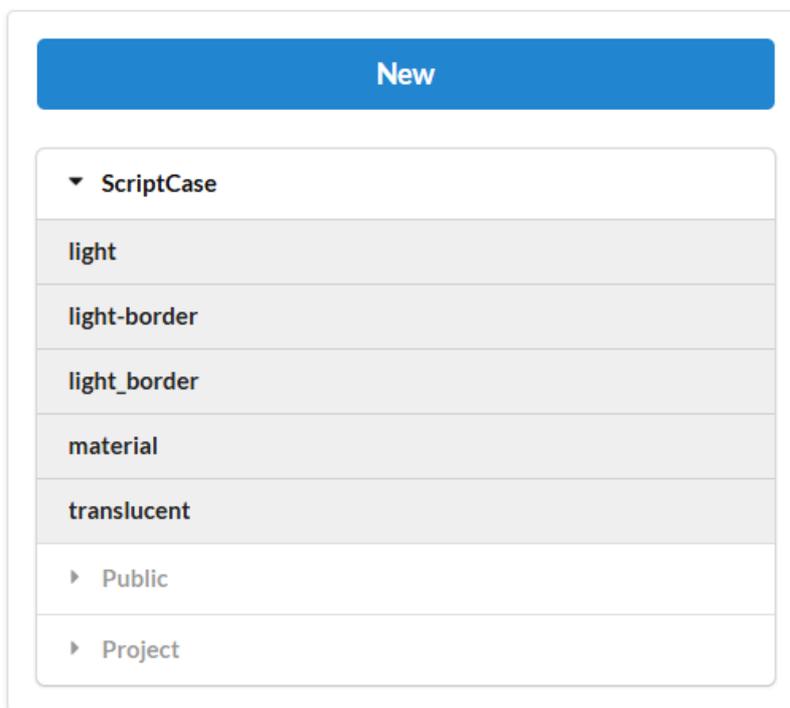

Theme List

When accessing the theme editor, the existing themes will be listed, grouped according to their scope.

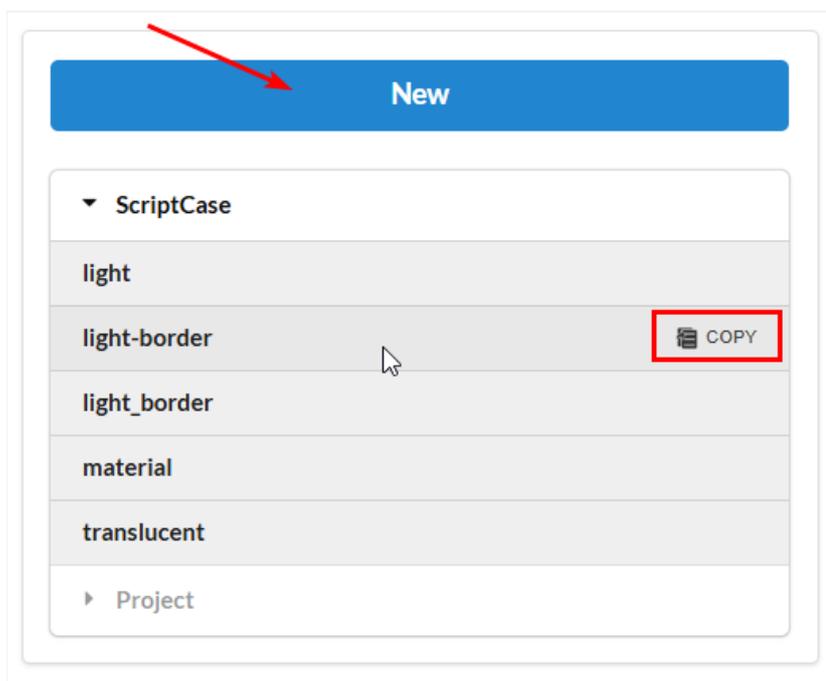

- **Scriptcase:** Default themes provided by Scriptcase. These themes cannot be edited or deleted but can be copied to create new ones.
- **Public:** Themes available for all projects.
- **Project:** Themes available only for the current project.

Tooltip themes

Creating Themes

New TippyJS themes can be created from existing Scriptcase themes or from scratch by clicking the **New** button.

Copying Themes (Copy Button)

The themes provided by Scriptcase can serve as a foundation for creating new themes. By clicking the Copy button, which

appears when hovering over a specific theme, the developer can create a copy to use as a base for CSS customization.

Blank Theme (New Button)

By clicking the **New** button, the editing screen will open with a blank theme, allowing the developer to create a theme from scratch.

There is no specific structure required to create a TippyJS theme. However, maintaining a basic structure already used by the component can simplify the application of styles and ensure that TippyJS correctly recognizes the custom theme.

Below is a basic template for a TippyJS theme.

```
/* Basic structure of a custom TippyJS theme */

/* Tooltip box */
.tippy-box[data-theme~="theme-name"] {
  /* Tooltip background color */
  background-color: #f0f0f0;

  /* Text color inside the tooltip */
  color: #333;

  /* Tooltip rounded corners */
  border-radius: 6px;

  /* Tooltip shadow */
  box-shadow: 0 4px 10px rgba(0, 0, 0, 0.1);

  /* Font and text size */
  font-size: 14px;

  /* Tooltip padding */
  padding: 10px;
}

/* Tooltip content (the text or HTML inside it) */
.tippy-box[data-theme~="theme-name"] .tippy-content {
  /* Sets content padding */
  padding: 8px 12px;

  /* Font styling for the content */
  font-family: Arial, sans-serif;
}

/* Arrow customization */
.tippy-box[data-theme~="theme-name"] .tippy-arrow {
  /* Arrow size */
  width: 12px;
  height: 6px;
}

/* Arrow when the tooltip is above the target (top) */
.tippy-box[data-theme~="theme-name"][data-placement^="top"] > .tippy-arrow::before {
  /* Arrow color to match the tooltip background */
  border-top-color: #f0f0f0;
}

/* Arrow when the tooltip is below the target (bottom) */
.tippy-box[data-theme~="theme-name"][data-placement^="bottom"] > .tippy-arrow::before {
  border-bottom-color: #f0f0f0;
}
```

```

/* Arrow when the tooltip is to the left of the target (left) */
.tippy-box[data-theme~="theme-name"][data-placement^="left"] > .tippy-arrow::before {
  border-left-color: #f0f0f0;
}

/* Arrow when the tooltip is to the right of the target (right) */
.tippy-box[data-theme~="theme-name"][data-placement^="right"] > .tippy-arrow::before {
  border-right-color: #f0f0f0;
}

/* Transition effect (appearance and disappearance animation) */
.tippy-box[data-theme~="theme-name"] {
  /* Smooth opacity transition when showing/hiding the tooltip */
  transition: opacity 0.3s ease-in-out, transform 0.3s ease-in-out;
}

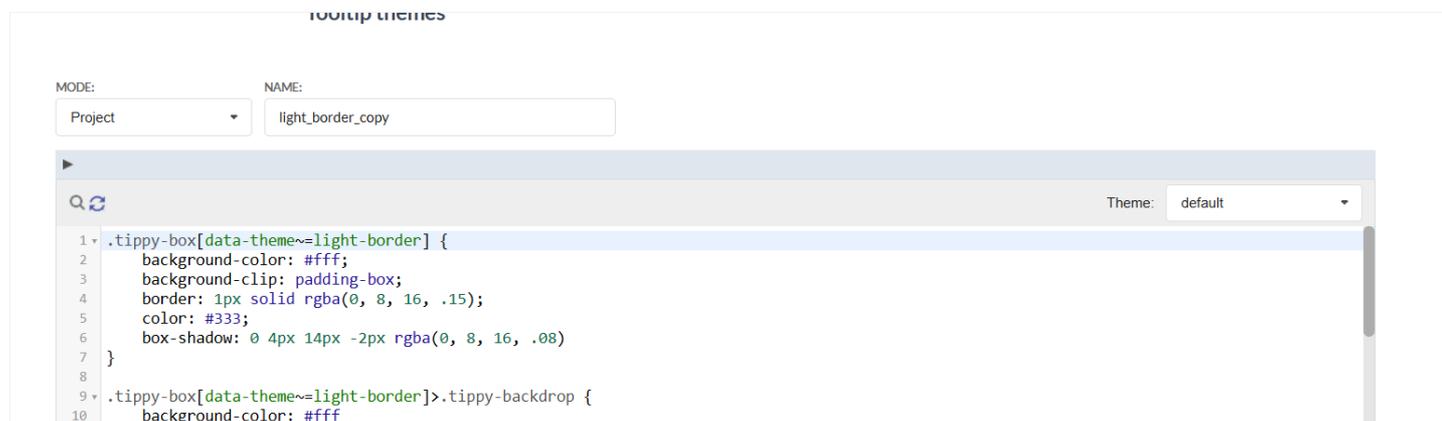

/* Tooltip when it is visible */
.tippy-box[data-theme~="theme-name"][data-state="visible"] {
  /* Tooltip is fully visible */
  opacity: 1;
  transform: scale(1);
}

/* Tooltip when it is hidden */
.tippy-box[data-theme~="theme-name"][data-state="hidden"] {
  /* Tooltip is partially invisible while hidden */
  opacity: 0;
  transform: scale(0.95); /* "Shrink" effect when disappearing */
}

```

Code Editor

CSS editing screen for creating a TippyJS theme

- **Mode** - Defines the scope in which the theme will be saved. The developer can choose between:
 - **Project** - The created theme will be available only in the current project.
 - **Public** - The created theme will be available in any project.
- **Name** - Sets the name for the new theme. By default, when copying a theme, *_copy* is added after the original theme's name.
- **Theme** - Defines the CSS code editor's theme.
-  - Enables the code editor's search feature.
-  - Enables the code editor's replace feature.

Scriptcase Locales Overview

ScriptCase offers a complete generator so that you can define the languages and regional settings that your project will support. The locales settings can be accessed via the menu Locales.

Application Language

The language menu for the applications allows you to translate the ScriptCase's default messages, and also create custom messages to be used in different parts of the applications.

To see how to set the Application Language, [click here](#).

Regional Settings

The regional settings allows you to define some parameters of the monetary unit, date and numbers, according to the country or region where your application is going be used. Clicking on Customizing, you can modify the values that'll be used in your applications.

To see how to set the Regional Settings, [click here](#).

Application Language

The language menu for the applications allows you to translate the ScriptCases default messages, and also create custom messages to be used in different parts of the applications.

Messages

Using the messages menu, it's possible to select and edit messages. The messages are divided in the categories: "ScriptCase Messages" and "Project Messages". New categories can be created using the item "New Folder".

Selecting a lang to be modified, a new page will appear with the columns of each language of your project. You'll inform the value of the message in each language.

The screenshot displays the 'Application language' configuration page. The interface includes a breadcrumb trail (Home, Regional Settings, Application language) and a search bar. A sidebar on the left, titled 'MESSAGES', shows a tree view of message categories: Home, Scriptcase Messages (JavaScript, Buttons, Calendar, Charts, Flash Charts, Log, Others, PDF, Search, Security, Validation), Project messages (General). The main content area is a table with three columns: 'Index', 'Default value in English', and 'Portuguese/Português (Brasil)'. The table lists various error messages and their translations.

Index	Default value in English	Portuguese/Português (Brasil)
lang_errm_ajax_data	Invalid data	Dados inválidos
lang_errm_ajax_rqrd	Required field	Campo Obrigatório
lang_errm_cfrm_remv	Delete the selected rows?	Deseja excluir os registros marcados?
lang_errm_cmlb_nfnd	Common libs not found:	Diretório de produção não encontrado:
lang_errm_dbas	Database access	Acesso a base de dados
lang_errm_dbcn_conn	An error occurred while connecting to the database:	Ocorreu um erro durante a conexão com
lang_errm_dbcn_data	Unable to connect to the database. The php session time out has expired or the connection parameters are incorrect.	Não foi possível conectar com o banco
lang_errm_dbcn_nfnd	The database connection was not found, contact the system administrator. Connection:	Conexão com o banco de dados não
lang_errm_dbcn_nspt	Connection for database not supported by this application, contact the system administrator. Connection:	Conexão para banco de dados não
lang_errm_dber	Error while accessing the database	Erro ao acessar o

Regional Settings

The regional settings allows you to define some parameters of the monetary unit, date and number according to the country or region where your application is going be used. Clicking on Customize you can modify the values that'll be used in your applications.

Regional Settings		?
English (United States) ▼		Customize...
EXAMPLES:		
Number	123,456,789.00	-123,456,789.00
Currency unit	\$123,456,789.00	(\$123,456,789.00)
Time	11:13:40 AM	
Date	03/27/2017	
First day	Sunday	

Customizing Regional Settings

In the General group, you can set the writing direction. This setting configures if the characters will be inserted from left-to-right or right-to-left.

General		?
ATTRIBUTE VALUE		
Writing direction	Left to Right ▼	

In the Number group, we have some parameters like the Decimal Symbol, digit grouping and negative format. These parameters are used in the applications that uses the decimal type field.

Number		?
ATTRIBUTE VALUE		
Decimal symbol	.	
Character negative sign	-	
Negative number format	-1.1 ▼	
Character digits grouping	,	
Digit grouping	123,456,789 ▼	

In the Currency Unit group, we have some parameters like the Monetary Symbol, Currency positive format, etc. These parameters are used in the applications that uses the Currency type field.

Currency unit	
ATTRIBUTE VALUE	
Symbol	\$
Currency positive format	\$1.1 ▼
Currency negative format	(\$1.1) ▼
Decimal symbol	.
Character digits grouping	,
Digit grouping	123,456,789 ▼

Within the Time and Date groups are available the parameters of Date and time, that can be used in the fields of the Type Time, Date and Datetime.

Time	
ATTRIBUTE VALUE	
Separator	:
Positioning AM/PM	Right with space ▼
Symbol A.M.	AM
Symbol P.M.	PM

Date	
ATTRIBUTE VALUE	
Format	mmddyyyy ▼
First day	Sunday ▼
Separator	/

Modules Overview

Scriptcase offers a comprehensive set of security features, integrating security and logging modules to quickly establish efficient access control across your project.

Old Security Module

This module provides system protection, creating access control and defining privileges for users, ensuring that only authorized users have access to certain applications.

Five types of security modules are available, which work in a similar way, their main distinction is in the way permissions are applied to users.

[Click here](#) to access documentation about the Old Security Module.

New Security Module

Its operation is similar to the traditional security module, however, it has more configuration options and makes all these options available in the **Configuration** application, allowing the system's security settings to be changed at the end, by the system administrator, making the security module more dynamic.

[Click here](#) to access documentation about the New Security Module.

Notifications Module

The Notification Module automatically generates a set of applications used in the management of system notifications. This module allows you to create access control with restrictions according to the type of Notification module.

[Click here](#) to access the documentation about the notifications module.

Log Module

Records events and activities in the system, creating a detailed history of actions such as login, data updates and other operations. Logs are essential for monitoring user changes to the system and are valuable in audits.

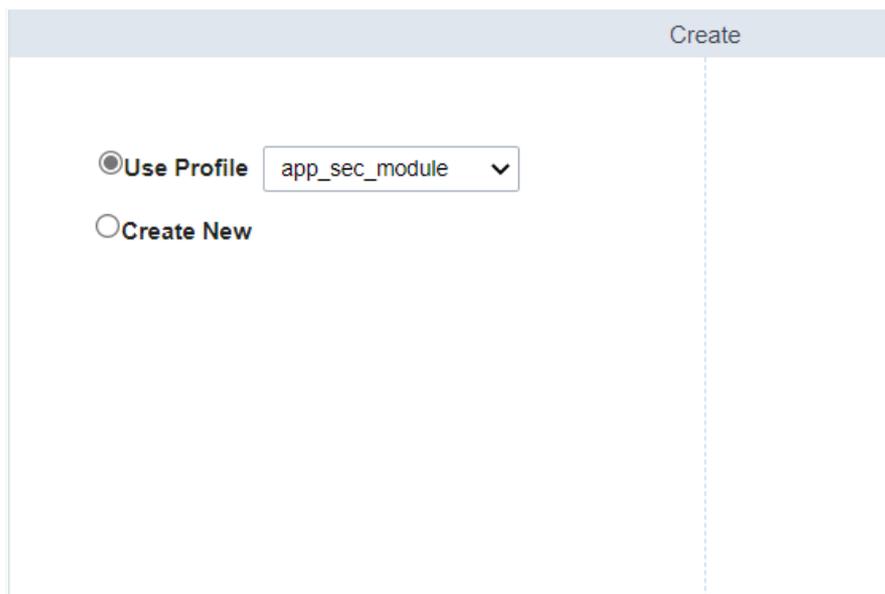

[Click here](#) to access documentation about the logging module.

Security Module Overview

Create

This screen is displayed when accessing the security module if there is any previously configured security profile.

On this screen, the developer chooses to create a new security module or use an existing profile.

Use Profile

When selecting this option the module configurations are filled according to the configurations used in the selected profile creation.

The creation of profiles in the security module occurs at the end of the module's configuration process, storing the options and settings made.

Profiles can be saved in three ways.

- **Public** - With this option all projects and users of the tool will have access to this profile.
- **Project** - When saving the profile at the project level, all users of the project where the profile was created will have access for use..
- **User** - Only the user who performed the profile configuration will have access to its use in any project.

Create New

When choosing to create a new module, the module's configurations change to Scriptcase's default values.

Choose the Security Type

Choose the Security type

User

Application

Group

LDAP

Only authenticate

Total control

This is the first step in creating the security module.

On this screen, we must select the type of security that will be created. In this case the **User module** will be chosen.

Security module per User

Under this security type all users have access to all applications. It works only for user authentication. Scriptcase will create one table to store the user and password information and validate the access using a login screen.

For more details about the **User Security Module**, [click here](#)

Security module per Application

Under this type Scriptcase will also control login and password as the User Security and also create a restricted access control to the applications or system options according to the logged user. It is possible to define which applications is accessible to each user.

For more details about the **Application Security Module**, [click here](#)

Security module per Group

This type of security includes the options of User and Application types, however with the Group Security type you will group the users and define the permissions to access the applications or system options according to the groups. One user can belong to one or more groups.

For more details about the **Group Security Module**, [click here](#)

Security module per LDAP

The Lightweight Directory Access Protocol (LDAP) is an open, vendor-neutral, industry standard application protocol for accessing and maintaining distributed directory information services over an Internet Protocol (IP) network. You can use this protocol within Scriptcase Security module to authentication users in two ways:

Authentication only

Performs only a simple user authentication, similar to User Security Type.

For more details about the **Ldap Authentication only**, [click here](#)

Total Control

where we can define the access by groups, similar to the Group Security Type.

For more details about the **Ldap Total Control**, [click here](#)

Per-User Security Module Overview

Making use of the security modules, you can implement a complete access rules for systems developed by ScriptCase. The process for the security module creation is quick and simple.

Security module per User

In user security, all registered users have access to system applications, working only as user authentication.

For those who want to create the tables in advance, only the user table is mandatory. The logged and users_social tables are created only when activating the Protect Logged users and Use social networks options, respectively.

Below see all the tables created for this type of security.

sec_users

```
CREATE TABLE "sec_users" (
  "login" TEXT NOT NULL,
  "pswd" TEXT NOT NULL,
  "name" TEXT,
  "email" TEXT,
  "active" TEXT,
  "activation_code" TEXT,
  "priv_admin" TEXT,
  "mfa" TEXT,
  "picture" BLOB,
  PRIMARY KEY ("login")
);
```

sec_logged

```
CREATE TABLE "sec_logged" (
  "login" TEXT NOT NULL,
  "date_login" TEXT,
  "sc_session" TEXT,
  "ip" TEXT
);
```

The table **Logged users** will be created only if the option **Protect Logged users** is checked during the Security Module creation.

sec_users_social

```
CREATE TABLE "sec_users_social" (
  "login" TEXT NOT NULL,
  "resource" TEXT NOT NULL,
  "resource_id" TEXT NOT NULL,
  PRIMARY KEY ("login", "resource", "resource_id")
);
```

The table **users_social** will be created only if the option **Use social networks** is checked during the Security Module creation.

sec_settings

```
CREATE TABLE "sec_settings" (
  set_name TEXT NOT NULL,
  set_value TEXT,
  PRIMARY KEY ("set_name")
)
```

Use Existing Tables

Connection

Define the connection where the security module tables fixed. All existing connections in the project will be displayed

If you need to create a new connection, [click here](#) and see how.

Use existing tables

Allows you to use existing tables in your database. These tables must have, at least, the same fields used by the Scriptcase security module.

We recommend that you use this option if you have used Scriptcase to create the tables before, to minimize errors.

If you want to know the specifications for this security module, [click here](#).

Create tables

Once this option is selected, Scriptcase is responsible for creating the tables necessary for the use of the security module.

Tables prefix

Defines a prefix for the tables that will be created by the security module.

By default, the Scriptcase uses “**sec_**”.

Delete if tables already exist

This option deletes tables with the same name from your database.

E.G.: When defining the **prj_** prefix for your tables, if there is any table with the name **prj_users** in your database, it will be deleted.

This option is only available when selecting a **Create tables** option.

Protect Logged Users

This option prevents the same user from accessing the system simultaneously in different session.

By checking this option, the **logged** table will be created.

When using the default prefix or the table name will be **sec_logged**.

Use Social Networks

This option allows the configuration of Facebook and Twitter for the authentication of system users.

By checking this option, the **users_social** table will be created.

When using Social Networks, the **Login Template** option will not be available to define the security module login layout.

Association tables

This step is essential if the option **“Use existing tables”** is selected.

In this case, you must associate the fields from the existing tables to fields of security applications (applications generated by the Security Module).

If you have selected the option **“Create tables”**, in the previous step, it associates the fields automatically.

If you choose to create the tables beforehand, see below as local tables and fields.

sec_users

```
CREATE TABLE "sec_users" (
  "login" TEXT NOT NULL,
  "pswd" TEXT NOT NULL,
  "name" TEXT,
  "email" TEXT,
  "active" TEXT,
  "activation_code" TEXT,
  "priv_admin" TEXT,
  "mfa" TEXT,
  "picture" BLOB,
  PRIMARY KEY ("login")
);
```

sec_logged

```
CREATE TABLE "sec_logged" (
  "login" TEXT NOT NULL,
  "date_login" TEXT,
  "sc_session" TEXT,
  "ip" TEXT
);
```

The table **Logged users** will be created only if the option **Protect Logged users** is checked during the Security Module creation.

sec_users_social

```
CREATE TABLE "sec_users_social" (
  "login" TEXT NOT NULL,
  "resource" TEXT NOT NULL,
  "resource_id" TEXT NOT NULL,
  PRIMARY KEY ("login", "resource", "resource_id")
);
```

The table **users_social** will be created only if the option **Use social networks** is checked during the Security Module creation.

General

Applications Prefix

You can set a prefix to the application names of the Security Module.

When session expires

Define the behaviour when the session expires.

- **No action** - The user continues using the application, but no saves after the session expires.
- **Redirect to login after the session expiration** - The application returns to the login after expiring the session.
- **Display a message that the session has expired** - Shows the message "session has expired" to the user.

Encryption

Use encryption to store the password in the table of users.

Enable Security

Activate the flag Application Security for all project applications.

Remember login

Activating the flag allows the user to remain logged in when returning to the system when the session ends, without having logged out.

Cookie expiration time

Cookie expiration time in days for **Remember login** option

Label Position at Login

Defines the Label positioning of the fields in relation to the data.

- **Beside** - Default value of the applications, placing the label on the right side of the input label to the Side
- **Above** - Positions the label above the input label Above
- **Below** - Positions the label below the input label Below
- **Watermark** - Positions the label as Watermark.

Enable Captcha

It activates the captcha for the login application.

- **No** - Does not display the captcha in the login application.
- **Captcha** - Uses the built-in scriptcase library for captcha display.
- **reCAPTCHA** - Uses Google's reCAPTCHA V2. To configure, [click here](#).

[Watch a video of reCAPTCHA. If you prefer, see a tutorial on how to generate the keys.](#)

Site Key

Key generated by Google after reCAPTCHA project creation.

Secret Key

Key generated by Google after reCAPTCHA project creation.

Folder

The project folder name to store the applications generated by Security Module.

Theme

The theme to create the Security Module applications.

Log

This option is available if the project already has a Log Module.

[Click here](#) and check out how to create a Log Module

Menu

This option is only available if your project already has a Menu Application. You can associate the existing Menu and include all applications generated by the Security Module to it. If you do not select an existing Menu here, it creates a new Menu Application.

Menu Type

Security Module menu type (option only available if you do not select an existing menu in the previous item)

This option is available when using the **Create Application Menu** option in the **menu** item

Use SweetAlert

Enables the use of sweetAlert in security module applications.

Settings

Defines whether the security module editing application will be generated.

With this option active, the system administrator user will be able to change some settings of the security module at the end, when accessing the system.

See below for the list of options available for editing the security module.

- **Action for session expiration** - Define the system behavior when the session expires. This feature is triggered as soon as a new action is performed.
 - **No action:** No action will be taken and the user will continue using the system, however no action will be saved.
 - **Redirect to login:** When performing some action on the system, the user will be redirected to the login application.
 - **Displays a message and redirects to login:** or perform some action on the system, a message will be displayed informing you that the session has expired with an ok button. By clicking on the button, the user will be redirected to the login application.
- **Remember login** - Activating the flag allows the user to remain logged in when returning to the system when the session ends, without having logged out.
- **Remember login** expiration time - Cookie expiration time in days for the **Remember login** option. By default, Scriptcase sets the limit to 30 days.
- **Recover Password** - Enables the reset password button on the login screen.
- **New Users** - Enables the add new users button on the login screen.
- **Brute force** - Enables or disables the failed access attempt limit.
- **Block time for Brute Force protection** - Defines the time, in minutes, that the user will remain unreachable after several failed login attempts.
- **Brute Force Attempts for blocking** - Defines the number of failed access attempts until protection is activated.
- **2F** - Defines whether two-factor authentication will be used on the system.
- **2FA Expiration Time** - Determines the time in seconds that the 2FA authentication token will expire

Login

Here you can set the type and amount of characters allowed for the username and password fields.

User

Minimum size

Minimum amount of characters used by the user.

Maximum size

Maximum size of the characters used by the user.

Allowed characters

Define which characters are allowed when creating a password.

- **All** - Accepts all values
- **Select** - Allows you to select the allowed characters. The options are:
 - Letters
 - Numbers
 - Accent
 - Cedilla
 - Space
 - Dot
 - Comma

Password

Minimum size

Minimum amount of characters used by the user.

Maximum size

Maximum size of the characters used by the user.

Allowed characters

Define which characters are allowed when creating a password.

View password characters

This option toggles in the password field, allowing the displayed password to be displayed.

- **All** - Accepts all values
- **Select** - Allows you to select the allowed characters. The options are:
 - Letters
 - Numbers
 - Accent
 - Cedilla
 - Space
 - Dot
 - Comma

E-mail Settings

Email Server

Select an email API to use in the security module.

This email will be used in the options:

- All options of **Retrieve Password**
- **New User** when select the options: **Requires activation by email**, **Send email to administrator**.

Custom - Enter the SMTP data in the options below.

The options below are only available when the **custom** option is selected.

SMTP Server

Enter the SMTP server address.

SMTP Port

Enter the SMTP server port. This information must comply with the secure connection option. Use 465 for SSL, 587 for TLS, or 25 for unsafe connection. If you do not inform the port, Scriptcase applies the default one: 25.

Secure Connection

Use SSL or TSL, or leave it blank for insecure connection.

- SSL
- TSL

SMTP User

Enter the SMTP User information.

SMTP Password

Enter the SMTP password information.

SMTP E-mail

Enter the SMTP outgoing email.

SMTP

To proceed with the password recovery, it is necessary that has the SMTP server configured for a successful process. Look [here](#) how to realize this procedure.

Yahoo

For more information about these settings [Click Here](#).

Some email applications uses older, less secure technologies to sign in to your email account, and Google will block these requests by default. To solve this, sign in to your Google account and enable access through less secure apps through this [link](#).

See also: [Ways to securely access Yahoo Mail](#)

SMTP Server Settings Yahoo

SMTP Server	smtp.mail.yahoo.com
Port	465 or 587
E-mail address	Your full email address (name@domain.com.)

SMTP Server Settings Yahoo

Password	The password for your account.
Requires SSL	Yes
Requires TLS	Yes (if available)
Requires authentication	Yes

Gmail

For more information about these settings [Click Here](#).

Some email applications uses older, less secure technologies to sign in to your email account, and Google will block these requests by default. To solve this, sign in to your Google account and enable access through less secure apps through this [link](#).

SMTP Server Settings Gmail

SMTP Server	smtp.gmail.com
E-mail address	Your full email address (Ex. example@gmail.com)
Password	The password for your account.
Port (TLS)	587
Port (SSL)	465
TLS / SSL Required	Yes

Outlook / Hotmail

For more information about these settings [Click Here](#)

SMTP Server Settings Outlook.com

SMTP Server	smtp-mail.outlook.com
E-mail address	Your full email address (Ex. myname@outlook.com, not an alias)
Password	The password for your account.
Port	587 (you can use port 25 as an alternative)
TLS / SSL Required	Yes

Retrieve Password

It defines the password recovery method in the project.

The password recovery options work only when the SMTP server is configured, please check the Email settings.

Send the password by e-mail

The system emails the user password just if the SMTP has been correctly set up, and the password is not using encryption.

Reset password and send new one by email

The system resets the password automatically and sends it to the user by email (just if the SMTP has been correctly set up).

Send a link to e-mail with reset option

The system emails the user a link to access an application and reset the password.

New users

Settings for creating new users in the security system.

The options activation by email and send an email to admin work only when the SMTP server is configured properly, access Email settings to set it up.

Allows the registration of new users

This option sets the availability of users registration directly in the login system. If you do not check this option, only users with administrative access can insert new users.

Requires activation by email

This option sets whether the new user must validate his registration by email to activate the account (Configure the email SMTP to use this option)

Send email to administrator

This option sets whether the system administrator receives an email whenever a new user is registered. (Configure the email SMTP to use this option)

Social Network

Allows the use of **Facebook** and **Twitter** to login to the security module.

When using social network authentication the **Login Template** option will not be available.

Facebook

Enable login via facebook. For the login to work, it is necessary to configure an application to obtain the **App ID** and **Secret**

[See how to generate facebook credentials](#)

App ID

Enter the **Application ID** available in the application settings on facebook developers.

Secret

Enter the **Application Secret Key** available in the application settings on facebook developers.

Twitter

Enable login via Twitter. For the login to work, it is necessary to configure an application to obtain the **App ID** and **Secret**

App ID

Enter the **Application ID**.

Secret

Enter the **Application Secret Key**

Logged Users

Defines the system behavior for login protection.

This option is available if you have checked Protect logged users during the connection step.

Display logged users

If you check this option Scriptcase will also create with the Security Module a Grid Application to display a report with all users current logged on the system

Brute Force Attack Protection

Enables/disables the blocking of users after some unsuccessful access attempts.

Brute Force lockout time (in Minutes)

Time, in minutes, that the user will remain inaccessible after several unsuccessful access attempts. (Available only when Brute Force Attack Protection is enabled)

Numbers of attempts before lock

Number of failed access attempts, until the protection is enabled. (Available only when enable protection for brute force attacks)

Login Template

Allows the use of a custom HTML when creating the security module login application.

This HTML must be previously loaded into an external library, which in turn must be enabled for use in the project. [See how to enable an external library.](#)

This option is only available when **Authentication by social network** is not being used.

Use the template for the login screen

Defines whether the login application will use a custom HTML or a standard Scriptcase theme.

No

By checking no, the login application will be created with the project's default theme.

Yes

When checking yes, the **Login Template** button will be enabled, thus allowing the selection of one of the listed templates.

It is necessary to enable the external library that will be used.

- **Enable external Libraries** - Redirects to external library management screen.
- **Reload** - Reloads the select, listing the unlisted libraries after enabled.

Two Factor Authentication

Authentication (2FA)

In this option the user will select the type of 2 factor authentication to be used, there are three options:

Auth

This option will send the code to your Authentication app from Google.

[See how to use the authentication API](#)

SMS

This option will send the authentication code by SMS.

[See how to use the SMS API](#)

E-mail

This option will send the authentication code by SMS.

[See how to use the email sending APIs](#)

API

In this option you select the API previously created to be used to send the code.

Code expiration time

Time in following to expire token sent for authentication.

Insert Data

This option inserts the first user into the security tables. This user has administrator privileges to manage the security system and add new users.

ATTENTION: To increase the security of your project, we recommend changing the default password "admin/admin" at this step or after the first access.

Login

This option sets the system administrator user.

By default the defined user is **admin**

Password

This option sets the system administrator password.

By default the defined password is **admin**

Name

This option sets the name of the administrator user on the system.

E-mail

This option sets the system administrator user E-mail.

For sending email to the administrator to work, either SMTP is configured correctly or an email API is selected in the Email Settings screen in the previous step.

Save Profile

Using this option, you save all settings during the Security Module creation. It can be used later for other projects.

Save Profile

Allows you to save a profile with all the current security module settings.

Name

Profile name. It identifies the profile.

Target

This option sets what developers can use the saved profile afterward.

- Public - Set the security profile available in any project of your Scriptcase.
- Project - Set the security profile available only in the current project.
- User - Set the security profile available only to the current Scriptcase user

Building Security

Security module creation summary screen, listing changes made by the tool.

Open Project

Go to the Home of the currently open project.

Generate Source Code

Generates the source code of all applications created by the security module.

After the creation of the security module, it will be necessary to generate the phone of all the applications, which all had a change in the use security flag. Minus the Login and Menu applications.

Per-Application Security Module Overview

Making use of the security modules, you can implement a complete access rules for systems developed by ScriptCase. The process for the security module creation is quick and simple.

Security module per Application

It has a restriction of access to applications according to the user. In this type of security, the administrator must define which applications can be accessed by system users.

In this type of security, these tables are created:

sec_users

```
CREATE TABLE "sec_users" (
  "login" TEXT NOT NULL,
  "pswd" TEXT NOT NULL,
  "name" TEXT,
  "email" TEXT,
  "active" TEXT,
  "activation_code" TEXT,
  "priv_admin" TEXT,
  "mfa" TEXT,
  "picture" BLOB,
  PRIMARY KEY ("login")
);
```

sec_apps

```
CREATE TABLE "sec_apps" (
  "app_name" TEXT NOT NULL,
  "app_type" TEXT,
  "description" TEXT,
  PRIMARY KEY ("app_name")
)
```

sec_users_apps

```
CREATE TABLE "sec_users_apps" (
  "login" TEXT NOT NULL,
  "app_name" TEXT NOT NULL,
  "priv_access" TEXT,
  "priv_insert" TEXT,
  "priv_delete" TEXT,
  "priv_update" TEXT,
  "priv_export" TEXT,
  "priv_print" TEXT,
  PRIMARY KEY ("login", "app_name")
)
```

sec_logged

```
CREATE TABLE "sec_logged" (
  "login" TEXT NOT NULL,
  "date_login" TEXT,
  "sc_session" TEXT,
  "ip" TEXT
);
```

The table **Logged users** will be created only if the option **Protect Logged users** is checked during the Security Module creation.

sec_users_social

```
CREATE TABLE "sec_users_social" (
  "login" TEXT NOT NULL,
  "resource" TEXT NOT NULL,
  "resource_id" TEXT NOT NULL,
  PRIMARY KEY ("login", "resource", "resource_id")
);
```

The table **users_social** will be created only if the option **Use social networks** is checked during the Security Module creation.

sec_settings

```
CREATE TABLE "sec_settings" (  
set_name TEXT NOT NULL,  
set_value TEXT,  
PRIMARY KEY ("set_name")  
)
```

Use Existing Tables

Connection

Define the connection where the security module tables fixed. All existing connections in the project will be displayed

If you need to create a new connection, [click here](#) and see how.

Use existing tables

Allows you to use existing tables in your database. These tables must have, at least, the same fields used by the Scriptcase security module.

We recommend that you use this option if you have used Scriptcase to create the tables before, to minimize errors.

If you want to know the specifications for this security module, [click here](#).

Create tables

Once this option is selected, Scriptcase is responsible for creating the tables necessary for the use of the security module.

Tables prefix

Defines a prefix for the tables that will be created by the security module.

By default, the Scriptcase uses “**sec_**”.

Delete if tables already exist

This option deletes tables with the same name from your database.

E.G.: When defining the **prj_** prefix for your tables, if there is any table with the name **prj_users** in your database, it will be deleted.

This option is only available when selecting a **Create tables** option.

Protect Logged Users

This option prevents the same user from accessing the system simultaneously in different session.

By checking this option, the **logged** table will be created.

When using the default prefix or the table name will be **sec_logged**.

Use Social Networks

This option allows the configuration of Facebook and Twitter for the authentication of system users.

By checking this option, the **users_social** table will be created.

When using Social Networks, the **Login Template** option will not be available to define the security module login layout.

Association tables

This step is essential if the option **“Use existing tables”** is selected.

In this case, you must associate the fields from the existing tables to fields of security applications (applications generated by the Security Module).

If you have selected the option **“Create tables”**, in the previous step, it associates the fields automatically.

If you choose to create the tables beforehand, see below as local tables and fields.

sec_users

```
CREATE TABLE "sec_users" (
  "login" TEXT NOT NULL,
  "pswd" TEXT NOT NULL,
  "name" TEXT,
  "email" TEXT,
  "active" TEXT,
  "activation_code" TEXT,
  "priv_admin" TEXT,
  "mfa" TEXT,
  "picture" BLOB,
  PRIMARY KEY ("login")
);
```

sec_apps

```
CREATE TABLE "sec_apps" (
  "app_name" TEXT NOT NULL,
  "app_type" TEXT,
  "description" TEXT,
  PRIMARY KEY ("app_name")
)
```

sec_users_apps

```
CREATE TABLE "sec_users_apps" (
  "login" TEXT NOT NULL,
  "app_name" TEXT NOT NULL,
  "priv_access" TEXT,
  "priv_insert" TEXT,
  "priv_delete" TEXT,
  "priv_update" TEXT,
  "priv_export" TEXT,
  "priv_print" TEXT,
  PRIMARY KEY ("login", "app_name")
)
```

sec_logged

```
CREATE TABLE "sec_logged" (
  "login" TEXT NOT NULL,
  "date_login" TEXT,
  "sc_session" TEXT,
  "ip" TEXT
);
```

The table **Logged users** will be created only if the option **Protect Logged users** is checked during the Security Module creation.

sec_users_social

```
CREATE TABLE "sec_users_social" (
  "login" TEXT NOT NULL,
  "resource" TEXT NOT NULL,
  "resource_id" TEXT NOT NULL,
  PRIMARY KEY ("login", "resource", "resource_id")
)
```

);

The table **users_social** will be created only if the option **Use social networks** is checked during the Security Module creation.

General

Applications Prefix

You can set a prefix to the application names of the Security Module.

When session expires

Define the behaviour when the session expires.

- **No action** - The user continues using the application, but no saves after the session expires.
- **Redirect to login after the session expiration** - The application returns to the login after expiring the session.
- **Display a message that the session has expired** - Shows the message "session has expired" to the user.

Encryption

Use encryption to store the password in the table of users.

Enable Security

Activate the flag Application Security for all project applications.

Remember login

Activating the flag allows the user to remain logged in when returning to the system when the session ends, without having logged out.

Cookie expiration time

Cookie expiration time in days for **Remember login** option

Label Position at Login

Defines the Label positioning of the fields in relation to the data.

- **Beside** - Default value of the applications, placing the label on the right side of the input label to the Side
- **Above** - Positions the label above the input label Above
- **Below** - Positions the label below the input label Below
- **Watermark** - Positions the label as Watermark.

Enable Captcha

It activates the captcha for the login application.

- **No** - Does not display the captcha in the login application.
- **Captcha** - Uses the built-in scriptcase library for captcha display.
- **reCAPTCHA** - Uses Google's reCAPTCHA V2. To configure, [click here](#).

[Watch a video of reCAPTCHA. If you prefer, see a tutorial on how to generate the keys.](#)

Site Key

Key generated by Google after reCAPTCHA project creation.

Secret Key

Key generated by Google after reCAPTCHA project creation.

Folder

The project folder name to store the applications generated by Security Module.

Theme

The theme to create the Security Module applications.

Log

This option is available if the project already has a Log Module.

[Click here](#) and check out how to create a Log Module

Menu

This option is only available if your project already has a Menu Application. You can associate the existing Menu and include all applications generated by the Security Module to it. If you do not select an existing Menu here, it creates a new Menu Application.

Menu Type

Security Module menu type (option only available if you do not select an existing menu in the previous item)

This option is available when using the **Create Application Menu** option in the **menu** item

Use SweetAlert

Enables the use of sweetAlert in security module applications.

Settings

Defines whether the security module editing application will be generated.

With this option active, the system administrator user will be able to change some settings of the security module at the end, when accessing the system.

See below for the list of options available for editing the security module.

- **Action for session expiration** - Define the system behavior when the session expires. This feature is triggered as soon as a new action is performed.
 - **No action:** No action will be taken and the user will continue using the system, however no action will be saved.
 - **Redirect to login:** When performing some action on the system, the user will be redirected to the login application.
 - **Displays a message and redirects to login:** or perform some action on the system, a message will be displayed informing you that the session has expired with an ok button. By clicking on the button, the user will be redirected to the login application.
- **Remember login** - Activating the flag allows the user to remain logged in when returning to the system when the session ends, without having logged out.
- **Remember login** expiration time - Cookie expiration time in days for the **Remember login** option. By default, Scriptcase sets the limit to 30 days.
- **Recover Password** - Enables the reset password button on the login screen.
- **New Users** - Enables the add new users button on the login screen.
- **Brute force** - Enables or disables the failed access attempt limit.
- **Block time for Brute Force protection** - Defines the time, in minutes, that the user will remain unreachable after several failed login attempts.
- **Brute Force Attempts for blocking** - Defines the number of failed access attempts until protection is activated.
- **2F** - Defines whether two-factor authentication will be used on the system.
- **2FA Expiration Time** - Determines the time in seconds that the 2FA authentication token will expire

Login

Here you can set the type and amount of characters allowed for the username and password fields.

User

Minimum size

Minimum amount of characters used by the user.

Maximum size

Maximum size of the characters used by the user.

Allowed characters

Define which characters are allowed when creating a password.

- **All** - Accepts all values
- **Select** - Allows you to select the allowed characters. The options are:
 - Letters
 - Numbers
 - Accent
 - Cedilla
 - Space
 - Dot
 - Comma

Password

Minimum size

Minimum amount of characters used by the user.

Maximum size

Maximum size of the characters used by the user.

Allowed characters

Define which characters are allowed when creating a password.

View password characters

This option toggles in the password field, allowing the displayed password to be displayed.

- **All** - Accepts all values
- **Select** - Allows you to select the allowed characters. The options are:
 - Letters
 - Numbers
 - Accent
 - Cedilla
 - Space
 - Dot
 - Comma

E-mail Settings

Email Server

Select an email API to use in the security module.

This email will be used in the options:

- All options of **Retrieve Password**
- **New User** when select the options: **Requires activation by email**, **Send email to administrator**.

Custom - Enter the SMTP data in the options below.

The options below are only available when the **custom** option is selected.

SMTP Server

Enter the SMTP server address.

SMTP Port

Enter the SMTP server port. This information must comply with the secure connection option. Use 465 for SSL, 587 for TLS, or 25 for unsafe connection. If you do not inform the port, Scriptcase applies the default one: 25.

Secure Connection

Use SSL or TSL, or leave it blank for insecure connection.

- SSL
- TSL

SMTP User

Enter the SMTP User information.

SMTP Password

Enter the SMTP password information.

SMTP E-mail

Enter the SMTP outgoing email.

SMTP

To proceed with the password recovery, it is necessary that has the SMTP server configured for a successful process. Look [here](#) how to realize this procedure.

Yahoo

For more information about these settings [Click Here](#).

Some email applications uses older, less secure technologies to sign in to your email account, and Google will block these requests by default. To solve this, sign in to your Google account and enable access through less secure apps through this [link](#).

See also: [Ways to securely access Yahoo Mail](#)

SMTP Server Settings Yahoo

SMTP Server	smtp.mail.yahoo.com
Port	465 or 587
E-mail address	Your full email address (name@domain.com.)

SMTP Server Settings Yahoo

Password	The password for your account.
Requires SSL	Yes
Requires TLS	Yes (if available)
Requires authentication	Yes

Gmail

For more information about these settings [Click Here](#).

Some email applications uses older, less secure technologies to sign in to your email account, and Google will block these requests by default. To solve this, sign in to your Google account and enable access through less secure apps through this [link](#).

SMTP Server Settings Gmail

SMTP Server	smtp.gmail.com
E-mail address	Your full email address (Ex. example@gmail.com)
Password	The password for your account.
Port (TLS)	587
Port (SSL)	465
TLS / SSL Required	Yes

Outlook / Hotmail

For more information about these settings [Click Here](#)

SMTP Server Settings Outlook.com

SMTP Server	smtp-mail.outlook.com
E-mail address	Your full email address (Ex. myname@outlook.com, not an alias)
Password	The password for your account.
Port	587 (you can use port 25 as an alternative)
TLS / SSL Required	Yes

Retrieve Password

It defines the password recovery method in the project.

The password recovery options work only when the SMTP server is configured, please check the Email settings.

Send the password by e-mail

The system emails the user password just if the SMTP has been correctly set up, and the password is not using encryption.

Reset password and send new one by email

The system resets the password automatically and sends it to the user by email (just if the SMTP has been correctly set up).

Send a link to e-mail with reset option

The system emails the user a link to access an application and reset the password.

New users

Settings for creating new users in the security system.

The options activation by email and send an email to admin work only when the SMTP server is configured properly, access Email settings to set it up.

Allows the registration of new users

This option sets the availability of users registration directly in the login system. If you do not check this option, only users with administrative access can insert new users.

Requires activation by email

This option sets whether the new user must validate his registration by email to activate the account (Configure the email SMTP to use this option)

Send email to administrator

This option sets whether the system administrator receives an email whenever a new user is registered. (Configure the email SMTP to use this option)

Social Network

Allows the use of **Facebook** and **Twitter** to login to the security module.

When using social network authentication the **Login Template** option will not be available.

Facebook

Enable login via facebook. For the login to work, it is necessary to configure an application to obtain the **App ID** and **Secret**

[See how to generate facebook credentials](#)

App ID

Enter the **Application ID** available in the application settings on facebook developers.

Secret

Enter the **Application Secret Key** available in the application settings on facebook developers.

Twitter

Enable login via Twitter. For the login to work, it is necessary to configure an application to obtain the **App ID** and **Secret**

App ID

Enter the **Application ID**.

Secret

Enter the **Application Secret Key**

Logged Users

Defines the system behavior for login protection.

This option is available if you have checked Protect logged users during the connection step.

Display logged users

If you check this option Scriptcase will also create with the Security Module a Grid Application to display a report with all users current logged on the system

Brute Force Attack Protection

Enables/disables the blocking of users after some unsuccessful access attempts.

Brute Force lockout time (in Minutes)

Time, in minutes, that the user will remain inaccessible after several unsuccessful access attempts. (Available only when Brute Force Attack Protection is enabled)

Numbers of attempts before lock

Number of failed access attempts, until the protection is enabled. (Available only when enable protection for brute force attacks)

Login Template

Allows the use of a custom HTML when creating the security module login application.

This HTML must be previously loaded into an external library, which in turn must be enabled for use in the project. [See how to enable an external library.](#)

This option is only available when **Authentication by social network** is not being used.

Use the template for the login screen

Defines whether the login application will use a custom HTML or a standard Scriptcase theme.

No

By checking no, the login application will be created with the project's default theme.

Yes

When checking yes, the **Login Template** button will be enabled, thus allowing the selection of one of the listed templates.

It is necessary to enable the external library that will be used.

- **Enable external Libraries** - Redirects to external library management screen.
- **Reload** - Reloads the select, listing the unlisted libraries after enabled.

Two Factor Authentication

Authentication (2FA)

In this option the user will select the type of 2 factor authentication to be used, there are three options:

Auth

This option will send the code to your Authentication app from Google.

[See how to use the authentication API](#)

SMS

This option will send the authentication code by SMS.

[See how to use the SMS API](#)

E-mail

This option will send the authentication code by SMS.

[See how to use the email sending APIs](#)

API

In this option you select the API previously created to be used to send the code.

Code expiration time

Time in following to expire token sent for authentication.

Insert Data

This option inserts the first user into the security tables. This user has administrator privileges to manage the security system and add new users.

ATTENTION: To increase the security of your project, we recommend changing the default password “admin/admin” at this step or after the first access.

Login

This option sets the system administrator user.

By default the defined user is **admin**

Password

This option sets the system administrator password.

By default the defined password is **admin**

Name

This option sets the name of the administrator user on the system.

E-mail

This option sets the system administrator user E-mail.

For sending email to the administrator to work, either SMTP is configured correctly or an email API is selected in the Email Settings screen in the previous step.

Add Applications

Add Applications

This option adds the applications already created in the project to the Security Module applications' table.

Application Includes - When selected, all existing applications in the project will be included in the security module.

When unchecking this option, the existing applications in the project when creating the module will need to be inserted through the application synchronization, after executing the security module.

Save Profile

Using this option, you save all settings during the Security Module creation. It can be used later for other projects.e

Save Profile

Allows you to save a profile with all the current security module settings.

Name

Profile name. It identifies the profile.

Target

This option sets what developers can use the saved profile afterward.

- Public - Set the security profile available in any project of your Scriptcase.
- Project - Set the security profile available only in the current project.
- User - Set the security profile available only to the current Scriptcase user

Building Security

Security module creation summary screen, listing changes made by the tool.

Open Project

Go to the Home of the currently open project.

Generate Source Code

Generates the source code of all applications created by the security module.

After the creation of the security module, it will be necessary to generate the phone of all the applications, which all had a change in the use security flag. Minus the Login and Menu applications.

Per-Group Security Module Overview

Making use of the security modules, you can implement a complete access rules for systems developed by ScriptCase. The process for the security module creation is quick and simple.

Security module per Group

In this type of security, access to applications is defined according to the user groups created and configured by the system administrator.

Every user must be part of at least one user group.

In this type of security, these tables are created:

sec_users

```
CREATE TABLE "sec_users" (
  "login" TEXT NOT NULL,
  "pswd" TEXT NOT NULL,
  "name" TEXT,
  "email" TEXT,
  "active" TEXT,
  "activation_code" TEXT,
  "priv_admin" TEXT,
  "mfa" TEXT,
  "picture" BLOB,
  PRIMARY KEY ("login")
);
```

sec_apps

```
CREATE TABLE "sec_apps" (
  "app_name" TEXT NOT NULL,
  "app_type" TEXT,
  "description" TEXT,
  PRIMARY KEY ("app_name")
)
```

sec_groups

```
CREATE TABLE "sec_groups" (
  "group_id" INTEGER NOT NULL PRIMARY KEY AUTOINCREMENT,
  "description" TEXT,
  UNIQUE ("description")
)
```

sec_users_groups

```
CREATE TABLE "sec_users_groups" (
  "login" TEXT NOT NULL,
  "group_id" INTEGER NOT NULL,
  PRIMARY KEY ("login", "group_id")
)
```

sec_groups_apps

```
CREATE TABLE "sec_groups_apps" (
  "group_id" INTEGER NOT NULL,
  "app_name" TEXT NOT NULL,
  "priv_access" TEXT,
  "priv_insert" TEXT,
  "priv_delete" TEXT,
  "priv_update" TEXT,
  "priv_export" TEXT,
  "priv_print" TEXT,
  PRIMARY KEY ("group_id", "app_name")
)
```

sec_logged

```
CREATE TABLE "sec_logged" (  
  "login" TEXT NOT NULL,  
  "date_login" TEXT,  
  "sc_session" TEXT,  
  "ip" TEXT  
);
```

The table **Logged users** will be created only if the option **Protect Logged users** is checked during the Security Module creation.

sec_users_social

```
CREATE TABLE "sec_users_social" (  
  "login" TEXT NOT NULL,  
  "resource" TEXT NOT NULL,  
  "resource_id" TEXT NOT NULL,  
  PRIMARY KEY ("login", "resource", "resource_id")  
);
```

The table **users_social** will be created only if the option **Use social networks** is checked during the Security Module creation.

sec_settings

```
CREATE TABLE "sec_settings" (  
  set_name TEXT NOT NULL,  
  set_value TEXT,  
  PRIMARY KEY ("set_name")  
)
```

Use Existing Tables

Connection

Define the connection where the security module tables fixed. All existing connections in the project will be displayed

If you need to create a new connection, [click here](#) and see how.

Use existing tables

Allows you to use existing tables in your database. These tables must have, at least, the same fields used by the Scriptcase security module.

We recommend that you use this option if you have used Scriptcase to create the tables before, to minimize errors.

If you want to know the specifications for this security module, [click here](#).

Create tables

Once this option is selected, Scriptcase is responsible for creating the tables necessary for the use of the security module.

Tables prefix

Defines a prefix for the tables that will be created by the security module.

By default, the Scriptcase uses “**sec_**”.

Delete if tables already exist

This option deletes tables with the same name from your database.

E.G.: When defining the **prj_** prefix for your tables, if there is any table with the name **prj_users** in your database, it will be deleted.

This option is only available when selecting a **Create tables** option.

Protect Logged Users

This option prevents the same user from accessing the system simultaneously in different session.

By checking this option, the **logged** table will be created.

When using the default prefix or the table name will be **sec_logged**.

Use Social Networks

This option allows the configuration of Facebook and Twitter for the authentication of system users.

By checking this option, the **users_social** table will be created.

When using Social Networks, the **Login Template** option will not be available to define the security module login layout.

Association tables

This step is essential if the option **“Use existing tables”** is selected.

In this case, you must associate the fields from the existing tables to fields of security applications (applications generated by the Security Module).

If you have selected the option **“Create tables”**, in the previous step, it associates the fields automatically.

If you choose to create the tables beforehand, see below as local tables and fields.

sec_users

```
CREATE TABLE "sec_users" (
  "login" TEXT NOT NULL,
  "pswd" TEXT NOT NULL,
  "name" TEXT,
  "email" TEXT,
  "active" TEXT,
  "activation_code" TEXT,
  "priv_admin" TEXT,
  "mfa" TEXT,
  "picture" BLOB,
  PRIMARY KEY ("login")
);
```

sec_apps

```
CREATE TABLE "sec_apps" (
  "app_name" TEXT NOT NULL,
  "app_type" TEXT,
  "description" TEXT,
  PRIMARY KEY ("app_name")
)
```

sec_groups

```
CREATE TABLE "sec_groups" (
  "group_id" INTEGER NOT NULL PRIMARY KEY AUTOINCREMENT,
  "description" TEXT,
  UNIQUE ("description")
)
```

sec_users_groups

```
CREATE TABLE "sec_users_groups" (
  "login" TEXT NOT NULL,
  "group_id" INTEGER NOT NULL,
  PRIMARY KEY ("login", "group_id")
)
```

sec_groups_apps

```
CREATE TABLE "sec_groups_apps" (
  "group_id" INTEGER NOT NULL,
  "app_name" TEXT NOT NULL,
  "priv_access" TEXT,
  "priv_insert" TEXT,
  "priv_delete" TEXT,
  "priv_update" TEXT,
  "priv_export" TEXT,
  "priv_print" TEXT,
  PRIMARY KEY ("group_id", "app_name")
)
```

sec_logged

```
CREATE TABLE "sec_logged" (
```

```
"login" TEXT NOT NULL,  
"date_login" TEXT,  
"sc_session" TEXT,  
"ip" TEXT  
);
```

The table **Logged users** will be created only if the option **Protect Logged users** is checked during the Security Module creation.

sec_users_social

```
CREATE TABLE "sec_users_social" (  
"login" TEXT NOT NULL,  
"resource" TEXT NOT NULL,  
"resource_id" TEXT NOT NULL,  
PRIMARY KEY ("login", "resource", "resource_id")  
);
```

The table **users_social** will be created only if the option **Use social networks** is checked during the Security Module creation.

General

Applications Prefix

You can set a prefix to the application names of the Security Module.

When session expires

Define the behaviour when the session expires.

- **No action** - The user continues using the application, but no saves after the session expires.
- **Redirect to login after the session expiration** - The application returns to the login after expiring the session.
- **Display a message that the session has expired** - Shows the message "session has expired" to the user.

Encryption

Use encryption to store the password in the table of users.

Enable Security

Activate the flag Application Security for all project applications.

Remember login

Activating the flag allows the user to remain logged in when returning to the system when the session ends, without having logged out.

Cookie expiration time

Cookie expiration time in days for **Remember login** option

Label Position at Login

Defines the Label positioning of the fields in relation to the data.

- **Beside** - Default value of the applications, placing the label on the right side of the input label to the Side
- **Above** - Positions the label above the input label Above
- **Below** - Positions the label below the input label Below
- **Watermark** - Positions the label as Watermark.

Enable Captcha

It activates the captcha for the login application.

- **No** - Does not display the captcha in the login application.
- **Captcha** - Uses the built-in scriptcase library for captcha display.
- **reCAPTCHA** - Uses Google's reCAPTCHA V2. To configure, [click here](#).

[Watch a video of reCAPTCHA. If you prefer, see a tutorial on how to generate the keys.](#)

Site Key

Key generated by Google after reCAPTCHA project creation.

Secret Key

Key generated by Google after reCAPTCHA project creation.

Folder

The project folder name to store the applications generated by Security Module.

Theme

The theme to create the Security Module applications.

Log

This option is available if the project already has a Log Module.

[Click here](#) and check out how to create a Log Module

Menu

This option is only available if your project already has a Menu Application. You can associate the existing Menu and include all applications generated by the Security Module to it. If you do not select an existing Menu here, it creates a new Menu Application.

Menu Type

Security Module menu type (option only available if you do not select an existing menu in the previous item)

This option is available when using the **Create Application Menu** option in the **menu** item

Use SweetAlert

Enables the use of sweetAlert in security module applications.

Settings

Defines whether the security module editing application will be generated.

With this option active, the system administrator user will be able to change some settings of the security module at the end, when accessing the system.

See below for the list of options available for editing the security module.

- **Action for session expiration** - Define the system behavior when the session expires. This feature is triggered as soon as a new action is performed.
 - **No action:** No action will be taken and the user will continue using the system, however no action will be saved.
 - **Redirect to login:** When performing some action on the system, the user will be redirected to the login application.
 - **Displays a message and redirects to login:** or perform some action on the system, a message will be displayed informing you that the session has expired with an ok button. By clicking on the button, the user will be redirected to the login application.
- **Remember login** - Activating the flag allows the user to remain logged in when returning to the system when the session ends, without having logged out.
- **Remember login** expiration time - Cookie expiration time in days for the **Remember login** option. By default, Scriptcase sets the limit to 30 days.
- **Recover Password** - Enables the reset password button on the login screen.
- **New Users** - Enables the add new users button on the login screen.
- **Brute force** - Enables or disables the failed access attempt limit.
- **Block time for Brute Force protection** - Defines the time, in minutes, that the user will remain unreachable after several failed login attempts.
- **Brute Force Attempts for blocking** - Defines the number of failed access attempts until protection is activated.
- **2F** - Defines whether two-factor authentication will be used on the system.
- **2FA Expiration Time** - Determines the time in seconds that the 2FA authentication token will expire

Login

Here you can set the type and amount of characters allowed for the username and password fields.

User

Minimum size

Minimum amount of characters used by the user.

Maximum size

Maximum size of the characters used by the user.

Allowed characters

Define which characters are allowed when creating a password.

- **All** - Accepts all values
- **Select** - Allows you to select the allowed characters. The options are:
 - Letters
 - Numbers
 - Accent
 - Cedilla
 - Space
 - Dot
 - Comma

Password

Minimum size

Minimum amount of characters used by the user.

Maximum size

Maximum size of the characters used by the user.

Allowed characters

Define which characters are allowed when creating a password.

View password characters

This option toggles in the password field, allowing the displayed password to be displayed.

- **All** - Accepts all values
- **Select** - Allows you to select the allowed characters. The options are:
 - Letters
 - Numbers
 - Accent
 - Cedilla
 - Space
 - Dot
 - Comma

E-mail Settings

Email Server

Select an email API to use in the security module.

This email will be used in the options:

- All options of **Retrieve Password**
- **New User** when select the options: **Requires activation by email**, **Send email to administrator**.

Custom - Enter the SMTP data in the options below.

The options below are only available when the **custom** option is selected.

SMTP Server

Enter the SMTP server address.

SMTP Port

Enter the SMTP server port. This information must comply with the secure connection option. Use 465 for SSL, 587 for TLS, or 25 for unsafe connection. If you do not inform the port, Scriptcase applies the default one: 25.

Secure Connection

Use SSL or TSL, or leave it blank for insecure connection.

- SSL
- TSL

SMTP User

Enter the SMTP User information.

SMTP Password

Enter the SMTP password information.

SMTP E-mail

Enter the SMTP outgoing email.

SMTP

To proceed with the password recovery, it is necessary that has the SMTP server configured for a successful process. Look [here](#) how to realize this procedure.

Yahoo

For more information about these settings [Click Here](#).

Some email applications uses older, less secure technologies to sign in to your email account, and Google will block these requests by default. To solve this, sign in to your Google account and enable access through less secure apps through this [link](#).

See also: [Ways to securely access Yahoo Mail](#)

SMTP Server Settings Yahoo

SMTP Server	smtp.mail.yahoo.com
Port	465 or 587
E-mail address	Your full email address (name@domain.com.)

SMTP Server Settings Yahoo

Password	The password for your account.
Requires SSL	Yes
Requires TLS	Yes (if available)
Requires authentication	Yes

Gmail

For more information about these settings [Click Here](#).

SMTP Server Settings Gmail

SMTP Server	smtp.gmail.com
E-mail address	Your full email address (Ex. example@gmail.com)
Password	The password for your account.
Port (TLS)	587
Port (SSL)	465
TLS / SSL Required	Yes

Outlook / Hotmail

For more information about these settings [Click Here](#)

SMTP Server Settings Outlook.com

SMTP Server	smtp-mail.outlook.com
E-mail address	Your full email address (Ex. myname@outlook.com, not an alias)
Password	The password for your account.
Port	587 (you can use port 25 as an alternative)
TLS / SSL Required	Yes

Retrieve Password

It defines the password recovery method in the project.

The password recovery options work only when the SMTP server is configured, please check the Email settings.

Send the password by e-mail

The system emails the user password just if the SMTP has been correctly set up, and the password is not using encryption.

Reset password and send new one by email

The system resets the password automatically and sends it to the user by email (just if the SMTP has been correctly set up).

Send a link to e-mail with reset option

The system emails the user a link to access an application and reset the password.

New users

Settings for creating new users in the security system.

The options activation by email and send an email to admin work only when the SMTP server is configured properly, access Email settings to set it up.

Allows the registration of new users

This option sets the availability of users registration directly in the login system. If you do not check this option, only users with administrative access can insert new users.

Requires activation by email

This option sets whether the new user must validate his registration by email to activate the account (Configure the email SMTP to use this option)

Send email to administrator

This option sets whether the system administrator receives an email whenever a new user is registered. (Configure the email SMTP to use this option)

Social Network

Allows the use of **Facebook** and **Twitter** to login to the security module.

When using social network authentication the **Login Template** option will not be available.

Facebook

Enable login via facebook. For the login to work, it is necessary to configure an application to obtain the **App ID** and **Secret**

[See how to generate facebook credentials](#)

App ID

Enter the **Application ID** available in the application settings on facebook developers.

Secret

Enter the **Application Secret Key** available in the application settings on facebook developers.

Twitter

Enable login via Twitter. For the login to work, it is necessary to configure an application to obtain the **App ID** and **Secret**

App ID

Enter the **Application ID**.

Secret

Enter the **Application Secret Key**

Logged Users

Defines the system behavior for login protection.

This option is available if you have checked Protect logged users during the connection step.

Display logged users

If you check this option Scriptcase will also create with the Security Module a Grid Application to display a report with all users current logged on the system

Brute Force Attack Protection

Enables/disables the blocking of users after some unsuccessful access attempts.

Brute Force lockout time (in Minutes)

Time, in minutes, that the user will remain inaccessible after several unsuccessful access attempts. (Available only when Brute Force Attack Protection is enabled)

Numbers of attempts before lock

Number of failed access attempts, until the protection is enabled. (Available only when enable protection for brute force attacks)

Login Template

Allows the use of a custom HTML when creating the security module login application.

This HTML must be previously loaded into an external library, which in turn must be enabled for use in the project. [See how to enable an external library.](#)

This option is only available when **Authentication by social network** is not being used.

Use the template for the login screen

Defines whether the login application will use a custom HTML or a standard Scriptcase theme.

No

By checking no, the login application will be created with the project's default theme.

Yes

When checking yes, the **Login Template** button will be enabled, thus allowing the selection of one of the listed templates.

It is necessary to enable the external library that will be used.

- **Enable external Libraries** - Redirects to external library management screen.
- **Reload** - Reloads the select, listing the unlisted libraries after enabled.

Two Factor Authentication

Authentication (2FA)

In this option the user will select the type of 2 factor authentication to be used, there are three options:

Auth

This option will send the code to your Authentication app from Google.

[See how to use the authentication API](#)

SMS

This option will send the authentication code by SMS.

[See how to use the SMS API](#)

E-mail

This option will send the authentication code by SMS.

[See how to use the email sending APIs](#)

API

In this option you select the API previously created to be used to send the code.

Code expiration time

Time in following to expire token sent for authentication.

Insert Data

This option inserts the first user into the security tables. This user has administrator privileges to manage the security system and add new users.

ATTENTION: To increase the security of your project, we recommend changing the default password “admin/admin” at this step or after the first access.

Login

This option sets the system administrator user.

By default the defined user is **admin**

Password

This option sets the system administrator password.

By default the defined password is **admin**

Name

This option sets the name of the administrator user on the system.

E-mail

This option sets the system administrator user E-mail.

For sending email to the administrator to work, either SMTP is configured correctly or an email API is selected in the Email Settings screen in the previous step.

Add Applications

Add Applications

This option adds the applications already created in the project to the Security Module applications' table.

Application Includes - When selected, all existing applications in the project will be included in the security module.

When unchecking this option, the existing applications in the project when creating the module will need to be inserted through the application synchronization, after executing the security module.

Save Profile

Using this option, you save all settings during the Security Module creation. It can be used later for other projects.

Save Profile

Allows you to save a profile with all the current security module settings.

Name

Profile name. It identifies the profile.

Target

This option sets what developers can use the saved profile afterward.

- Public - Set the security profile available in any project of your Scriptcase.
- Project - Set the security profile available only in the current project.
- User - Set the security profile available only to the current Scriptcase user

Building Security

Security module creation summary screen, listing changes made by the tool.

Open Project

Go to the Home of the currently open project.

Generate Source Code

Generates the source code of all applications created by the security module.

After the creation of the security module, it will be necessary to generate the phone of all the applications, which all had a change in the use security flag. Minus the Login and Menu applications.

LDAP Auth-Only Security Module Overview

Making use of the security modules, you can implement a complete access rules for systems developed by ScriptCase. The process for the security module creation is quick and simple.

Security module per LDAP - Only Authenticate

In user Ldap Only Authenticate, all registered users have access to system applications, working only as user authentication.

This type of security does not need the creation of any table, having all user access control being performed by the Ldap server.

Use Existing Tables

Connection

Defines the connection that will be used in security module applications.

This type of security does not generate any tables, as all control is performed through Ldap

General

Applications Prefix

You can set a prefix to the application names of the Security Module.

When session expires

Define the behaviour when the session expires.

- **No action** - The user continues using the application, but no saves after the session expires.
- **Redirect to login after the session expiration** - The application returns to the login after expiring the session.
- **Display a message that the session has expired** - Shows the message "session has expired" to the user.

Encryption

Use encryption to store the password in the table of users.

Enable Security

Activate the flag Application Security for all project applications.

Remember login

Activating the flag allows the user to remain logged in when returning to the system when the session ends, without having logged out.

Cookie expiration time

Cookie expiration time in days for **Remember login** option

Label Position at Login

Defines the Label positioning of the fields in relation to the data.

- **Beside** - Default value of the applications, placing the label on the right side of the input label to the Side
- **Above** - Positions the label above the input label Above
- **Below** - Positions the label below the input label Below
- **Watermark** - Positions the label as Watermark.

Enable Captcha

It activates the captcha for the login application.

- **No** - Does not display the captcha in the login application.
- **Captcha** - Uses the built-in scriptcase library for captcha display.
- **reCAPTCHA** - Uses Google's reCAPTCHA V2. To configure, [click here](#).

[Watch a video of reCAPTCHA. If you prefer, see a tutorial on how to generate the keys.](#)

Site Key

Key generated by Google after reCAPTCHA project creation.

Secret Key

Key generated by Google after reCAPTCHA project creation.

Folder

The project folder name to store the applications generated by Security Module.

Theme

The theme to create the Security Module applications.

Log

This option is available if the project already has a Log Module.

[Click here](#) and check out how to create a Log Module

Menu

This option is only available if your project already has a Menu Application. You can associate the existing Menu and include all applications generated by the Security Module to it. If you do not select an existing Menu here, it creates a new Menu Application.

Menu Type

Security Module menu type (option only available if you do not select an existing menu in the previous item)

This option is available when using the **Create Application Menu** option in the **menu** item

Use SweetAlert

Enables the use of sweetAlert in security module applications.

Settings

Defines whether the security module editing application will be generated.

With this option active, the system administrator user will be able to change some settings of the security module at the end, when accessing the system.

See below for the list of options available for editing the security module.

- **Action for session expiration** - Define the system behavior when the session expires. This feature is triggered as soon as a new action is performed.
 - **No action:** No action will be taken and the user will continue using the system, however no action will be saved.
 - **Redirect to login:** When performing some action on the system, the user will be redirected to the login application.
 - **Displays a message and redirects to login:** or perform some action on the system, a message will be displayed informing you that the session has expired with an ok button. By clicking on the button, the user will be redirected to the login application.
- **Remember login** - Activating the flag allows the user to remain logged in when returning to the system when the session ends, without having logged out.
- **Remember login** expiration time - Cookie expiration time in days for the **Remember login** option. By default, Scriptcase sets the limit to 30 days.
- **Recover Password** - Enables the reset password button on the login screen.
- **New Users** - Enables the add new users button on the login screen.
- **Brute force** - Enables or disables the failed access attempt limit.
- **Block time for Brute Force protection** - Defines the time, in minutes, that the user will remain unreachable after several failed login attempts.
- **Brute Force Attempts for blocking** - Defines the number of failed access attempts until protection is activated.
- **2F** - Defines whether two-factor authentication will be used on the system.
- **2FA Expiration Time** - Determines the time in seconds that the 2FA authentication token will expire

Login

Here you can set the type and amount of characters allowed for the username and password fields.

User

Minimum size

Minimum amount of characters used by the user.

Maximum size

Maximum size of the characters used by the user.

Allowed characters

Define which characters are allowed when creating a password.

- **All** - Accepts all values
- **Select** - Allows you to select the allowed characters. The options are:
 - Letters
 - Numbers
 - Accent
 - Cedilla
 - Space
 - Dot
 - Comma

Password

Minimum size

Minimum amount of characters used by the user.

Maximum size

Maximum size of the characters used by the user.

Allowed characters

Define which characters are allowed when creating a password.

View password characters

This option toggles in the password field, allowing the displayed password to be displayed.

- **All** - Accepts all values
- **Select** - Allows you to select the allowed characters. The options are:
 - Letters
 - Numbers
 - Accent
 - Cedilla
 - Space
 - Dot
 - Comma

Ldap

In Ldap settings it is necessary to inform the access data to the previously configured server.

Server

Enter here the LDAP server IP.

DN

Enter the input attributes.

Port

Enter here the port for access to the server. Default port is 389.

Suffix

Enter the user suffix.

Login Template

Allows the use of a custom HTML when creating the security module login application.

This HTML must be previously loaded into an external library, which in turn must be enabled for use in the project. [See how to enable an external library.](#)

This option is only available when **Authentication by social network** is not being used.

Use the template for the login screen

Defines whether the login application will use a custom HTML or a standard Scriptcase theme.

No

By checking no, the login application will be created with the project's default theme.

Yes

When checking yes, the **Login Template** button will be enabled, thus allowing the selection of one of the listed templates.

It is necessary to enable the external library that will be used.

- **Enable external Libraries** - Redirects to external library management screen.
- **Reload** - Reloads the select, listing the unlisted libraries after enabled.

Two Factor Authentication

Authentication (2FA)

In this option the user will select the type of 2 factor authentication to be used, there are three options:

Auth

This option will send the code to your Authentication app from Google.

[See how to use the authentication API](#)

SMS

This option will send the authentication code by SMS.

[See how to use the SMS API](#)

E-mail

This option will send the authentication code by SMS.

[See how to use the email sending APIs](#)

API

In this option you select the API previously created to be used to send the code.

Code expiration time

Time in following to expire token sent for authentication.

Insert Data

This option inserts the first user into the security tables. This user has administrator privileges to manage the security system and add new users.

ATTENTION: To increase the security of your project, we recommend changing the default password "admin/admin" at this step or after the first access.

Login

This option sets the system administrator user.

By default the defined user is **admin**

Password

This option sets the system administrator password.

By default the defined password is **admin**

Name

This option sets the name of the administrator user on the system.

E-mail

This option sets the system administrator user E-mail.

For sending email to the administrator to work, either SMTP is configured correctly or an email API is selected in the Email Settings screen in the previous step.

Save Profile

Using this option, you save all settings during the Security Module creation. It can be used later for other projects.

Save Profile

Allows you to save a profile with all the current security module settings.

Name

Profile name. It identifies the profile.

Target

This option sets what developers can use the saved profile afterward.

- Public - Set the security profile available in any project of your Scriptcase.
- Project - Set the security profile available only in the current project.
- User - Set the security profile available only to the current Scriptcase user

Building Security

Security module creation summary screen, listing changes made by the tool.

Open Project

Go to the Home of the currently open project.

Generate Source Code

Generates the source code of all applications created by the security module.

After the creation of the security module, it will be necessary to generate the phone of all the applications, which all had a change in the use security flag. Minus the Login and Menu applications.

LDAP Total-Control Security Module Overview

Making use of the security modules, you can implement a complete access rules for systems developed by ScriptCase. The process for the security module creation is quick and simple.

Ldap - Total Control

In this type of security, access to applications is defined according to the user groups created and configured by the system administrator.

Below see all the tables created for this type of security.

sec_users

```
CREATE TABLE "sec_users" (
  "login" TEXT NOT NULL,
  "pswd" TEXT NOT NULL,
  "name" TEXT,
  "email" TEXT,
  "active" TEXT,
  "activation_code" TEXT,
  "priv_admin" TEXT,
  "mfa" TEXT,
  "picture" BLOB,
  PRIMARY KEY ("login")
);
```

sec_apps

```
CREATE TABLE "sec_apps" (
  "app_name" TEXT NOT NULL,
  "app_type" TEXT,
  "description" TEXT,
  PRIMARY KEY ("app_name")
)
```

sec_users_apps

```
CREATE TABLE "sec_users_apps" (
  "login" TEXT NOT NULL,
  "app_name" TEXT NOT NULL,
  "priv_access" TEXT,
  "priv_insert" TEXT,
  "priv_delete" TEXT,
  "priv_update" TEXT,
  "priv_export" TEXT,
  "priv_print" TEXT,
  PRIMARY KEY ("login", "app_name")
)
```

sec_logged

```
CREATE TABLE "sec_logged" (
  "login" TEXT NOT NULL,
  "date_login" TEXT,
  "sc_session" TEXT,
  "ip" TEXT
);
```

The table **Logged users** will be created only if the option **Protect Logged users** is checked during the Security Module creation.

sec_users_social

```
CREATE TABLE "sec_users_social" (
  "login" TEXT NOT NULL,
  "resource" TEXT NOT NULL,
  "resource_id" TEXT NOT NULL,
  PRIMARY KEY ("login", "resource", "resource_id")
);
```

The table **users_social** will be created only if the option **Use social networks** is checked during the Security Module creation.

sec_settings

```
CREATE TABLE "sec_settings" (  
set_name TEXT NOT NULL,  
set_value TEXT,  
PRIMARY KEY ("set_name")  
)
```

Use Existing Tables

Connection

Define the connection where the security module tables fixed. All existing connections in the project will be displayed

If you need to create a new connection, [click here](#) and see how.

Use existing tables

Allows you to use existing tables in your database. These tables must have, at least, the same fields used by the Scriptcase security module.

We recommend that you use this option if you have used Scriptcase to create the tables before, to minimize errors.

If you want to know the specifications for this security module, [click here](#).

Create tables

Once this option is selected, Scriptcase is responsible for creating the tables necessary for the use of the security module.

Tables prefix

Defines a prefix for the tables that will be created by the security module.

By default, the Scriptcase uses “**sec_**”.

Delete if tables already exist

This option deletes tables with the same name from your database.

E.G.: When defining the **prj_** prefix for your tables, if there is any table with the name **prj_users** in your database, it will be deleted.

This option is only available when selecting a **Create tables** option.

Protect Logged Users

This option prevents the same user from accessing the system simultaneously in different session.

By checking this option, the **logged** table will be created.

When using the default prefix or the table name will be **sec_logged**.

Use Social Networks

This option allows the configuration of Facebook and Twitter for the authentication of system users.

By checking this option, the **users_social** table will be created.

When using Social Networks, the **Login Template** option will not be available to define the security module login layout.

Association tables

This step is essential if the option **“Use existing tables”** is selected.

In this case, you must associate the fields from the existing tables to fields of security applications (applications generated by the Security Module).

If you have selected the option **“Create tables”**, in the previous step, it associates the fields automatically.

If you choose to create the tables beforehand, see below as local tables and fields.

sec_users

```
CREATE TABLE "sec_users" (
  "login" TEXT NOT NULL,
  "pswd" TEXT NOT NULL,
  "name" TEXT,
  "email" TEXT,
  "active" TEXT,
  "activation_code" TEXT,
  "priv_admin" TEXT,
  "mfa" TEXT,
  "picture" BLOB,
  PRIMARY KEY ("login")
);
```

sec_logged

```
CREATE TABLE "sec_logged" (
  "login" TEXT NOT NULL,
  "date_login" TEXT,
  "sc_session" TEXT,
  "ip" TEXT
);
```

The table **Logged users** will be created only if the option **Protect Logged users** is checked during the Security Module creation.

sec_users_social

```
CREATE TABLE "sec_users_social" (
  "login" TEXT NOT NULL,
  "resource" TEXT NOT NULL,
  "resource_id" TEXT NOT NULL,
  PRIMARY KEY ("login", "resource", "resource_id")
);
```

The table **users_social** will be created only if the option **Use social networks** is checked during the Security Module creation.

General

Applications Prefix

You can set a prefix to the application names of the Security Module.

When session expires

Define the behaviour when the session expires.

- **No action** - The user continues using the application, but no saves after the session expires.
- **Redirect to login after the session expiration** - The application returns to the login after expiring the session.
- **Display a message that the session has expired** - Shows the message "session has expired" to the user.

Encryption

Use encryption to store the password in the table of users.

Enable Security

Activate the flag Application Security for all project applications.

Remember login

Activating the flag allows the user to remain logged in when returning to the system when the session ends, without having logged out.

Cookie expiration time

Cookie expiration time in days for **Remember login** option

Label Position at Login

Defines the Label positioning of the fields in relation to the data.

- **Beside** - Default value of the applications, placing the label on the right side of the input label to the Side
- **Above** - Positions the label above the input label Above
- **Below** - Positions the label below the input label Below
- **Watermark** - Positions the label as Watermark.

Enable Captcha

It activates the captcha for the login application.

- **No** - Does not display the captcha in the login application.
- **Captcha** - Uses the built-in scriptcase library for captcha display.
- **reCAPTCHA** - Uses Google's reCAPTCHA V2. To configure, [click here](#).

[Watch a video of reCAPTCHA. If you prefer, see a tutorial on how to generate the keys.](#)

Site Key

Key generated by Google after reCAPTCHA project creation.

Secret Key

Key generated by Google after reCAPTCHA project creation.

Folder

The project folder name to store the applications generated by Security Module.

Theme

The theme to create the Security Module applications.

Log

This option is available if the project already has a Log Module.

[Click here](#) and check out how to create a Log Module

Menu

This option is only available if your project already has a Menu Application. You can associate the existing Menu and include all applications generated by the Security Module to it. If you do not select an existing Menu here, it creates a new Menu Application.

Menu Type

Security Module menu type (option only available if you do not select an existing menu in the previous item)

This option is available when using the **Create Application Menu** option in the **menu** item

Use SweetAlert

Enables the use of sweetAlert in security module applications.

Settings

Defines whether the security module editing application will be generated.

With this option active, the system administrator user will be able to change some settings of the security module at the end, when accessing the system.

See below for the list of options available for editing the security module.

- **Action for session expiration** - Define the system behavior when the session expires. This feature is triggered as soon as a new action is performed.
 - **No action:** No action will be taken and the user will continue using the system, however no action will be saved.
 - **Redirect to login:** When performing some action on the system, the user will be redirected to the login application.
 - **Displays a message and redirects to login:** or perform some action on the system, a message will be displayed informing you that the session has expired with an ok button. By clicking on the button, the user will be redirected to the login application.
- **Remember login** - Activating the flag allows the user to remain logged in when returning to the system when the session ends, without having logged out.
- **Remember login** expiration time - Cookie expiration time in days for the **Remember login** option. By default, Scriptcase sets the limit to 30 days.
- **Recover Password** - Enables the reset password button on the login screen.
- **New Users** - Enables the add new users button on the login screen.
- **Brute force** - Enables or disables the failed access attempt limit.
- **Block time for Brute Force protection** - Defines the time, in minutes, that the user will remain unreachable after several failed login attempts.
- **Brute Force Attempts for blocking** - Defines the number of failed access attempts until protection is activated.
- **2F** - Defines whether two-factor authentication will be used on the system.
- **2FA Expiration Time** - Determines the time in seconds that the 2FA authentication token will expire

Login

Here you can set the type and amount of characters allowed for the username and password fields.

User

Minimum size

Minimum amount of characters used by the user.

Maximum size

Maximum size of the characters used by the user.

Allowed characters

Define which characters are allowed when creating a password.

- **All** - Accepts all values
- **Select** - Allows you to select the allowed characters. The options are:
 - Letters
 - Numbers
 - Accent
 - Cedilla
 - Space
 - Dot
 - Comma

Password

Minimum size

Minimum amount of characters used by the user.

Maximum size

Maximum size of the characters used by the user.

Allowed characters

Define which characters are allowed when creating a password.

View password characters

This option toggles in the password field, allowing the displayed password to be displayed.

- **All** - Accepts all values
- **Select** - Allows you to select the allowed characters. The options are:
 - Letters
 - Numbers
 - Accent
 - Cedilla
 - Space
 - Dot
 - Comma

E-mail Settings

Email Server

Select an email API to use in the security module.

This email will be used in the options:

- All options of **Retrieve Password**
- **New User** when select the options: **Requires activation by email**, **Send email to administrator**.

Custom - Enter the SMTP data in the options below.

The options below are only available when the **custom** option is selected.

SMTP Server

Enter the SMTP server address.

SMTP Port

Enter the SMTP server port. This information must comply with the secure connection option. Use 465 for SSL, 587 for TLS, or 25 for unsafe connection. If you do not inform the port, Scriptcase applies the default one: 25.

Secure Connection

Use SSL or TSL, or leave it blank for insecure connection.

- SSL
- TSL

SMTP User

Enter the SMTP User information.

SMTP Password

Enter the SMTP password information.

SMTP E-mail

Enter the SMTP outgoing email.

SMTP

To proceed with the password recovery, it is necessary that has the SMTP server configured for a successful process. Look [here](#) how to realize this procedure.

Yahoo

For more information about these settings [Click Here](#).

Some email applications uses older, less secure technologies to sign in to your email account, and Google will block these requests by default. To solve this, sign in to your Google account and enable access through less secure apps through this [link](#).

See also: [Ways to securely access Yahoo Mail](#)

SMTP Server Settings Yahoo

SMTP Server	smtp.mail.yahoo.com
Port	465 or 587
E-mail address	Your full email address (name@domain.com.)

SMTP Server Settings Yahoo

Password	The password for your account.
Requires SSL	Yes
Requires TLS	Yes (if available)
Requires authentication	Yes

Gmail

For more information about these settings [Click Here](#).

Some email applications uses older, less secure technologies to sign in to your email account, and Google will block these requests by default. To solve this, sign in to your Google account and enable access through less secure apps through this [link](#).

SMTP Server Settings Gmail

SMTP Server	smtp.gmail.com
E-mail address	Your full email address (Ex. example@gmail.com)
Password	The password for your account.
Port (TLS)	587
Port (SSL)	465
TLS / SSL Required	Yes

Outlook / Hotmail

For more information about these settings [Click Here](#)

SMTP Server Settings Outlook.com

SMTP Server	smtp-mail.outlook.com
E-mail address	Your full email address (Ex. myname@outlook.com, not an alias)
Password	The password for your account.
Port	587 (you can use port 25 as an alternative)
TLS / SSL Required	Yes

Ldap

In Ldap settings it is necessary to inform the access data to the previously configured server.

Server

Enter here the LDAP server IP.

DN

Enter the input attributes.

Port

Enter here the port for access to the server. Default port is 389.

Suffix

Enter the user suffix.

Social Network

Allows the use of **Facebook** and **Twitter** to login to the security module.

When using social network authentication the **Login Template** option will not be available.

Facebook

Enable login via facebook. For the login to work, it is necessary to configure an application to obtain the **App ID** and **Secret**

[See how to generate facebook credentials](#)

App ID

Enter the **Application ID** available in the application settings on facebook developers.

Secret

Enter the **Application Secret Key** available in the application settings on facebook developers.

Twitter

Enable login via Twitter. For the login to work, it is necessary to configure an application to obtain the **App ID** and **Secret**

App ID

Enter the **Application ID**.

Secret

Enter the **Application Secret Key**

Logged Users

Defines the system behavior for login protection.

This option is available if you have checked Protect logged users during the connection step.

Display logged users

If you check this option Scriptcase will also create with the Security Module a Grid Application to display a report with all users current logged on the system

Brute Force Attack Protection

Enables/disables the blocking of users after some unsuccessful access attempts.

Brute Force lockout time (in Minutes)

Time, in minutes, that the user will remain inaccessible after several unsuccessful access attempts. (Available only when Brute Force Attack Protection is enabled)

Numbers of attempts before lock

Number of failed access attempts, until the protection is enabled. (Available only when enable protection for brute force attacks)

Login Template

Allows the use of a custom HTML when creating the security module login application.

This HTML must be previously loaded into an external library, which in turn must be enabled for use in the project. [See how to enable an external library.](#)

This option is only available when **Authentication by social network** is not being used.

Use the template for the login screen

Defines whether the login application will use a custom HTML or a standard Scriptcase theme.

No

By checking no, the login application will be created with the project's default theme.

Yes

When checking yes, the **Login Template** button will be enabled, thus allowing the selection of one of the listed templates.

It is necessary to enable the external library that will be used.

- **Enable external Libraries** - Redirects to external library management screen.
- **Reload** - Reloads the select, listing the unlisted libraries after enabled.

Two Factor Authentication

Authentication (2FA)

In this option the user will select the type of 2 factor authentication to be used, there are three options:

Auth

This option will send the code to your Authentication app from Google.

[See how to use the authentication API](#)

SMS

This option will send the authentication code by SMS.

[See how to use the SMS API](#)

E-mail

This option will send the authentication code by SMS.

[See how to use the email sending APIs](#)

API

In this option you select the API previously created to be used to send the code.

Code expiration time

Time in following to expire token sent for authentication.

Insert Data

This option inserts the first user into the security tables. This user has administrator privileges to manage the security system and add new users.

ATTENTION: To increase the security of your project, we recommend changing the default password “admin/admin” at this step or after the first access.

Login

This option sets the system administrator user.

By default the defined user is **admin**

Password

This option sets the system administrator password.

By default the defined password is **admin**

Name

This option sets the name of the administrator user on the system.

E-mail

This option sets the system administrator user E-mail.

For sending email to the administrator to work, either SMTP is configured correctly or an email API is selected in the Email Settings screen in the previous step.

Add Applications

Add Applications

This option adds the applications already created in the project to the Security Module applications' table.

Application Includes - When selected, all existing applications in the project will be included in the security module.

When unchecking this option, the existing applications in the project when creating the module will need to be inserted through the application synchronization, after executing the security module.

Save Profile

Using this option, you save all settings during the Security Module creation. It can be used later for other projects.e

Save Profile

Allows you to save a profile with all the current security module settings.

Name

Profile name. It identifies the profile.

Target

This option sets what developers can use the saved profile afterward.

- Public - Set the security profile available in any project of your Scriptcase.
- Project - Set the security profile available only in the current project.
- User - Set the security profile available only to the current Scriptcase user

Building Security

Security module creation summary screen, listing changes made by the tool.

Open Project

Go to the Home of the currently open project.

Generate Source Code

Generates the source code of all applications created by the security module.

After the creation of the security module, it will be necessary to generate the phone of all the applications, which all had a change in the use security flag. Minus the Login and Menu applications.

Security Module Overview

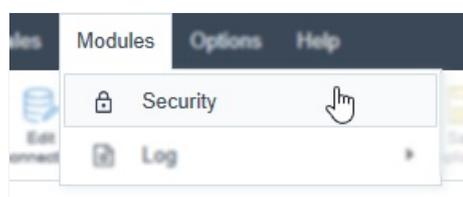

The **Security Module** automatically generates a set of applications used to manage system security. This generator creates all validation of access and use of applications, in addition to options such as: *password recovery*, *two-factor authentication*, *new user registration*, *login with social network*, among other resources available for settings.

Resources must be configured by the developer in the module creation process according to the system definition.

With the **New Security Module**, all settings defined at creation will also be available in the **Configuration** application, as long as it is enabled by the developer, thus allowing the system administrator user to configure/change the settings used by the developer when creating the module.

With the new module, changes such as email configuration, authentication API, password length, use of captcha, among other options, are now available within the system itself.

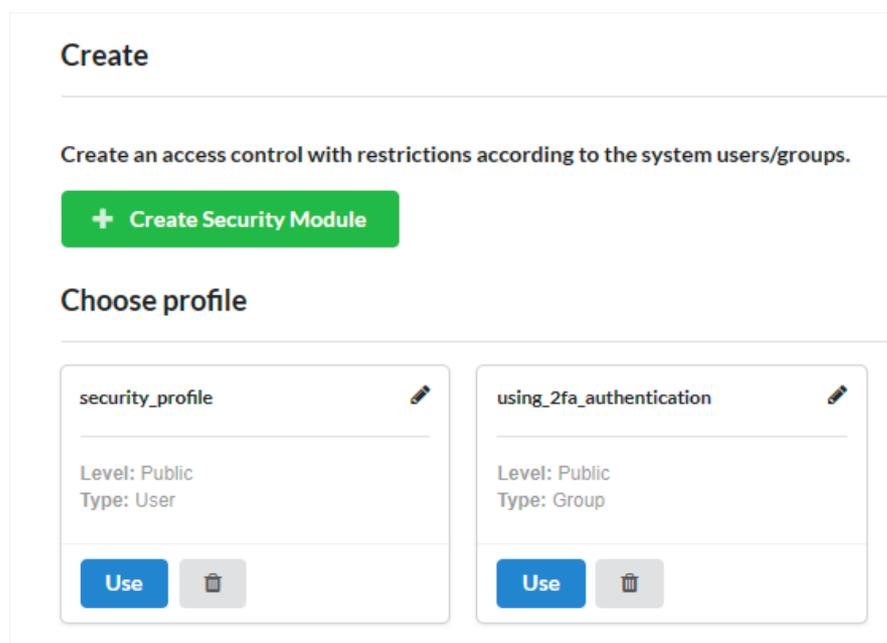

The security generator is available in the menu: **Modules > Security**.

Create/Choose Profile

On this screen, the **Create Security Module** button (to create a new blank module) and the saved profiles of previously created modules will be displayed. These profiles store the configurations made when creating the module, so when selecting a profile the configuration options will be filled in.

The **Create/Choose Profile** page will be opened if there is a security profile saved, otherwise, the security module will be opened on the **Security Types** screen

Types of security

At this stage, the developer must select the type of security they want to create, according to the system's needs.

Choose the Security type

<p>Group</p> <hr/> <p>Creates an application based on security level for the Group. Access to selected Application is granted for specific Group.</p> <p>Use</p>	<p>Application</p> <hr/> <p>Creates an application based on the application level security. Where the application is related to the user.</p> <p>Use</p>	<p>User</p> <hr/> <p>Creates applications based on security for user level. Where the application is linked to user login.</p> <p>Use</p>
<p>LDAP</p> <hr/> <p>Creates an application based on the application level LDAP. Where the application is related with LDAP.</p> <p>Use</p>	<p>LDAP/Application</p> <hr/> <p>Creates user authentication applications, where all access control is carried out by the LDAP server.</p> <p>Use</p>	

The types of security are: [Group](#), [Application](#), [User](#), [LDAP](#) e [LDAP/Application](#). They all provide similar configuration resources, the main difference between them is in the way access control and permission to use applications are applied to users.

Group

In this type of security, system access and use permissions will be assigned to groups of users, for example: *Administrators*, *Employees* and *Customers*.

Users will have access permissions according to the groups they are part of. A user in the Administrator group will have full access to the system (sales report, user control), while a user in the customer group would only have access to the store and profile configuration.

[Click Here](#) to access detailed documentation for the Group Security Module.

Application

Security by application works in a similar way to group security, with access permissions and use of the system, the difference is in the way these permissions will be applied. In this type of security, the administrator will have to define the permissions to use the system individually, per user.

[Click Here](#) to access the detailed documentation of the **Application Security Module**.

User

The module per user only has basic access control to the system. In this type of security, it is not possible to define access levels, all users will have access to all system applications.

[Click Here](#) to access detailed documentation of the **Security Module per User**.

LDAP

This security module works in a similar way to user security, only controlling access to the system, without access levels, but using an LDAP server.

[Click Here](#) to access detailed documentation for the **Ldap** Type Security Module.

LDAP/Application

This type of security with LDAP works like the group security module, where the administrator defines the access and use

permissions of the system for a group of users, but using an LDAP server.

[Click Here](#) to access detailed documentation for the Security Module of type **Ldap/Application**.

Group-Based Security Module

In the **Group Security Module**, the system administrator has the ability to restrict access to different applications based on predefined user groups. This means that each group can have specific permissions to access certain functionalities or areas of the system, offering precise control over the actions allowed for each set of users.

Check below the tables that will be created in your database when configuring a security module.

The **sec_logged** (Logged User) and **sec_users_social** (Social Network Authentication) tables will be created if these features are enabled, the creation of the other tables is mandatory.

sec_users

```
CREATE TABLE "sec_users" (
  "login" TEXT NOT NULL,
  "pswd" TEXT NOT NULL,
  "name" TEXT,
  "email" TEXT,
  "active" TEXT,
  "activation_code" TEXT,
  "priv_admin" TEXT,
  "mfa" TEXT,
  "picture" BLOB,
  "role" TEXT,
  "phone" TEXT,
  "pswd_last_updated" TIMESTAMP,
  "mfa_last_updated" TIMESTAMP DEFAULT NULL,
  PRIMARY KEY ("login")
);
```

sec_apps

```
CREATE TABLE "sec_apps" (
  "app_name" TEXT NOT NULL,
  "app_type" TEXT,
  "description" TEXT,
  PRIMARY KEY ("app_name")
);
```

sec_groups

```
CREATE TABLE "sec_groups" (
  "group_id" INTEGER NOT NULL PRIMARY KEY AUTOINCREMENT,
  "description" TEXT
);
```

sec_users_groups

```
CREATE TABLE "sec_users_groups" (
  "login" TEXT NOT NULL,
  "group_id" INTEGER NOT NULL,
  PRIMARY KEY ("login", "group_id")
);
```

sec_groups_apps

```
CREATE TABLE "sec_groups_apps" (
  "group_id" INTEGER NOT NULL,
  "app_name" TEXT NOT NULL,
  "priv_access" TEXT,
  "priv_insert" TEXT,
  "priv_delete" TEXT,
  "priv_update" TEXT,
  "priv_export" TEXT,
  "priv_print" TEXT,
  PRIMARY KEY ("group_id", "app_name")
);
```

sec_logged

```
CREATE TABLE "sec_logged" (  
  login TEXT NOT NULL,  
  date_login TEXT,  
  sc_session TEXT,  
  ip TEXT  
);
```

NOTA: A tabela **Usuários logados** será criada somente se a opção **Proteger usuários logados** for habilitada durante a criação do Módulo de Segurança.

sec_users_social

```
CREATE TABLE "sec_users_social" (  
  "login" TEXT NOT NULL,  
  "resource" TEXT NOT NULL,  
  "resource_id" TEXT NOT NULL,  
  PRIMARY KEY ("login", "resource", "resource_id")  
);
```

NOTA: A tabela **users_social** será criada somente se a opção **Utilizar redes sociais** for verificada durante a criação do Módulo de Segurança.

sec_settings

```
CREATE TABLE "sec_settings" (  
  set_name TEXT NOT NULL,  
  set_value TEXT,  
  PRIMARY KEY ("set_name")  
);
```

Configure Connection

Connection

Defines the connection that will be used to create the security module tables.

All existing connections in the project will be displayed.

Mode

Use existing tables

When using this option, the developer must have the necessary tables in his database to create the security module.

[Click here](#) to check the tables necessary for this type of security.

Create tables

Once this option is selected, Scriptcase is responsible for creating the tables necessary to use the security module.

Table prefix

Defines a prefix for the tables that will be created by the security module.

By default, Scriptcase uses **sec_**.

Delete tables if they already exist

This option eliminates tables with the same name in your database, based on the tables used by the module, listed below.

For example, by setting the prefix **prj_** to your tables, if there is any table with the name **prj_users** in your database, it will be deleted and a new table will be created.

This option is only available when a **Create tables** option is selected.

Protect logged in users

This option prevents the same user from accessing the system simultaneously in different sessions. By checking this option, the **logged** table will be created.

When using the default prefix **sec_** the table name will be **sec_logged**.

Use social medias

This option allows the configuration of Facebook and Twitter to authenticate system users. When checking this option, the **users_social** table will be created.

When using the default prefix **sec_** the table name will be **sec_users_social**.

Table association

The **Associate Tables** screen will be displayed if the **Use existing tables** option is selected in the **Configure Connection** step.

When using the **Create tables** option, this step will be carried out automatically, with the tables that will be created by the security module generator.

At this stage, fields from existing tables must be associated with security application fields (applications generated by the Security Module).

Check below the structure of the tables created for this type of security.

sec_users

```
CREATE TABLE "sec_users" (
  "login" TEXT NOT NULL,
  "pswd" TEXT NOT NULL,
  "name" TEXT,
  "email" TEXT,
  "active" TEXT,
  "activation_code" TEXT,
  "priv_admin" TEXT,
  "mfa" TEXT,
  "picture" BLOB,
  "role" TEXT,
  "phone" TEXT,
  "pswd_last_updated" TIMESTAMP,
  "mfa_last_updated" TIMESTAMP DEFAULT NULL,
  PRIMARY KEY ("login")
);
```

sec_apps

```
CREATE TABLE "sec_apps" (
  "app_name" TEXT NOT NULL,
  "app_type" TEXT,
  "description" TEXT,
  PRIMARY KEY ("app_name")
);
```

sec_groups

```
CREATE TABLE "sec_groups" (
  "group_id" INTEGER NOT NULL PRIMARY KEY AUTOINCREMENT,
  "description" TEXT
);
```

sec_users_groups

```
CREATE TABLE "sec_users_groups" (
  "login" TEXT NOT NULL,
  "group_id" INTEGER NOT NULL,
  PRIMARY KEY ("login", "group_id")
);
```

sec_groups_apps

```
CREATE TABLE "sec_groups_apps" (
  "group_id" INTEGER NOT NULL,
  "app_name" TEXT NOT NULL,
  "priv_access" TEXT,
  "priv_insert" TEXT,
  "priv_delete" TEXT,
  "priv_update" TEXT,
  "priv_export" TEXT,
  "priv_print" TEXT,
  PRIMARY KEY ("group_id", "app_name")
);
```

sec_logged

```
CREATE TABLE "sec_logged" (  
  login TEXT NOT NULL,  
  date_login TEXT,  
  sc_session TEXT,  
  ip TEXT  
);
```

NOTA: A tabela **Usuários logados** será criada somente se a opção **Proteger usuários logados** for habilitada durante a criação do Módulo de Segurança.

sec_users_social

```
CREATE TABLE "sec_users_social" (  
  "login" TEXT NOT NULL,  
  "resource" TEXT NOT NULL,  
  "resource_id" TEXT NOT NULL,  
  PRIMARY KEY ("login", "resource", "resource_id")  
);
```

NOTA: A tabela **users_social** será criada somente se a opção **Utilizar redes sociais** for verificada durante a criação do Módulo de Segurança.

General

Prefix Application

Defines a prefix for the applications that will be created by the security module. By default, the field is filled with the prefix *app_*.

This field is mandatory when creating the security module.

Folder

Defines the name of the folder that will be created in the project to group the applications created by the security generator. By default, the folder name is *Security*.

Enable Security

Defines whether the **Use Security** attribute will be enabled in the applications selected in the *Insert Applications* tab.

By default, applications generated by the security module have the Use Security option enabled.

Remember login

Enables the **Remember me** option at system login.

Example of the Remember Me feature

This feature stores user data in cookies, and allows them to return to the system even after closing the session. If the user has logged out, the cookie data is deleted and he or she will have to log in again.

Cookie expiration time

Defines the lifetime, in days, of the cookie that contains the access data of users who selected the **Remember me** option.

By default, Scriptcase sets the limit to 30 days.

When session expires

Determines system behavior when user session expires.

- **No action:** A message will be displayed, user not authorized, and an OK button to return to the login screen.
- **Redirect to login:** In this option the user will be redirected directly to the login screen.
- **Display a message and redirect to login:** An unauthorized user message will be displayed and you will be redirected to the login screen.

Theme

Defines the theme that will be used in applications created by the Security Module.

To add or remove themes from the select, access the Project > Properties menu, there you can add or remove themes for the project.

Log

Defines the log module that will be used in the system. [Click here](#) and check out how to create a Log Module.

Menu

Defines the menu application used to create the security item, which contains the applications generated by the module for system management.

This attribute is mandatory for module creation. If the project already has a menu application, they will be listed and can be used in creation. The developer can choose to create a new menu application using the option: **Create application menu**.

Menu orientation

Defines the orientation of the menu that will be created when selecting the *Create application menu* option in the **Menu** attribute.

If you select an existing menu, this attribute will be disabled

Menu theme

Determines the initial theme of the menu application that will be created when selecting the *Create application menu* option in the **Menu** attribute.

If you select an existing menu, this attribute will be disabled

Use SweetAlert

Use SweetAlert to display application messages. When enabled, this option will override the browser's "confirm" and "alert" settings.

Login

Here you can define the type and number of characters allowed for the username and password fields.

Label Position at Login

Defines the positioning of the fields' Label in relation to the data.

- **Above:** Positions the label above the Above input label at login.
- **Below:** Positions the label below the Down input label at login
- **Watermark:** Positions the label as a watermark.

Login mode

Defines how the user login will be performed.

- **User** - Default form of access, in this option

Cryptography

Use encryption to store the password in the user table. You have the following encryptions available: **MD5, SHA1, SHA256 and SHA512**

Show password characters

Defines whether the reveal password button will be displayed in the password field.

Password field with reveal password button

Use Captcha

It activates the captcha for the login application. The following options are available:

- **No:** Does not display the captcha in the login application.
- **Captcha:** Uses the built-in script library to display the captcha.
- **recaptcha:** Uses Google's recaptcha V2. To configure, see the video below:

[Watch a recaptcha setup video.](#)

Secret Key

Key generated by Google after creating the recaptcha project.

This option will be available when using recaptcha. [See how to generate these credentials.](#)

Site Key

Key generated by Google after creating the recaptcha project.

This option will be available when using recaptcha. [See how to generate these credentials.](#)

Last password change

Defines the time, in days, until the system requests the user to change their password.

If the value entered is 0, the password will not be reset.

Password strength

Defines the mandatory characters to compose the password for new users.

- **Capital letters**

- **Small letters**
- **Numbers**
- **Special characters**

Example of password strength in the application

Show language selection at login

Enables the display of the language field at login.

Example of language selection at login

Login Field

- **Minimum size:** Defines the minimum number of characters that can be used to define a login.
- **Maximum length:** Stipulates the maximum number of characters for defining a login.

Password field

- **Minimum length:** Minimum number of characters used to define the password.
- **Maximum length:** Defines the maximum number of characters for defining a password.

The maximum values cannot be lower than the minimum values.

Login Template

When enabling the **Use a template attribute on the login screen**, the field for selecting the template that will be used will be available. Templates must be loaded/created in an external library, which in turn must be enabled for use in the project. [See how to use an external library](#)

This option is only available when **Social Network Authentication** is not used.

If you do not have templates created or enabled for the project, use the button to quickly access the external library settings.

After creating or enabling a template in the external library, if it is not listed, click on the button to reload the select values.

E-mail Settings

API

This attribute will define whether an API or a customized SMTP will be used for the security module.

SMTP Server

Enter the SMTP server port. This information must be in accordance with the secure connection option.

Door

Defines the connection port according to the SSL used. Use 465 for **SSL**, 587 for **TLS**, or 25 for insecure connection. If you do not enter the port, Scriptcase applies the default port: 25.

Secure Connection:

Use **SSL** or **TSL**, or leave it blank for insecure connection.

SMTP User

Enter user information for SMTP connection. * **EX:** scriptcase@yahoo.com

SMTP Password

Enter the password for the SMTP connection.

SMTP email

Enter the outgoing SMTP email.

Sender's name

Sets the sender name

Email server

Select an email API to use in the security module or define a custom SMTP.

This email will be used in the options:

- All **Recover Password** options
- **New User** when selecting the options: **Requires activation by email, Send email to administrator.**

If you do not have an API created for use, check [here](#) how to create it.

Customized

Enter all SMTP settings required for operation.

The options below are only available when the **Custom** option is selected.

- **The SMTP server:** Enter the SMTP server address.
 - **EX:** smtp.mail.yahoo.com
- **SMTP Port:** Enter the SMTP server port. This information must be in accordance with the secure connection option. Use 465 for **SSL**, 587 for **TLS**, or 25 for insecure connection. If you do not enter the port, Scriptcase applies the default port: 25.
- **Secure Connection:** Use **SSL** or **TSL**, or leave it blank for insecure connection.
- **SMTP User:** Enter user information for SMTP connection.
 - **EX:** scriptcase@yahoo.com

- **SMTP Password:** Enter the password for the SMTP connection.
- **SMTP email:** Enter the outgoing SMTP email.

SMTP

To proceed with the password recovery, it is necessary that has the SMTP server configured for a successful process. Look [here](#) how to realize this procedure.

Yahoo

For more information about these settings [Click Here](#).

Some email applications uses older, less secure technologies to sign in to your email account, and Google will block these requests by default. To solve this, sign in to your Google account and enable access through less secure apps through this [link](#).
See also: [Ways to securely access Yahoo Mail](#)

SMTP Server Settings Yahoo

SMTP Server	smtp.mail.yahoo.com
Port	465 or 587
E-mail address	Your full email address (name@domain.com.)
Password	The password for your account.
Requires SSL	Yes
Requires TSL	Yes (if available)
Requires authentication	Yes

Gmail

For more information about these settings [Click Here](#).

Some email applications uses older, less secure technologies to sign in to your email account, and Google will block these requests by default. To solve this, sign in to your Google account and enable access through less secure apps through this [link](#).

SMTP Server Settings Gmail

SMTP Server	smtp.gmail.com
E-mail address	Your full email address (Ex. example@gmail.com)
Password	The password for your account.
Port (TLS)	587
Port (SSL)	465
TLS / SSL Required	Yes

Outlook / Hotmail

For more information about these settings [Click Here](#)

SMTP Server Settings Outlook.com

SMTP Server	smtp-mail.outlook.com
E-mail address	Your full email address (Ex. myname@outlook.com, not an alias)
Password	The password for your account.
Port	587 (you can use port 25 as an alternative)
TLS / SSL Required	Yes

New users

Settings for creating new users in the security system.

New Users

Allows new users to register

This option defines the availability of user registration directly in the login system. If you do not check this option, only users with administrative access can add new users.

Requires email activation

This option defines whether the new user must validate their registration by email to activate the account (Configure SMTP email to use this option)

Send email to administrator

This option defines whether the system administrator receives an email whenever a new user is registered. (Configure SMTP email to use this option)

Default Group

Defines the default group that the user will be inserted into when created.

This feature is only available for the group security module or LDAP/Applications

Recover password

Send email with password

The system sends the user's password via email only if SMTP has been configured correctly, and the password is not using encryption.

Reset password and send new one by email

The system automatically resets the password and sends it to the user via email (only if SMTP has been configured correctly).

Send email with a link to generate a new password

The system sends the user a link to access an application and reset the password.

The email sending options, for example, *Send email with password* or *Requires activation by email* requires the correct configuration of the administrator's email in the **Email Settings** tab.

Two Factor Authentication

Two-factor authentication (2FA)

Determines whether or not two-factor authentication is used in the system. Currently, the security module supports three ways of configuring resources:

- **Authentication:** This option will send the code to your Google authentication app.
- **SMS:** This option will send the authentication code via SMS.
- **Email:** This option will send the authentication code to the configured email.

Operation mode

In this attribute, the developer can define whether users will be required to use authentication to access the system or whether they may not use the resource.

- **All** - All users are required to configure
- **Individual** - Each user has the option of using authentication or not.

API

Lists the available APIs according to the type of authentication selected in the *Two-factor authentication (2FA)* attribute.

If you do not have any API created for the project, use the button to quickly access the API settings.

After configuring the API, click the to reload the select values.

If you do not have an API created for use, check [here](#) how to create it.

Code expiration time

Set the time in **seconds** that the 2FA authentication token will expire.

,

Social Network

The Scriptcase allows user authentication through social networks such as **X** (formerly Twitter), **Facebook**, and **Google**. This feature makes application access easier by eliminating the need to create new credentials, making login more practical and secure.

To enable login with a social network, it is necessary to configure an application on the corresponding platform to obtain the access credentials.

When using social network authentication, the **Login Template** option will not be available.

Facebook

Authentication via **Facebook** allows users to log in to the system using their social network accounts. To enable this feature, it is necessary to register an application on **Facebook for Developers**. See how to [Generate Facebook credentials](#).

To use **Facebook**, check the **checkbox** to enable the **App ID** and **Secret** fields and enter the previously generated data.

App ID

Enter the **App ID** available in the settings of the application created in **Facebook Developers**.

Secret

Enter the **Secret** available in the settings of the application created in **Facebook Developers**.

X (formerly Twitter)

Allows user authentication via **X** (formerly Twitter), using the platform's API. To configure this feature, it is necessary to create an application in the **X Developer Portal** to obtain the authentication credentials. See how to [Generate X credentials](#).

To use login with **X**, check the **checkbox** to enable the **Key** and **Secret** fields and enter the previously generated data.

Key

Enter the **Key** available in the settings of the application created in **X Developers**.

Secret

Enter the **Secret** available in the settings of the application created in **X Developers**.

Google

Login via **Google** allows users to authenticate using their platform accounts quickly and securely. To enable this feature in Scriptcase, it is necessary to configure an application in **Google Cloud Console**. See how to [Generate Google credentials](#).

To use login with **Google**, check the **checkbox** to enable the **Client ID** and **Secret** fields and enter the previously generated data.

Client ID

Enter the **Client ID** available in the settings of the application created in **Google Developers**.

Secret

Enter the **Secret** available in the settings of the application created in **Google Developers**.

Logged Users

This setting defines the system behavior for login protection.

This option is available if you checked **Protect logged in users** during the connection step.

Show logged in users

If you select this option, Scriptcase will also create a Grid Application with the Security Module to display a report with all users currently connected to the system.

Brute Force attack protection

Allows/disables blocking users after a few failed access attempts.

Brute Force block time (in minutes)

Time, in minutes, that the user will remain inaccessible after several failed access attempts. (Only available when Protection against Ruth Force Attacks is activated)

Number of attempts before blocking

Number of failed access attempts until protection is enabled. (Available only when protection is enabled for brute force attacks)

Insert Data

This option inserts the first user into the security tables. This user has administrator privileges to manage the system and add new users.

Login

This option defines the system administrator user. By default, the user defined by Scriptcase is **admin**.

Password

This option sets the system administrator password. By default, the user defined by Scriptcase is **admin**.

To increase the security of your project, we recommend changing the default username and password "admin" at this stage or after the first access.

Name

This option defines the name of the administrator user on the system.

Email

This option defines the email address of the system administrator user. This email can be used for some new user registration settings, such as notification to the administrator.

For the email to be sent successfully to the administrator, the SMTP parameters must have been configured or an email API must have been selected in the previous step in [Configurations](#).

Add Applications

This option adds the applications already created in the project to the Security Module applications table.

Include All

All project applications will be added to the application table.

Select Applications

Allows the developer to select specific applications to include in the application table. When clicking Select, all existing applications in the project will be listed.

Application selection screen

On this screen you can search for applications by name or filter by their types.

Once selected, the applications will be listed below.

List of selected applications

When unchecking this option, existing applications in the project when creating the module will need to be inserted through application synchronization, after executing the security module.

Save Profile

This feature will always be displayed when completing the security module configuration. The saved profiles will be displayed on the initial module creation screen, in the **Create / Choose Profile** step.

Viewing Saved Profiles

Ao clicar em **Usar**, o processo de criação do módulo de segurança se dará da mesma forma, porém, com as opções de configuração preenchidas com os valores salvos no perfil. When clicking on **Use**, the security module creation process will take place in the same way, however, with the configuration options filled in with the values saved in the profile.

Save Profile

When enabled, the settings made in the created module will be saved in the profile.

Name

When enabling profile saving, the name becomes a mandatory field to identify the created profile.

Level

Defines the viewing scope in which the profile will be saved.

- **Public:** Defines that the security profile will be available in any Scriptcase project.
- **Project:** Defines that the security profile will only be available in the project in which it was created.
- **User:** Defines that the security profile will only be available to the Scriptcase user who created it.

Building Security

Finally, a summary of the creation of the security module, listing the changes made by Scriptcase to your project.

- **Open Project:** You will be redirected to the home page of the project being modified.
- **Generate source code:** Generates the source code of all applications created by the security module.
- **Download SQL:** Makes the table structures of the created module available to the developer

After creating the security module, it will be necessary to generate the source code of all applications that were marked by the security module usage flag. Except Login and Menu applications.

Application-Based Security Module

In the **User Security Module**, the system administrator has the ability to restrict access to different applications according to the user. In this type of security, the administrator must define which users can use certain applications, restricting access individually.

Check below the tables that will be created in your database when configuring a security module.

The **sec_logged** (Logged User) and **sec_users_social** (Social Network Authentication) tables will be created if these features are enabled, the creation of the other tables is mandatory.

sec_users

```
CREATE TABLE "sec_users" (
  "login" TEXT NOT NULL,
  "pswd" TEXT NOT NULL,
  "name" TEXT,
  "email" TEXT,
  "active" TEXT,
  "activation_code" TEXT,
  "priv_admin" TEXT,
  "mfa" TEXT,
  "picture" BLOB,
  "role" TEXT,
  "phone" TEXT,
  "pswd_last_updated" TIMESTAMP,
  "mfa_last_updated" TIMESTAMP DEFAULT NULL,
  PRIMARY KEY ("login")
);
```

sec_apps

```
CREATE TABLE "sec_apps" (
  "app_name" TEXT NOT NULL,
  "app_type" TEXT,
  "description" TEXT,
  PRIMARY KEY ("app_name")
);
```

sec_users_apps

```
CREATE TABLE "sec_users_apps" (
  "login" TEXT NOT NULL,
  "app_name" TEXT NOT NULL,
  "priv_access" TEXT,
  "priv_insert" TEXT,
  "priv_delete" TEXT,
  "priv_update" TEXT,
  "priv_export" TEXT,
  "priv_print" TEXT,
  PRIMARY KEY ("login", "app_name")
);
```

sec_logged

```
CREATE TABLE "sec_logged" (
  login TEXT NOT NULL,
  date_login TEXT,
  sc_session TEXT,
  ip TEXT
);
```

NOTA: A tabela **Usuários logados** será criada somente se a opção **Proteger usuários logados** for habilitada durante a criação do Módulo de Segurança.

sec_users_social

```
CREATE TABLE "sec_users_social" (
  "login" TEXT NOT NULL,
  "resource" TEXT NOT NULL,
  "resource_id" TEXT NOT NULL,
```

```
PRIMARY KEY ("login", "resource", "resource_id")
);
```

NOTA: A tabela **users_social** será criada somente se a opção **Utilizar redes sociais** for verificada durante a criação do Módulo de Segurança.

sec_settings

```
CREATE TABLE "sec_settings" (
  set_name TEXT NOT NULL,
  set_value TEXT,
  PRIMARY KEY ("set_name")
);
```

Configure Connection

Connection

Defines the connection that will be used to create the security module tables.

All existing connections in the project will be displayed.

Mode

Use existing tables

When using this option, the developer must have the necessary tables in his database to create the security module.

[Click here](#) to check the tables necessary for this type of security.

Create tables

Once this option is selected, Scriptcase is responsible for creating the tables necessary to use the security module.

Table prefix

Defines a prefix for the tables that will be created by the security module.

By default, Scriptcase uses **sec_**.

Delete tables if they already exist

This option eliminates tables with the same name in your database, based on the tables used by the module, listed below.

For example, by setting the prefix **prj_** to your tables, if there is any table with the name **prj_users** in your database, it will be deleted and a new table will be created.

This option is only available when a **Create tables** option is selected.

Protect logged in users

This option prevents the same user from accessing the system simultaneously in different sessions. By checking this option, the **logged** table will be created.

When using the default prefix **sec_** the table name will be **sec_logged**.

Use social medias

This option allows the configuration of Facebook and Twitter to authenticate system users. When checking this option, the **users_social** table will be created.

When using the default prefix **sec_** the table name will be **sec_users_social**.

Association tables

The **Associate Tables** screen will be displayed if the **Use existing tables** option is selected in the **Configure Connection** step.

When using the **Create tables** option, this step will be carried out automatically, with the tables that will be created by the security module generator.

At this stage, fields from existing tables must be associated with security application fields (applications generated by the Security Module).

Check below the structure of the tables created for this type of security.

sec_users

```
CREATE TABLE "sec_users" (
  "login" TEXT NOT NULL,
  "pswd" TEXT NOT NULL,
  "name" TEXT,
  "email" TEXT,
  "active" TEXT,
  "activation_code" TEXT,
  "priv_admin" TEXT,
  "mfa" TEXT,
  "picture" BLOB,
  "role" TEXT,
  "phone" TEXT,
  "pswd_last_updated" TIMESTAMP,
  "mfa_last_updated" TIMESTAMP DEFAULT NULL,
  PRIMARY KEY ("login")
);
```

sec_apps

```
CREATE TABLE "sec_apps" (
  "app_name" TEXT NOT NULL,
  "app_type" TEXT,
  "description" TEXT,
  PRIMARY KEY ("app_name")
);
```

sec_users_apps

```
CREATE TABLE "sec_users_apps" (
  "login" TEXT NOT NULL,
  "app_name" TEXT NOT NULL,
  "priv_access" TEXT,
  "priv_insert" TEXT,
  "priv_delete" TEXT,
  "priv_update" TEXT,
  "priv_export" TEXT,
  "priv_print" TEXT,
  PRIMARY KEY ("login", "app_name")
);
```

sec_logged

```
CREATE TABLE "sec_logged" (
  login TEXT NOT NULL,
  date_login TEXT,
  sc_session TEXT,
  ip TEXT
);
```

NOTA: A tabela **Usuários logados** será criada somente se a opção **Proteger usuários logados** for habilitada durante a criação do Módulo de Segurança.

sec_users_social

```
CREATE TABLE "sec_users_social" (  
  "login" TEXT NOT NULL,  
  "resource" TEXT NOT NULL,  
  "resource_id" TEXT NOT NULL,  
  PRIMARY KEY ("login", "resource", "resource_id")  
);
```

NOTA: A tabela **users_social** será criada somente se a opção **Utilizar redes sociais** for verificada durante a criação do Módulo de Segurança.

General

Prefix Application

Defines a prefix for the applications that will be created by the security module. By default, the field is filled with the prefix *app_*.

This field is mandatory when creating the security module.

Folder

Defines the name of the folder that will be created in the project to group the applications created by the security generator. By default, the folder name is *Security*.

Enable Security

Defines whether the **Use Security** attribute will be enabled in the applications selected in the *Insert Applications* tab.

By default, applications generated by the security module have the Use Security option enabled.

Remember login

Enables the **Remember me** option at system login.

Example of the Remember Me feature

This feature stores user data in cookies, and allows them to return to the system even after closing the session. If the user has logged out, the cookie data is deleted and he or she will have to log in again.

Cookie expiration time

Defines the lifetime, in days, of the cookie that contains the access data of users who selected the **Remember me** option.

By default, Scriptcase sets the limit to 30 days.

When session expires

Determines system behavior when user session expires.

- **No action:** A message will be displayed, user not authorized, and an OK button to return to the login screen.
- **Redirect to login:** In this option the user will be redirected directly to the login screen.
- **Display a message and redirect to login:** An unauthorized user message will be displayed and you will be redirected to the login screen.

Theme

Defines the theme that will be used in applications created by the Security Module.

To add or remove themes from the select, access the Project > Properties menu, there you can add or remove themes for the project.

Log

Defines the log module that will be used in the system. [Click here](#) and check out how to create a Log Module.

Menu

Defines the menu application used to create the security item, which contains the applications generated by the module for system management.

This attribute is mandatory for module creation. If the project already has a menu application, they will be listed and can be used in creation. The developer can choose to create a new menu application using the option: **Create application menu**.

Menu orientation

Defines the orientation of the menu that will be created when selecting the *Create application menu* option in the **Menu** attribute.

If you select an existing menu, this attribute will be disabled

Menu theme

Determines the initial theme of the menu application that will be created when selecting the *Create application menu* option in the **Menu** attribute.

If you select an existing menu, this attribute will be disabled

Use SweetAlert

Use SweetAlert to display application messages. When enabled, this option will override the browser's "confirm" and "alert" settings.

Login

Here you can define the type and number of characters allowed for the username and password fields.

Label Position at Login

Defines the positioning of the fields' Label in relation to the data.

- **Above:** Positions the label above the Above input label at login.
- **Below:** Positions the label below the Down input label at login
- **Watermark:** Positions the label as a watermark.

Login mode

Defines how the user login will be performed.

- **User** - Default form of access, in this option

Cryptography

Use encryption to store the password in the user table. You have the following encryptions available: **MD5, SHA1, SHA256 and SHA512**

Show password characters

Defines whether the reveal password button will be displayed in the password field.

Password field with reveal password button

Use Captcha

It activates the captcha for the login application. The following options are available:

- **No:** Does not display the captcha in the login application.
- **Captcha:** Uses the built-in script library to display the captcha.
- **recaptcha:** Uses Google's recaptcha V2. To configure, see the video below:

[Watch a recaptcha setup video.](#)

Secret Key

Key generated by Google after creating the recaptcha project.

This option will be available when using recaptcha. [See how to generate these credentials.](#)

Site Key

Key generated by Google after creating the recaptcha project.

This option will be available when using recaptcha. [See how to generate these credentials.](#)

Last password change

Defines the time, in days, until the system requests the user to change their password.

If the value entered is 0, the password will not be reset.

Password strength

Defines the mandatory characters to compose the password for new users.

- **Capital letters**

- **Small letters**
- **Numbers**
- **Special characters**

Example of password strength in the application

Show language selection at login

Enables the display of the language field at login.

Example of language selection at login

Login Field

- **Minimum size:** Defines the minimum number of characters that can be used to define a login.
- **Maximum length:** Stipulates the maximum number of characters for defining a login.

Password field

- **Minimum length:** Minimum number of characters used to define the password.
- **Maximum length:** Defines the maximum number of characters for defining a password.

The maximum values cannot be lower than the minimum values.

Login Template

When enabling the **Use a template attribute on the login screen**, the field for selecting the template that will be used will be available. Templates must be loaded/created in an external library, which in turn must be enabled for use in the project. [See how to use an external library](#)

This option is only available when **Social Network Authentication** is not used.

If you do not have templates created or enabled for the project, use the button to quickly access the external library settings.

After creating or enabling a template in the external library, if it is not listed, click on the button to reload the select values.

E-mail Settings

API

This attribute will define whether an API or a customized SMTP will be used for the security module.

SMTP Server

Enter the SMTP server port. This information must be in accordance with the secure connection option.

Door

Defines the connection port according to the SSL used. Use 465 for **SSL**, 587 for **TLS**, or 25 for insecure connection. If you do not enter the port, Scriptcase applies the default port: 25.

Secure Connection:

Use **SSL** or **TSL**, or leave it blank for insecure connection.

SMTP User

Enter user information for SMTP connection. * **EX:** scriptcase@yahoo.com

SMTP Password

Enter the password for the SMTP connection.

SMTP email

Enter the outgoing SMTP email.

Sender's name

Sets the sender name

Email server

Select an email API to use in the security module or define a custom SMTP.

This email will be used in the options:

- All **Recover Password** options
- **New User** when selecting the options: **Requires activation by email, Send email to administrator.**

If you do not have an API created for use, check [here](#) how to create it.

Customized

Enter all SMTP settings required for operation.

The options below are only available when the **Custom** option is selected.

- **The SMTP server:** Enter the SMTP server address.
 - **EX:** smtp.mail.yahoo.com
- **SMTP Port:** Enter the SMTP server port. This information must be in accordance with the secure connection option. Use 465 for **SSL**, 587 for **TLS**, or 25 for insecure connection. If you do not enter the port, Scriptcase applies the default port: 25.
- **Secure Connection:** Use **SSL** or **TSL**, or leave it blank for insecure connection.
- **SMTP User:** Enter user information for SMTP connection.
 - **EX:** scriptcase@yahoo.com

- **SMTP Password:** Enter the password for the SMTP connection.
- **SMTP email:** Enter the outgoing SMTP email.

SMTP

To proceed with the password recovery, it is necessary that has the SMTP server configured for a successful process. Look [here](#) how to realize this procedure.

Yahoo

For more information about these settings [Click Here](#).

Some email applications uses older, less secure technologies to sign in to your email account, and Google will block these requests by default. To solve this, sign in to your Google account and enable access through less secure apps through this [link](#).
See also: [Ways to securely access Yahoo Mail](#)

SMTP Server Settings Yahoo

SMTP Server	smtp.mail.yahoo.com
Port	465 or 587
E-mail address	Your full email address (name@domain.com.)
Password	The password for your account.
Requires SSL	Yes
Requires TSL	Yes (if available)
Requires authentication	Yes

Gmail

For more information about these settings [Click Here](#).

Some email applications uses older, less secure technologies to sign in to your email account, and Google will block these requests by default. To solve this, sign in to your Google account and enable access through less secure apps through this [link](#).

SMTP Server Settings Gmail

SMTP Server	smtp.gmail.com
E-mail address	Your full email address (Ex. example@gmail.com)
Password	The password for your account.
Port (TLS)	587
Port (SSL)	465
TLS / SSL Required	Yes

Outlook / Hotmail

For more information about these settings [Click Here](#)

SMTP Server Settings Outlook.com

SMTP Server	smtp-mail.outlook.com
E-mail address	Your full email address (Ex. myname@outlook.com, not an alias)
Password	The password for your account.
Port	587 (you can use port 25 as an alternative)
TLS / SSL Required	Yes

New users

Settings for creating new users in the security system.

New Users

Allows new users to register

This option defines the availability of user registration directly in the login system. If you do not check this option, only users with administrative access can add new users.

Requires email activation

This option defines whether the new user must validate their registration by email to activate the account (Configure SMTP email to use this option)

Send email to administrator

This option defines whether the system administrator receives an email whenever a new user is registered. (Configure SMTP email to use this option)

Default Group

Defines the default group that the user will be inserted into when created.

This feature is only available for the group security module or LDAP/Applications

Recover password

Send email with password

The system sends the user's password via email only if SMTP has been configured correctly, and the password is not using encryption.

Reset password and send new one by email

The system automatically resets the password and sends it to the user via email (only if SMTP has been configured correctly).

Send email with a link to generate a new password

The system sends the user a link to access an application and reset the password.

The email sending options, for example, *Send email with password* or *Requires activation by email* requires the correct configuration of the administrator's email in the **Email Settings** tab.

Two Factor Authentication

Two-factor authentication (2FA)

Determines whether or not two-factor authentication is used in the system. Currently, the security module supports three ways of configuring resources:

- **Authentication:** This option will send the code to your Google authentication app.
- **SMS:** This option will send the authentication code via SMS.
- **Email:** This option will send the authentication code to the configured email.

Operation mode

In this attribute, the developer can define whether users will be required to use authentication to access the system or whether they may not use the resource.

- **All** - All users are required to configure
- **Individual** - Each user has the option of using authentication or not.

API

Lists the available APIs according to the type of authentication selected in the *Two-factor authentication (2FA)* attribute.

If you do not have any API created for the project, use the button to quickly access the API settings.

After configuring the API, click the to reload the select values.

If you do not have an API created for use, check [here](#) how to create it.

Code expiration time

Set the time in **seconds** that the 2FA authentication token will expire.

,

Social Network

The Scriptcase allows user authentication through social networks such as **X** (formerly Twitter), **Facebook**, and **Google**. This feature makes application access easier by eliminating the need to create new credentials, making login more practical and secure.

To enable login with a social network, it is necessary to configure an application on the corresponding platform to obtain the access credentials.

When using social network authentication, the **Login Template** option will not be available.

Facebook

Authentication via **Facebook** allows users to log in to the system using their social network accounts. To enable this feature, it is necessary to register an application on **Facebook for Developers**. See how to [Generate Facebook credentials](#).

To use **Facebook**, check the **checkbox** to enable the **App ID** and **Secret** fields and enter the previously generated data.

App ID

Enter the **App ID** available in the settings of the application created in **Facebook Developers**.

Secret

Enter the **Secret** available in the settings of the application created in **Facebook Developers**.

X (formerly Twitter)

Allows user authentication via **X** (formerly Twitter), using the platform's API. To configure this feature, it is necessary to create an application in the **X Developer Portal** to obtain the authentication credentials. See how to [Generate X credentials](#).

To use login with **X**, check the **checkbox** to enable the **Key** and **Secret** fields and enter the previously generated data.

Key

Enter the **Key** available in the settings of the application created in **X Developers**.

Secret

Enter the **Secret** available in the settings of the application created in **X Developers**.

Google

Login via **Google** allows users to authenticate using their platform accounts quickly and securely. To enable this feature in Scriptcase, it is necessary to configure an application in **Google Cloud Console**. See how to [Generate Google credentials](#).

To use login with **Google**, check the **checkbox** to enable the **Client ID** and **Secret** fields and enter the previously generated data.

Client ID

Enter the **Client ID** available in the settings of the application created in **Google Developers**.

Secret

Enter the **Secret** available in the settings of the application created in **Google Developers**.

Logged Users

This setting defines the system behavior for login protection.

This option is available if you checked **Protect logged in users** during the connection step.

Show logged in users

If you select this option, Scriptcase will also create a Grid Application with the Security Module to display a report with all users currently connected to the system.

Brute Force attack protection

Allows/disables blocking users after a few failed access attempts.

Brute Force block time (in minutes)

Time, in minutes, that the user will remain inaccessible after several failed access attempts. (Only available when Protection against Ruth Force Attacks is activated)

Number of attempts before blocking

Number of failed access attempts until protection is enabled. (Available only when protection is enabled for brute force attacks)

Insert Data

This option inserts the first user into the security tables. This user has administrator privileges to manage the system and add new users.

Login

This option defines the system administrator user. By default, the user defined by Scriptcase is **admin**.

Password

This option sets the system administrator password. By default, the user defined by Scriptcase is **admin**.

To increase the security of your project, we recommend changing the default username and password "admin" at this stage or after the first access.

Name

This option defines the name of the administrator user on the system.

Email

This option defines the email address of the system administrator user. This email can be used for some new user registration settings, such as notification to the administrator.

For the email to be sent successfully to the administrator, the SMTP parameters must have been configured or an email API must have been selected in the previous step in [Configurations](#).

Add Applications

This option adds the applications already created in the project to the Security Module applications table.

Include All

All project applications will be added to the application table.

Select Applications

Allows the developer to select specific applications to include in the application table. When clicking Select, all existing applications in the project will be listed.

Application selection screen

On this screen you can search for applications by name or filter by their types.

Once selected, the applications will be listed below.

List of selected applications

When unchecking this option, existing applications in the project when creating the module will need to be inserted through application synchronization, after executing the security module.

Save Profile

This feature will always be displayed when completing the security module configuration. The saved profiles will be displayed on the initial module creation screen, in the **Create / Choose Profile** step.

Viewing Saved Profiles

Ao clicar em **Usar**, o processo de criação do módulo de segurança se dará da mesma forma, porém, com as opções de configuração preenchidas com os valores salvos no perfil. When clicking on **Use**, the security module creation process will take place in the same way, however, with the configuration options filled in with the values saved in the profile.

Save Profile

When enabled, the settings made in the created module will be saved in the profile.

Name

When enabling profile saving, the name becomes a mandatory field to identify the created profile.

Level

Defines the viewing scope in which the profile will be saved.

- **Public:** Defines that the security profile will be available in any Scriptcase project.
- **Project:** Defines that the security profile will only be available in the project in which it was created.
- **User:** Defines that the security profile will only be available to the Scriptcase user who created it.

Building Security

Finally, a summary of the creation of the security module, listing the changes made by Scriptcase to your project.

- **Open Project:** You will be redirected to the home page of the project being modified.
- **Generate source code:** Generates the source code of all applications created by the security module.
- **Download SQL:** Makes the table structures of the created module available to the developer

After creating the security module, it will be necessary to generate the source code of all applications that were marked by the security module usage flag. Except Login and Menu applications.

User-Based Security Module

In the **Security Module by User**, all registered users have access to the system applications, functioning only as authentication for each user.

Check below the tables that will be created in your database when configuring a security module.

The **sec_logged** (Logged User) and **sec_users_social** (Social Network Authentication) tables will be created if these features are enabled, the creation of the other tables is mandatory.

sec_users

```
CREATE TABLE "sec_users" (
  "login" TEXT NOT NULL,
  "pswd" TEXT NOT NULL,
  "name" TEXT,
  "email" TEXT,
  "active" TEXT,
  "activation_code" TEXT,
  "priv_admin" TEXT,
  "mfa" TEXT,
  "picture" BLOB,
  "role" TEXT,
  "phone" TEXT,
  "pswd_last_updated" TIMESTAMP,
  "mfa_last_updated" TIMESTAMP DEFAULT NULL,
  PRIMARY KEY ("login")
);
```

sec_logged

```
CREATE TABLE "sec_logged" (
  login TEXT NOT NULL,
  date_login TEXT,
  sc_session TEXT,
  ip TEXT
);
```

NOTA: A tabela **Usuários logados** será criada somente se a opção **Proteger usuários logados** for habilitada durante a criação do Módulo de Segurança.

sec_users_social

```
CREATE TABLE "sec_users_social" (
  "login" TEXT NOT NULL,
  "resource" TEXT NOT NULL,
  "resource_id" TEXT NOT NULL,
  PRIMARY KEY ("login", "resource", "resource_id")
);
```

NOTA: A tabela **users_social** será criada somente se a opção **Utilizar redes sociais** for verificada durante a criação do Módulo de Segurança.

sec_settings

```
CREATE TABLE "sec_settings" (
  set_name TEXT NOT NULL,
  set_value TEXT,
  PRIMARY KEY ("set_name")
);
```

Configure Connection

Connection

Defines the connection that will be used to create the security module tables.

All existing connections in the project will be displayed.

Mode

Use existing tables

When using this option, the developer must have the necessary tables in his database to create the security module.

[Click here](#) to check the tables necessary for this type of security.

Create tables

Once this option is selected, Scriptcase is responsible for creating the tables necessary to use the security module.

Table prefix

Defines a prefix for the tables that will be created by the security module.

By default, Scriptcase uses **sec_**.

Delete tables if they already exist

This option eliminates tables with the same name in your database, based on the tables used by the module, listed below.

For example, by setting the prefix **prj_** to your tables, if there is any table with the name **prj_users** in your database, it will be deleted and a new table will be created.

This option is only available when a **Create tables** option is selected.

Protect logged in users

This option prevents the same user from accessing the system simultaneously in different sessions. By checking this option, the **logged** table will be created.

When using the default prefix **sec_** the table name will be **sec_logged**.

Use social medias

This option allows the configuration of Facebook and Twitter to authenticate system users. When checking this option, the **users_social** table will be created.

When using the default prefix **sec_** the table name will be **sec_users_social**.

Association tables

The **Associate Tables** screen will be displayed if the **Use existing tables** option is selected in the **Configure Connection** step.

When using the **Create tables** option, this step will be carried out automatically, with the tables that will be created by the security module generator.

At this stage, fields from existing tables must be associated with security application fields (applications generated by the Security Module).

Check below the structure of the tables created for this type of security.

sec_users

```
CREATE TABLE "sec_users" (
  "login" TEXT NOT NULL,
  "pswd" TEXT NOT NULL,
  "name" TEXT,
  "email" TEXT,
  "active" TEXT,
  "activation_code" TEXT,
  "priv_admin" TEXT,
  "mfa" TEXT,
  "picture" BLOB,
  "role" TEXT,
  "phone" TEXT,
  "pswd_last_updated" TIMESTAMP,
  "mfa_last_updated" TIMESTAMP DEFAULT NULL,
  PRIMARY KEY ("login")
);
```

sec_logged

```
CREATE TABLE "sec_logged" (
  login TEXT NOT NULL,
  date_login TEXT,
  sc_session TEXT,
  ip TEXT
);
```

NOTA: A tabela **Usuários logados** será criada somente se a opção **Proteger usuários logados** for habilitada durante a criação do Módulo de Segurança.

sec_users_social

```
CREATE TABLE "sec_users_social" (
  "login" TEXT NOT NULL,
  "resource" TEXT NOT NULL,
  "resource_id" TEXT NOT NULL,
  PRIMARY KEY ("login", "resource", "resource_id")
);
```

NOTA: A tabela **users_social** será criada somente se a opção **Utilizar redes sociais** for verificada durante a criação do Módulo de Segurança.

General

Prefix Application

Defines a prefix for the applications that will be created by the security module. By default, the field is filled with the prefix *app_*.

This field is mandatory when creating the security module.

Folder

Defines the name of the folder that will be created in the project to group the applications created by the security generator. By default, the folder name is *Security*.

Enable Security

Defines whether the **Use Security** attribute will be enabled in the applications selected in the *Insert Applications* tab.

By default, applications generated by the security module have the Use Security option enabled.

Remember login

Enables the **Remember me** option at system login.

Example of the Remember Me feature

This feature stores user data in cookies, and allows them to return to the system even after closing the session. If the user has logged out, the cookie data is deleted and he or she will have to log in again.

Cookie expiration time

Defines the lifetime, in days, of the cookie that contains the access data of users who selected the **Remember me** option.

By default, Scriptcase sets the limit to 30 days.

When session expires

Determines system behavior when user session expires.

- **No action:** A message will be displayed, user not authorized, and an OK button to return to the login screen.
- **Redirect to login:** In this option the user will be redirected directly to the login screen.
- **Display a message and redirect to login:** An unauthorized user message will be displayed and you will be redirected to the login screen.

Theme

Defines the theme that will be used in applications created by the Security Module.

To add or remove themes from the select, access the Project > Properties menu, there you can add or remove themes for the project.

Log

Defines the log module that will be used in the system. [Click here](#) and check out how to create a Log Module.

Menu

Defines the menu application used to create the security item, which contains the applications generated by the module for system management.

This attribute is mandatory for module creation. If the project already has a menu application, they will be listed and can be used in creation. The developer can choose to create a new menu application using the option: **Create application menu**.

Menu orientation

Defines the orientation of the menu that will be created when selecting the *Create application menu* option in the **Menu** attribute.

If you select an existing menu, this attribute will be disabled

Menu theme

Determines the initial theme of the menu application that will be created when selecting the *Create application menu* option in the **Menu** attribute.

If you select an existing menu, this attribute will be disabled

Use SweetAlert

Use SweetAlert to display application messages. When enabled, this option will override the browser's "confirm" and "alert" settings.

Login

Here you can define the type and number of characters allowed for the username and password fields.

Label Position at Login

Defines the positioning of the fields' Label in relation to the data.

- **Above:** Positions the label above the Above input label at login.
- **Below:** Positions the label below the Down input label at login
- **Watermark:** Positions the label as a watermark.

Login mode

Defines how the user login will be performed.

- **User** - Default form of access, in this option

Cryptography

Use encryption to store the password in the user table. You have the following encryptions available: **MD5, SHA1, SHA256 and SHA512**

Show password characters

Defines whether the reveal password button will be displayed in the password field.

Password field with reveal password button

Use Captcha

It activates the captcha for the login application. The following options are available:

- **No:** Does not display the captcha in the login application.
- **Captcha:** Uses the built-in script library to display the captcha.
- **recaptcha:** Uses Google's recaptcha V2. To configure, see the video below:

[Watch a recaptcha setup video.](#)

Secret Key

Key generated by Google after creating the recaptcha project.

This option will be available when using recaptcha. [See how to generate these credentials.](#)

Site Key

Key generated by Google after creating the recaptcha project.

This option will be available when using recaptcha. [See how to generate these credentials.](#)

Last password change

Defines the time, in days, until the system requests the user to change their password.

If the value entered is 0, the password will not be reset.

Password strength

Defines the mandatory characters to compose the password for new users.

- **Capital letters**

- **Small letters**
- **Numbers**
- **Special characters**

Example of password strength in the application

Show language selection at login

Enables the display of the language field at login.

Example of language selection at login

Login Field

- **Minimum size:** Defines the minimum number of characters that can be used to define a login.
- **Maximum length:** Stipulates the maximum number of characters for defining a login.

Password field

- **Minimum length:** Minimum number of characters used to define the password.
- **Maximum length:** Defines the maximum number of characters for defining a password.

The maximum values cannot be lower than the minimum values.

Login Template

When enabling the **Use a template attribute on the login screen**, the field for selecting the template that will be used will be available. Templates must be loaded/created in an external library, which in turn must be enabled for use in the project. [See how to use an external library](#)

This option is only available when **Social Network Authentication** is not used.

If you do not have templates created or enabled for the project, use the button to quickly access the external library settings.

After creating or enabling a template in the external library, if it is not listed, click on the button to reload the select values.

E-mail Settings

API

This attribute will define whether an API or a customized SMTP will be used for the security module.

SMTP Server

Enter the SMTP server port. This information must be in accordance with the secure connection option.

Door

Defines the connection port according to the SSL used. Use 465 for **SSL**, 587 for **TLS**, or 25 for insecure connection. If you do not enter the port, Scriptcase applies the default port: 25.

Secure Connection:

Use **SSL** or **TSL**, or leave it blank for insecure connection.

SMTP User

Enter user information for SMTP connection. * **EX:** scriptcase@yahoo.com

SMTP Password

Enter the password for the SMTP connection.

SMTP email

Enter the outgoing SMTP email.

Sender's name

Sets the sender name

Email server

Select an email API to use in the security module or define a custom SMTP.

This email will be used in the options:

- All **Recover Password** options
- **New User** when selecting the options: **Requires activation by email, Send email to administrator.**

If you do not have an API created for use, check [here](#) how to create it.

Customized

Enter all SMTP settings required for operation.

The options below are only available when the **Custom** option is selected.

- **The SMTP server:** Enter the SMTP server address.
 - **EX:** smtp.mail.yahoo.com
- **SMTP Port:** Enter the SMTP server port. This information must be in accordance with the secure connection option. Use 465 for **SSL**, 587 for **TLS**, or 25 for insecure connection. If you do not enter the port, Scriptcase applies the default port: 25.
- **Secure Connection:** Use **SSL** or **TSL**, or leave it blank for insecure connection.
- **SMTP User:** Enter user information for SMTP connection.
 - **EX:** scriptcase@yahoo.com

- **SMTP Password:** Enter the password for the SMTP connection.
- **SMTP email:** Enter the outgoing SMTP email.

SMTP

To proceed with the password recovery, it is necessary that has the SMTP server configured for a successful process. Look [here](#) how to realize this procedure.

Yahoo

For more information about these settings [Click Here](#).

Some email applications uses older, less secure technologies to sign in to your email account, and Google will block these requests by default. To solve this, sign in to your Google account and enable access through less secure apps through this [link](#).
See also: [Ways to securely access Yahoo Mail](#)

SMTP Server Settings Yahoo

SMTP Server	smtp.mail.yahoo.com
Port	465 or 587
E-mail address	Your full email address (name@domain.com.)
Password	The password for your account.
Requires SSL	Yes
Requires TSL	Yes (if available)
Requires authentication	Yes

Gmail

For more information about these settings [Click Here](#).

Some email applications uses older, less secure technologies to sign in to your email account, and Google will block these requests by default. To solve this, sign in to your Google account and enable access through less secure apps through this [link](#).

SMTP Server Settings Gmail

SMTP Server	smtp.gmail.com
E-mail address	Your full email address (Ex. example@gmail.com)
Password	The password for your account.
Port (TLS)	587
Port (SSL)	465
TLS / SSL Required	Yes

Outlook / Hotmail

For more information about these settings [Click Here](#)

SMTP Server Settings Outlook.com

SMTP Server	smtp-mail.outlook.com
E-mail address	Your full email address (Ex. myname@outlook.com, not an alias)
Password	The password for your account.
Port	587 (you can use port 25 as an alternative)
TLS / SSL Required	Yes

New users

Settings for creating new users in the security system.

New Users

Allows new users to register

This option defines the availability of user registration directly in the login system. If you do not check this option, only users with administrative access can add new users.

Requires email activation

This option defines whether the new user must validate their registration by email to activate the account (Configure SMTP email to use this option)

Send email to administrator

This option defines whether the system administrator receives an email whenever a new user is registered. (Configure SMTP email to use this option)

Default Group

Defines the default group that the user will be inserted into when created.

This feature is only available for the group security module or LDAP/Applications

Recover password

Send email with password

The system sends the user's password via email only if SMTP has been configured correctly, and the password is not using encryption.

Reset password and send new one by email

The system automatically resets the password and sends it to the user via email (only if SMTP has been configured correctly).

Send email with a link to generate a new password

The system sends the user a link to access an application and reset the password.

The email sending options, for example, *Send email with password* or *Requires activation by email* requires the correct configuration of the administrator's email in the **Email Settings** tab.

Two Factor Authentication

Two-factor authentication (2FA)

Determines whether or not two-factor authentication is used in the system. Currently, the security module supports three ways of configuring resources:

- **Authentication:** This option will send the code to your Google authentication app.
- **SMS:** This option will send the authentication code via SMS.
- **Email:** This option will send the authentication code to the configured email.

Operation mode

In this attribute, the developer can define whether users will be required to use authentication to access the system or whether they may not use the resource.

- **All** - All users are required to configure
- **Individual** - Each user has the option of using authentication or not.

API

Lists the available APIs according to the type of authentication selected in the *Two-factor authentication (2FA)* attribute.

If you do not have any API created for the project, use the button to quickly access the API settings.

After configuring the API, click the to reload the select values.

If you do not have an API created for use, check [here](#) how to create it.

Code expiration time

Set the time in **seconds** that the 2FA authentication token will expire.

,

Social Network

The Scriptcase allows user authentication through social networks such as **X** (formerly Twitter), **Facebook**, and **Google**. This feature makes application access easier by eliminating the need to create new credentials, making login more practical and secure.

To enable login with a social network, it is necessary to configure an application on the corresponding platform to obtain the access credentials.

When using social network authentication, the **Login Template** option will not be available.

Facebook

Authentication via **Facebook** allows users to log in to the system using their social network accounts. To enable this feature, it is necessary to register an application on **Facebook for Developers**. See how to [Generate Facebook credentials](#).

To use **Facebook**, check the **checkbox** to enable the **App ID** and **Secret** fields and enter the previously generated data.

App ID

Enter the **App ID** available in the settings of the application created in **Facebook Developers**.

Secret

Enter the **Secret** available in the settings of the application created in **Facebook Developers**.

X (formerly Twitter)

Allows user authentication via **X** (formerly Twitter), using the platform's API. To configure this feature, it is necessary to create an application in the **X Developer Portal** to obtain the authentication credentials. See how to [Generate X credentials](#).

To use login with **X**, check the **checkbox** to enable the **Key** and **Secret** fields and enter the previously generated data.

Key

Enter the **Key** available in the settings of the application created in **X Developers**.

Secret

Enter the **Secret** available in the settings of the application created in **X Developers**.

Google

Login via **Google** allows users to authenticate using their platform accounts quickly and securely. To enable this feature in Scriptcase, it is necessary to configure an application in **Google Cloud Console**. See how to [Generate Google credentials](#).

To use login with **Google**, check the **checkbox** to enable the **Client ID** and **Secret** fields and enter the previously generated data.

Client ID

Enter the **Client ID** available in the settings of the application created in **Google Developers**.

Secret

Enter the **Secret** available in the settings of the application created in **Google Developers**.

Logged Users

This setting defines the system behavior for login protection.

This option is available if you checked **Protect logged in users** during the connection step.

Show logged in users

If you select this option, Scriptcase will also create a Grid Application with the Security Module to display a report with all users currently connected to the system.

Brute Force attack protection

Allows/disables blocking users after a few failed access attempts.

Brute Force block time (in minutes)

Time, in minutes, that the user will remain inaccessible after several failed access attempts. (Only available when Protection against Ruth Force Attacks is activated)

Number of attempts before blocking

Number of failed access attempts until protection is enabled. (Available only when protection is enabled for brute force attacks)

Insert Data

This option inserts the first user into the security tables. This user has administrator privileges to manage the system and add new users.

Login

This option defines the system administrator user. By default, the user defined by Scriptcase is **admin**.

Password

This option sets the system administrator password. By default, the user defined by Scriptcase is **admin**.

To increase the security of your project, we recommend changing the default username and password "admin" at this stage or after the first access.

Name

This option defines the name of the administrator user on the system.

Email

This option defines the email address of the system administrator user. This email can be used for some new user registration settings, such as notification to the administrator.

For the email to be sent successfully to the administrator, the SMTP parameters must have been configured or an email API must have been selected in the previous step in [Configurations](#).

Add Applications

This option adds the applications already created in the project to the Security Module applications table.

Include All

All project applications will be added to the application table.

Select Applications

Allows the developer to select specific applications to include in the application table. When clicking Select, all existing applications in the project will be listed.

Application selection screen

On this screen you can search for applications by name or filter by their types.

Once selected, the applications will be listed below.

List of selected applications

When unchecking this option, existing applications in the project when creating the module will need to be inserted through application synchronization, after executing the security module.

Save Profile

This feature will always be displayed when completing the security module configuration. The saved profiles will be displayed on the initial module creation screen, in the **Create / Choose Profile** step.

Viewing Saved Profiles

Ao clicar em **Usar**, o processo de criação do módulo de segurança se dará da mesma forma, porém, com as opções de configuração preenchidas com os valores salvos no perfil. When clicking on **Use**, the security module creation process will take place in the same way, however, with the configuration options filled in with the values saved in the profile.

Save Profile

When enabled, the settings made in the created module will be saved in the profile.

Name

When enabling profile saving, the name becomes a mandatory field to identify the created profile.

Level

Defines the viewing scope in which the profile will be saved.

- **Public:** Defines that the security profile will be available in any Scriptcase project.
- **Project:** Defines that the security profile will only be available in the project in which it was created.
- **User:** Defines that the security profile will only be available to the Scriptcase user who created it.

Building Security

Finally, a summary of the creation of the security module, listing the changes made by Scriptcase to your project.

- **Open Project:** You will be redirected to the home page of the project being modified.
- **Generate source code:** Generates the source code of all applications created by the security module.
- **Download SQL:** Makes the table structures of the created module available to the developer

After creating the security module, it will be necessary to generate the source code of all applications that were marked by the security module usage flag. Except Login and Menu applications.

LDAP Security Module

The **LDAP security module** works in a similar way to the per-user module, where everyone has access to the system applications, functioning only as user authentication.

This type of security does not create any table, with all user access control being carried out by the Ldap server.

Use Existing Tables

Connection

Defines the connection that will be used in security module applications.

This type of security does not generate any tables, as all control is performed through Ldap

General

Prefix Application

Defines a prefix for the applications that will be created by the security module. By default, the field is filled with the prefix *app_*.

This field is mandatory when creating the security module.

Folder

Defines the name of the folder that will be created in the project to group the applications created by the security generator. By default, the folder name is *Security*.

Enable Security

Defines whether the **Use Security** attribute will be enabled in the applications selected in the *Insert Applications* tab.

By default, applications generated by the security module have the Use Security option enabled.

Remember login

Enables the **Remember me** option at system login.

Example of the Remember Me feature

This feature stores user data in cookies, and allows them to return to the system even after closing the session. If the user has logged out, the cookie data is deleted and he or she will have to log in again.

Cookie expiration time

Defines the lifetime, in days, of the cookie that contains the access data of users who selected the **Remember me** option.

By default, Scriptcase sets the limit to 30 days.

When session expires

Determines system behavior when user session expires.

- **No action:** A message will be displayed, user not authorized, and an OK button to return to the login screen.
- **Redirect to login:** In this option the user will be redirected directly to the login screen.
- **Display a message and redirect to login:** An unauthorized user message will be displayed and you will be redirected to the login screen.

Theme

Defines the theme that will be used in applications created by the Security Module.

To add or remove themes from the select, access the Project > Properties menu, there you can add or remove themes for the project.

Log

Defines the log module that will be used in the system. [Click here](#) and check out how to create a Log Module.

Menu

Defines the menu application used to create the security item, which contains the applications generated by the module for system management.

This attribute is mandatory for module creation. If the project already has a menu application, they will be listed and can be used in creation. The developer can choose to create a new menu application using the option: **Create application menu**.

Menu orientation

Defines the orientation of the menu that will be created when selecting the *Create application menu* option in the **Menu** attribute.

If you select an existing menu, this attribute will be disabled

Menu theme

Determines the initial theme of the menu application that will be created when selecting the *Create application menu* option in the **Menu** attribute.

If you select an existing menu, this attribute will be disabled

Use SweetAlert

Use SweetAlert to display application messages. When enabled, this option will override the browser's "confirm" and "alert" settings.

Login

Here you can define the type and number of characters allowed for the username and password fields.

Label Position at Login

Defines the positioning of the fields' Label in relation to the data.

- **Above:** Positions the label above the Above input label at login.
- **Below:** Positions the label below the Down input label at login
- **Watermark:** Positions the label as a watermark.

Login mode

Defines how the user login will be performed.

- **User** - Default form of access, in this option

Cryptography

Use encryption to store the password in the user table. You have the following encryptions available: **MD5, SHA1, SHA256 and SHA512**

Show password characters

Defines whether the reveal password button will be displayed in the password field.

Password field with reveal password button

Use Captcha

It activates the captcha for the login application. The following options are available:

- **No:** Does not display the captcha in the login application.
- **Captcha:** Uses the built-in script library to display the captcha.
- **recaptcha:** Uses Google's recaptcha V2. To configure, see the video below:

[Watch a recaptcha setup video.](#)

Secret Key

Key generated by Google after creating the recaptcha project.

This option will be available when using recaptcha. [See how to generate these credentials.](#)

Site Key

Key generated by Google after creating the recaptcha project.

This option will be available when using recaptcha. [See how to generate these credentials.](#)

Last password change

Defines the time, in days, until the system requests the user to change their password.

If the value entered is 0, the password will not be reset.

Password strength

Defines the mandatory characters to compose the password for new users.

- **Capital letters**

- **Small letters**
- **Numbers**
- **Special characters**

Example of password strength in the application

Show language selection at login

Enables the display of the language field at login.

Example of language selection at login

Login Field

- **Minimum size:** Defines the minimum number of characters that can be used to define a login.
- **Maximum length:** Stipulates the maximum number of characters for defining a login.

Password field

- **Minimum length:** Minimum number of characters used to define the password.
- **Maximum length:** Defines the maximum number of characters for defining a password.

The maximum values cannot be lower than the minimum values.

Login Template

When enabling the **Use a template attribute on the login screen**, the field for selecting the template that will be used will be available. Templates must be loaded/created in an external library, which in turn must be enabled for use in the project. [See how to use an external library](#)

This option is only available when **Social Network Authentication** is not used.

If you do not have templates created or enabled for the project, use the button to quickly access the external library settings.

After creating or enabling a template in the external library, if it is not listed, click on the button to reload the select values.

Ldap

In the LDAP configurations, it is necessary to enter the access data for the previously configured server.

Server

Enter the LDAP server IP here.

DN

Enter the input attributes.

Door

Enter the server access door here. **The default port is 389.**

Suffix

Enter the user suffix.

Insert Data

This option inserts the first user into the security tables. This user has administrator privileges to manage the system and add new users.

Login

This option defines the system administrator user. By default, the user defined by Scriptcase is **admin**.

Password

This option sets the system administrator password. By default, the user defined by Scriptcase is **admin**.

To increase the security of your project, we recommend changing the default username and password "admin" at this stage or after the first access.

Name

This option defines the name of the administrator user on the system.

Email

This option defines the email address of the system administrator user. This email can be used for some new user registration settings, such as notification to the administrator.

For the email to be sent successfully to the administrator, the SMTP parameters must have been configured or an email API must have been selected in the previous step in [Configurations](#).

Add Applications

This option adds the applications already created in the project to the Security Module applications table.

Include All

All project applications will be added to the application table.

Select Applications

Allows the developer to select specific applications to include in the application table. When clicking Select, all existing applications in the project will be listed.

Application selection screen

On this screen you can search for applications by name or filter by their types.

Once selected, the applications will be listed below.

List of selected applications

When unchecking this option, existing applications in the project when creating the module will need to be inserted through application synchronization, after executing the security module.

Save Profile

This feature will always be displayed when completing the security module configuration. The saved profiles will be displayed on the initial module creation screen, in the **Create / Choose Profile** step.

Viewing Saved Profiles

Ao clicar em **Usar**, o processo de criação do módulo de segurança se dará da mesma forma, porém, com as opções de configuração preenchidas com os valores salvos no perfil. When clicking on **Use**, the security module creation process will take place in the same way, however, with the configuration options filled in with the values saved in the profile.

Save Profile

When enabled, the settings made in the created module will be saved in the profile.

Name

When enabling profile saving, the name becomes a mandatory field to identify the created profile.

Level

Defines the viewing scope in which the profile will be saved.

- **Public:** Defines that the security profile will be available in any Scriptcase project.
- **Project:** Defines that the security profile will only be available in the project in which it was created.
- **User:** Defines that the security profile will only be available to the Scriptcase user who created it.

Building Security

Finally, a summary of the creation of the security module, listing the changes made by Scriptcase to your project.

- **Open Project:** You will be redirected to the home page of the project being modified.
- **Generate source code:** Generates the source code of all applications created by the security module.
- **Download SQL:** Makes the table structures of the created module available to the developer

After creating the security module, it will be necessary to generate the source code of all applications that were marked by the security module usage flag. Except Login and Menu applications.

LDAP-Based Application Security Module

In **LDAP/Application Security Module** it works in a similar way to the group module, where the system administrator has the ability to restrict access to different applications based on predefined user groups. This means that each group can have specific permissions to access certain functionalities or areas of the system, offering precise control over the actions allowed for each set of users.

Check below the tables that will be created in your database when configuring a security module.

The **sec_logged** (Logged User) and **sec_users_social** (Social Network Authentication) tables will be created if these features are enabled, the creation of the other tables is mandatory.

sec_users

```
CREATE TABLE "sec_users" (
  "login" TEXT NOT NULL,
  "pswd" TEXT NOT NULL,
  "name" TEXT,
  "email" TEXT,
  "active" TEXT,
  "activation_code" TEXT,
  "priv_admin" TEXT,
  "mfa" TEXT,
  "picture" BLOB,
  "role" TEXT,
  "phone" TEXT,
  "pswd_last_updated" TIMESTAMP,
  "mfa_last_updated" TIMESTAMP DEFAULT NULL,
  PRIMARY KEY ("login")
);
```

sec_apps

```
CREATE TABLE "sec_apps" (
  "app_name" TEXT NOT NULL,
  "app_type" TEXT,
  "description" TEXT,
  PRIMARY KEY ("app_name")
);
```

sec_users_apps

```
CREATE TABLE "sec_users_apps" (
  "login" TEXT NOT NULL,
  "app_name" TEXT NOT NULL,
  "priv_access" TEXT,
  "priv_insert" TEXT,
  "priv_delete" TEXT,
  "priv_update" TEXT,
  "priv_export" TEXT,
  "priv_print" TEXT,
  PRIMARY KEY ("login", "app_name")
);
```

sec_logged

```
CREATE TABLE "sec_logged" (
  login TEXT NOT NULL,
  date_login TEXT,
  sc_session TEXT,
  ip TEXT
);
```

NOTA: A tabela **Usuários logados** será criada somente se a opção **Proteger usuários logados** for habilitada durante a criação do Módulo de Segurança.

sec_users_social

```
CREATE TABLE "sec_users_social" (
  "login" TEXT NOT NULL,
  "resource" TEXT NOT NULL,
```

```
"resource_id" TEXT NOT NULL,  
PRIMARY KEY ("login", "resource", "resource_id")  
);
```

NOTA: A tabela **users_social** será criada somente se a opção **Utilizar redes sociais** for verificada durante a criação do Módulo de Segurança.

sec_settings

```
CREATE TABLE "sec_settings" (  
  set_name TEXT NOT NULL,  
  set_value TEXT,  
  PRIMARY KEY ("set_name")  
);
```

Configure Connection

Connection

Defines the connection that will be used to create the security module tables.

All existing connections in the project will be displayed.

Mode

Use existing tables

When using this option, the developer must have the necessary tables in his database to create the security module.

[Click here](#) to check the tables necessary for this type of security.

Create tables

Once this option is selected, Scriptcase is responsible for creating the tables necessary to use the security module.

Table prefix

Defines a prefix for the tables that will be created by the security module.

By default, Scriptcase uses **sec_**.

Delete tables if they already exist

This option eliminates tables with the same name in your database, based on the tables used by the module, listed below.

For example, by setting the prefix **prj_** to your tables, if there is any table with the name **prj_users** in your database, it will be deleted and a new table will be created.

This option is only available when a **Create tables** option is selected.

Protect logged in users

This option prevents the same user from accessing the system simultaneously in different sessions. By checking this option, the **logged** table will be created.

When using the default prefix **sec_** the table name will be **sec_logged**.

Use social medias

This option allows the configuration of Facebook and Twitter to authenticate system users. When checking this option, the **users_social** table will be created.

When using the default prefix **sec_** the table name will be **sec_users_social**.

Association tables

The **Associate Tables** screen will be displayed if the **Use existing tables** option is selected in the **Configure Connection** step.

When using the **Create tables** option, this step will be carried out automatically, with the tables that will be created by the security module generator.

At this stage, fields from existing tables must be associated with security application fields (applications generated by the Security Module).

Check below the structure of the tables created for this type of security.

sec_users

```
CREATE TABLE "sec_users" (
  "login" TEXT NOT NULL,
  "pswd" TEXT NOT NULL,
  "name" TEXT,
  "email" TEXT,
  "active" TEXT,
  "activation_code" TEXT,
  "priv_admin" TEXT,
  "mfa" TEXT,
  "picture" BLOB,
  "role" TEXT,
  "phone" TEXT,
  "pswd_last_updated" TIMESTAMP,
  "mfa_last_updated" TIMESTAMP DEFAULT NULL,
  PRIMARY KEY ("login")
);
```

sec_logged

```
CREATE TABLE "sec_logged" (
  login TEXT NOT NULL,
  date_login TEXT,
  sc_session TEXT,
  ip TEXT
);
```

NOTA: A tabela **Usuários logados** será criada somente se a opção **Proteger usuários logados** for habilitada durante a criação do Módulo de Segurança.

sec_users_social

```
CREATE TABLE "sec_users_social" (
  "login" TEXT NOT NULL,
  "resource" TEXT NOT NULL,
  "resource_id" TEXT NOT NULL,
  PRIMARY KEY ("login", "resource", "resource_id")
);
```

NOTA: A tabela **users_social** será criada somente se a opção **Utilizar redes sociais** for verificada durante a criação do Módulo de Segurança.

General

Prefix Application

Defines a prefix for the applications that will be created by the security module. By default, the field is filled with the prefix *app_*.

This field is mandatory when creating the security module.

Folder

Defines the name of the folder that will be created in the project to group the applications created by the security generator. By default, the folder name is *Security*.

Enable Security

Defines whether the **Use Security** attribute will be enabled in the applications selected in the *Insert Applications* tab.

By default, applications generated by the security module have the Use Security option enabled.

Remember login

Enables the **Remember me** option at system login.

Example of the Remember Me feature

This feature stores user data in cookies, and allows them to return to the system even after closing the session. If the user has logged out, the cookie data is deleted and he or she will have to log in again.

Cookie expiration time

Defines the lifetime, in days, of the cookie that contains the access data of users who selected the **Remember me** option.

By default, Scriptcase sets the limit to 30 days.

When session expires

Determines system behavior when user session expires.

- **No action:** A message will be displayed, user not authorized, and an OK button to return to the login screen.
- **Redirect to login:** In this option the user will be redirected directly to the login screen.
- **Display a message and redirect to login:** An unauthorized user message will be displayed and you will be redirected to the login screen.

Theme

Defines the theme that will be used in applications created by the Security Module.

To add or remove themes from the select, access the Project > Properties menu, there you can add or remove themes for the project.

Log

Defines the log module that will be used in the system. [Click here](#) and check out how to create a Log Module.

Menu

Defines the menu application used to create the security item, which contains the applications generated by the module for system management.

This attribute is mandatory for module creation. If the project already has a menu application, they will be listed and can be used in creation. The developer can choose to create a new menu application using the option: **Create application menu**.

Menu orientation

Defines the orientation of the menu that will be created when selecting the *Create application menu* option in the **Menu** attribute.

If you select an existing menu, this attribute will be disabled

Menu theme

Determines the initial theme of the menu application that will be created when selecting the *Create application menu* option in the **Menu** attribute.

If you select an existing menu, this attribute will be disabled

Use SweetAlert

Use SweetAlert to display application messages. When enabled, this option will override the browser's "confirm" and "alert" settings.

Login

Here you can define the type and number of characters allowed for the username and password fields.

Label Position at Login

Defines the positioning of the fields' Label in relation to the data.

- **Above:** Positions the label above the Above input label at login.
- **Below:** Positions the label below the Down input label at login
- **Watermark:** Positions the label as a watermark.

Login mode

Defines how the user login will be performed.

- **User** - Default form of access, in this option

Cryptography

Use encryption to store the password in the user table. You have the following encryptions available: **MD5, SHA1, SHA256 and SHA512**

Show password characters

Defines whether the reveal password button will be displayed in the password field.

Password field with reveal password button

Use Captcha

It activates the captcha for the login application. The following options are available:

- **No:** Does not display the captcha in the login application.
- **Captcha:** Uses the built-in script library to display the captcha.
- **recaptcha:** Uses Google's recaptcha V2. To configure, see the video below:

[Watch a recaptcha setup video.](#)

Secret Key

Key generated by Google after creating the recaptcha project.

This option will be available when using recaptcha. [See how to generate these credentials.](#)

Site Key

Key generated by Google after creating the recaptcha project.

This option will be available when using recaptcha. [See how to generate these credentials.](#)

Last password change

Defines the time, in days, until the system requests the user to change their password.

If the value entered is 0, the password will not be reset.

Password strength

Defines the mandatory characters to compose the password for new users.

- **Capital letters**

- **Small letters**
- **Numbers**
- **Special characters**

Example of password strength in the application

Show language selection at login

Enables the display of the language field at login.

Example of language selection at login

Login Field

- **Minimum size:** Defines the minimum number of characters that can be used to define a login.
- **Maximum length:** Stipulates the maximum number of characters for defining a login.

Password field

- **Minimum length:** Minimum number of characters used to define the password.
- **Maximum length:** Defines the maximum number of characters for defining a password.

The maximum values cannot be lower than the minimum values.

Login Template

When enabling the **Use a template attribute on the login screen**, the field for selecting the template that will be used will be available. Templates must be loaded/created in an external library, which in turn must be enabled for use in the project. [See how to use an external library](#)

This option is only available when **Social Network Authentication** is not used.

If you do not have templates created or enabled for the project, use the button to quickly access the external library settings.

After creating or enabling a template in the external library, if it is not listed, click on the button to reload the select values.

E-mail Settings

API

This attribute will define whether an API or a customized SMTP will be used for the security module.

SMTP Server

Enter the SMTP server port. This information must be in accordance with the secure connection option.

Door

Defines the connection port according to the SSL used. Use 465 for **SSL**, 587 for **TLS**, or 25 for insecure connection. If you do not enter the port, Scriptcase applies the default port: 25.

Secure Connection:

Use **SSL** or **TSL**, or leave it blank for insecure connection.

SMTP User

Enter user information for SMTP connection. * **EX:** scriptcase@yahoo.com

SMTP Password

Enter the password for the SMTP connection.

SMTP email

Enter the outgoing SMTP email.

Sender's name

Sets the sender name

Email server

Select an email API to use in the security module or define a custom SMTP.

This email will be used in the options:

- All **Recover Password** options
- **New User** when selecting the options: **Requires activation by email, Send email to administrator.**

If you do not have an API created for use, check [here](#) how to create it.

Customized

Enter all SMTP settings required for operation.

The options below are only available when the **Custom** option is selected.

- **The SMTP server:** Enter the SMTP server address.
 - **EX:** smtp.mail.yahoo.com
- **SMTP Port:** Enter the SMTP server port. This information must be in accordance with the secure connection option. Use 465 for **SSL**, 587 for **TLS**, or 25 for insecure connection. If you do not enter the port, Scriptcase applies the default port: 25.
- **Secure Connection:** Use **SSL** or **TSL**, or leave it blank for insecure connection.
- **SMTP User:** Enter user information for SMTP connection.
 - **EX:** scriptcase@yahoo.com

- **SMTP Password:** Enter the password for the SMTP connection.
- **SMTP email:** Enter the outgoing SMTP email.

SMTP

To proceed with the password recovery, it is necessary that has the SMTP server configured for a successful process. Look [here](#) how to realize this procedure.

Yahoo

For more information about these settings [Click Here](#).

Some email applications uses older, less secure technologies to sign in to your email account, and Google will block these requests by default. To solve this, sign in to your Google account and enable access through less secure apps through this [link](#).
See also: [Ways to securely access Yahoo Mail](#)

SMTP Server Settings Yahoo

SMTP Server	smtp.mail.yahoo.com
Port	465 or 587
E-mail address	Your full email address (name@domain.com.)
Password	The password for your account.
Requires SSL	Yes
Requires TSL	Yes (if available)
Requires authentication	Yes

Gmail

For more information about these settings [Click Here](#).

Some email applications uses older, less secure technologies to sign in to your email account, and Google will block these requests by default. To solve this, sign in to your Google account and enable access through less secure apps through this [link](#).

SMTP Server Settings Gmail

SMTP Server	smtp.gmail.com
E-mail address	Your full email address (Ex. example@gmail.com)
Password	The password for your account.
Port (TLS)	587
Port (SSL)	465
TLS / SSL Required	Yes

Outlook / Hotmail

For more information about these settings [Click Here](#)

SMTP Server Settings Outlook.com

SMTP Server	smtp-mail.outlook.com
E-mail address	Your full email address (Ex. myname@outlook.com, not an alias)
Password	The password for your account.
Port	587 (you can use port 25 as an alternative)
TLS / SSL Required	Yes

New users

Settings for creating new users in the security system.

New Users

Allows new users to register

This option defines the availability of user registration directly in the login system. If you do not check this option, only users with administrative access can add new users.

Requires email activation

This option defines whether the new user must validate their registration by email to activate the account (Configure SMTP email to use this option)

Send email to administrator

This option defines whether the system administrator receives an email whenever a new user is registered. (Configure SMTP email to use this option)

Default Group

Defines the default group that the user will be inserted into when created.

This feature is only available for the group security module or LDAP/Applications

Recover password

Send email with password

The system sends the user's password via email only if SMTP has been configured correctly, and the password is not using encryption.

Reset password and send new one by email

The system automatically resets the password and sends it to the user via email (only if SMTP has been configured correctly).

Send email with a link to generate a new password

The system sends the user a link to access an application and reset the password.

The email sending options, for example, *Send email with password* or *Requires activation by email* requires the correct configuration of the administrator's email in the **Email Settings** tab.

Two Factor Authentication

Two-factor authentication (2FA)

Determines whether or not two-factor authentication is used in the system. Currently, the security module supports three ways of configuring resources:

- **Authentication:** This option will send the code to your Google authentication app.
- **SMS:** This option will send the authentication code via SMS.
- **Email:** This option will send the authentication code to the configured email.

Operation mode

In this attribute, the developer can define whether users will be required to use authentication to access the system or whether they may not use the resource.

- **All** - All users are required to configure
- **Individual** - Each user has the option of using authentication or not.

API

Lists the available APIs according to the type of authentication selected in the *Two-factor authentication (2FA)* attribute.

If you do not have any API created for the project, use the button to quickly access the API settings.

After configuring the API, click the to reload the select values.

If you do not have an API created for use, check [here](#) how to create it.

Code expiration time

Set the time in **seconds** that the 2FA authentication token will expire.

,

Ldap

In the LDAP configurations, it is necessary to enter the access data for the previously configured server.

Server

Enter the LDAP server IP here.

DN

Enter the input attributes.

Door

Enter the server access door here. **The default port is 389.**

Suffix

Enter the user suffix.

Social Network

The Scriptcase allows user authentication through social networks such as **X** (formerly Twitter), **Facebook**, and **Google**. This feature makes application access easier by eliminating the need to create new credentials, making login more practical and secure.

To enable login with a social network, it is necessary to configure an application on the corresponding platform to obtain the access credentials.

When using social network authentication, the **Login Template** option will not be available.

Facebook

Authentication via **Facebook** allows users to log in to the system using their social network accounts. To enable this feature, it is necessary to register an application on **Facebook for Developers**. See how to [Generate Facebook credentials](#).

To use **Facebook**, check the **checkbox** to enable the **App ID** and **Secret** fields and enter the previously generated data.

App ID

Enter the **App ID** available in the settings of the application created in **Facebook Developers**.

Secret

Enter the **Secret** available in the settings of the application created in **Facebook Developers**.

X (formerly Twitter)

Allows user authentication via **X** (formerly Twitter), using the platform's API. To configure this feature, it is necessary to create an application in the **X Developer Portal** to obtain the authentication credentials. See how to [Generate X credentials](#).

To use login with **X**, check the **checkbox** to enable the **Key** and **Secret** fields and enter the previously generated data.

Key

Enter the **Key** available in the settings of the application created in **X Developers**.

Secret

Enter the **Secret** available in the settings of the application created in **X Developers**.

Google

Login via **Google** allows users to authenticate using their platform accounts quickly and securely. To enable this feature in Scriptcase, it is necessary to configure an application in **Google Cloud Console**. See how to [Generate Google credentials](#).

To use login with **Google**, check the **checkbox** to enable the **Client ID** and **Secret** fields and enter the previously generated data.

Client ID

Enter the **Client ID** available in the settings of the application created in **Google Developers**.

Secret

Enter the **Secret** available in the settings of the application created in **Google Developers**.

Logged Users

This setting defines the system behavior for login protection.

This option is available if you checked **Protect logged in users** during the connection step.

Show logged in users

If you select this option, Scriptcase will also create a Grid Application with the Security Module to display a report with all users currently connected to the system.

Brute Force attack protection

Allows/disables blocking users after a few failed access attempts.

Brute Force block time (in minutes)

Time, in minutes, that the user will remain inaccessible after several failed access attempts. (Only available when Protection against Ruth Force Attacks is activated)

Number of attempts before blocking

Number of failed access attempts until protection is enabled. (Available only when protection is enabled for brute force attacks)

Insert Data

This option inserts the first user into the security tables. This user has administrator privileges to manage the system and add new users.

Login

This option defines the system administrator user. By default, the user defined by Scriptcase is **admin**.

Password

This option sets the system administrator password. By default, the user defined by Scriptcase is **admin**.

To increase the security of your project, we recommend changing the default username and password "admin" at this stage or after the first access.

Name

This option defines the name of the administrator user on the system.

Email

This option defines the email address of the system administrator user. This email can be used for some new user registration settings, such as notification to the administrator.

For the email to be sent successfully to the administrator, the SMTP parameters must have been configured or an email API must have been selected in the previous step in [Configurations](#).

Add Applications

This option adds the applications already created in the project to the Security Module applications table.

Include All

All project applications will be added to the application table.

Select Applications

Allows the developer to select specific applications to include in the application table. When clicking Select, all existing applications in the project will be listed.

Application selection screen

On this screen you can search for applications by name or filter by their types.

Once selected, the applications will be listed below.

List of selected applications

When unchecking this option, existing applications in the project when creating the module will need to be inserted through application synchronization, after executing the security module.

Save Profile

This feature will always be displayed when completing the security module configuration. The saved profiles will be displayed on the initial module creation screen, in the **Create / Choose Profile** step.

Viewing Saved Profiles

Ao clicar em **Usar**, o processo de criação do módulo de segurança se dará da mesma forma, porém, com as opções de configuração preenchidas com os valores salvos no perfil. When clicking on **Use**, the security module creation process will take place in the same way, however, with the configuration options filled in with the values saved in the profile.

Save Profile

When enabled, the settings made in the created module will be saved in the profile.

Name

When enabling profile saving, the name becomes a mandatory field to identify the created profile.

Level

Defines the viewing scope in which the profile will be saved.

- **Public:** Defines that the security profile will be available in any Scriptcase project.
- **Project:** Defines that the security profile will only be available in the project in which it was created.
- **User:** Defines that the security profile will only be available to the Scriptcase user who created it.

Building Security

Finally, a summary of the creation of the security module, listing the changes made by Scriptcase to your project.

- **Open Project:** You will be redirected to the home page of the project being modified.
- **Generate source code:** Generates the source code of all applications created by the security module.
- **Download SQL:** Makes the table structures of the created module available to the developer

After creating the security module, it will be necessary to generate the source code of all applications that were marked by the security module usage flag. Except Login and Menu applications.

Log Module

Using the log module, you can create multiple log schema, each project application can be linked to a different log schema, which will be configured individually. Each project can have one or more log schemes applied to its applications.

Schema list

Access the menu Modules > Log and click **Create / Edit Log Module**.

If you are creating your first log schema project, proceed direct to step three, for the schema Creation/editing.

It lists all log schemes previously created. On this screen, we can manage the schema created.

- **Edit Applications** - Edits the relation between the applications and the schemes.
- **New scheme** - Creates a new Log scheme in the project.
- **Create Application Log** - Creates a report using the log table, that is also used by the project's default scheme.
- **Edit Scheme Icon** - Edits the Log scheme.
- **Delete Scheme Icon** - Deletes the Log scheme.

New Schema

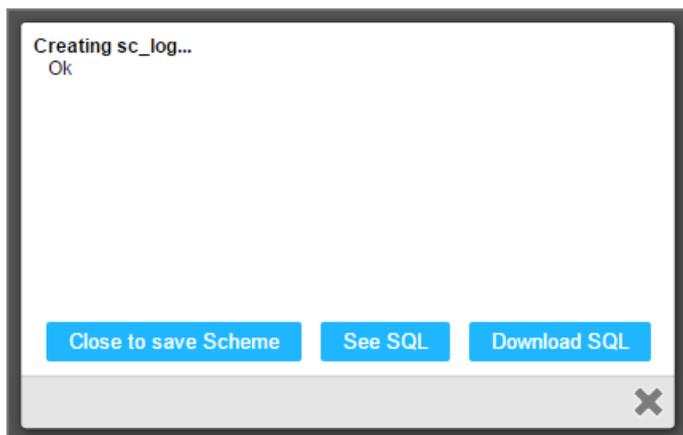

- **Name** - Log schema name that will be created. It is a mandatory field.
- **Description** - Short description for the new schema.

- **Connection** - Connection on where the log table will be created. It is a mandatory field.
- **Table** - Table name on where the log information will be stored. It is a mandatory field.
- **Existing Table** - This option deletes the table that has the same name in the database and create a new one. If you want to use the existing table to store the log data just leave this option unchecked.
- **Default Schema** - It sets the schema that is being created as the default one for project.
- **Login** - Global variable used to store the logged user information into the system. This variable must be the same used in the Security Module. By default, Scriptcase sets this variable on both modules as `[usr_login]`.

Default Values

- **Events** - Actions that will be stored in the log table.
- **Storage mode** - User data that will be stored in the log table.

A confirmation screen will appear when you save, just click **Close** to leave and save the schema.

- **Close to save the schema** - Saves the schema you created, and redirects to the applications screen.
- **See SQL** - Display the SQL used by Scriptcase to create the table 'sc_log' that will be used to store the log events.
- **Download SQL** - This option will download the SQL used by Scriptcase to create the table 'sc_log'.
- **Close Icon** - This option cancels the schema creation and redirects to a new schema creation.

After the confirmation, you will be redirected to link the log schema to the project applications.

Link Applications

In this step, you must define which log schema will be used in each project application. The list of applications can be filtered by type or by log schema used.

At the top, you can apply actions to all rows or you can select only one action for each row individually.

Application		Events					
		Apply Schema ▼	Save to log ▼	<input type="checkbox"/> Access	<input type="checkbox"/> Insert	<input type="checkbox"/> Update	<input type="checkbox"/> Delete
<input checked="" type="checkbox"/> <input type="checkbox"/>	control	▼	Only key ▼	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Form							
<input checked="" type="checkbox"/> <input type="checkbox"/>	form_customers	▼	Only key ▼	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

Search: -- All schemes -- ▼ | -- Top -- ▼ Back Save

- **Apply schema** - Select the schema that will be used for the applications. (when you select a schema, the other information is filled according to what was previously configured).
- **Store for the Log** - User data that will be stored in the Log table.
- **Access** - This event stores the information every time the application is accessed.
- **Insert** - This event stores the information when inserting a record.
- **Update** - This event stores the information when updating a record.
- **Delete** - This event stores the information when deleting a record.

Log Report

In this report, you can see all stored information according to the schema selected during the report creation.

Create Application Log		
ATTRIBUTE	VALUE	DESCRIPTION
Schema	log ▼	Log schema in which the application will be based.
Name	app_grid_log	Name of application that will be generated
Folder	log	Incorrect folder name.
Theme	Sc8_BlueWood ▼	Template application.
Use security	<input checked="" type="radio"/> Yes <input type="radio"/> No	Use safety on application.
Create Cancel		

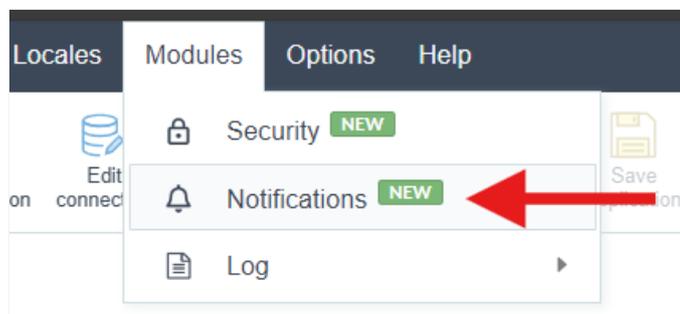

- **Schema** - Log schema that the application will be based on
- **Name** - Application name
- **Folder** - Folder name where the application will be stored
- **Theme** - Theme used for the generated application
- **Security** - This option attaches a security profile to the log schema.

Notification Module Overview

The Notification Module automatically generates a set of applications used in the management of system notifications. This module allows you to create access control with restrictions according to the type of Notification module.

Create / Choose profile

Access the menu and click on: **Modules > Notifications**.

On this screen, you can create a module from scratch or choose a previously saved profile.

Create

Create an access control with restrictions according to the Notification module type.

Next

Connection

Choose the connection in which the module will be created.

Mode

If you already have notification module tables in your database, you can choose to use them. If you do not have them yet, you can choose the **'Create tables'** option.

[Click here](#) to learn how to use existing tables.

Table prefix

Choose the prefix for the tables.

Module type

Choose the option according to the security module created: User or User and Group

Delete tables if they already exists

If enabled, the module will remove the tables if they already exists.

The fields that reference the **users, groups, login, users x groups, name, capo id, email field, description field and phone field** tables will automatically be according to the module type.

Associate tables

When choosing to use existing tables for the notification module, you must associate them manually.

See below the structure of the notification module tables

General

In this step, General Settings, Email, SMS and Insert Applications will be available

Below you will see each configuration option in detail.

Application prefix

allows you to define the prefix that will be given to the applications. By default, the prefix will be **notif_**

Folder

allows you to define the name of the folder that will be responsible for storing the applications related to the notification module.

Theme

Allows you to choose the theme of the applications of the notification module

Log

Will display the log module if you have any module created.

Menu

Allows you to choose between the options:

- - Create menu application - : When choosing this option, a menu will be created by the module. This option will enable the Menu theme and menu orientation options.
- Menu application: If you have a menu application created separately or by the security module, you will be able to define it.

Menu theme

If you want to create a menu application, this option will be enabled, allowing you to choose which theme will be defined for the menu.

Menu orientation

If you want to create a menu application, this option will be enabled, allowing you to choose which menu orientation.

Email Settings

In this tab, you define the email sending settings.

API

Allows you to choose between 3 options:

- **Disabled:** Ignores the use of email API
- **Use the same as the security module:** Allows you to use the same email settings as the security module
- **Customized:** Enables the other fields so that you can manually define the email credentials.

SMTP server

Defines the email SMTP server.

SMTP port

Defines the port to be used.

Secure connection

Defines whether the connection will be secure or not: SSL or TLS

SMTP user

Defines the SMTP user

SMTP password

Defines the password

SMTP E-mail

Defines the email to be used when sending email messages

SMTP sender name

Defines the name that will be displayed to the sender when sending emails.

If you do not have an API created for use, check [here](#) how to create it.

SMS Settings

In this tab, the SMS sending settings are defined.

API

If you have already created an sms api, you can define it in this option, otherwise, the disabled option will be the only one displayed.

Number of characters to limit SMS

This option allows you to define the number of characters in the SMS message

If you do not have an API created for use, check [here](#) how to create it.

Insert Applications

In this tab, you can add applications to the notification module and the security module's application tables.

Include all

With this option enabled, all applications contained in the module will be included in the application table.

Select table

Allows you to select the notification module and security module tables that will be related.

Save Profile

Using this option, you save all the settings made during the creation of the Notification Module. With the profile, the settings of this module can be used later for other projects.

Save Profile

Allows you to save a profile with all the current settings of the notification module.

Name

Name that will be given to the profile with these settings. It will help to identify the profile later.

Level

This option allows you to select the viewing scope in which the profile will be saved. There are three options:

- **Public:** Defines that the notification profile will be available in any Scriptcase project.
- **Project:** Defines that the notification profile will only be available in the project in which it was created.
- **User:** Defines that the notification profile will only be available to the Scriptcase user who created it.

Options Overview

Gathers the main configurations of ScriptCase. For the users with administrator privileges, it's possible to register the ScriptCase, manage the system users, do backups and restore projects and other configurations.

For the other users, without administrator privileges, its possible to define the default language for ScriptCase, customize Scriptcase's toolbar and other options that when done, will be available for the users that did them, for those who won't change these configurations, they'll use the default configurations from ScriptCase.

Admin Settings Overview

The **Settings** menu brings together the tool's management settings and is accessible only to users who have administrator privileges in Scriptcase.

The **admin** user, created by default when installing the tool, has administrator privileges. As this is a standard user, it is recommended to change the password, as well as [set the SMTP](#) so that the **Forgot your password?** option works correctly.

System Settings

Here you can define the settings about the Scriptcase development environment.

Language

Defines the default Language for the projects.

Quantity of compilations in parallel

Defines multiple threads to generate applications. The default value is 5, so it can compile five applications at the same time.

Display the compile-time applications individually

Allows displaying the compilation time for each application individually.

Number of automatic application copies

Scriptcase stores versions of each application automatically. Here, you can set the limit of backup copies it keeps. The older one is overwritten.

Send an alert if the last backup is older than(days)

It allow you to set a number of days to alert when the last Scriptcase backup is obsolete.

Show backup alert for

Defines the user's group to receive the backup alert.

Check for ScriptCase update versions after login

Defines the period to check if there is a new Scriptcase update released.

Performing Scriptcase's database verification

Defines the period to check the backup of ScriptCase's database (Not the projects).

ScriptCase Session Timeout (min)

The time limit for executing PHP scripts during application development. For example, to compile or save applications. (in seconds).

Time to expire the login cookie (days)

The quantity of days Scriptcase keeps the cookies of login.

Check IP when log on via cookie

Scriptcase uses the cookies to validate the IP of the logged user.

Check Browser when log on via cookie

Scriptcase uses the cookies to validate the browser of the logged user.

Check Machine when log on via cookie

Scriptcase uses the cookies to validate the computer configuration of the logged user.

Show Generation Status Message

Allows you to define the action messages of ScriptCase, when it is compiling or running your applications, in

the options:

- **Main:** Displays a subgroup of the messages.
- **None:** Does not display the messages.
- **All:** Enables the display of all the messages.

Use cache for connection metadata

Seeks better performance without having to read the database dictionary every time applications are created. This information is added in files, so that there is a more agile creation in the recovery of existing metadata in the databases.

Save metadata cache on disk

Allows files to be created in a directory, from the project name, containing a lifetime to be recreated.

Cache lifetime in days

Sets the cache lifetime for files to be recreated. In addition to this option, files will also be created in the following situations:

- When editing connections, if there is any change in the database, the cache is recreated.
- The “reload” icon next to the tables.
- The SQL Builder “reload” button.

SMTP Server

You should inform SMTP server address for the provider.

SMTP Port

Port used by the mail server. Use port 465 for security with SSL, port 587 for security with TLS, or port 25 as port without security. By omitting the value, Scriptcase defaults to 25.

SSL

Defines if it uses SSL security or not.

SMTP User

Inform the SMTP server user.

SMTP Password

Inform the SMTP server password.

SMTP E-Mail

Inform the sender e-mail. Who is sending the emails.

PROXY Server

Inform the IP of your Proxy Server.

PROXY Gateway

Inform the Gateway of your Proxy Server.

PROXY User

Inform the proxy user.

PROXY Password

Enter the proxy user password.

Use session in database

It allows us to store the session data into the database.

Show an option on the deployment wizard to store the PHP session variables in a Database

It allows displaying in deployment, an option to store the session into the database.

Pass the PHP Session ID in the URL

It allows passing the PHP Session ID in the URL.

Foreign key improvement

When it comes to the form, this enables an improvement in the definition of lookups in a field that is a foreign key.

Example of a lookup created when the flag is enabled:

```
SELECT orderid, customerid FROM orders ORDER BY customerid
```

Example of a lookup created when the flag is disabled:

```
SELECT orderid, orderid FROM orders ORDER BY customerid
```

When it comes to grid applications, this enabled flag creates automatic lookups for fields. Regarding the data dictionary, with this option enabled, the data dictionary will now allow the foreign key to be defined when editing fields, more precisely in the additional properties of the fields.

Timezone

It sets the PHP Timezone used in ScriptCase.

Default Values

With this configuration, it is possible to standardize the projects' creation of the applications, increasing the applications' productivity in development. If you wish to change the settings for a specific project, access the menu **Project > Default Values**.

Common Settings

Logo

The Favicon to represent the project in the browser. It uses the same Favicon for all applications of the project.

Records per page

Amount of records per page.

Theme

The default selected Theme for the projects.

Show Summary

Displays the number of records on the page and the total of the records in the application. This option is able in the application toolbar.

Use template in the HTML Editor

Selecting Yes, it uses the new template of the HTML Editor field. Set the themes through the menu **Layout > HTML Editor Templates**.

HTML Editor template

Defines the template for editing the field HTML Editor.

Initial sort fields

Text

Set the initial sorting for the text fields.

Date

Set the initial sorting for the date fields.

Number

Set the initial sorting for the number fields.

Currency

Set the initial sorting for the currency fields.

Grid

Table Width

It defines the length of the application table. This option is available to select **Pixel** or **Percent** in the table width unit.

Table Width Unit

The unit used to define the application's width. Automatic (Automatic Width according to the fields' size);

Pixel (Set the width in pixels. Example: 800 pixels); Percent (Set the width in percentage. Example: 80%)

Tab a Group By

The left margin of the Group By.

Separates the Group

The margin between two Group By.

Lines per page

List of options for the user to select the quantity of the records per page. If you need an option to list all the records, you should add "all" to the options. Ex.: 10,20,30, all

Form

Table Width

It defines the length of the application table. This option is available to select **Pixel** or **Percent** in the table width unit.

Table Width Unit

The unit used to define the application's width. Automatic (Automatic Width according to the fields' size); Pixel (Set the width in pixels. Example: 800 pixels); Percent (Set the width in percentage. Example: 80%)

Tab

Tab Alignment

The alignment of the tabs in the application.

Menu

Horizontal Alignment of the Menu

Menu alignment.

Horizontal Alignment of the Items

Menu item alignment

Template

It defines the default templates of the Header and Footer.

Toolbar Buttons

It defines the default buttons in the toolbar for the new applications.

System Folders

Here you can set the directories path to stores the Scriptcase data information. Scriptcase uses the default paths when using the installer or the **Typical** manual installation method. You don't need to make changes. We recommend contacting the support if you wish to change them.

Root Directory for the Web Server files

Set the Root of the Web Server. On **IIS servers**, you should use the path: "inetpub/wwwroot".

Application Path

Set the folder that stores the generated applications source code.

Production Path

Set the folder of the Scriptcase "prod" files. It keeps all the libraries needed to execute the generated applications.

Documents Directory

Set the folder to store document files used in applications.

Images Directory

Set the folder to store image files when using the upload field (Image File Name) of applications.

Temporary Files Directory

Set the folder of temporary files used to manipulate the images and the exporting data of the applications.

Projects

List of Scriptcase existing projects. You can view all project details, such as users who have access, the current version of projects, number of applications, among other information.

Project

Project name.

Description

Project description.

Creation

Project creation date.

Applications

The number of applications from each project version. 1:33(Versions count: number of applications)

Action

Project details.

By clicking on the magnifying glass next to the number of applications, you can see more details of the project. In addition to some information previously views on the list of projects.

Connections

Lists of connections of the project.

User

List the users that can access the project. Default permissions, like create applications.

Administrators

User/Groups that are administrators of the project. It's possible to create and edit connections in the properties of the project, with this permission.

You may need to set the permission of each user individually as the group permission also.

Security type

Select the way how Scriptcase users can access the interface.

Security Type

The method of data storage. We can select the following methods:

Scriptcase

It stores the access data into the ScriptCase's database.

LDAP

It stores the access data into the LDAP Server and Scriptcase goes there to validate the access.

Security Level

Select the type of security. this option is independent of the storage method.

User

It defines the permissions for each user. You must configure them individually.

Group

It defines the permissions for the User Groups. Here, we must associate the users to one or more groups and set the permissions for each group.

User/Groups

It defines the permissions by the groups and by users. The grant by the user overwrites the group grants. It allows having users existing in the same groups but with different permissions.

The security level option is the same independently of the Security Type. (Scriptcase or LDAP)

Scriptcase

Managing user groups. You will see a list of the existing groups and some information about them.

This option will only be available on the left side menu when we select the Groups option in the **Security Type**

Name

Name of the groups.

Description

Group Description.

Users

The users from this group.

Projects

Set the projects that the users of this group can access.

Actions

Users

Let you select the users for this group.

Edit

Let you edit the group information.

Delete

Delete the group.

You will see more details about the existing options.

New Group

Create new groups. We can define the privileges of the groups.

Name

The name of the group.

Description

The group description.

Admin Privilege

It defines if the users of the group have Administrator Privileges.

Privileges

Project

Let you set which actions the group users can do when accessing a project.

Application

It defines the permission to create applications.

Connections

It defines if the users can manage the database of the project.

Projects

Set the projects that the group users can access.

Admin projects

It defines if the group have Administrator grant for the project.

Users

After creating the group, we can define which users are part of the group.

LDAP

This page let you sync with LDAP. We recommend using the LDAP Administrator user, this way, it lists all the group users of the server. So you can connect with LDAP into ScriptCase and you have the LDAP privileges

there.

This option is available on the left side menu, if you select the LDAP option in **Security Type**

Server

IP of the LDAP server (Needs to be setup before proceeding).

Suffix

Domain of the server.

DN

Domain Component.

User

Administrator of the Server.

Password

User password informed.

Port

Server Port.

After saving the LDAP server connection, It lists the users and groups in the tabs according to the server. Initially, only the administrator user (The same used for LDAP connection) has access to ScriptCase. The Administrator must enable other users and associate them with the groups.

Users

You can see this option when selecting Users in the Security Level. It lists all the users from the LDAP server. We can manage the privileges of each user to the projects and options of ScriptCase.

Groups

You can see this option when selecting Group in the Security Level. It lists all the groups from the LDAP server. You may access this tab to enable the groups and set their privileges.

User / Groups

You can see this option when selecting the security level User/Groups. Here, there is two tabs. In this case, the permissions are defined for the group of users and/or individually by user. On this type of security, you must add the permissions of the group and user.

Users

User Management

This page allows to manage the Users of your Scriptcase. There is a list of all registered users, where we can edit or delete each one. We can also include new users.

This option is available on the left menu when selecting the **Security Type**

User

The username of the registered users.

Insert

Date and time of the user creation.

Applications

It shows how many applications each user has created.

Action

Detail

It shows a detailed view of the user. The email, privileges, projects and his groups.

Edit

It allows changing the privileges and the projects for an user.

Change Password

Change the password of the user.

Let's see some options.

New User

When clicking on the button **New User** it redirects to a page to inform the user login, password and privileges.

User

The login of the new user.

e-mail

The user e-mail.

New Password

The password of the user.

Confirm Password

Type the password again to confirm it.

Privileges

Administration

The grant to access the main settings area of ScriptCase.

Projects

Let you set which actions the user can do when accessing a project.

Application

The grant to create applications.

Database

It sets the database actions an user can do in the projects.

Project

Set the projects that the user can access.

Then you must select which projects the user can manage.

The project manager can change the preferences of the project, the existing connections and default values.

Editing a User

The editing page is similar to the new user screen. It has the same options.

User

The login of the new user.

e-mail

The user e-mail.

Privileges

Administration

The grant to access the main settings area of ScriptCase.

Projects

Let you set which actions the user can do when accessing a project.

Application

The grant to create applications.

Database

It sets the database actions an user can do in the projects.

Project

Set the projects that the user can access.

Then you must select which projects the user can manage.

The project manager can change the preferences of the project, the existing connections and default values.

Changing the Password

Just inform the new password for the user.

Delete Users

We can delete more than one user at the same time

When deleting a user that has applications linked to its login, you must inform if you want to delete the applications or if you want to associate them with another user.

Delete Application

It deletes all applications created by the user.

Move Application

It associate the applications to another user.

Services

Online

This page shows all logged users into Scriptcase in real time. The current page each user is accessing, the date and time of access and other information.

Update ?						
Online Users						
USERS	IP	LOGON	ACCESS	ONLINE	PAGE	APPLICATION
admin	127.0.0.1	03/27/17 11:32	03/27/17 11:52	20:50	OnLine Users	

Users

Username of the online user.

IP

IP of the workstation where the user is accessing.

Logon

Date and time of log in.

Access

Date and Time of the last know user activity in session.

Online

Time of the user current session.

Page

The page is the user accessing at the moment.

Application

The Application is the user accessing at the moment. This information may return empty if the user is accessing the ScriptCase settings.

Backup

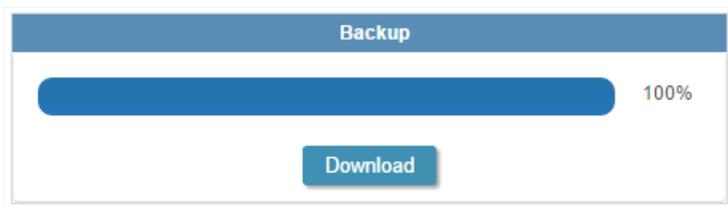

ScriptCase's backup works similarly as the project export, but the backup does the export of all applications of your ScriptCase. To perform a backup, inform the name to generate the file.

Backup Routine

Backup File Name

tempbkp

Finally, download the generated file and save it in a secure location.

Restore

This option is similar to Project Import, however using the restore you can import more than one project at a time. When you access the restore you will see a list of backups performed recently, you will be able to restore these backups or to import a backup exported from other Scriptcase installation.

Restore Routine				?
SELECT THE BACKUP FILE.				
BACKUP	CREATED IN	TYPE	RESTORE ZIP	
<input type="checkbox"/> bkp_samples	11/17/17 04:54	Global		
<input type="checkbox"/> bkp_OnlineShop	03/13/17 09:00	Global		
<input type="checkbox"/> bkp_OnlineShop	03/13/17 09:00	Global		

Backup

Backup generated files.

Created in

Creation date and time of the listed backups.

Restore

Backup restore.

Detail

Backup details.

Delete

Deletes the backup permanently.

To restore another backup, which is not in the list, select **zip restore** and upload a backup file created by Scriptcase.

After choosing the backup file, confirm the restoration. You must inform if you want to overwrite duplicate files or keep the existing ones in Scriptcase.

Restore Routine			?
BACKUP	CREATED IN	STATUS	
es_20171117-04541420180108011148	p_/bk/sc9_ sa:mph	new	
If duplicated :		Do not restore ▼	
<input type="button" value="Process"/> <input type="button" value="Back"/>			

Configure Log

ScriptCase stores (in the database) a log of the main actions done by the users. We can customize the log registry by selecting or not the actions that we want to store.

View Log

This option allows you to view the main actions done by the users separately by day. You can view the information of a desired date by clicking on the calendar. You can distinguish the days that have log with a blue background.

? 03/27/17 Log						
S	M	T	W	T	F	S
			1	2	3	4
5	6	7	8	9	10	11
12	13	14	15	16	17	18
19	20	21	22	23	24	25
26	27	28	29	30	31	
March ▼		2017 ▼				

	Login	IP	Time	Type	Action	Info
1	admin	127.0.0.1	09:47:19	Access	Login	en_us
2	admin	127.0.0.1	09:47:45	System	Create Connection	Connection: conn_example
3	admin	127.0.0.1	09:48:44	Application	Create	Project: samples1 Application: control Type:

9	admin	127.0.0.1	11:32:07	Access	Login	en_us

Login

Login of the user responsible for the action.

IP

IP of the computer that the user did the actions.

Time

Time when the action was done.

Type

The type of action done.

Action

What action was done.

Info

Details of the action;

Scriptcase Update

ScriptCase update area. All the update process is done by the INTERNET, using our servers. We recommend using a fast connection.

If the computer hasn't an INTERNET connection, it is necessary to realize the Scriptcase manual update.

Check our documentation about **Manual Update** according to your operating system:

- [Windows](#)
- [Linux](#)
- [MacOS](#)

Verifying Updates

Firstly, we must check if a new version of ScriptCase is available.

ScriptCase Update

Backup (Important)

We strongly recommend that you back up the Scriptcase before upgrading through menu **Options > Settings > Services > Backup**.

Antivirus

In some cases the antivirus can block the upgrade or leave it a little slower.

Network with restrictions

If your network has a domain constraint **scriptcase.net**, please contact your network administrator to add an exception.

Scriptcase Update

ScriptCase will check if your ScriptCase version is updated.

[Check ScriptCase Update »](#) ?

Selecting Items for Update

Then we can choose if we want updating the documentation and "prod" files.

ScriptCase Update

Checking ScriptCase Update version...
ScriptCase Update version is up to date...

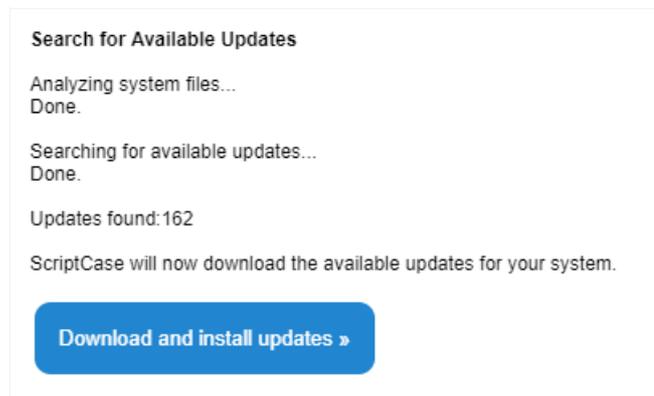

ScriptCase will analyze your system and search for available updates.

Check ScriptCase Manual Updates
 Check Production Environment Updates

[Search for updates »](#)

Applying Scriptcase Updates

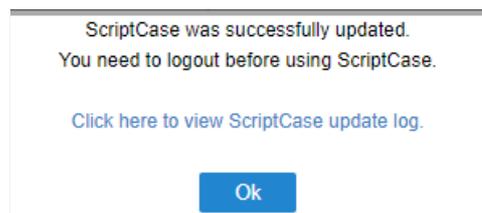

Then, we can see the total of files update found.

Do not interrupt the process after start the Update.

Ending the Update Process

After downloading and updating all the files, you can see the log of changes done in the process: [Click here to view ScriptCase update log](#) .

If you are having problems connecting to our server, check if your firewall is allowing the connections to these links:

- **scriptcase.com.br**
- **scriptcase.net**

Online Registration

The **Online Registration** is made on a quick way. In order to do this kind of registration the machine where the scriptcase is installed must have internet access.

In addition to internet access, the network must have permission to access the domain `scriptcase.net`, for communication to take place.

Online Registration

On this screen, we must inform the data necessary for the registration, **User** and **Password** (Login and Password to access the site) and the **Serial** linked to the informed account.

The data used for the Scriptcase registration (Username and Password) refer to the user who owns the license (account of the site used to acquire a tool license). The login and password used to access Scriptcase are only for access to the development environment

User

Inform the user who owns the license. This **usuary** is the same **used** to perform **login on our site**, and access the [client area](#).

Paasword

Enter the password of the user informed on the field above. This password is the same used to login in our website.

If you have forgotten your password to access the website, click on the link to recover your password: https://www.scriptcase.net/password_retrieval/

Serial

Inform the serial that will be used for registration. This serial must belong to the account informed in the field *User*.

If you have recently purchased a license, your serial will be available in your purchase confirmation email. You can also view your serials in the client area on our website. [See how to find your serial on the site](#).

Confirmation

After completing the registration, a confirmation screen will appear, like the one below. Click on OK, you will be redirected to login screen.

Offline Request

The *Offline Request* is the first stage of the **Offline Registration**, it is where we will obtain the file used on the registration.

See a step by step of [how to do an Offline registration](#)

Offline License Request

On this screen, we need to inform the data necessary for registering the tool: **User** and **Password** (Login and password to access the site) and a **Serial** linked to the informed account.

After entering the details, click on Request.

The data used for the Scriptcase registration (Username and Password) refer to the user who owns the license (account of the site used to acquire a tool license). The login and password used to access Scriptcase are only for access to the development environment

User

Inform the user who owns the license. This **usuary** is the same **used** to perform **login on our site**, and access the [client area](#).

Paasword

Enter the password of the user informed on the field above. This password is the same used to login in our website.

If you have forgotten your password to access the website, click on the link to recover your password: https://www.scriptcase.net/password_retrieval/

Serial

Inform the serial that will be used for registration. This serial must belong to the account informed in the field *User*.

If you have recently purchased a license, your serial will be available in your purchase confirmation email. You can also view your serials in the client area on our website. [See how to find your serial on the site](#).

Download and validation of the file

On this screen we have the **Download** button, to download the `scriptcase_v9.req` file with some data necessary for registration and the access link to the registration request page <https://www.scriptcase.net/licenserequest/>

We must download the file and place it on a portable storage device so that we can move it to a machine with internet access, since the next step will be to upload this file on our website.

See a step-by-step of [how to do an Offline registration](#)

Form for generating the .lic file (Site page)

The link <https://www.scriptcase.net/licenserequest/> send us to the .lic file generation form, where we need to inform the serial number and upload the .req file generated in Scriptcase.

You must inform the same serial used to generate the .req file and upload the file in the upload field.

A new file will be generated with the `lic` extension (`scriptcase_v9.lic`). Download and save the file to a portable storage device.

This file will be used for the second step of [Offline Registration](#).

Offline Registration

This is the final step in the process to make an **Offline Registration** , where the tool registration will actually be performed.

To proceed, you must have the .lic file generated in the step [Offline Request](#).

The generation of the file carried out in the step **Offline Request** is mandatory for offline registration. See a complete step-by-step of [how to do Offline registration](#)

Offline License Registration

On this screen, we need to inform the data necessary for registering the tool: **User, Password** (Login and password to access the website) and a **Serial** linked to the informed account. In addition, we need to upload the .lic file previously generated.

The data informed must be the same used on the step [Offline Request](#) where the .req was generated

User

Inform the user who owns the license. This **usuary** is the same **used** to perform **login on our site**,and access the [client area](#).

Paasword

Enter the password of the user informed on the field above. This password is the same used to login in our website.

If you have forgotten your password to access the website, click on the link to recover your password: https://www.scriptcase.net/password_retrieval/

Serial

Inform the serial that will be used for registration. This serial must belong to the account informed in the field *User*.

If you have recently purchased a license, your serial will be available in your purchase confirmation email. You can also view your serials in the client area on our website. [See how to find your serial on the site](#).

Upload field

Upload the .lic file generated in the step [Offline Request](#)

Confirmation

After clicking on **Register** a confirmation message will be displayed.

After registration, you will be redirected to the login screen.

My ScriptCase

Interface where you can define the ScriptCase settings. All the users have access to this section, and the changes done are tied to the login(user) that you are currently using. This way each user can have their own settings for ScriptCase.

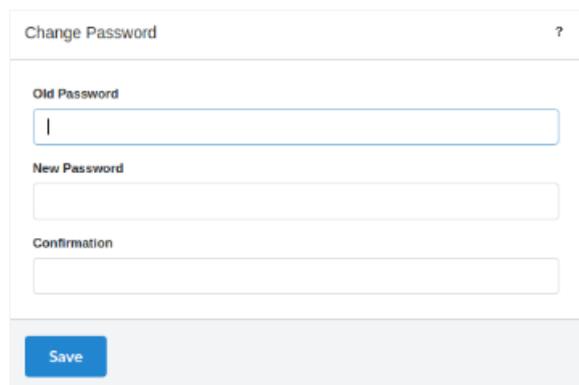

- **Language** - Scriptcase interface language. When informing the language in **My ScriptCase**, the selected language at the login won't be considered.
- **Security Resources** - When Uncheck these options, the security settings won't be considered when running the applications in the development environment. When deploying the applications, they will respect the security settings normally.
- **Initial Information** - Defines the information that will be displayed on the application listing.
- **Show Friendly URL** - Defines the display of the field to inform the Friendly URL in the application.
- **Main Menu Interface** - Defines the width of the left side menu of the home page, where the applications are listed and the option of incrementation.
- **Application Settings Interface** - Defines the width of the left side menu of the applications settings and the option of incrementation.
- **Auto Save** - Allows the modifications to be saved automatically.
- **Display INSERT CODE on events** - Defines if the examples will be displaying in the events of the applications.
- **Convert indentation to tab** - Allows to use "tab" hotkey to indent your code or line selected.
- **Show folders at home** - Allows for the sub-folders to be listed with the applications, when selecting a folder on the side menu in the home of the project.
- **Allow Hotkeys** - This option allows to enable/disable Scriptcase hotkeys. [Click Here](#) to view the hotkeys list.

Change Password

Interface where you can change the password of your user. We always recommend using passwords with a certain level of complexity, to prevent hacks of brute force.

Inform your current password, and the new password twice just to confirm it.

For the option of password recovery to work, the administrator need to setup the SMTP configurations correctly in ScriptCase's settings.

Change Password ?

Old Password

New Password

Confirmation

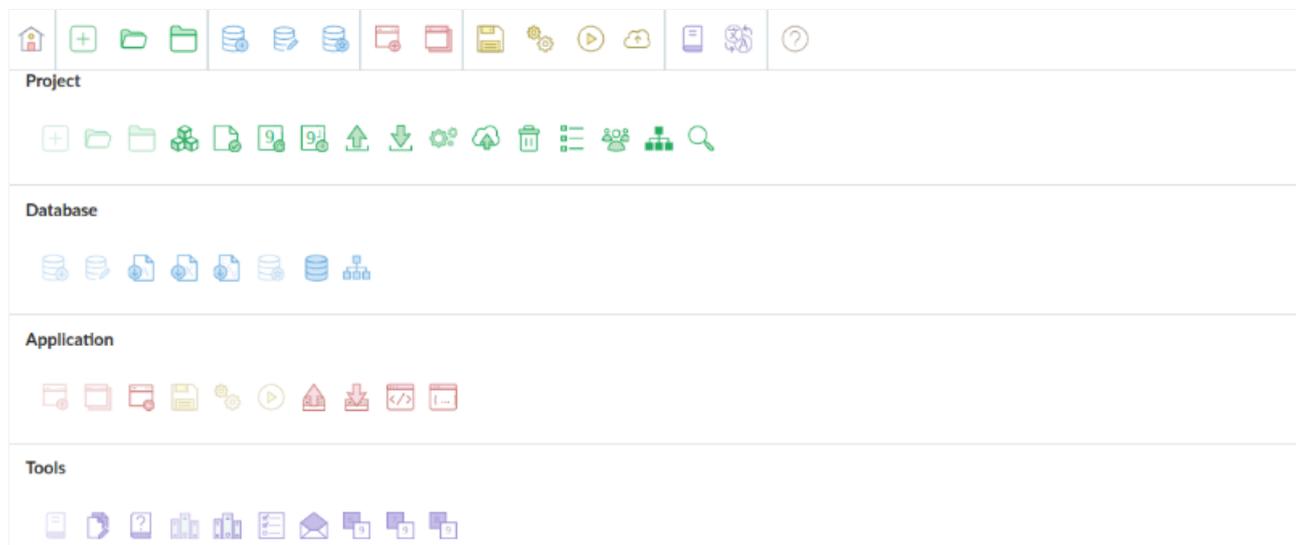

Save

- **Old Password** - Inform your current password.
- **New Password** - Inform your new password.
- **Confirmation** - Confirm the new password.

My Toolbar

Allows each user to customize their toolbar, by including or removing unnecessary items for your usage, giving you a better experience while developing the applications. This option is tied to the user that did the modification, this way each user can modify their own toolbar the way they desire.

The icons are divided in categories. To include an item to the toolbar, we just need to drag it to the toolbar.

- **Toolbar** - Icons that'll be displayed on the toolbar of ScriptCase.

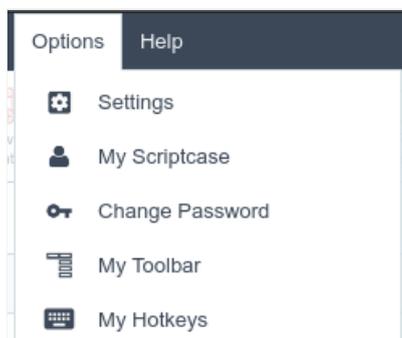

Buttons

- **Save** - Saves the modifications done to the toolbar.
- **Add Separator** - Adds a separator to the toolbar, after the last item of the current setup.
- **Create item** - Creates a new item in the toolbar. Inform the URL, icon and description of the new item.
- **Return to default** - Restores the toolbar to its default configuration.

My Hotkeys

Allows you to change the default Hotkeys of your Scriptcase interface, offering to you more practicality and customization to your development.

To change the default hotkeys, you just need access the menu **Options > My Hotkeys**.

Will be open the hotkeys and the setting options, as the image below:

Edit Keyboard Shortcuts

Clear Restore Default +

ACTION: <input type="text" value="Save application"/>	KEYBINDING: <input type="text" value="CONTROL + S"/>	<input type="button" value="x"/>

ACTION: <input type="text" value="Generate source"/>	KEYBINDING: <input type="text" value="F8"/>	<input type="button" value="x"/>

Upload settings Download settings Save ?

- **Clear:** Clears all predefined settings by Scriptcase or by user.
- **Restore Default:** Restores all the default shortcuts that was changed or erased.
- **Action:** Selects the action that will be made when press the selected keybind.
- **Add "+":** Adds a new action in the keybind list.
- **Keybinding:** Selects the keybinds that will be responsible for execute the chosen action.
- **Upload Settings:** Realizes the importation of the keybind settings exported.
- **Download Settings:** Realizes the download of the keybind settings in use.

Deployment Overview

Publishing is the process of deploying applications/projects developed in Scriptcase to be accessed by end-users. This process involves generating the project's files and configuring the production environment.

In Scriptcase, there are two types of publishing.

Typical Publishing {id-01}

A simplified and automated publishing process. In this type of publishing, the configurations of the **production environment directories** and the **project connection names** are set by default. Thus, all the necessary files for the system's operation are placed inside the **_lib** folder when generating a publication.

To proceed with the Typical Deploy [Click Here](#).

Production Environment Directories in Typical Publishing

- Production environment: `_lib\prod`
- Image directory: `_lib\file\img`
- Tmp folder: `_lib\tmp`
- File directory: `_lib\file\doc`

Advanced Publishing {id-02}

This type of publishing allows the developer to customize the location of the production environment files on the server, enabling, for example, the use of the same production environment for several projects published on the same server.

During the publishing process, the developer must specify the **production environment directories** and **link the connection names** from the development environment to the production environment. Therefore, it is recommended that the developer have a production environment with the file structure ready, so that during publishing, the correct file locations can be specified.

To proceed with the Advanced Deploy [Click Here](#).

Prerequisites for Publishing

For applications to function correctly outside the development environment, some requirements must be followed.

- **Web Server:** Have a configured web server: Apache (**recommended**), IIS, nginx, or another;
- **Database:** Enable the database driver that will be used by the system. Check how to [enable the driver](#) for your database.
- **Production Environment:** Keep the [production environment updated](#) and compatible with the current version of the tool;
- **Necessary PHP Functions:** Some PHP functions must be enabled for the correct functioning of some application features. [Check the list of these functions](#)
- **Compatible PHP:** Have a PHP configured on the web server, compatible with the version of Scriptcase used. Check the compatibility table below.

PHP Compatibility in Development with PHP in Production

The PHP version used in the development environment directly affects the PHP version that can be used in the production environment.

See the table below.

PHP of Installation (Development)	Compatible PHP in Production Environment (Production)				
Scriptcase with PHP 7.3	PHP 7.2	PHP 7.3	PHP 7.4		
Scriptcase with PHP 8.1	PHP 7.2	PHP 7.3	PHP 7.4	PHP 8.0	PHP 8.1

Typical Deploy

Pre-Requirements

For applications to function correctly outside the development environment, some requirements must be followed.

- **Web Server:** Have a configured web server: Apache (**recommended**), IIS, nginx, or another;
- **Database:** Enable the database driver that will be used by the system. Check how to [enable the driver](#) for your database.
- **Production Environment:** Keep the [production environment updated](#) and compatible with the current version of the tool;
- **Necessary PHP Functions:** Some PHP functions must be enabled for the correct functioning of some application features. [Check the list of these functions](#)
- **Compatible PHP:** Have a PHP configured on the web server, compatible with the version of Scriptcase used. Check the compatibility table below.

PHP Compatibility in Development with PHP in Production

The PHP version used in the development environment directly affects the PHP version that can be used in the production environment.

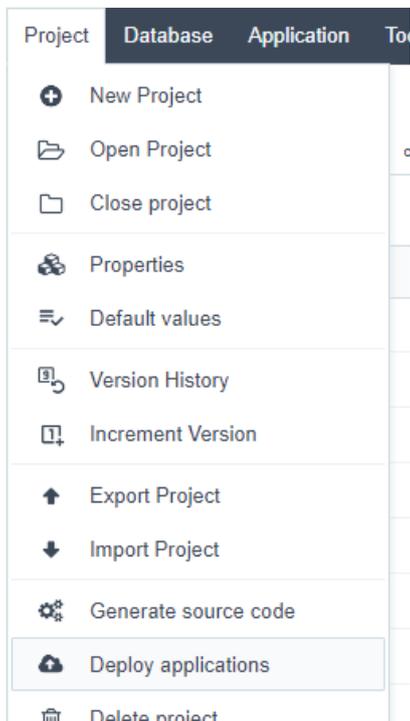

See the table below.

PHP of Installation (Development)	Compatible PHP in Production Environment (Production)				
Scriptcase with PHP 7.3	PHP 7.2	PHP 7.3	PHP 7.4		
Scriptcase with PHP 8.1	PHP 7.2	PHP 7.3	PHP 7.4	PHP 8.0	PHP 8.1

This type of deployment is for users that want the Production Environment (Common Libraries) with the default settings from ScriptCase, the basic setup is done already by ScriptCase. We will show the entire process of deployment in this documentation.

Project Deployment

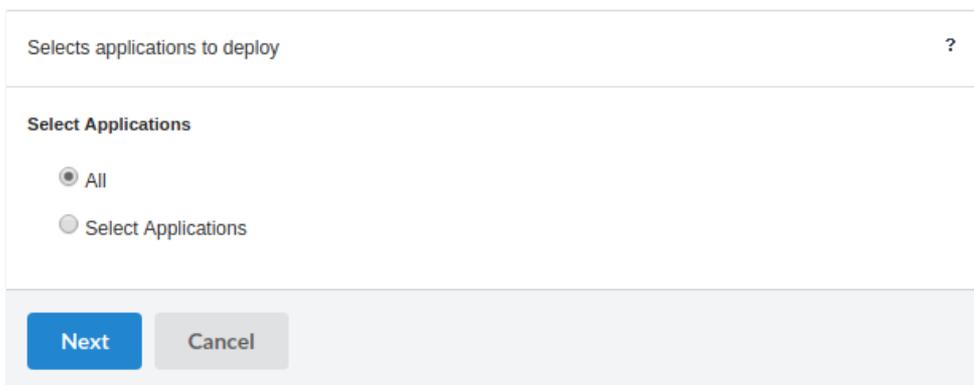

Access your project and choose the option **“Project -> Deploy Project”**, available on the top menu.

After clicking on the Deploy applications button, you will have the option to deploy all the applications from the project or you can select the applications that you want to deploy.

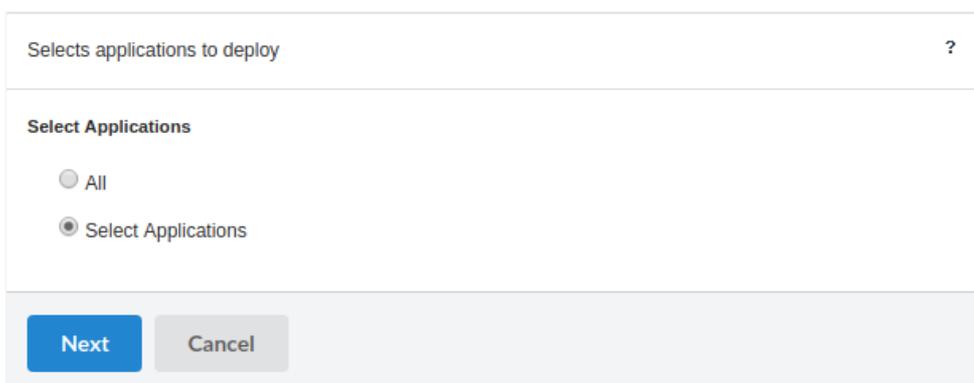

Select All Applications

When select this option, all the applications of the project will be deployed.

Select the applications individually

This option allow us to select the applications that will be deployed.

List of available applications

During this process, the Scriptcase list all the Applications in the project so you can select the applications that you wish to deploy.

Choose of the deployment type (Typical)

Next, we need to choose the type of desired deployment.

Applications Deployment?

What type of deployment would you like to use?

Typical (recommended)

Advanced

Properties of a deployment

Deployment properties

We must define which application will be the deployment initial application. In this step, we also define if we will send the common libraries with our project.

Applications Deployment ?

Deploy with production environment

Deploy with the common files(CSS, buttons, images, messages)

Publish with FusionChart maps

* Publishing server operating system

Windows

Linux 32 bits

Linux 64 bits

OSX / Mac OS

Choose the initial application

Generate link to the initial application

Select homepage language

It is necessary to select the common libraries, which are the files responsible for the Production Environment. It is necessary to select the common files, for the images, css and custom messages to be sent at the moment of the deploy.

Option	Description
Deploy with the Common Libraries(Prod)	Contains the used libraries by our applications and also the informations of connections used by the project.
Deploy with the common files	This option define if the files that make up an application will be sent in the publication files. The files are: Images, css and customized messages.
Publish with FusionChart Maps	Checking this option, the referred files to the FusionCharts library will be added in the deployment file.
Publishing server operating system	This is a mandatory option for a project deployment, when you select the operating system, the Scriptcase will create the correct structure for your deployment.
Choose the Initial Application	Defines the initial system application.
Generate link to the Initial application	This feature avoids the creation of redirections in the production environment and creates an access screen for the initial application defined in the previous attribute. This configuration should prevent the system from being mistakenly identified as an insecure page by some browsers.
Select homepage language	Defines the language of the text that will be displayed on the home page, where the button for accessing the home application will be displayed.

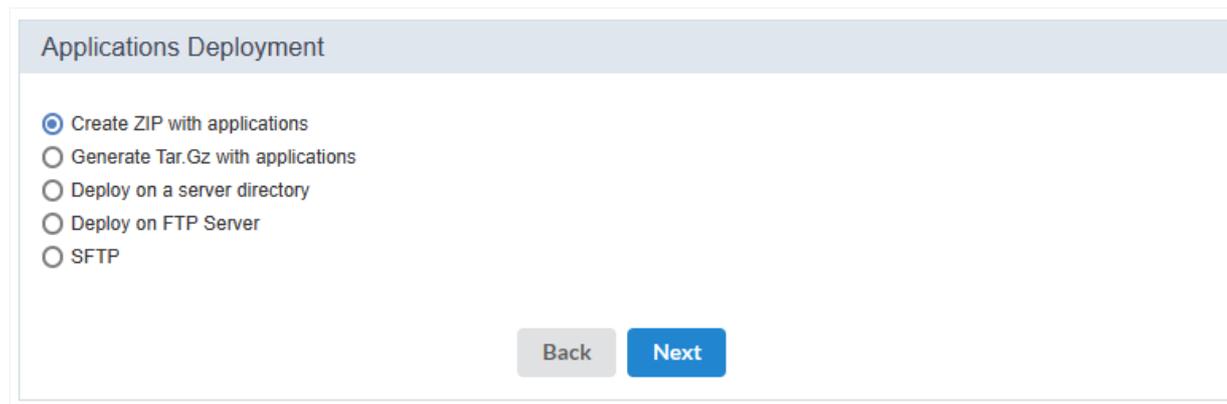

Generated Files

At this stage, the way in which the publication will be carried out will be defined.

- **Generate ZIP with applications** - In this option, at the end of the publication, a button will be displayed to download the .zip file generated with the publication files. We recommend using it to publish in production environments configured on Windows.
- **Generate Tar.Gz with applications** - A .Tar.Gz will be generated with the publication files, at the end of the process the file download will be displayed. This type of compression is recommended for publishing in production environments configured on Linux or MacOS.
- **Publish to directory on the server** - Allows direct publishing to a local directory, where Scriptcase is installed. This type of publication is recommended for servers that share the development and production environment. The publication files will be generated within the indicated folder, therefore, we recommend using an exclusive folder for publication. For example, when indicating the C:\Program Files\NetMake\v9-php81\wwwroot\project_name directory, the application files, and the _lib directory with css and themes will be placed directly in the project_name folder.
- **Publish to FTP server** - Sends the publication files directly to the configured FTP server. The publication files will be placed in the indicated directory, therefore, we recommend using a specific directory for the publication.
- **SFTP** - Just like FTP, publishing via SFTP sends the publication files directly to the configured server, placing the publication files in the specified directory.

Generate ZIP or Tar.Gz with applications

The Scriptcase will generate a file **Zip** or **Tar.Gz**. In the end of this process, will be displayed a report of the deployed applications with the download link for download the project.

Applications Deployment

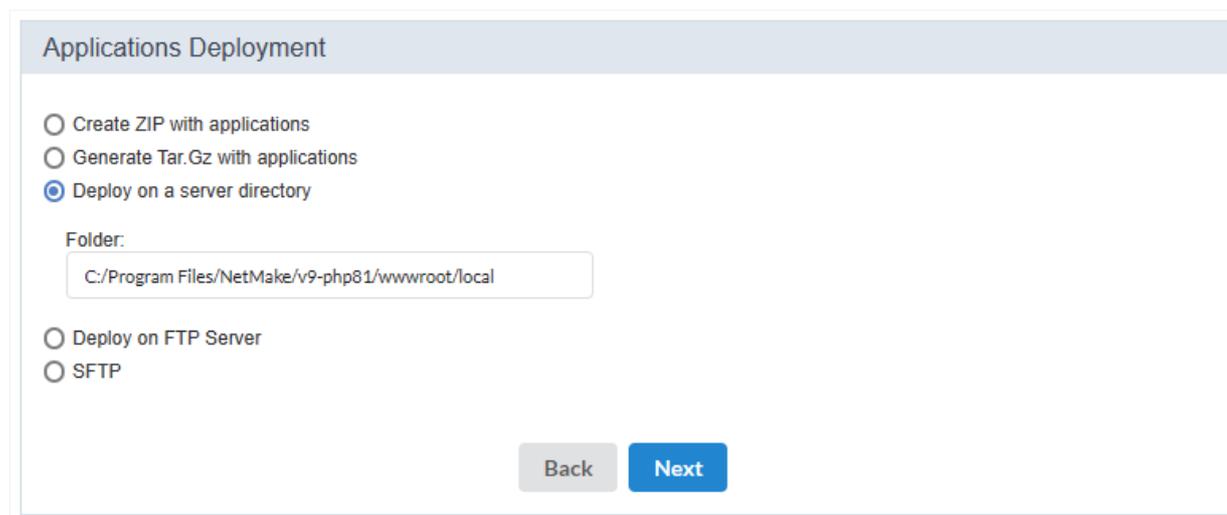

- Create ZIP with applications
- Generate Tar.Gz with applications
- Deploy on a server directory
- Deploy on FTP Server
- SFTP

Back Next

The file **ZIP** or **Tar.Gz** generated, must be decompressed only in the deployment server, to avoid that the files be corrupted.

Deploy on a server directory

Deploys the project in the informed directory. We must inform the absolute path to the deployment directory.

Applications Deployment

- Create ZIP with applications
- Generate Tar.Gz with applications
- Deploy on a server directory
- Deploy on FTP Server
- SFTP

Folder:

Back Next

This option should be used in the case that the deploy is going to be in the same sever where ScriptCase is installed, otherwise this option is not valid.

Deploy on FTP server

This option generates the files directly in the FTP remote server.

Applications Deployment

- Create ZIP with applications
- Generate Tar.Gz with applications
- Deploy on a server directory
- Deploy on FTP Server

FTP server:

User:

Password:

FTP Folder:

SFTP

Options	Description
FTP server	Server where you will deploy your project. Inform the domain or the server's IP.
User	User for the FTP server in the production, remembering that the user need to have permission to write in the server folder, otherwise it will not work.
Password	Password for the FTP user.
FTP Folder	Server directory where the project will be deployed in.

To use this option is necessary that you have a server that provides the FTP access and an user with write permissions.

Deploy on a SFTP server

Deploys the application automatically on a remote SFTP server.

Applications Deployment ?

Create ZIP with applications
 Generate Tar.Gz with applications
 Deploy on a server directory
 Deploy on FTP Server
 SFTP

SFTP Path (Full path):

Compress files before sending.

Back
Next

Options	Description
SFTP server	Server where you will deploy your project. Inform the domain or the server's IP.
Port	Defines the port that will be used when connecting to the server.
User	User for the SFTP server in the production, remembering that the user need to have permission to write in the server folder, otherwise it will not work.
Password	Password for the SFTP user.
SFTP Folder	Server directory where the project will be deployed in.
Compress files before sending	This option defines if the files will be compressed before being sent to the server or if they will be sent one by one. We recommend checking the option so that the files are compressed before sending, in this way the publication tends to be much faster, especially when publishing with a large number of files.

To use the **SFTP** option is necessary that the user have permission to write on the server folder.

Deployment log

At the end of the process you will receive a report with all the applications deployed and a download link of the project ready to be published.

Applications Deployment

 100%

Deployment finished

Folder: C:/Program Files/NetMake/v9-php81/wwwroot/local

Applications	Result	Processing Time
control	OK	0.00
Common files	OK	1.92
Production Environment	OK	168.61
Processing time		00:02:50

Server Directories

In the server root was created a folder(typical) where we will decompress the deployment files.

C:\Program Files\NetMake\v9\wwwroot\tipica

<ul style="list-style-type: none"> ▢ _lib ▢ app_form_sec_apps ▢ app_grid_sec_groups ▢ app_retrieve_pswd ▢ form_customers ▢ grid_products 	<ul style="list-style-type: none"> ▢ app_change_pswd ▢ app_form_sec_groups ▢ app_grid_sec_users ▢ app_search_sec_groups ▢ form_products ▢ grid_sc_log
--	---

In the end of the compression process, we must access your project through the browser.

In the first access we must configure the connections in [Production Environment](#).

Connections Create

The database connection that your application use was not found. You need to access the production environment and create the connection.

Connections not found: conn_mysql

[Click here to create the connections now.](#)

Advanced Deploy

Pre-Requirements

For applications to function correctly outside the development environment, some requirements must be followed.

- **Web Server:** Have a configured web server: Apache (**recommended**), IIS, nginx, or another;
- **Database:** Enable the database driver that will be used by the system. Check how to [enable the driver](#) for your database.
- **Production Environment:** Keep the [production environment updated](#) and compatible with the current version of the tool;
- **Necessary PHP Functions:** Some PHP functions must be enabled for the correct functioning of some application features. [Check the list of these functions](#)
- **Compatible PHP:** Have a PHP configured on the web server, compatible with the version of Scriptcase used. Check the compatibility table below.

PHP Compatibility in Development with PHP in Production

The PHP version used in the development environment directly affects the PHP version that can be used in the production environment.

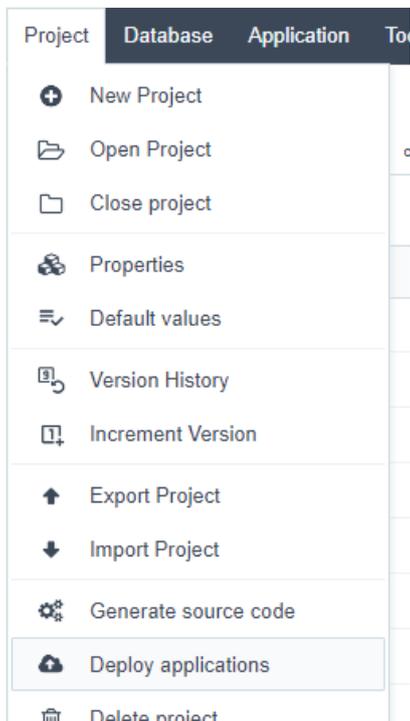

See the table below.

PHP of Installation (Development)	Compatible PHP in Production Environment (Production)				
Scriptcase with PHP 7.3	PHP 7.2	PHP 7.3	PHP 7.4		
Scriptcase with PHP 8.1	PHP 7.2	PHP 7.3	PHP 7.4	PHP 8.0	PHP 8.1

Different from the typical deploy, where the directories' setup is done from ScriptCase using the default settings, the advanced deployment allows you to choose the directories is according to the server's architecture where it is going to be deployed.

Project Deployment

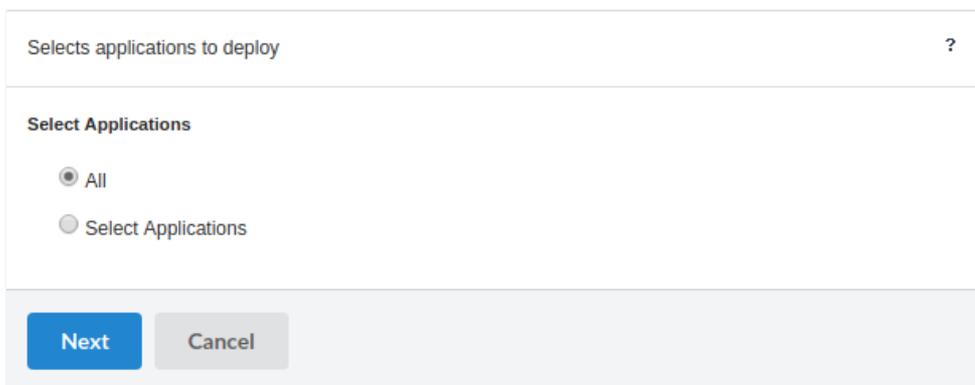

Access your project and choose the option "**Project -> Deploy Project**", available on the top menu.

After clicking on the Deploy applications button, you will have the option to deploy all the applications from the project or you can select the applications that you want to deploy.

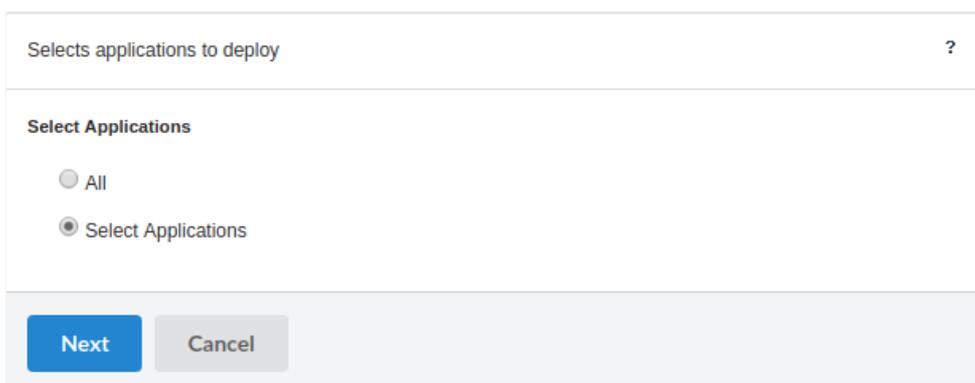

Select All Applications

When select this option, all the applications of the project will be deployed.

Select the applications individually

This option allow us to select the applications that will be deployed.

List of available applications

During this process, the Scriptcase list all the Applications in the project so you can select the applications that you wish to deploy.

Choose of the deployment type (Advanced)

Next, we need to choose the type of desired deployment.

Applications Deployment
?

What type of deployment would you like to use?

Typical (recommended)

Advanced

Create a deployment template to save the defined settings. Or, you can use an existing template to reuse the established settings in your project.

Applications Deployment

Use an existent Template
 Create new deployment template

Template Name

Template Name

This option is necessary to inform the deployment template name that will be used in the project. This option can be reused in future deployments.

Setting the Advanced Deploy

We must define which application will be the project initial application. In this step we also define if we will send the FusionCharts Maps in the deployment file.

Applications Deployment

Template sample

Deploy with the common files(CSS, buttons, images, messages)

Common Libraries Folder

Images Folder

Temp Folder

Documents Folder

Choose the initial application

Generate a page containing a link to the initial application.

Select homepage language

NOTE: It is necessary to select correctly the deployment server operating system, allowing the correct generation of the folders structures for deployment.

Option	Description
Deploy with the common files	This option is obligatory for a project deployment, for the images, CSS and customized messages be send in the moment of deploy generation.
Publish with FusionChart Maps	Checking this option, the referred files to the FusionCharts library will be added in the deployment file.
Publishing server operating system	This option is obligatory for a project deployment, when you select the operating system, the Scriptcase will create the correct structure for your deployment.
Common Libraries Folder	It is necessary define the main directory where will be deployed the production environment. By default, the Scriptcase recommends to use: <code>/scriptcase/prod</code> .
Images Folder	It is necessary define the directory that will be stored the images in the production environment. By default, the Scriptcase recommends to use: <code>/scriptcase/file/img</code> .
Temp Folder	It is necessary define the directory that will be stored the temporary files in the production environment. By default, the Scriptcase recommends to use: <code>/scriptcase/tmp</code> .
Documents Folder	It is necessary define the directory that will be stored the documents in the production environment. By default, the Scriptcase recommends to use: <code>/home/\$user/public_html/scriptcase/file/doc</code> . Is this option is necessary to inform the absolute path to the documents folder.
Choose the Initial Application	Defines the system initial application.
Generate link to the Initial application	This resource prevents the creation of a redirect in the production environment and creates an access screen for the initial application defined in the previous attribute. This configuration should prevent the erroneous identification of the system as an insecure page performed by some browsers.
Select homepage language	Defines the language of the text that will be displayed on the home page, where the button for accessing the home application will be displayed.

Defining the production connection name

Define the connection name that will be used by the project after deploying.

Connection names

In this option, we will inform the names of the connections exists in your project for deployment.

Generated Files

At this stage, the way in which the publication will be carried out will be defined.

- **Generate ZIP with applications** - In this option, at the end of the publication, a button will be displayed to download the .zip file generated with the publication files. We recommend using it to publish in production environments configured on Windows.
- **Generate Tar.Gz with applications** - A .Tar.Gz will be generated with the publication files, at the end of the process the file download will be displayed. This type of compression is recommended for publishing in production environments configured on Linux or MacOS.
- **Publish to directory on the server** - Allows direct publishing to a local directory, where Scriptcase is installed. This type of publication is recommended for servers that share the development and production environment. The publication files will be generated within the indicated folder, therefore, we recommend using an exclusive folder for publication. For example, when indicating the C:\Program Files\NetMake\v9-php81\wwwroot\project_name directory, the application files, and the _lib directory with css and themes will be placed directly in the project_name folder.
- **Publish to FTP server** - Sends the publication files directly to the configured FTP server. The publication files will be placed in the indicated directory, therefore, we recommend using a specific directory for the publication.
- **SFTP** - Just like FTP, publishing via SFTP sends the publication files directly to the configured server, placing the publication files in the specified directory.

Generate ZIP or Tar.Gz with applications

The Scriptcase will generate a file **Zip** or **Tar.Gz**. In the end of this process, will be displayed a report of the deployed applications with the download link for download the project.

The file **ZIP** or **Tar.Gz** generated, must be decompressed only in the deployment server, to avoid that the files be corrupted.

Deploy on a server directory

Deploys the project in the informed directory. We must inform the absolute path to the deployment directory.

Applications Deployment

Create ZIP with applications
 Generate Tar.Gz with applications
 Deploy on a server directory

Production Environment	OK	168.61
Processing time		00:02:50

Production Environment Overview

The **production environment** gathers the settings essential for the functioning of the published applications. In it, the APIs used in projects and connections must be configured. It is also possible to perform some configurations basic on your web server, such as setting the PHP timezone between others

The production environment can be implemented in two ways.

1. **Shared between two or more projects:** In this case, the settings are centralized in a single environment. The advantage is the ease in maintaining the settings, since all changes will be made in a single place.
2. **Individually configured for each project:** In this case, each project will have its own production environment with specific settings adjusted according to the project's needs.

Both have their advantages and disadvantages and can be adopted depending on the infrastructure and requirements of the projects in question. The important thing is to ensure that the production environment is correctly configured to guarantee the proper functioning of the applications or projects published on the server.

Environment prerequisites

To publish projects and use the production environment, the following prerequisites must be met:

- **Web Server** configured and compatible with PHP versions approved for Scriptcase applications such as: *Apache, IIS or nginx*.
- **PHP** approved for use in the tool's applications. Check the compatibility list on the [Typical deploy](#) and [Advanced deploy](#) page.
- **Database extension** used in the project connection, enables the creation of the connection.

Accessing the production environment

Access must be carried out using the browser of your choice, as long as it is compatible. Check the list below.

The default path when performing a typical deploy is: `/project_name/_lib/prod` already in the advanced deploy the directory will be defined by the developer at the time of deploy.

Examples of accessing prod in a typical deploy

- 180.204.163.144:8092/project_name/_lib/prod/
- mysc.domain.net/project_name/_lib/prod/

Examples of accessing prod in an advanced deploy

- 180.204.163.144:8092/production/
- mysc.domain.net/project_name/prod/

Compatible Browsers

 Chrome	Any version
 Firefox	Version 4 or higher
 Edge	Any version
 Opera	Version 9 or higher
 Safari	Version 5.2 or higher

Configuration Options

The production environment has miscellaneous available configurations, click on the desired option to access the documentation section referring to the resource.

Database Connections

- [Create New Connection](#) - Allows creating connections used in the production environment. Make sure the connection name matches what is expected by the application.
- [Edit Connection](#) - Allows modifying the data of a previously created connection.
- [Rename Connection](#) - Allows changing the name of an existing connection.
- [Pending connections](#) - Lists connections for published projects that are using the production environment and have not yet been configured.

Production Configuration

- [Configure production environment](#) - Allows adjusting various environment settings such as file lifetime, time zone, and other options.
- [Applications directory](#) - Registration screen of directories of published projects, which use the production environment.
- [Incompatible applications](#) - Verifies application compatibility with the production environment.
- [Configure password recovery](#) - Defines the email to be used for password recovery in the environment.
- [Update production environment](#) - Automatically updates production environment files.
- [API](#) - Configuration screen for APIs used in the development environment.
- [Change Password](#) - Allows changing the password of the production environment.
- **Help** - Link to access this documentation page.
- **Diagnosis** - Accesses the diagnostic file of your environment, where you can view server configurations.
- **Logout** - Performs a secure logout, ending the session in your production environment.

First access

To access the Scriptcase production environment, you must use your preferred web browser.

Accessing prod

The location of the production environment may vary depending on the type of deployment performed.

In a [typical deploy](#), the default access directory is `/project_name/_lib/prod`.

However, if you have performed an [advanced deploy](#), the location of the “prod” directory will be defined by the project developer at the time of deployment.

Examples of accessing “prod” in a typical deployment:

- 180.204.163.144:8092/project_name/_lib/prod
- mysc.domain.net/project_name/_lib/prod

Examples of accessing “prod” in an advanced deployment:

- 180.204.163.144:8092/production
- mysc.domain.net/project_name/prod/

Check the list of supported browsers

 Chrome	Any version
 Firefox	Version 4 or higher
 Edge	Any version
 Opera	Version 9 or higher
 Safari	Version 5.2 or higher

Setting a new password

On your first access to the production environment, you will need to set the password.

It is essential to emphasize that the production environment stores sensitive information, so it is of utmost importance to set a strong password. We recommend choosing a combination of alphanumeric characters, uppercase and lowercase letters, as well as symbols, to create a strong and secure password.

The screenshot shows the 'Production Environment' login page for Scriptcase. At the top is the Scriptcase logo. Below it, the page is titled 'Production Environment'. There are four main input fields: 'Recovery email' (an empty text box), 'Language' (a dropdown menu set to 'English (United States)'), 'New password' (a text box with five dots), and 'Confirm new password' (an empty text box). Below these fields is a light blue box with the heading 'Password must contain:' and four bullet points: 'Minimum 8 characters', 'Minimum one number', 'Uppercase and lowercase letters', and 'The password and confirmation must be equal.'. Below the password fields is a captcha image showing the letters 'S H B P' and a refresh button. Underneath the captcha is a text box with the prompt 'Write the letters in the image above'. At the bottom left is a blue 'Log in' button.

Email

Enter an email address for password recovery in the production environment. This field is optional and can be changed later within the production environment.

The password recovery process will be exclusively conducted through the provided email.

Language

Set the language in the production environment. Currently available in the following languages: Portuguese (Brazil), English, and Spanish.

New Password

Define a new password.

Confirm new password

Re-enter the password defined in the **New password** field. The two passwords must be identical.

Captcha

Enter the same letters you see in the image.

Accessing with the new password

When accessing the production environment again, use the password defined during the first access.

Remember that the password must be at least 8 characters long and include at least one uppercase letter, one lowercase letter, and one number.

The screenshot shows the 'Production Environment' login page for Scriptcase. At the top left is the Scriptcase logo, which consists of a blue and yellow arrow pointing right followed by the text 'scriptcase' in a sans-serif font. Below the logo is a white form area with a dark blue border. The form has a title 'Production Environment' followed by a horizontal line. There are two input fields: 'Password' with a masked password of ten dots, and 'Language' with a dropdown menu showing 'English (United States)'. At the bottom of the form, there is a blue 'Login' button on the left and a 'Recover Password' link on the right.

Password

Enter the password defined during the first access to your production environment.

Language

Set the language in the production environment. Currently available in the following languages: Portuguese (Brazil), English, and Spanish.

Password recovery

The password recovery option will be exclusively available through the email registered during the password reset step or in the [Configure Password Recovery](#) menu. Learn more about this feature by [clicking here](#).

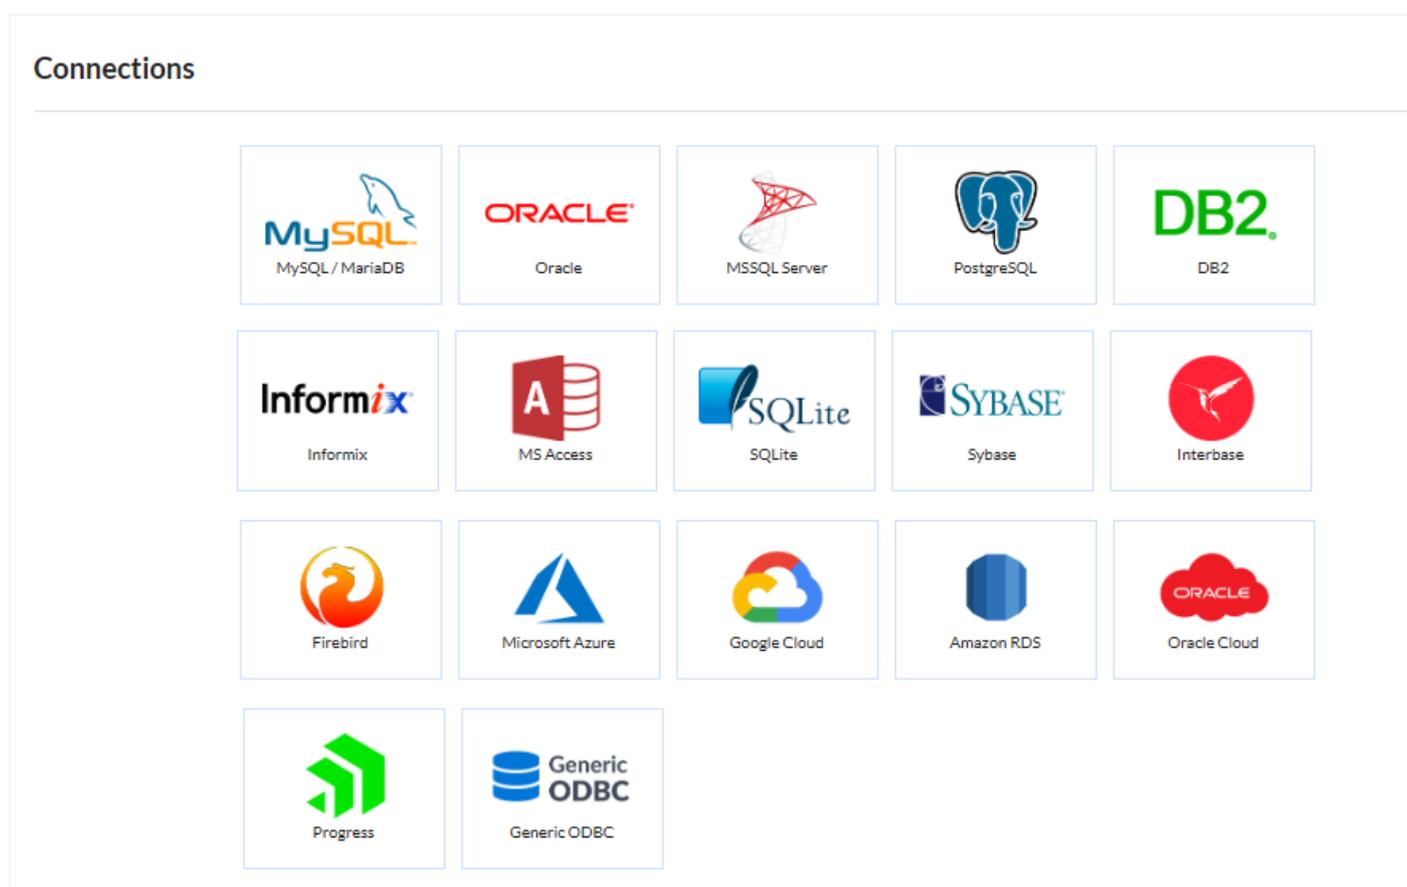

Database Connections

In this section, you will find all the settings related to database connections in the production environment. Here, you can configure and manage the connections that will be used by your projects.

Create new connection

In this section, you can create connections to the databases used by your project.

The connection name in the production environment should match the name used during the deployment of the project.

Next, you need to provide the Database Server. If your database is hosted on the same server as the applications, you can use 'localhost' to refer to it. If the database is on a different server, you can use the machine name or IP address. Additionally, provide the login credentials (if applicable) to access the database.

The connection in the production environment should have the same name as the connection used by the project in the development environment.

Example of MySQL connection screen

New connection

New connection | Advanced

Connection Name: DBMS Type:

Server/Host (Name or IP): Port:

Username: Password:

Database Name:

The establishment of the connection in production is similar to that performed in the development environment. Therefore, if you need more details to configure the connection, access the [connection pages](#) and check the configuration details.

- **Connection name:** Specify the name of the connection in the production environment. Make sure to use the name expected by your project, as this information is defined during the deployment.
- **Database management system model:** Select the driver to establish the connection.
- **Database Server:** Allows connecting via the server's domain or IP address.
- **Port (default 3306):** Select the port to establish the connection.
- **User:** Provide the database user to establish the connection.
- **Password:** Enter the database password to establish the connection.
- **Database:** Specify the database to be used in the connection.

Edit existing connection

All existing connections in the production environment will be listed here. To edit a connection, simply click on the desired connection card, and the connection configuration screen with the current data will open.

In this screen, you can also delete existing connections in the environment by clicking the **Delete** button.

Before modifying or deleting a connection, make sure it is not in use.

The refresh button reloads the list of connections.

Example of connection list

Click on the icon to select the connection to edit Refresh

	
conn_mysql	conn_sqlite
	

The establishment of the connection in production is similar to that performed in the development environment. Therefore, if you need more details to configure the connection, access the [connection pages](#) and check the configuration details.

Rename connection

This option allows you to rename a connection in the production environment.

In the **Select the connection** field, all existing connections will be listed. Select one of them and enter the desired new name.

Rename Connection

Select the connection

conn_mysql
▼

Enter the new name

new_name

Rename

This procedure **does not change the name of the connection used by the project**. The connection in the production environment should have the same name as the connection used by the project in the development environment.

Pending connections

Displays the list of pending connections, which have not yet been created, for projects using the production environment.

When accessing a published project, which has not yet had its connection configured, the connection not found screen will be displayed.

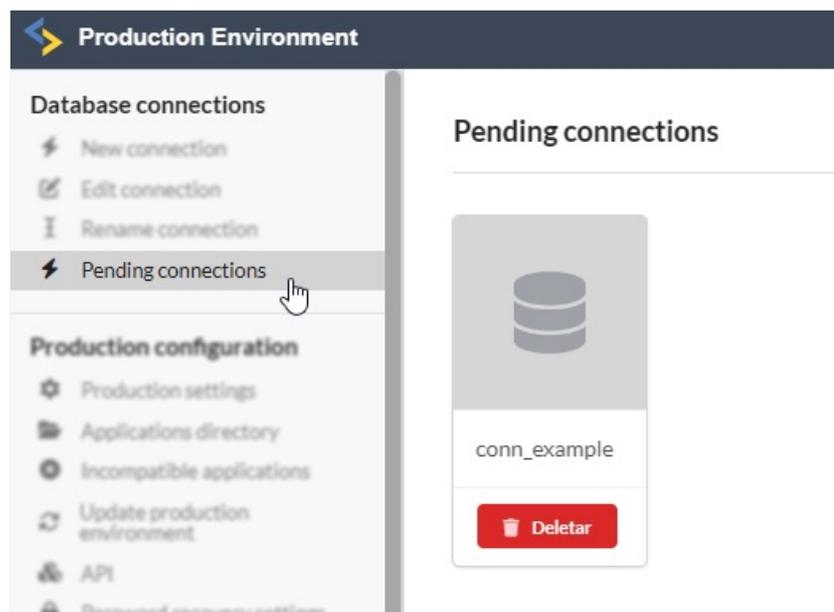

Create Connections

The database connection your application uses was not found. You will need to access the production environment and create the connection.

Connection not found: conn_example

 Create connection

When accessing the production environment used by the project, access the item Pending connections. On this screen, all connections, from projects that use this production environment, that have not yet been configured will be listed.

Production Configuration

In this section, you will find the settings related to the production environment, where you need to define some essential resources for the functioning of the deployed project.

Production Settings

Configure the available settings in the production environment below.

Production settings ?

Temporary files directory

Cache files directory

PDF Server IP **Time to live (minutes) of files** **Time to live (minutes) of cache files**

Language **PHP timezone** **Authorization key to view the maps**

Save

Temporary Files Directory

This directory is used to temporarily store files generated by exports and upload fields in the project.

Cache Files Directory

In this directory, cache files, commonly used images, and text files are stored for applications.

PDF Server IP

This field defines the IP address of the server where application PDF files will be generated.

This configuration should only be used to resolve any PDF generation blocking issues related to the server's IP or hostname. If there are no problems with your PDF generation, leave this field blank.

Cache Files Lifetime (Minutes)

Here, you can define the time, in minutes, that files in the Cache Files Directory should persist before being refreshed or deleted.

Files Lifetime (Minutes)

This field determines the time, in minutes, that files in the Temporary Files Directory should persist before being removed.

Language

Sets the language used in the production environment.

PHP Timezone

Specify the timezone that will be used by your project. If you leave this field blank, the PHP environment's timezone will be used.

Authorization Key for Map Viewing

To use Google Maps features in the environment, enter the authorization key for the Google Maps API here.

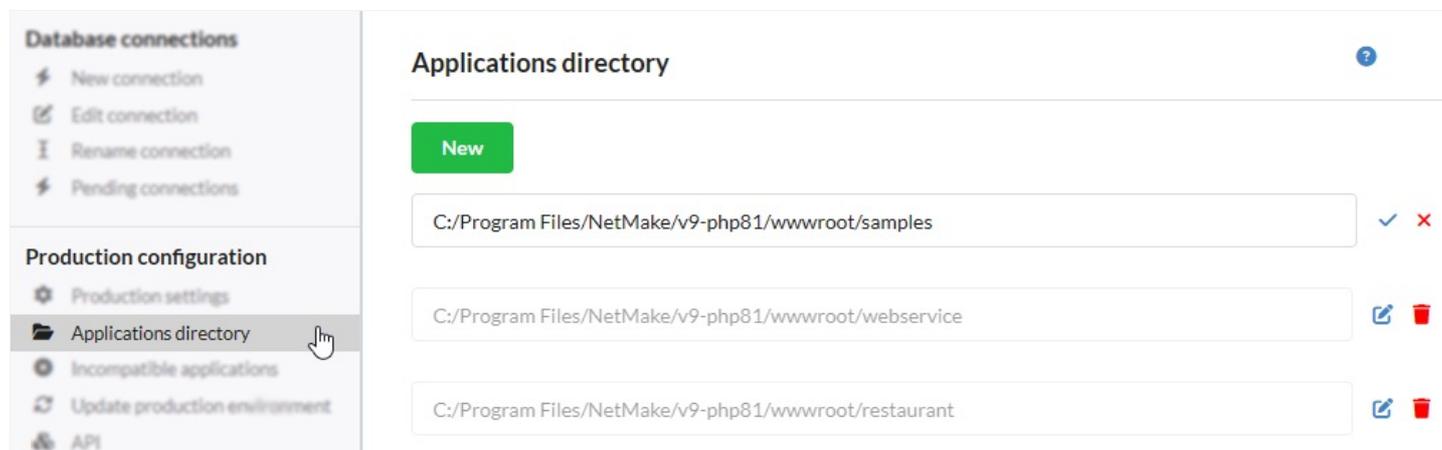

Learn how to create the key by accessing the article [Google Maps API Credentials](#)

Applications directory

On this screen, the developer must register the directories that have applications published and linked to the production environment in configuration.

This registration is necessary for these directories to be listed in the item [Aplicações desatualizadas](#) in order to verify the compatibility of the applications with the production environment being configured.

The directory must be registered informing the complete path from the root of the server.

Click **New** to add more directories and without **Save** to store the changed directories.

It is possible to register directories that do not yet have applications, but that will be used in a future publication.

Incompatible applications

On this screen, all the directories registered in the **Directory of applications** section will be listed so that the developer can verify the compatibility of the applications published in these directories with the current production environment.

This verification will be carried out by comparing the **current version of the production environment** with the **version of the production environment used by Scriptcase at the time of publication** of these applications.

Applications will be considered incompatible if they have different versions between the production environments mentioned above.

For example, if Scriptcase's production environment is in version 2.0.000 and the server's production environment is in version 1.0.000, the applications published by this Scriptcase in this production environment will be considered incompatible.

Incompatible applications				
<input type="checkbox"/>	Directory	Applications	Last check	
<input type="checkbox"/>	C:/Program Files/NetMake/v9-php81/wwwroot/publi	0	06/07/2023 17:46:27	Compatible deployment
	C:/Program Files/NetMake/v9-php81/wwwroot/samples			Incompatible directory
<input type="checkbox"/>	C:/Program Files/NetMake/v9-php81/wwwroot/restaurant	40	06/07/2023 17:39:34	<button>View applications</button>

Check application compatibility

To carry out the verification, select the desired directories and click on the **Validate** button. When finished, a confirmation message will be displayed.

Then the scan results will be displayed, as in the image below.

Incompatible applications ?			
<input type="checkbox"/> Directory	Applications	Last check	
<input type="checkbox"/> C:/Program Files/NetMake/v9-php81/wwwroot/publi	0	06/07/2023 17:46:27	Compatible deployment
C:/Program Files/NetMake/v9-php81/wwwroot/samples			Incompatible directory
<input type="checkbox"/> C:/Program Files/NetMake/v9-php81/wwwroot/restaurant	40	06/07/2023 17:39:34	View applications

Directory

Lists the directories registered in the **Application Directory** section.

Applications

Total directory applications that are incompatible with the environment the production environment in configuration

Last Check

Date and time of the last verification performed on the directory.

Action column

This column will return the result of the check.

- **Compatible deployment message** - All applications in the directory are compatible with the current production environment.
- **View applications button** - One or more applications in the directory are incompatible with the current production environment, click the button to list the applications.
- **Incompatible directory message** - The specified directory has no applications.

Example directory with compatible applications

17:46:27	Compatible deployment
----------	-----------------------

Example directory with incompatible applications

17:39:34	View applications
----------	-----------------------------------

See applications

When clicking on the button, all incompatible applications in the directory will be listed and the details.

Incompatible applications ?			
Directory : C:/Program Files/NetMake/v9-php81/wwwroot/restaurant			
Application	Deployment version ?	Version of this environment ?	Solution
app_form_add_users	1.0.000	1.0.003	Deploy the application again
app_form_sec_apps	12	1.0.003	Update this production environment

Application

In this column, the names of the applications that are incompatible with the current production environment will be displayed.

Publication version

Informes the version of the production environment, used in the development environment, by Scriptcase at the time the application was published.

Version of this environment

Reports the current version of the production environment being configured.

Solution

This column displays the action that must be taken to make the applications compatible with the production environment and a link to a tutorial regarding the informed solution..

Solution
Deploy the application again
Update this production environment

Configure Password Recovery

In this section, you define the email address that will be used for password recovery in the environment.

In this process, a temporary code will be sent to the email address set in this configuration. Therefore, it is recommended to use an email with restricted access.

Password recovery settings

Email

[Salvar](#)

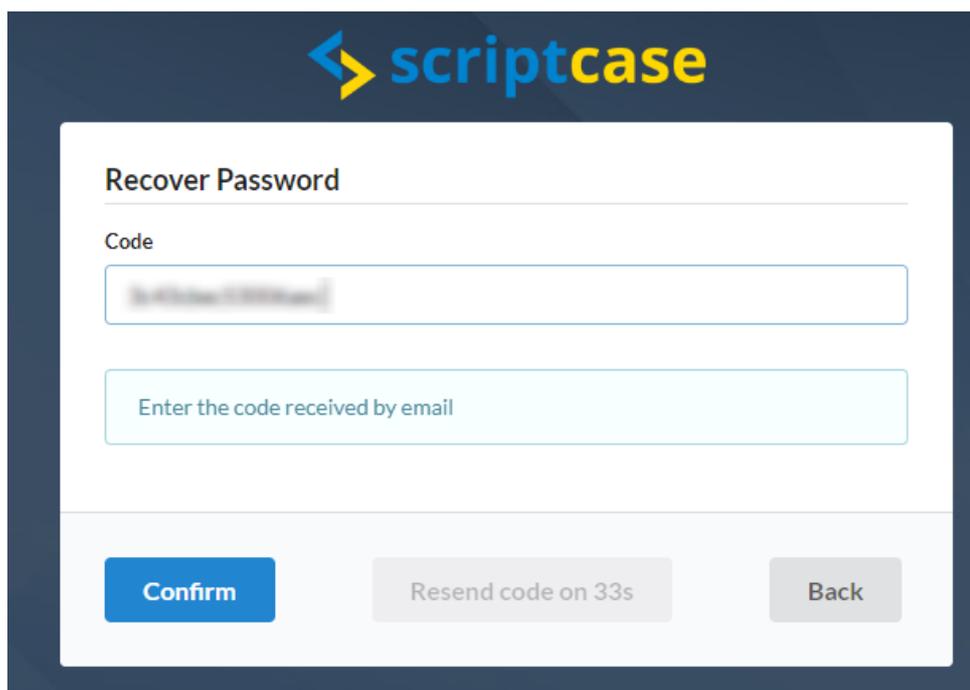

Follow the steps below to recover the password.

Recover Password in the production environment

When clicking the **Recover Password** link, a temporary code will be sent to the provided email address. This code needs to be entered on the password recovery screen, which will be displayed after sending the email.

Example of the code information screen

Enter the code in the field and click **confirm**.

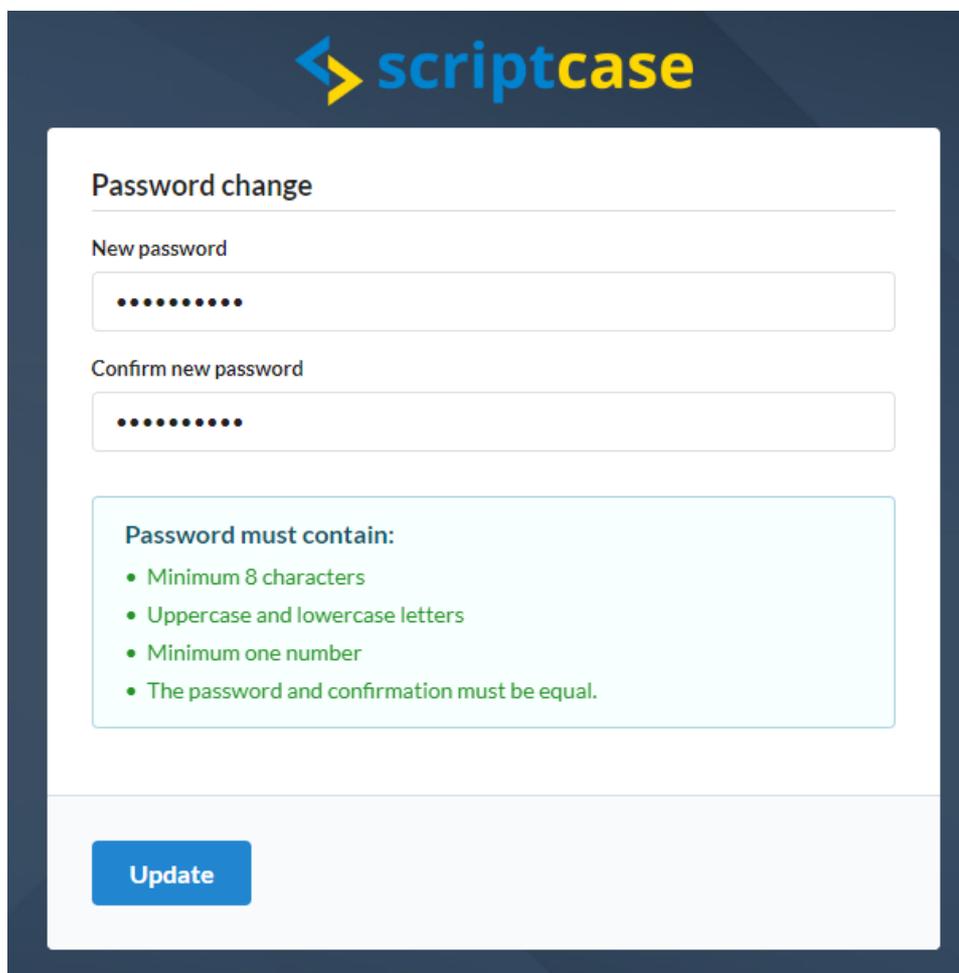

The screenshot shows a web interface for password recovery. At the top is the 'scriptcase' logo. Below it is the heading 'Recover Password'. A 'Code' label is positioned above a text input field. The input field contains a blurred alphanumeric code. Below the input field is a light blue box with the text 'Enter the code received by email'. At the bottom of the form are three buttons: a blue 'Confirm' button, a grey 'Resend code on 33s' button, and a grey 'Back' button.

Password Reset

The password reset screen will appear. Enter the new password, following the specified criteria, and click Change. After confirming the change, the login screen will be displayed.

It is essential to emphasize that the production environment stores sensitive information, so it is of utmost importance to set a strong password. We recommend choosing a combination of alphanumeric characters, uppercase and lowercase letters, as well as symbols, to create a strong and secure password.

Example of the new password definition screen

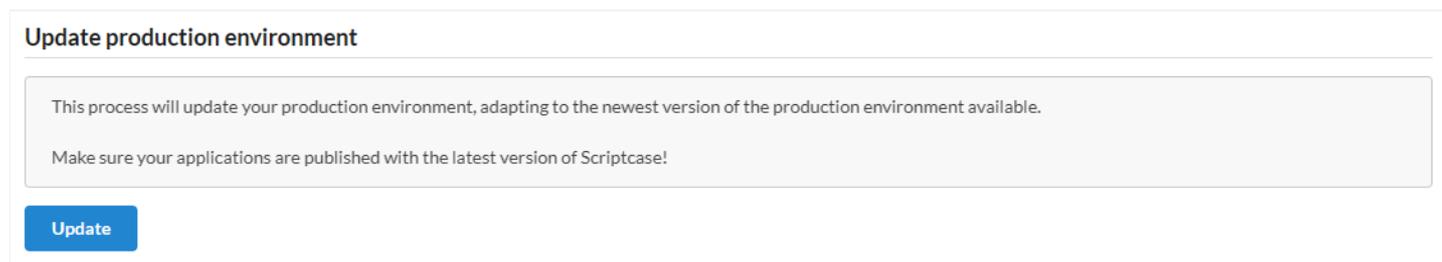

The screenshot shows the 'Password change' form in the Scriptcase interface. At the top left is the Scriptcase logo. The form has a title 'Password change' and two input fields: 'New password' and 'Confirm new password', both containing masked characters. Below these fields is a light blue box with the heading 'Password must contain:' and a bulleted list of requirements: 'Minimum 8 characters', 'Uppercase and lowercase letters', 'Minimum one number', and 'The password and confirmation must be equal.'. At the bottom left of the form is a blue 'Update' button.

Update Production Environment

This feature allows you to quickly and securely update the production environment automatically.

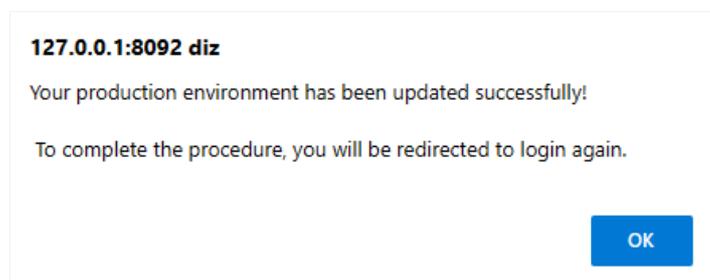

Automatic update screen

The screenshot shows the 'Update production environment' screen. It has a title 'Update production environment' and a light gray box containing the text: 'This process will update your production environment, adapting to the newest version of the production environment available. Make sure your applications are published with the latest version of Scriptcase!'. At the bottom left is a blue 'Update' button.

After completing the update, a confirmation screen will be displayed.

Update confirmation screen

The screenshot shows the 'Update confirmation screen'. It has a title '127.0.0.1:8092 diz' and contains the text: 'Your production environment has been updated successfully! To complete the procedure, you will be redirected to login again.'. At the bottom right is a blue 'OK' button.

API

When publishing the project, the **API data configured in the development environment** within Scriptcase **is not sent**.

Therefore, it is necessary to configure the API in the production environment during the deployment. Remember that the API must have the same name used in the development environment so that applications can use them.

The API configuration in the production environment is similar to the one in the development environment. If you have any doubts, [check the Scriptcase API documentation](#).

Example of the API list in the production environment

API

#	Name	Gateway	Action
1	payment_api	braintree	
2	smtp_sample_api	smtp	

+ Add

Change Password

Allows you to change the current password of the production environment. You need to provide the current password to validate the change.

Password reset screen

Password Change

Old password

New password

Confirm New password

Password must contain:

- Minimum 8 characters
- Uppercase and lowercase letters
- Minimum one number
- The password and confirmation must be equal.

Update

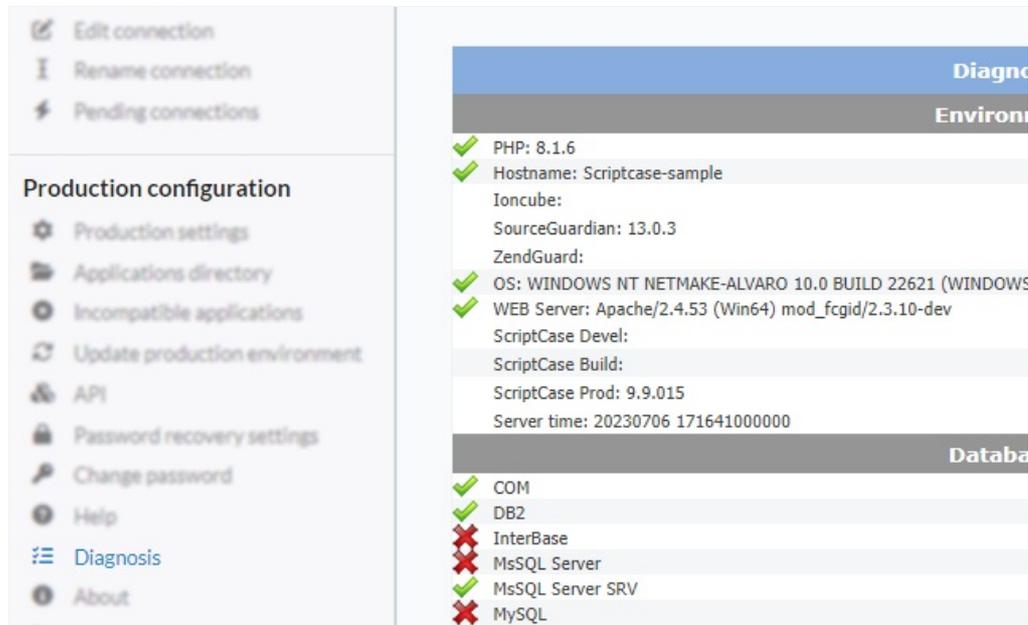

Help

Link to the documentation page on the website regarding the production environment.

Diagnosis

Displays your Web server configuration information, such as: PHP version used, enabled drivers, among other important information.

It is only possible to view this information after logging in to the production environment.

Scriptcase Macros Overview

What are macros?

Macros are functions created by Scriptcase developers to help you customize your application and coding. Using Macros simplifies your code editing as well as your validation processes.

The code editor within Scriptcase provides you some functionalities which allow you to change the code editor to wide screen or to display the sidebars menus with some options.

Once you're inside the event code editor, you will see the right side bar menu with the available macros being displayed with a green point

Scriptcase's macros always start you can type with a "sc_". A hint is that "sc_" and hit **ctrl + spacebar** in your keyboard to check a list of available macros in the event you are.

Where can they be used?

You can use the macros within the application events, depending on the scope described in the article [Events X Macros](#) and within [internal](#) or [external libraries](#) from Scriptcase. application methods and fields lookups.

SCRIPTCASE MACROS

Scriptcase has macros and special variables that allow the user to manipulate events, buttons, applications, security control, manipulate with dates, etc.

Follows a table of all macros and special variables from **ScriptCase**, including the list of applications that works for each one.

MACROS AND SPECIAL VARIABLES	
SQL	
sc_begin_trans ("Connection")	This macro starts a set of transactions in the database.
sc_change_connection ("Old_Connection", "New_Connection")	This macro dynamically change the application connections.
sc_commit_trans ("Connection")	Makes all data modifications performed since the beginning of the transaction a permanent part of the database.
sc_concat ()	This macro is used to combine two or more strings and/or fields from the table.
sc_connection_edit ("Connetion_Name", \$arr_conn)	This macro edits an existing connection at runtime.
sc_connection_new ("Connection_Name", \$arr_conn)	This macro creates new connections dynamically.
sc_error_continue ("Event")	This macro deactivates the Scriptcase standard database error treatment message for an event.
sc_error_delete	This macro configure the variable that contains the database error message that can occurs during the exclusion of a record.
sc_error_insert	This macro configure the variable that contains the database error message that can occurs during the addition of a record.
sc_error_update	This macro configure the variable that contains the database error message that can occurs during the update of a record.
sc_exec_sql ("SQL Command", "Connection")	This macro execute SQL commands passed as parameter or a SQL command in the SQL field action type.
sc_lookup (Dataset, "SQL Command", "Connection")	This macro executes a SELECT command stored in the second parameter and returns the data in a variable.
sc_lookup_field (Dataset, "SQL Command", "connection_name")	This macro executes a SELECT command stored in the second parameter and returns the data in a variable.
sc_reset_change_connection	This macro erases the changes made using "sc_change_connection".
sc_reset_connection_edit	This macro undoes the connection edits made by macro "sc_connection_edit".
sc_reset_connection_new	This macro undoes the connections made by the macro "sc_connection_new".
sc_rollback_trans ("Connection")	This macro discards a set of transations in the data base.
sc_select (dataset, "SQL Command", "Connection")	This macro executes the commands passed in the second parameter and returns the dataset in a variable.
sc_select_field ({Field})	This macro modify dynamically a field that will be recovered in the grid.
sc_select_order ("Field")	This macro modifies the grids "ORDER BY" clause field dynamically.
sc_select_where (add)	This macro dynamically adds a condition to the grid WHERE clause.
sc_set_fetchmode (parm);	This macro allows to change the type of return from the dataset of the select commands
sc_sql_injection ({My_Field}) or (\$My_Variable)	This macro is used to protect the field/variable against "SQL injection" attempts.
sc_sql_protect (Value, "Type", "Connection")	This macro protects the value passed as parameter according with the used database.
sc_where_current	This macro is used to make a reference of the where clause currently used.
sc_where_orig	Retrieve where clause used in original select command of the application.
Variables - Database Database Variables	Global variables containing database access values used by main connection.
Date	
sc_date (Date, "Format", "Operator", D, M, Y)	This macro calculates and returns increments and decrements using dates.
sc_date_conv ({Field_Date}, "Input_Format", "Output_Format")	This macro converts the date field passed as parameter with an input format to another field with an output format.
sc_date_diff ({Date1}, "Format Date1", {Date2}, "Format Date2")	This macro calculates the difference between two dates (passed as parameters) returning the result in days.
sc_date_diff_2 ({Date1}, "Format Date1", {Date2}, "Format Date2", Option)	This macro calculates the difference between two dates returning the amount of days, months and years.
sc_date_empty ({Field_Date})	This macro checks if a date field its empty returning a boolean.
sc_time_diff ({datetime_01}, "Date_01 Format", {datetime_02}, "Date_02 Format")	Calculate difference in hours, returning the amount of hours, minutes and seconds.
Control	
sc_actionbar_clicked_state ()	Returns the current state of the ajax button created in the action bar.
sc_actionbar_disable ("button_name")	Disables the buttons created on the action bar.
sc_actionbar_enable ("boton_nombre")	Enables the buttons created on the action bar.
sc_actionbar_hide ("button_name")	Hides created buttons in the action bar.
sc_actionbar_show ("button_name")	Displays the created buttons on the action bar.
sc_actionbar_state ("button_name", "state_name")	Changes the current state of the button on the action bar.
sc_ajax_javascript ('JavascriptMethodName', array("parameter"))	This macro allows the execution of JavaScript methods in form/control events
sc_alert ("Message", \$array)	This macro shows a Javascript alert message on the screen.
sc_api_download (profile, settings, file, destination)	This macro is used to download or download files using the Storage APIs.
sc_api_gc_get_obj (\$app_name , \$json_oauth, \$auth_code)	The macro sc_api_gc_get_obj generates the token_code
sc_api_gc_get_url (\$app_name, \$json_oauth)	This macro generates a URL for user authentication of the google account used for API configuration
sc_api_storage_delete (profile, file, parents)	This macro is used to delete files stored in cloud storage services.
sc_api_upload (profile, settings, file, parents)	This macro is used to upload files using the Storage APIs.
sc_apl_conf ("Application", "Property", "Value")	This macro modify the application execution property.
sc_apl_default ("application", "type");	This macro allows that the user defines in your initial application what will happen when the application lost the session.
sc_calc_dv (Digit, Rest, Value, Module, Weights, Type)	This macro calculate verifier digits. (checksums)
sc_call_api (\$profile, \$arr_settings)	This macro allows us to use as integrated Scriptcase APIs
sc_captcha_display ("on/off")	Dynamically controls the display of captcha in the application.
sc_changed ({Field_Name})	This macro returns "true" if the field name have been changed.
sc_confirm ("Message")	This macro shows a Javascript confirmation screen.
sc_decode ({My_Field})	This macro returns the encrypted field or variable to its original value.
sc_encode ({My_Field})	This macro returns the field or variable with the content encrypted.
sc_error_exit (URL / My_Application, "Target");	Interrupts the method being processed and must be used in conjunction with the "sc_error_message" macro
sc_error_message ("Text")	This macro generates an error message.

sc_exit (Option)	This macro forces the application to exit.
sc_field_no_validate ('field_name')	It ignores the validations defined in the field configuration screen, such as: Required field, character types, among others.
sc_getfield ("myField")	This macro assigns the properties of a field to a javascript variable.
sc_get_language	This macro returns the abbreviation of the language being used.
sc_get_regional	This macro returns the abbreviation of the regional settings being used.
sc_get_theme	This macro returns the application theme name.
sc_get_wizard_step	Retrieves the id of the current page, in the transition between the steps of a wizard form.
sc_groupby_label ("My_Field")	This macro dynamically modify the field label displayed in group by lines.
sc_image (Image01.jpg)	This macro loads images passed as parameter to use in the application.
sc_include ("File", "Source")	This macro is used to "include" PHP routines.
sc_include_lib ("Lib1", "Lib2", ...)	This macro is used to dynamically select the application libraries.
sc_include_library ("Target", "Library Name", "File", "include_once", "Require")	This macro includes a PHP file from a library in the application.
sc_label ("field_name")	This macro its used to modify dynamically the grid form field label.
sc_language	This macro returns the application language
sc_link (Column, Application, Parameters, "Hint", "Target", Height, Width)	This macro dynamically creates or modifies links between grid applications and other applications.
sc_log_add ("action", "description")	This macro will add a record into the log table.
sc_log_split ({description})	This macro returns what was inserted in the "description" field of the log table in an array format.
sc_mail_send (SMTP, Usr, Pw, From, To, Subject, Message, Mens_Type, Copies, Copies_Type, Port, Connection_Type, Attachment, SSL)	This macro is used to send e-mails.
sc_make_link (Application, Parameters)	This macro is used to create a string with the link data to another application.
sc_master_value ("Object", "Value")	This macro update a Master Application object from a Detail Application.
sc_redir ('app_name/url', parameter01; parameter02, 'target', 'error', 'modal_height', 'modal_width')	This macro is used to redirect to another application or URL.
sc_reset_apl_default	This macro can reset sc_apl_default macro settings.
sc_reset_global ([Global_Variable1], [Global_Variable2] ...)	This macro deletes session variables received as a parameter or multiple parameters.
sc_send_mail_api (\$arr_settings)	Enables dynamic sending of embedded emails with Mandrill and Amazon SES
sc_send_notification ('title', 'message', 'destiny_type', 'to', 'from', 'link', 'dtxpire', 'profile')	Sends notifications dynamically to the system users.
sc_send_sms (\$arr_settings)	This macro is used to send text SMS messages
sc_seq_register	This macro provide the register sequential number.
sc_set_global (\$variable_01) or ({My_Field})	This macro is used to register session variables.
sc_set_groupby_rule	This macro is used to select a specific GROUP BY rule.
sc_set_language ('String Language')	This macro allows us to dynamically change the application language.
sc_set_regional ('String Regional')	This macros allows to dynamically change the application regional settings.
sc_set_theme ('String Theme')	This macro is used to dynamically define the application themes.
sc_site_ssl	This macro verifies if its been used on a safe/secure site. (https protocol)
sc_statistic (arr_val, tp_var)	Calculates and returns an array with statistical values, from an array with numeric values
sc_trunc_num ({My_Field}, Decimal_Number)	This macro its used to set the number of decimals.
sc_url_exit (URL)	This macro modifies the application exit URL.
sc_url_library ("Target", "Library Name", "File")	This macro returns the path of a file, inside a library, to be used on the applications.
sc_warning 'on' or 'off'	This macro dynamically activates or deactivates warning messages control.
sc_webservice ("Method", "URL", "Port", "Send Method", "Parameters Array", "Setting's Array", "Timeout", "Return")	This macro is used to communicate with a web service.
sc_zip_file ("File", "Zip")	This macro is used to generate ZIP files from a file list and/or directories.
Variables - Totalling Totalling Variables	Variables that contains all the totals (general and for grouping).
Variables - Totalling (group by) Totalling Variables (group by)	Breaking totals variables.
Filter	
sc_where_filter	This macro its used to save the where clause content generated through the filter form.
Security	
sc_apl_status ("Application", "Status")	This macro Activate/Deactivate the applications at user level.
sc_ldap_groups	Retrieves the existing groups in Active Directory (AD).
sc_ldap_login (\$server, \$version, \$user, \$password, \$dn, \$group, \$port, \$library)	Main macro for LDAP authentication, responsible for establishing the connection with the server.
sc_ldap_logout ()	This macro is used to release the connection after using the macro sc_ldap_login
sc_ldap_search (\$filter = 'all', \$attributes = array())	This macro is used to perform searches in the LDAP.
sc_ldap_users (\$filter = 'all', \$attributes = array())	Retrieves LDAP users and their attributes based on the authenticated user's permissions.
sc_reset_apl_conf ("Application", "Property")	This macro deletes all the modifications effected by "sc_apl_conf" macro.
sc_reset_apl_status	This macro deletes all the application security status variables.
sc_reset_menu_delete	This macro restores a menu item structure. (removed by the macro "sc_menu_delete").
sc_reset_menu_disable	This macro its used to enable a menu item structure. (disabled by the macro "sc_menu_disable").
sc_user_logout ('variable_name', 'variable_content', 'apl_redir.php', 'target')	Macro used to log the user out to the system.
Shows	
sc_ajax_message ("Message", "Title", "Parameters", "Parameters_Redir", "String_toast");	This macro allows the application to display customized messages.
sc_ajax_refresh	Used to dynamically reload data in grid applications.
sc_block_display (Block_Name, on/off)	This macro dynamically show/hide the fields of a specific block.
sc_change_css ("attribute", "value", "field_name")	Allows manipulating CSS properties of query fields and rows.
sc_event_hint ('field_name', 'help message', maximum_width)	Allows adding a help text to links created from an onClick Ajax event.
sc_field_color ("Field", "Color")	This macro changes the color of a determined field text.
sc_field_disabled ("Field_Name = True/False", "Parameter")	This macro is used to block a field to get any data that would be typed on it.
sc_field_disabled_record ("Field_Name = True/False", "Parametre")	This macro has the objective to block the typing on determined fields in the Forms.
sc_field_display ({My_Field}, on/off)	This macro will display or hide a specific field dynamically.
sc_field_init_off (Field1, Field2,...)	This macro is intended to inhibit the query fields on the initial load.
sc_field_readonly ({Field}, on/off)	This macro dynamically sets a form field attribute to "Read-Only"
sc_field_style ({My_Field}, "Background-Color", "Size", "Color", "Family", "Weight")	This macro allows to dynamically modify the grid field style.
sc_foot_hide ()	This macro disables the footer display.

sc_format_num ({My_Field}, "Group_Symb", "Dec_Symb", "Amount_Dec", "Fill_Zeros", "Side_Neg", "Currency_Symb", "Side_Currency_Symb")	This macro its used to format numerical values.
sc_format_num_region ({My_Field}, "Qtde_Dec", "Insert_Zeros", "Monetary_Sym")	This macro has the objective to format numbers, using the regional settings
sc_form_show 'on' or 'off'	This macro dynamically show or hide the form.
sc_get_groupby_rule ()	This macro provides the name of the Group By rule running at the time.
sc_head_hide ()	Inhibits the header display.
sc_hide_groupby_rule ('group1', 'grop2', 'group3')	Macro used to disable Group By rules.
sc_set_focus ('Field')	This macro its used to set the focus to a specific field in a form application.
sc_text_style ({My_Field}, "Background-Color", "Size", "Color", "Family", "Weight")	This macro allows to dynamically modify the text style of a grid field.
Buttons	
sc_btn_copy	This macro returns "true" when the "copy" button is selected in a form.
sc_btn_delete	This macro returns "true" when the "Delete" button is selected in a form.
sc_btn_disabled ("name_button", "status")	It is intended to dynamically enable or disable a toolbar button.
sc_btn_display ("Button_Name", "on/off")	This macro shows and hides buttons on the toolbar in execution time.
sc_btn_insert	This macro returns "true" when the "Add" button is selected in a form.
sc_btn_label ("btn_name", "new_label")	This macro is used to change the label of the buttons.
sc_btn_new	This macro returns "true" when the "Add New" button is selected in a form.
sc_btn_update	This macro returns "true" when the "Save" button is selected in a form.
PDF	
sc_set_export_name ("export_type", "file_name")	Changes the name of files exported by the query
Variables - Authentication Authentication Variables	User/Password for the WEB server.
Menu	
sc_appmenu_add_item ("Menu_Name", "Id_Item", "Id_Parent", "Label", "Aplication", "Parameters", "Icon", "Hint", "Target")	This Macro adds an item to the menu dynamically.
sc_appmenu_create ("Menu_Name")	This macro dynamically creates a menu item.
sc_appmenu_exist_item ("Menu_Name", "Id_Item")	This macro checks if there is a menu item.
sc_appmenu_remove_item ("Menu_Name", "Id_Item")	This macro dynamically removes a menu item.
sc_appmenu_reset ("Menu_Name")	This macro reset the array used in the dinamicly creation of a menu application.
sc_appmenu_update_item ("Menu_Name", "Id_Item", "Id_Parent", "Label", "Aplication", "Parameters", "Icon", "Hint", "Target")	This macro updates a menu item.
sc_btn_disable ('button_id', 'on/off')	This macro is used to disable Menu buttons.
sc_menu_delete (Id_Item1)	This macro remove items of the menu structure.
sc_menu_disable (Id_Item1)	This macro deactivates menu structure items.
sc_menu_force_mobile (boolean)	This macro is used to force the creation of menus to mobile devices.
sc_menu_item	This macro identifies the menu item selected.
sc_script_name	This macro identifies the application name that was selected in the menu.

[sc_actionbar_clicked_state\(\)](#)

--

The `sc_actionbar_clicked_state()` macro allows the developer to retrieve the current state of an action bar button at the moment of the click. This way, it is possible to validate the current state of the button and, based on the system's business rules, change it as necessary.

This macro is exclusive to AJAX events of action bar buttons.

Examples

Example: Identification of the current state of the button in the ajax event, to change the state when clicking.

```
if (sc_actionbar_clicked_state() == 'pending') {  
    sc_actionbar_state('ajax_btn', 'sent');  
} else {  
    sc_actionbar_state('ajax_btn', 'pending');  
}
```

Example: Example for viewing the current value of the button.

```
echo sc_actionbar_clicked_state();
```

Macro Scope

Grid application

onClick

`sc_actionbar_disable("button_name")`

Disables the action bar button, making it unavailable for clicking.

This macro can be used for any type of button (link or ajax) on the action bar.

Parameter definition

Parameter	Syntax	Description
button_name	<p>It is not possible to use variables, the name of the button must be informed using double quotes or single quotes.</p> <p>Example <code>sc_actionbar_disable("ajax_btn");</code></p>	<p>This parameter is mandatory.</p> <p>We must inform the name of the action bar button that will be disabled.</p>

Examples

Example 1: Basic macro usage

```
sc_actionbar_disable("link_detalhe");
```

Example 2: Disabling the link button to the order detail if there are no items in the order.

```
// Example created in the onRecord event of the grid using the order and orderdetail table
// If there are no items in the order, the button will be disabled
```

```
$query = "SELECT count(*) FROM OrderDetails WHERE OrderID = ". {OrderID};
sc_lookup(ds, $query);
```

```
if ({ds[0][0]} == 0) {
```

```
    //Exemplo de utilização da macro sc_actionbar_disable
```

```
    sc_actionbar_disable("button_name");
```

```
} else {
```

```
    sc_actionbar_enable("button_name");
```

```
}
```

Macro Scope

Grid application

```
onClick
onRecord
```

```
sc_actionbar_enable("boton_nombre")
```

Enables the action bar button, making it available for clicking.

This macro can be used for any type of button (link or ajax) on the action bar.

Parameter definition

Parameter	Syntax	Description
button_name	<p>It is not possible to use variables, the name of the button must be informed using double quotes or single quotes</p> <p>Example <code>sc_actionbar_enable("ajax_btn");</code></p>	<p>This parameter is mandatory.</p> <p>We must inform the name of the action bar button that will be enabled.</p>

Examples

Example 1: Basic macro usage

```
sc_actionbar_enable("button_name");
```

Example 2: Enabling the link button to the order detail if there is any record to be displayed.

```
// Example created in the onRecord event of the grid using the order table and orderdetail table
// If there are no items ordered in the measurement, the button will be disabled
```

```
$query = "SELECT count(*) FROM OrderDetails WHERE OrderID = " . {OrderID};
sc_lookup(ds, $query);
```

```
if ({ds[0][0]} <> 0) {
```

```
    //Example of using the sc_actionbar_enable macro
    sc_actionbar_enable("button_name");
```

```
} else {
```

```
    sc_actionbar_disable("button_name");
```

```
}
```

Macro Scope

Grid application

```
onClick
onRecord
```

```
sc_actionbar_hide("button_name")
```

This macro hides the button created on the action bar, which can be displayed again with the `sc_actionbar_show` macro.

This macro can be used with any type of button (link or ajax) created in the action bar.

Parameter definition

Parameter	Syntax	Description
button_name	<p>It is not possible to use variables. The button name must be informed using double quotes or single quotes.</p> <p>Example <code>sc_actionbar_hide("ajax_btn");</code></p>	<p>This parameter is mandatory.</p> <p>We must inform the name of the action bar button that must be hidden.</p>

Exemplos

Example 1: Basic macro usage

```
sc_actionbar_show("button_name");
```

Example 2: Showing the order detail link button if there are any records to show.

```
// Example created in the onRecord event of the query using the order and orderdetail table
// If there are no items in the order, the detail link button will be hidden.
```

```
$query = "SELECT count(*) FROM OrderDetails WHERE OrderID = " . {OrderID};
sc_lookup(ds, $query);
```

```
if ({ds[0][0]} == 0) {
```

```
    //Example of using the macro sc_actionbar_hide
    sc_actionbar_hide("button_name");
```

```
} else {
```

```
    sc_actionbar_show("button_name");
```

```
}
```

Macro Scope

Grid application

```
onClick
onRecord
```

```
sc_actionbar_show("button_name")
```

This macro displays the action bar button, hidden using the `sc_actionbar_hide` macro

This macro can be used for any type of button (link or ajax) on the action bar.

Parameter definition

Parameter	Syntax	Description
button_name	<p>It is not possible to use variables. The button name must be informed using double quotes or single quotes.</p> <p>Example <code>sc_actionbar_show("ajax_btn");</code></p>	<p>This parameter is mandatory.</p> <p>We must inform the name of the action bar button that will be displayed.</p>

Exemplos

Example 1: Basic macro usage

```
sc_actionbar_show("button_name");
```

Example 2: Showing the order detail link button if there are any records to show.

```
// Example created in the onRecord event of the query using the order and orderdetail table
// If there are no items in the order, the button will not be displayed
```

```
$query = "SELECT count(*) FROM OrderDetails WHERE OrderID = " . {OrderID};
sc_lookup(ds, $query);
```

```
if ({ds[0][0]} <> 0) {
```

```
    //Exemplo de utilização da macro sc_actionbar_enable
    sc_actionbar_show("button_name");
```

```
} else {
```

```
    sc_actionbar_hide("button_name");
```

```
}
```

Macro Scope

Grid application

```
onClick
onRecord
```

```
sc_actionbar_state("button_name", "state_name")
```

This macro allows you to change the current state of the action bar button through.

To use the button's, *ajax* event, we recommend using this macro together with `sc_actionbar_clicked_state()`; that makes it possible to recover the current state of the button.

Definition of Parameters

Parameters	Type	Values	Description
<code>button_name</code>	string	The button name must be informed using double quotes or single quotes. Example In bold, you can see the example of how the parameter <code>button_name</code> must be informed: <code>sc_actionbar_state("ajax_btn", "sent");</code>	This is a mandatory parameter. You need inform the name of the button created on the action bar.
<code>state_name</code>	string	The state name must be informed using double quotes or single quotes. Example In bold, you can see the example of how the parameter <code>state_name</code> must be informed: <code>sc_actionbar_state("ajax_btn", "sent");</code>	This is a mandatory parameter. You need inform the name of the next state that the button will assume.

Examples

Example - Changing the *ajax_btn* button state between **pending** and **sent** in the button's onclick event.

```
if (sc_actionbar_clicked_state() == 'pending') {
    sc_actionbar_state('ajax_btn', 'sent');
} else {
    sc_actionbar_state('ajax_btn', 'pending');
}
```

Example - Changing the state of the *ajax_btn* button between **pending** and **sent**, and storing the change in the base in the *email_sent* field.

```
if (sc_actionbar_clicked_state() == 'pending') {
    $update = "update orders set email_sent = 'S' WHERE orderid = ". {orderid};
    sc_exec_sql($update);
    sc_actionbar_state('ajax_btn', 'sent');
} else {
    $update = "update orders set email_sent = 'N' WHERE orderid = ". {orderid};
    sc_exec_sql($update);
    sc_actionbar_state('ajax_btn', 'pending');
}
```

Example - Display of the state of the *ajax_btn* button according to the value stored in the *email_sent* field in the *onRecord* event of the Grid application.

```
if ({email_sent} == 'S') {
    sc_actionbar_state('ajax_btn', 'sent');
} else {
    sc_actionbar_state('ajax_btn', 'pending');
}
```

Macro Scope

Grid application

onClick
onRecord

```
sc_ajax_javascript( 'JavascriptMethodName', array("parameter"))
```

 [Watch a tutorial](#)

This macro allows the execution of JavaScript methods called from some events from **form, control, and calendar applications**.

To use this macro you need to create a javascript method in the [Programming settings](#).

This macro receives two parameters:

The first parameter (required) receives the javascript method name.
The second (optional) receives an array with the method parameters on it.

Examples:

Ex. 1: Method javascript without parameters:

```
sc_ajax_javascript('method_name');
sc_ajax_javascript('sum');
```

Ex. 2: Method javascript with a parameter:

```
sc_ajax_javascript('method_name', array("parameter"));
```

Ex. 3: Method javascript with two parameters:

```
sc_ajax_javascript('method_name', array("param1","param2"));
```

Example using global variables:

```
sc_ajax_javascript('sum', array([num1],[num2]));
```

Macro Scope

calendar application	Form application	Control Form
ajaxFieldonBlur	ajaxFieldonBlur	
OnChange	OnChange	
OnClick	OnClick	
OnFocus	OnFocus	
onAfterDelete	onAfterDelete	onBlur
onAfterDeleteAll	onAfterDeleteAll	onChange
onAfterInsert	onAfterInsert	onClick
onAfterInsertAll	onAfterInsertAll	onFocus
onAfterUpdate	onAfterUpdate	onValidateFailure
onAfterUpdateAll	onAfterUpdateAll	
onValidate	onValidate	
onValidateFailure	onValidateFailure	
onValidateSuccess	onValidateSuccess	

```
sc_ajax_message("Message", "Title", "Parameters", "Parameters_Redir", "String_toast");
```

[Watch a tutorial](#)

This macro allows the application to show customizable messages. Its use is restricted to **AJAX events of Form/Control applications**.

This macro is only available in applications with **AJAX support**.

Parameters	Description
Message	The message to be shown. This parameter is required.
Title	Messagebox title, if this parameter is empty, the title will not be shown.
Message Parameters String	Message format parameters. Ex.: modal=Y&button=Y&button_label=Ok&redir=form_employees.php&redir_target=_blank For more details about this parameter, see Table2.
Redirecting Parameters String	In this section is possible to define values for the redirecting target application. This parameter works only if a "redir" property was info for this parameter must be informed in this format: parameter=value;parameter=value. Ex.: customer_id=ALFKI;customer_name=ALBERT FRANCINET
Toast parameter string	Message formatting parameter using Toast. - toast : Y or N - toast_pos : 'top', 'top-start', 'top-end', 'center', 'center-start', 'center-end', 'bottom', 'bottom-start', 'bottom-end' - type : 'warning', 'error', 'success', 'info', 'question'

Table2: Message Parameters String

Property	Description	Values	Example
modal	Flag to define if the message will be shown in modal	Y or N	modal=Y
timeout	Time in seconds to hide the message. If this property is not informed, the message will be shown indefinitely. This property works only if "button" property is not enabled.	Seconds	timeout=5
button	Shows a button inside the message. This button default function is to close the message. If there is redirecting enabled, the application will be redirected after closing the message.	Y or N	button=Y
button_label	Button label. This option works only if the "button" property is enabled.	String	button=Y&button_label=OK
top	Message positioning value in pixels from top margin.	Pixels Number	top=300
left	Message positioning value in pixels from left margin.	Pixels Number	left=200
width	Messagebox width value in pixels	Pixels Number	width=320
height	Messagebox height value in pixels	Pixels Number	height=30
redir	URL or application name for redirecting. This macro works only if the "button" property is enabled.	String	button=Y&redir=form_employees.php
redir_target	Target for redirecting. This property works only when the "redir" property is enabled.	String	redir=form_employees.php&redir_target=_blank
show_close	Flag for exhibition of the "close" button on the messagebox title bar. When activated, this parameter forces a title bar to be shown, even if there is no title defined.	Y or N	show_close=Y
sc_ajax_refresh	Flag for exhibition of icon on the message body. The icon exhibition depends on the applications theme configuration (exhibition_excludes)	Y or N	body_icon=N

Example of use

Example 01

```
Supd = "UPDATE order SET status = 'completed' WHERE id = ". {orderid};
sc_ajax_message("Message", "Title", "timeout=0");
// Now the macro will be used to refresh the application's data.
sc_ajax_refresh();
```

Example 02: Using Toast

```
sc_ajax_message ("Client", "Title", "toast=Y&toast_pos=center-start&type=success");
```

Grid application

To display the message using Toast, this option must be enabled in the application interface.

sc_alert("Message", \$array)

Macro Scope

calendar application Grid application Form application Control Form

 [Watch a tutorial](#)

This macro sends a message in the alert style of Javascript (Sweetalert) or Sweetalert2.

Ps

To display the message using a/sweetalert2 library, the Use SweetAlert option must be enabled in the application where the macro will be used.

This option can be enabled in the application's configuration menu. To access the click on: Application> Configuration the option is in the Notification Settings block

Check below the parameters supported by the macro:

- **Message:** Mandatory parameter that contains the message that will be displayed.
- **\$array:** This parameter is optional when using the macro, more mandatory when we want to use Sweetalert2. When used, it expects to receive an array with Sweetalert2's settings.

Check the list of configurations accepted by Sweetalert2 in this macro:

Parameter	Value	Description
title	Example of how it should be informed within the array: 'title' => 'Titulo'	Text that will be displayed in the card title, if the toast option is marked as false. 'toast' => false
type	Example of how it should be informed within the array: 'type' => 'warning' List of accepted options: <ul style="list-style-type: none"> • success • error • warning • info 	Defines the type of message that will be displayed.
timer	Example of how it should be informed within the array: 'timer' => '2000'	Defines the time in milliseconds that the message will be displayed.
showConfirmButton	Example of how it should be informed within the array: 'showConfirmButton' => false List of accepted options: <ul style="list-style-type: none"> • True: Exibe o botão de confirmação. • false: Não exibe o botão de confirmação. 	Defines whether a confirmation button is displayed.
position	Example of how it should be informed within the array: 'position' => 'bottom-end' , List of accepted options: <ul style="list-style-type: none"> • top • top-start • top-end • center • center-start • center-end • bottom • bottom-start • bottom-end 	Defines the position where the pop-up will be displayed.
toast	Example of how it should be informed within the array: 'toast' => true	Defines whether or not we will use toast to display messages. When enabled, this option does not display the confirmation button.

Check below the examples of use of the macro:

E.g.: Message using Sweetalert

```
sc_alert("This is an alert message!!");
```

E.g.: Message using Sweetalert2

```
$params = array(
'title' => 'Title',
'type' => 'success',
'timer' => '2000',
'showConfirmButton' => false,
'position' => 'bottom-end',
'toast' => true
);
```

```
sc_alert("Inserted successfully!", $params);
```

Macro Scope

-----------	---	--	-----------------------------------	---	---	--	--------	--

sc_api_download(profile, settings, file, destination)

This macro is used to download the files stored in the Storage services available in Scriptcase, they are: Google Drive, DropBox and Amazon S3.

First of all, it is necessary to create the keys to use these APIs, either for use with the macro or through the tool interface.

See below for how to obtain the credentials for each of them.

- [Click here to learn how to get Google Drive credentials](#)
- [Click here to learn how to get DropBox credentials](#)
- [Click here to learn how to get Amazon S3 credentials](#)

Parameters

Parameters	Value	Description
profile	<p>Example of how the parameter should be informed.</p> <pre>'profile' => 'profile_name',</pre> <p>This parameter accepts only the name of the profile created.</p> <p>Click here, to see how to create a profile.</p>	<p>We must inform the name of the profile creating in the APIs option in the Tools menu.</p> <p>When used, this parameter loads the settings informed when the profile is created.</p> <p>When used, the settings parameter does not need to be informed.</p> <p>For more details see Using the macro with profile</p>
settings	<p>Example of how the parameter should be informed.</p> <pre>'settings' => ['app_name' => 'scriptcase', 'gateway' => 'dropbox', 'api_key' => "", 'api_secret' => "", 'access_token' => "",],</pre> <p>Note: For more information about the parameter, see the exclusive settings table below, for each of the APIs</p>	<p>It receives an array with the access credentials for the API that will be used.</p> <p>When used, the profile parameter does not need to be entered.</p>
file	<p>Example of how the parameter should be informed.</p> <pre>'file' => {image_file_name},</pre> <p>Allowed options:</p> <ul style="list-style-type: none"> • {image_file_name} • [global_variable] • 'File path' 	<p>This parameter receives the full path until the file is located.</p> <p>When using a field, it must be the upload nome do file type.</p>
destination	<p>Example of how the parameter should be informed.</p> <p>Using a field</p> <pre>'parents' => {field_name},</pre> <p>Informando uma String</p> <pre>'parents' => 'folder_name',</pre> <p>Allowed options:</p> <ul style="list-style-type: none"> • {field_name} • [global_variable] • 'Folder name or local cloud storage path' 	<p>Directory where the file will be stored</p> <p>When not informed, the file will be stored at the root of the storage server.</p>

Using the macro with profile

The use of the macro with a profile requires the prior creation of the same.

[Click here](#) to see how to create a profile on each of the available storage APIs.

The profile contains the data to use the desired API, thus, when using a profile in the macro, it is not necessary to use the settings parameter.

The profile parameter accepts only the name of the profile created, for the dynamic use of the macro, it will be necessary to use the settings parameters.

Example of using the macro with the profile.

```
sc_api_download([
  'profile' => 'myApi',
  'file' => {file},
  'destination' => {destination},
]);
```

Using the macro with settings parameter

The array with the access credentials that must be passed in the settings parameter varies according to the API used.

See below how to use this parameter according to each of the available APIs.

When using the settings parameter in the configuration in the macro, it is not necessary to inform a profile.

Using The Macro With Settings - Google Drive API

First, we must have the credentials for using the Google Drive API in hand, [click here](#) to learn how to obtain them.

After configuring the credentials, see below all the values of the array that must be passed in the settings parameter using the Google Drive API.

All values below are mandatory when using the settings parameter

Index	Value	Description
app_name	Example of how the parameter should be informed. <code>'app_name' => 'scriptcase',</code> This index accepts only string	App name entered when creating access credentials.
gateway	Example of how the parameter should be informed. <code>'gateway' => 'google_driver',</code> This index accepts only string	Gateway name to identify the API used.
json_oauth	Example of how the parameter should be informed. <code>'json_oauth' => 'JSON_code',</code> Allowed options: <ul style="list-style-type: none"> • 'string' • {field_name} • \$variable 	Receives the contents of the user generated authentication (JSON) file. This file must be downloaded after creating the credentials on the google website.
auth_code	Example of how the parameter should be informed. <code>'auth_code' => '5/4wHt7TBTY4MtvQ',</code> Allowed options: <ul style="list-style-type: none"> • {field_name} • \$variable 	Receives the auth_code code, generated after configuring the API following the steps described in the tutorial How to generate the auth_code for using the Google Driver API
token_code	Example of how the parameter should be informed. <code>'token_code' => '4/4wHt7TBTY4MtvQ',</code> Allowed options: <ul style="list-style-type: none"> • 'string' • {field_name} • \$variable 	It is possible to generate the token_code using our sc_api_gc_get_obj macro

Examples when using the macro in Google Drive implementing the parameter settings

```
sc_api_download([
'settings' => [
'app_name' => {appname},
'gateway' => 'google_drive',
'json_oauth' => {jsonoauth},
'auth_code' => {authcode},
'token_code' => {tokencode},
],
'file' => {files},
'destination' => {destination},
]);
```

Using A Macro With Settings - Dropbox

First, we must have the credentials for using the Google Drive API in hand, [click here](#) to learn how to obtain them.

After configuring the credentials, see below all the values of the array that must be passed in the settings parameter using the Dropbox API.

All values below are mandatory when using the settings parameter

Index	Value	Description
app_name	Example of how the parameter should be informed. <code>'app_name' => 'scriptcase',</code> This index accepts only string	App name entered when creating access credentials.

gateway	Exemplo de como o parâmetro deve ser informado. <code>'gateway' => 'google_driver',</code> This index accepts only string	Gateway name to identify the API used.
api_key	Exemplo de how the parameter should be informed. <code>'api_key' => {field_name},</code> Allowed options: <ul style="list-style-type: none"> • 'string' • {field_name} • \$variable 	Receives the app key, generated after configuring the API.
api_secret	Exemplo de how the parameter should be informed. <code>'api_secret' => {field_name},</code> Allowed options: <ul style="list-style-type: none"> • 'string' • {field_name} • \$variable 	Receives the app secret, generated after configuring the API.

Examples when using the macro in Dropbox implementing the parameter settings

```
sc_api_download([
'settings' => [
'gateway' => 'dropbox',
'api_key' => {apikey},
'api_secret' => {apisecret},
'access_token' => {accesstoken},
],
'file' => {file},
'destination' => {destination},
]);
```

Using The Macro With Settings - Amazon S3

First, we must have the credentials for using the Amazon S3 STORAGE API in hand, [click here](#) to learn how to obtain them.

After configuring the credentials, see below all the values of the array that must be passed in the settings parameter using the Amazon S3 API.

All values below are mandatory when using the settings parameter]

Index	Value	Description
app_name	Exemplo of how the parameter should be informed. <code>'app_name' => 'scriptcase',</code> This index accepts only string	App name entered when creating access credentials.
gateway	Exemplo of how the parameter should be informed. <code>'gateway' => 'google_driver',</code> This index accepts only string	Gateway name to identify the API used.
api_key	Exemplo of how the parameter should be informed. <code>'api_key' => {nome_campo},</code> Allowed options: <ul style="list-style-type: none"> • 'string' • {field_name} • \$variable 	Receives the api key, generated after configuring the API.
api_secret	Exemplo of how the parameter should be informed. <code>'api_secret' => {nome_campo},</code> Allowed options: <ul style="list-style-type: none"> • 'string' • {field_name} • \$variable 	Receives the api secret, generated after configuring the API.
region	Exemplo of how the parameter should be informed. <code>'region' => 'us-east-1',</code> The region parameter of the macro accepts only the region code. To make it easier, follow a link to check the code for each region. https://docs.aws.amazon.com/general/latest/gr/rande.html	Receives the region code, the same used in the creation of credentials.
bucket	Exemplo of how the parameter should be informed. <code>'bucket' => 'bucket_name',</code> Allowed options: <ul style="list-style-type: none"> • 'string' • {field_name} • \$variable 	Receives the Bucket Name, generated after configuring the API.

Examples when using the macro in Amazon S3 implementing the parameter settings

```
sc_api_download([
'settings' => [
'app_name' => 'scriptcase',
'gateway' => 'S3',
'api_key' => {apikey},
```

```
'api_secret' => {apisecret},
'region' => {api_region},
'bucket' => {api_bucket},
},
'file' => {file},
'destination' => {destination},
]);
```

Macro Scope

Grid application	Form application
onRecord	onLoad onLoadRecord

sc_api_gc_get_obj(\$app_name, \$json_oauth, \$auth_code)

The **sc_api_gc_get_obj** macro generates the token_code. It has three parameters:

1. **app_name** - Receive the app_name, available in your api configuration. This parameter accepts strings or variable.
2. **json_oauth** - Receives the content of the json file, this file is available for download in your API settings. This parameter accepts strings or variable.
3. **auth_code** - Receives the auth_code generated in the previous step or another valid auth_code that you have already generated.

For more usage and example information visit our knowledge base article: [How to generate the auth code and token code](#)

Macro Scope

calendar application	Grid application	Search application	Form application	Control Form	Menu application
onApplicationInit onScriptInit	onScriptInit	onFilterInit	onScriptInit	onApplicationInit onScriptInit	onApplicationInit

sc_api_gc_get_url(\$app_name, \$json_oauth)

The **sc_api_gc_get_url** macro generates a URL for google account user authentication used for API configuration.

It has two parameters:

1. **app_name** - Receive the app_name, available in your api configuration. This parameter accepts strings or variable.
2. **json_oauth** - Receive the content of the json file, this file is available for download in your api settings. This parameter accepts strings or variable.

For more usage and example information visit our knowledge base article: [How to generate the auth code and token code](#)

Macro Scope

calendar application	Form application	Control Form	Menu application	ReportPDF application
onApplicationInit onScriptInit	onScriptInit	onScriptInit	onApplicationInit	onApplicationInit

sc_api_storage_delete(profile, file, parents)

The macro `sc_api_storage_delete` is used to delete files stored on the storage services available in Scriptcase: Google Drive, Amazon, and Dropbox.

To use the macro, you need to configure the APIs; see the documentation below.

- [Google Drive API Configuration](#)
- [Dropbox API Configuration](#)
- [Amazon S3 API Configuration](#)

Parameter List

Parameter	Example	Description
profile	In this parameter, you should provide the profile name configured in the API menu. <code>'profile' => 'my_api'</code>	This receives the profile name created in the Tools > API menu, retrieving the data entered for API usage. Click here to see how to create a profile.
file	Using a field <code>'file' => {upload_file_name}</code> The file name can be provided using: <ul style="list-style-type: none"> • {upload_file_name} • [global_variable] • 'File path string' 	Receives the name of the file to be deleted from the storage server.
parents	Using a field <code>'parents' => {text_field_name}</code> The directory can be provided using: <ul style="list-style-type: none"> • {text_field_name} • [global_variable] • 'Folder name or local path in cloud storage' 	Directory where the file is stored in the cloud. If no value is provided, the API will use the root directory of the storage server to find the file to be deleted.

Example

```
sc_api_storage_delete({
  'profile' => 'my_profile',
  'file' => {file_name},
  'parents' => 'storage_directory',
});
```

Macro Scope

`sc_api_upload(profile, settings, file, parents)`

This macro is used to upload files to the cloud using the Google, Amazon and DropBox Storage APIs.

First of all, it is necessary to create the keys for using the API, either with the macro or in the fields interface.

- [Click here to learn how to get Google Drive credentials](#)
- [Click here to learn how to get DropBox credentials](#)
- [Click here to learn how to get Amazon S3 credentials](#)

After obtaining the credentials, proceed with the macro configuration.

See the list of parameters below.

Parameters	Value	Description
------------	-------	-------------

profile	<p>Example of how the parameter should be informed.</p> <pre>'profile' => 'profile_name',</pre> <p>This parameter accepts only the name of the profile created.</p> <p>Click here, to see how to create a profile.</p>	<p>We must inform the name of the profile creating in the APIs option in the Tools menu.</p> <p>When used, this parameter loads the settings informed when the profile is created.</p> <p>When used, the settings parameter does not need to be informed.</p> <p>For more details see Using the macro with profile</p>
settings	<p>Example of how the parameter should be informed.</p> <pre>'settings' => ['app_name' => 'scriptcase', 'gateway' => 'dropbox', 'api_key' => "", 'api_secret' => "", 'access_token' => "",],</pre> <p>Note: For more information about the parameter, see the exclusive settings table below, for each of the APIs</p>	<p>It receives an array with the access credentials for the API that will be used.</p> <p>When used, the profile parameter does not need to be entered.</p>
file	<p>Example of how the parameter should be informed.</p> <pre>'file' => {image_file_name},</pre> <p>Allowed options:</p> <ul style="list-style-type: none"> • {image_file_name} • [global_variable] • 'File path' 	<p>This parameter receives the full path until the file is located.</p> <p>When using a field, it must be the upload nome do file type.</p>
parents	<p>Example of how the parameter should be informed.</p> <p>Using a field</p> <pre>'parents' => {field_name},</pre> <p>Informando uma String</p> <pre>'parents' => 'folder_name',</pre> <p>Allowed options:</p> <ul style="list-style-type: none"> • {field_name} • [global_variable] • 'Folder name or local cloud storage path' 	<p>Directory where the file will be stored</p> <p>When not informed, the file will be stored at the root of the storage server.</p>

As seen above, the **settings** parameter receives an array with the access credentials for the API used.

This parameter should be used only when we have not defined a profile in the Tools> API menu

Each API has its own settings for the settings parameter, see below how each should be configured.

Using the macro with profile

The use of the macro with a profile requires the prior creation of the same.

[Click here](#) to see how to create a profile on each of the available storage APIs.

The profile contains the data to use the desired API, thus, when using a profile in the macro, it is not necessary to use the settings parameter.

The profile parameter accepts only the name of the profile created, for the dynamic use of the macro, it will be necessary to use the settings parameters.

Example of using the macro with the profile.

```
sc_api_upload([
  'profile' => 'profile_name',
  'file' => {file},
  'parents' => 'folder_name',
]);
```

Using the macro with settings parameter

The array with the access credentials that must be passed in the settings parameter varies according to the API used.

See below how to use this parameter according to each of the available APIs.

When using the settings parameter in the configuration in the macro, it is not necessary to inform a profile.

Using the macro with settings - Google Drive API

First, we must have the credentials for using the Google Drive API in hand, [click here](#) to learn how to obtain them.

After configuring the credentials, see below all the values of the array that must be passed in the settings parameter using the Google Drive API.

All values below are mandatory when using the settings parameter

Index	Value	Description
-------	-------	-------------

app_name	<p>Example of how the parameter should be informed.</p> <pre>'app_name' => 'scriptcase',</pre> <p>This index accepts only string</p>	App name entered when creating access credentials.
gateway	<p>Example of how the parameter should be informed.</p> <pre>'gateway' => 'google_driver',</pre> <p>This index accepts only string</p>	Gateway name to identify the API used.
json_oauth	<p>Example of how the parameter should be informed.</p> <pre>'json_oauth' => 'JSON_code',</pre> <p>Allowed options:</p> <ul style="list-style-type: none"> • 'string' • {field_name} • \$variable 	<p>Receives the contents of the user generated authentication (JSON) file.</p> <p>This file must be downloaded after creating the credentials on the google website.</p>
auth_code	<p>Example of how the parameter should be informed.</p> <pre>'auth_code' => '5/4wHt7TBTY4MtvQ',</pre> <p>Allowed options:</p> <ul style="list-style-type: none"> • {field_name} • \$variable 	<p>Receives the auth_code code, generated after configuring the API following the steps described in the tutorial</p> <p>How to generate the auth_code for using the Google Driver API</p>
token_code	<p>Example of how the parameter should be informed.</p> <pre>'token_code' => '4/4wHt7TBTY4MtvQ',</pre> <p>Allowed options:</p> <ul style="list-style-type: none"> • 'string' • {field_name} • \$variable 	<p>It is possible to generate the token_code using our sc_api_gc_get_obj_macro</p>

Examples when using the macro in Google Drive implementing the parameter settings

```
sc_api_upload([
  'settings' => [
    'app_name' => 'scriptcase',
    'gateway' => 'google_drive',
    'json_oauth' => "",
    'auth_code' => "",
    'token_code' => "",
  ],
  'file' => {file},
  'parents' => "",
]);
```

Using a macro with settings - Dropbox

First, we must have the credentials for using the Google Drive API in hand, [click here](#) to learn how to obtain them.

After configuring the credentials, see below all the values of the array that must be passed in the settings parameter using the Dropbox API.

All values below are mandatory when using the settings parameter

Index	Value	Description
app_name	<p>Example of how the parameter should be informed.</p> <pre>'app_name' => 'scriptcase',</pre> <p>This index accepts only string</p>	App name entered when creating access credentials.
gateway	<p>Exemplo de como o parâmetro deve ser informado.</p> <pre>'gateway' => 'google_driver',</pre> <p>This index accepts only string</p>	Gateway name to identify the API used.
api_key	<p>Example of how the parameter should be informed.</p> <pre>'api_key' => {field_name},</pre> <p>Allowed options:</p> <ul style="list-style-type: none"> • 'string' • {field_name} • \$variable 	Receives the app key, generated after configuring the API.
api_secret	<p>Example of how the parameter should be informed.</p> <pre>'api_secret' => {field_name},</pre> <p>Allowed options:</p> <ul style="list-style-type: none"> • 'string' • {field_name} • \$variable 	Receives the app secret, generated after configuring the API.

Examples when using the macro in Dropbox implementing the parameter settings

```
sc_api_upload([
  'settings' => [
```

```
'app_name' => 'scriptcase',
'gateway' => 'dropbox',
'api_key' => "",
'api_secret' => "",
'access_token' => "",
},
'file' => {file},
'parents' => "",
]);
```

Using the macro with settings - Amazon S3

First, we must have the credentials for using the Amazon S3 STORAGE API in hand, [click here](#) to learn how to obtain them.

After configuring the credentials, see below all the values of the array that must be passed in the settings parameter using the Amazon S3 API.

All values below are mandatory when using the settings parameter

Index	Value	Description
app_name	Example of how the parameter should be informed. 'app_name' => 'scriptcase', This index accepts only string	App name entered when creating access credentials.
gateway	Example of how the parameter should be informed. 'gateway' => 'google_driver', This index accepts only string	Gateway name to identify the API used.
api_key	Example of how the parameter should be informed. 'api_key' => {nome_campo}, Allowed options: • 'string' • {field_name} • \$variable	Receives the api key, generated after configuring the API.
api_secret	Example of how the parameter should be informed. 'api_secret' => {nome_campo}, Allowed options: • 'string' • {field_name} • \$variable	Receives the api secret, generated after configuring the API.
region	Example of how the parameter should be informed. 'region' => 'us-east-1', The region parameter of the macro accepts only the region code. To make it easier, follow a link to check the code for each region. https://docs.aws.amazon.com/general/latest/gr/rande.html	Receives the region code, the same used in the creation of credentials
bucket	Example of how the parameter should be informed. 'bucket' => 'bucket_name', Allowed options: • 'string' • {field_name} • \$variable	Receives the Bucket Name, generated after configuring the API.

Examples when using the macro in Amazon S3 implementing the parameter settings

```
sc_api_upload([
'settings' => [
'app_name' => 'scriptcase',
'gateway' => 'S3',
'api_key' => "",
'api_secret' => "",
'region' => "",
'bucket' => "",
},
'file' => {file},
'parents' => "",
]);
```

Macro Scope

Form application	Control Form
onAfterDelete onAfterUpdateAll onBeforeInsertAll onValidate	onValidate

 [Watch a tutorial](#)

This macro allows modifying the property of the application. The user can determine if a Form will start in insert mode, or a Grid starts by the filter, etc.

This macro **must** be used by one application to modify the properties of another application.

Properties for Form applications

Property	Value	Description
start	new	Forces the form to start in the insert mode in order to add new records.
insert	on/off	Qualifies (on) or unqualifies (off) the "add new" button to allow the addition of new records.
update	on/off	Qualifies (on) or unqualifies (off) the "save" button on the form.
delete	on/off	Qualifies (on) or unqualifies (off) the "delete" button on the form.
field_display_off	field	Dynamically hides a field.
field_display_on	field	Dynamically shows a field.
field_readonly	field	Dynamically set the "read-only" attribute in order to select the field.
rows		Forces the number of lines for each page (only for the form of multiple records).
rows_ins		Forces the number of lines for insert (only for the form of multiple records).

Property for Grid applications

Property	Value	Description
start	filter	Forces the Grid to start by the filter.
cols		Forces the number of columns. (vertical and slide kind)
rows		Forces the number of lines per page.
lig_edit	on/off	Qualifies (on) or unqualifies (off) the record edition. (the pencil icon)

Property for all applications

Property	Value	Description
exit	apl/URL	Forces application to exit to a specified location.

Ex. 1: Forces the "my_form" application to start in the addition mode.

```
sc_apl_conf("my_form", "start", "new");
```

Ex. 2: Doesn't allow the "my_form" application make addition of new registers.

```
sc_apl_conf("my_form", "add", "off");
```

Ex. 3: Sets "my_field" on the application "my_form" (readonly attribute) to "true" dinamically.

```
sc_apl_conf("my_form", "field_display_off", "my_field");
```

Ex. 4: Shows "my_field" on the application "my_form" dinamically.

```
sc_apl_conf("my_form", "field_display_on", "my_field");
```

Ex. 5: Forces the "my_grid" application to start by filter.

```
sc_apl_conf("my_grid", "start", "filter");
```

Ex. 6: Forces the "my_grid" application to show 20 lines.

```
sc_apl_conf("my_grid", "rows", "20");
```

Ex. 7: Hides "my_field" on the application "my_form" dinamically.

```
sc_apl_conf("my_form", "field_display_off", "my_field");
```

Ex. 8: Use the button on the toolbar menu.

```
if ({{sc_menu_item}} == "btn_1")
{
sc_apl_conf("form_customer", "start", "new");
}
```

Macro Scope

Blank application	calendar application	chart application	Grid application	Search application	Form application	Control Form	Menu application	Responsive Menu	Tree menu	Re ap
onExecute	onApplicationInit onScriptInit	onApplicationInit onScriptInit	onApplicationInit onScriptInit	onApplicationInit onFilterInit	onApplicationInit onScriptInit	onApplicationInit onScriptInit onValidate onValidateFailure onValidateSuccess	onApplicationInit onExecute onLoad	onApplicationInit onExecute onLoad	onApplicationInit onExecute onLoad	on on

```
sc_apl_default("application", "type");
```

[Watch a tutorial](#)

This macro allows that the user defines in your initial application what will happen when the application lost the session.

The macro has the following parameters:

Apl: Here it is necessary to inform which application the macro will redirect after lost the session.

Type: Here we will inform the redirecting type that will occur. There are two types:

- **R:** The application will only redirect to the initial application.
- **M:** Will be shown a message before the redirecting.

Example: In a login application defined as the initial application, we can define that this application will redirect to himself.

```
sc_apl_default("app_login","R")
```

Macro Scope

calendar application	chart application	Grid application	Search application	Form application	Control Form	ReportPDF application
onCalendarScriptInit onScriptInit	onScriptInit	onScriptInit	onFilterInit	onScriptInit	onScriptInit	onScriptInit

sc_apl_status("Application", "Status")

[Watch a tutorial](#)

Used to control security access. These macros activate/deactivate the applications that a user has access to.

Application: Is the name or the variable that contains the name of the application to be activated/deactivated.

Status: Is the value or variable that contains the value to be attributed to the application. The values are: "on" to activate and "off" to deactivate.

Ex. 1:

```
sc_apl_status ('atu_cad', 'off');
```

Ex. 2:

```
sc_apl_status ({var_name_app}, {var_status});
```

Macro Scope

onExecute	onApplicationInit onCalendarApplicationInit onCalendarScriptInit onScriptInit	onApplicationInit onScriptInit	onApplicationInit onScriptInit	onApplicationInit onFilterInit	onApplicationInit onScriptInit	onApplicationInit onScriptInit onValidate onValidateFailure onValidateSuccess	onApplicationInit onLoad	onApplicationInit onLoad	onApplicationInit onLoad

sc_appmenu_add_item("Menu_Name", "Id_Item", "Id_Parent", "Label", "Application", "Parameters", "Icon", "Hint", "Target")

 [Watch a tutorial](#)

Adds an item to a menu application dynamically.

It is only possible to use this macro when there is an array created before by the macro `sc_appmenu_create`.

Parameter	Description
Menu_name	Application menu name.
Id_item	Menu item id.
Id_Parent	Parent menu item id. For roots the null/empty value is passed.
Label	Menu item description.
Application	Menu item URL or application name
Parameters	String with parameters to pass to the menu item application. Ex.: param1=valor;param2=valor
Icon	Path to icon used in menu item.
Hint	Descriptive hint to menu item.
Target	Target for menu item link. ("_self" to use the same window, "_blank" to a new one and "_parent" to exit the window.

Ex. 1: Creates a menu named menu_main.

```
sc_appmenu_create('menu_main');
```

Ex. 2: Adds a on the menu_main the the item_1 named Category.

```
sc_appmenu_add_item('menu_main','item_1','','Category','');
```

Ex. 3: Adds a on the menu_main (item_2) the item_1 name Category linked to the form_category passing a few parameters.

```
sc_appmenu_add_item('menu_main','item_2','item_1','Category  
Form','form_category','param1=value;param2=value');
```

Macro Scope

Menu application	Responsive Menu	Tree menu
onApplicationInit onLoad	onApplicationInit onLoad	onApplicationInit onLoad

```
sc_appmenu_create("Menu_Name")
```

 [Watch a tutorial](#)

This macro starts or uses an array for a dynamic montage of a menu application. You must be informed or you will not apply the menu as a parameter.

This macro should be used in events of control or not **event onload of the menu**.

Ex. 1:
`sc_appmenu_create ('menu_main');`

Macro Scope

Menu application	Responsive Menu	Tree menu
onApplicationInit onLoad	onApplicationInit onLoad	onApplicationInit onLoad

sc_appmenu_exist_item("Menu_Name", "Id_Item")

 [Watch a tutorial](#)

This macro should be used in events of control or not **event onload of the menu**.

Ex. 1:
`sc_appmenu_create ('menu_main');`

Check if a menu item exists and return a true or false value.

Parameter	Description
Menu_Name	Menu App Name
Id_Item	Menu Item Identifier Code

Ex. 1:

```
if(sc_appmenu_exist_item('menu_main', 'item_2')){
sc_appmenu_update_item('menu_main','item_2','item_1','Category Form','form_category');
}
else{
sc_appmenu_add_item('menu_main','item_2','item_1','Category Form','form_category');
}
```

Macro Scope

Menu application	Responsive Menu	Tree menu
onApplicationInit onLoad	onApplicationInit onLoad	onApplicationInit onLoad

sc_appmenu_remove_item("Menu_Name", "Id_Item")

 [Watch a tutorial](#)

This macro dynamically removes a menu item.

To use this macro it **is necessary to execute the macro `sc_appmenu_create` before**.

Parameter	Description
menu_name	Menu application name
id_item	Menu item id

Ex. 1:
`sc_appmenu_remove_item('menu_main','item_2');`

Macro Scope

Menu application	Responsive Menu	Tree menu
onApplicationInit onLoad	onApplicationInit onLoad	onApplicationInit onLoad

sc_appmenu_reset("Menu_Name")

[Watch a tutorial](#)

This macro resets the array used in the dynamic creation of a menu application.
 This macro is expecting the menu application name as the single parameter.

Ex. 1:
`sc_appmenu_reset('menu_main');`

Macro Scope

Menu application	Responsive Menu	Tree menu
onApplicationInit onLoad	onApplicationInit onLoad	onApplicationInit onLoad

sc_appmenu_update_item("Menu_Name", "Id_Item", "Id_Parent", "Label", "Aplication", "Parameters", "Icon", "Hint", "Target")

[Watch a tutorial](#)

Updates an application menu item dynamically

It is only possible to use this macro when there is an array created before by the macro `sc_appmenu_create`.

It is only possible to use this macro on items created before by the macro `sc_appmenu_add_item`.

Parameter	Description
menu_name	Application menu item name
id_item	Application menu item id
id_parent	Application menu item parent id. For roots, the null/empty value is passed.
Label	Application menu item description.
Application	Menu item URL or application name
Parameters	String with a parameter to pass to the application menu item Ex.: param1=valor;param2=valor
Icon	Icon path used in the menu item.
Hint	Descriptive Hint for the menu item.
Target	The target for menu item link

Ex. 1:
`sc_appmenu_update_item('menu_main','item_2','item_1','Category Form','form_category');`

Macro Scope

Menu application	Responsive Menu	Tree menu
onApplicationInit onLoad	onApplicationInit onLoad	onApplicationInit onLoad

sc_begin_trans("Connection")

 [Watch a tutorial](#)

This macro starts a set of transactions in the database.

For the use of this macro you need to have a **transactional** database.

In form applications, the events (onAfterInsert, onAfterUpdate, onAfterDelete, onBeforeInsert, onBeforeUpdate or onBeforeDelete) are automatically protected by a transaction control, since the connection is the same of the application.

In the other cases, if the user need to make a transaction control, must begin with this macro and finish with the [sc_commit_trans\(\)](#) macro to confirm the updates or [sc_rollback_trans\(\)](#) to cancel the transactions.

The "connection" parameter is optional, necessary only if the command is executed in a different connection from the actual application.

Macro Scope

Blank application	calendar application	chart application	Grid application	Search application	Form application	Control Form	Menu application	Responsive Menu	Tree menu	ReportF applicat
onExecute	ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterInsert onAfterUpdate onBeforeDelete onBeforeInsert onBeforeUpdate onScriptInit onLoad onRefresh onValidate onValidateFailure onValidateSuccess	onFooter onHeader onScriptInit	onClick onFooter onGroupBy onHeader onScriptInit onNavigate onRecord	onFilterInit onFilterRefresh onFilterSave onFilterValidate	ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onBeforeDelete onBeforeDeleteAll onBeforeInsert onBeforeInsertAll onBeforeUpdate onBeforeUpdateAll onClick onScriptInit onLoad onNavigate onLoadRecord onRefresh onValidate onValidateFailure onValidateSuccess	onBlur onChange onClick onFocus onClick onScriptInit onLoadAll onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onExecute onLoad	onApplicationInit onExecute onLoad	onApplicationInit onExecute onLoad	onFooter onHeader onScriptInit onRecord

sc_block_display(Block_Name, on/off)

 [Watch a tutorial](#)

Dynamically determines the display fields of a specific block.

By default, all the blocks are displayed ("on" condition).

Ex. 1:

```
if ({type_customer} == "personal")
{
sc_block_display(company, off);
}
else
{
sc_block_display(personal, off);
}
```

Ex 2: Using a local variable as second parameter

```
$var = "off";
sc_block_display(company, $var);
```

Obs: In grids, this macro only works with "slide" orientation.

Macro Scope

calendar application	chart application	Grid application	Form application	Control Form
onAfterInsert onAfterUpdate onScriptInit onLoad onRefresh onValidate onValidateFailure onValidateSuccess	onScriptInit	onScriptInit onRecord	onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onScriptInit onLoad onNavigate onLoadRecord onRefresh onValidate onValidateFailure onValidateSuccess	onClick onScriptInit onLoadAll onRefresh

sc_btn_copy

 [Watch a tutorial](#)

Available when the "Copy" button is clicked. It can be tested and used inside the ScriptCase events, allowing specific programming in run time.

Ex. 1:

```
if (sc_btn_copy)
{
sc_message("Record copied successfully!");
}
```

Macro Scope

calendar application	Form application
onScriptInit onLoad	onScriptInit onLoad

sc_btn_delete

 [Watch a tutorial](#)

Available when the "Delete" button is clicked. It can be tested and used inside the ScriptCase events, allowing specific programming in run time.

Ex. 1:

```
if (sc_btn_delete)
{
sc_error_message("Unable to delete this record");
}
```

Macro Scope

calendar application	Form application
onValidate	onValidate
onValidateFailure	onValidateFailure
onValidateSuccess	onValidateSuccess

sc_btn_disable('button_id', 'on/off')

 [Watch a tutorial](#)

This macro is used to disable or enable buttons from a Menu application.

Ex:

```
sc_btn_disable('btn_2', 'off');
```

Macro Scope

Menu application	Responsive Menu	Tree menu
onApplicationInit	onApplicationInit	onLoad
onLoad	onLoad	

sc_btn_disabled("name_button", "status")

 [Watch a tutorial](#)

This macro is intended to dynamically enable or disable a toolbar button.

It has two required parameters:

Parameters	Value	Description
name_button	The value must be informed using variables or in string format, with double or single quotes. In bold, the example of how the parameter should be reported follows: <code>sc_btn_disabled(update, 'off');</code> Note: The name of the buttons should be all in tiny.	This parameter sets the button that will have its display changed. Button names are available in the table below, separated by application. <ul style="list-style-type: none"> Grid Form/Calendar Control
status	Like the field name, the parameter accepts only string, with single or double quotation marks. In bold, the example of how the parameter should be reported follows: <code>sc_btn_disabled(update, 'off');</code>	This parameter sets whether the button is enabled, when set to on , or disabled if set to off Values accepted in the parameter: <ul style="list-style-type: none"> on - The button will be disabled; off - The button will be enabled;

Name of Grid buttons

Buttons Name	Description
first	Goes to the first page of the grid.
back	Goes to the previous page of the grid.
forward	Goes to the next page of the grid.
last	Goes to the last page of the grid.
filter	Displays the "Filter" button.
pdf	Generates colored PDF.
det_pdf	Generates a detailed PDF.
pdfbw	Generates black and white PDF.
xls	Generates the XLS.
xml	Generates the XML.
csv	Generates the CVS.
rtf	Generates the RTF.
word	Generates the Word.

json	Generates the JSON.
print	Displays the "Print" button in the grid.
det_print	Displays the "Print" button in detail.
summary	Displays the "Summary" button in the grid.
new	Displays the "New" button. (if the application has a link for it, or if the form is running in the grid iframe)
insert	Displays the "Include" button of the form. (only for forms running in grid's iframe)
update	Displays the "Update" button of the form. (only for forms running in grid's iframe)
delete	Displays the "Delete" button of the form (only for forms running in grid's iframe)
qsearch	Displays the "Quick Search" button in the grid.
dynsearch	Displays the "Dynamic Search" button in the grid.
gridsave	Displays the "Save Grid" button in the grid.
sel_col	Select columns button
sort_col	Sort Button

Name of Form buttons

Buttons Name Description

first	Goes to the first page of the form.
back	Goes to the previous page of the form.
forward	Goes to the next page of the form.
last	Goes to the last page of the form.
new	Displays the "New" button on the form, if it's off the form will starts in insertion mode.
insert	Displays the "Include" button of the form.
update	Displays the "Update" button of the form.
delete	Displays the "Delete" button of the form.
copy	Displays the "Copy" button of the form.
pdf	Generates PDF file from a form.
print	Open the form in print mode.
dynsearch	Displays the "Dynamic Search" button in the grid.

Name of Control Buttons

Buttons Name Description

ok	Displays the "Ok" button on the control.
exit	Displays the "Exit" button on the control.
facebook	Displays the "Facebook" button on the control.
twitter	Displays the "Twitter" button on the control.
google	Displays the "Google+" button on the control.
paypal	Displays the "PayPal" button on the control.

Example: Enabling delete button only for admin user

```
if ( [user_login] == 'admin' ) {
    sc_btn_disabled('delete', 'on');
} else {
    sc_btn_disabled('delete', 'off');
}
```

Macro Scope

calendar application	chart application	Grid application	Form application	Control Form
onAfterDelete onAfterInsert onAfterUpdate onScriptInit onLoad onRefresh onValidate onValidateFailure onValidateSuccess	onScriptInit	onScriptInit	onAfterDelete onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onScriptInit onLoad onLoadRecord onRefresh onValidate onValidateFailure onValidateSuccess	onScriptInit onLoadAll onRefresh onValidate onValidateFailure onValidateSuccess

`sc_btn_display("Button_Name", "on/off")`

 [Watch a tutorial](#)

Activate toolbars buttons on the application in execution time.

Button_Name: Is the variable name that contains the name of the button to be

activated/deactivated.

Buttons Name (**Grid**):

group displays the "Group By" button in the grid.

Buttons Name	Description
first	Goes to the first page of the grid.
back	Goes to the previous page of the grid.
forward	Goes to the next page of the grid.
last	Goes to the last page of the grid.
filter	Displays the "Filter" button.
pdf	Generates colored PDF.
det_pdf	Generates a detailed PDF.
pdfbw	Generates black and white PDF.
xls	Generates the XLS.
xml	Generates the XML.
csv	Generates the CVS.
rtf	Generates the RTF.
word	Generates the Word.
json	Generates the JSON.
print	Displays the "Print" button in the grid.
det_print	Displays the "Print" button in detail.
summary	Displays the "Summary" button in the grid.
new	Displays the "New" button. (if the application has a link for it, or if the form is running in the grid iframe)
insert	Displays the "Include" button of the form. (only for forms running in grid's iframe)
update	Displays the "Update" button of the form. (only for forms running in grid's iframe)
delete	Displays the "Delete" button of the form (only for forms running in grid's iframe)
qsearch	Displays the "Quick Search" button in the grid.
dynsearch	Displays the "Dynamic Search" button in the grid.
gridsave	Displays the "Save Grid" button in the grid.
sel_col	Select columns button
sort_col	Sort Button

Buttons Name (**Form**):

Buttons Name	Description
first	Goes to the first page of the form.
back	Goes to the previous page of the form.
forward	Goes to the next page of the form.
last	Goes to the last page of the form.
new	Displays the "New" button on the form, if it's off the form will starts in insertion mode.
insert	Displays the "Include" button of the form.
update	Displays the "Update" button of the form.
delete	Displays the "Delete" button of the form.
copy	Displays the "Copy" button of the form.
qsearch	Displays the "Quick Search" button of the form.
pdf	Generates PDF file from a form.
print	Open the form in print mode.
dynsearch	Displays the "Dynamic Search" button in the grid.

Buttons Name (**Control**):

Buttons Name	Description
ok	Displays the "Ok" button on the control.
exit	Displays the "Exit" button on the control.
facebook	Displays the "Facebook" button on the control.
twitter	Displays the "Twitter" button on the control.
google	Displays the "Google+" button on the control.
paypal	Displays the "PayPal" button on the control.

OBS. Remember that the button's name must be lowercase.

Ex. 1:

```
sc_btn_display ('new', 'off');
```

Ex. 2: Using a local variable as second parameter

```
$var = "off";
sc_btn_display ('new', $var);
```

Ex. 3: If we use variables or fields ({Fields} or [Global_Variables]) as parameters its not allowed the use of the quotes or single quotes.

```
sc_btn_display ({variavle_button}, 'off');
```

Macro Scope

calendar application	chart application	Grid application	Form application	Control Form
onAfterDelete onAfterInsert onAfterUpdate onScriptInit onLoad onRefresh onValidate onValidateFailure onValidateSuccess	onScriptInit	onScriptInit	onAfterDelete onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onScriptInit onLoad onNavigate onLoadRecord onRefresh onValidate onValidateFailure onValidateSuccess	onScriptInit onLoadAll onRefresh onValidate onValidateFailure

sc_btn_insert

 [Watch a tutorial](#)

Available when the "Add" button is clicked. It can be tested and used inside the ScriptCase events, allowing specific Programmation in run time.

Ex. 1:

```
if (sc_btn_insert)
{
sc_message("Record inserted successfully");
}
```

Macro Scope

calendar application	Form application
onValidate onValidateFailure onValidateSuccess	onValidate onValidateFailure onValidateSuccess

sc_btn_label("btn_name", "new_label")

 [Watch a tutorial](#)

This macro is used to dynamically change the label of the buttons, whether they are created by the developer or Scriptcase's own.

For this, it is necessary to inform two mandatory parameters, 'btn_name' and 'new_label'.

Parâmetro	Valor	Descrição
btn_name	The parameter can be entered using variables (Global or Local) or string (Using Double or Single Quotes) In bold, here is the example of how the parameter should be entered: sc_btn_label('update', 'Update Record'); Values accepted in the parameter: <ul style="list-style-type: none"> • String - Protected by single or double quotes. Ex.: 'update' • Variables - Local or global. E.g.: \$btn_update 	Receives the name of the buttons that will have the label changed. Button names, which are automatically created by Scriptcase, are available below, separated by application. <ul style="list-style-type: none"> • Grid/Chart • Form/Calendar • Control
new_label	The parameter can be entered using variables (Global or Local) or string (Using Double or Single Quotes) sc_btn_label('update', 'Update Record'); Values accepted in the parameter:: <ul style="list-style-type: none"> • String - Protected by single or double quotes. E.g.: 'Update Record' • Variables - Local or global. E.g.: \$new_label • Lang -variable lang. E.g.: {lang_btn_label} 	This parameter receives the new label of the button informed in the previous parameter. In addition to string and variable, it is also possible to use a lang to define the label, enabling the translation of your application's internationalization.

[Click here and see examples of using the macro.](#)

Nombre de los botones de cuadrícula

Buttons Name	Description
first	Goes to the first page of the grid.
back	Goes to the previous page of the grid.
forward	Goes to the next page of the grid.
last	Goes to the last page of the grid.
filter	Displays the "Filter" button.
pdf	Generates colored PDF.
det_pdf	Generates a detailed PDF.
pdfbw	Generates black and white PDF.
xls	Generates the XLS.
xml	Generates the XML.
csv	Generates the CVS.
rtf	Generates the RTF.
word	Generates the Word.
json	Generates the JSON.
print	Displays the "Print" button in the grid.
det_print	Displays the "Print" button in detail.
summary	Displays the "Summary" button in the grid.
new	Displays the "New" button. (if the application has a link for it, or if the form is running in the grid iframe)
insert	Displays the "Include" button of the form. (only for forms running in grid's iframe)
update	Displays the "Update" button of the form. (only for forms running in grid's iframe)
delete	Displays the "Delete" button of the form (only for forms running in grid's iframe)
qsearch	Displays the "Quick Search" button in the grid.
dynsearch	Displays the "Dynamic Search" button in the grid.
gridsave	Displays the "Save Grid" button in the grid.
sel_col	Select columns button
sort_col	Sort Button

Name of Form buttons

Buttons Name	Description
first	Goes to the first page of the form.
back	Goes to the previous page of the form.
forward	Goes to the next page of the form.
last	Goes to the last page of the form.
new	Displays the "New" button on the form, if it's off the form will starts in insertion mode.
insert	Displays the "Include" button of the form.
update	Displays the "Update" button of the form.
delete	Displays the "Delete" button of the form.
copy	Displays the "Copy" button of the form.
pdf	Generates PDF file from a form.
print	Open the form in print mode.
dynsearch	Displays the "Dynamic Search" button in the grid.

Name of Control Buttons

Buttons Name	Description
ok	Displays the "Ok" button on the control.
exit	Displays the "Exit" button on the control.
facebook	Displays the "Facebook" button on the control.
twitter	Displays the "Twitter" button on the control.
google	Displays the "Google+" button on the control.
paypal	Displays the "PayPal" button on the control.

Exemplo: Parameter with string

```
sc_btn_label('update', 'Atualizar Registro');
```

Example: Parâmetro com lang

```
sc_btn_label("update", {lang_btn_label});
```

Example:Parameter with Global variable

```
[btn_name] = "update";
[label] = "update";
sc_btn_label([btn_name], [label]);
```

Example: Parameter with local variable

```

sbtn_name = "update";
$label= "update";
sc_btn_label($sbtn_name, $label);

```

Macro Scope

calendar application	chart application	Grid application	Form application	Control Form
onAfterDelete onAfterInsert onAfterUpdate onScriptInit onLoad onRefresh onValidate onValidateFailure onValidateSuccess	onScriptInit	onScriptInit	onAfterDelete onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onScriptInit onLoad onLoadRecord onRefresh onValidate onValidateFailure onValidateSuccess	onScriptInit onLoadAll onRefresh onValidate onValidateFailure

sc_btn_new

 [Watch a tutorial](#)

Available when the "Add New" button is clicked. It can be tested and used inside the ScriptCase events, allowing specific programming in run time.

Ex. 1:

```

if (sc_btn_new)
{
{My_Date} = date('Y/m/d');
}

```

Macro Scope

calendar application	Form application
onLoad	onLoad

sc_btn_update

 [Watch a tutorial](#)

Available when the "Save" button is clicked. It can be tested and used inside the ScriptCase events, allowing specific programming in run time.

Ex. 1:

```

if (sc_btn_update)
{
sc_error_message("Record updated successfully");
}

```

Macro Scope

calendar application	Form application
onValidate onValidateFailure onValidateSuccess	onValidate onValidateFailure onValidateSuccess

sc_calc_dv(Digit, Rest, Value, Module, Weights, Type)

[Watch a tutorial](#)

Calculate verifier (checksum) digits.

Parameter	Description
Digit	Variable that will receive the calculated digit.
Rest	Variable that will receive the "rest" of the division.
Value	Value or Variable to calculate the digit.
Module	Value or Variable containing the module to be used. The default value is the module "11".
Weights	Value or Variable containing the weights to be used. The default value is the "98765432".
Type	Value or Variable containing the parcels calculation to be used: 1 to the normal sum of the values of the parcels and 2 to the sum of each algorithm of the parcels. The default value is "1".

Ex. 1:
`sc_calc_dv({my_dv}, {my_rest}, 1234567, 11, 98765432, 1);`
 Parcels calculation: $7 \times 2 = 14$; $6 \times 3 = 18$; $5 \times 4 = 20$; $4 \times 5 = 20$; $3 \times 6 = 18$; $2 \times 7 = 14$; $1 \times 8 = 8$
 Parcels sum : $14 + 18 + 20 + 20 + 18 + 14 + 8 = 112$
 Rest of the division of $112 / 11 = 2$
 Digit: $11 - 2 = 9$

Ex. 2:
`sc_calc_dv({my_dv}, {my_rest}, 1234567, 10, 12, 2);`
 Parcels calculation: $7 \times 2 = 14$; $6 \times 1 = 6$; $5 \times 2 = 10$; $4 \times 1 = 4$; $3 \times 2 = 6$; $2 \times 1 = 2$; $1 \times 2 = 2$
 Parcels sum: $1 + 4 + 6 + 1 + 0 + 4 + 6 + 2 + 2 = 26$
 Rest of the division of $26 / 10 = 6$
 Digit: $10 - 6 = 4$

`sc_call_api($profile, $arr_settings)`

It allows us to use Scriptcase built-in APIs. We currently offer integration with the Mandrill and Amazon SES APIs.

This macro has two parameters:

Parameters	Description
\$profile	Required parameter. Can be passed empty "" or contain the gateway name configured in "tools> API".
\$arr_settings	This parameter is optional as long as the "profile" is not empty. When informed, this parameter must contain an Array with the Gateway used and the API key.

Example 1 - Parameter \$arr_settings, array with the API information

```
$settings = array( 'settings' => ['gateway' => 'mandrill', 'api_key' => {api_key}]);
$mandrill = sc_call_api("", $settings);
```

Example 2 - Sending email using mandrill.

```
$txt_no_tags = strip_tags({msg});

$sarr_merge = array(
    'name' => "",
    'type' => 'to',
    'email' => 'exemplo@exemplo.com'
);

$var_config = array( 'settings' => ['gateway' => 'mandrill', 'api_key' => {api_key}]);

$mandrill = sc_call_api("", $var_config);
$var_msg = array(
    'from_email' => {from_email},
    'from_name' => {from_name},
    'html' => {msg},
    'text' => $txt_no_tags,
    'to' => array($sarr_merge),
    'subject' => {subject},
    'important' => true,
    'auto_text' => null,
    'auto_html' => null,
    'inline_css' => null,
    'metadata' => array('website' => 'www.scriptcase.net')
);

$async = false;
$retorno = $mandrill->messages->send($var_msg, $async);
```

Example 3 - Sending SMS using clickatell.

```
$var_config = array(
    'message' => [
        'to' => {sms_to},
        'message' => {sms_txt},
    ],
    'settings' => [
        'gateway' => {gateway},
        'auth_token' => {auth_token},
    ]
);

sc_send_sms($var_config);
```

Example 4 - Using the macro with PagSeguro

```
$arr_settings = [
    'gateway' => 'pagseguro',
    'environment' => 'sandbox',
    'auth_email' => 'exemplo@gmail.com',
    'auth_token' => '72AE21503DDA4840BE1DC7945F6D1CE1'
];
sc_call_api("", $arr_settings);
```

Example 5 - Using the macro with PayPal

```
$arr_settings = [
    'gateway' => 'paypal',
    'environment' => 'sandbox',
    'auth_email' => 'exemplo@gmail.com',
    'auth_token' => '72AE21503DDA4840BE1DC7945F6D1CE1'
];
sc_call_api("", $arr_settings);
```

Macro Scope

Blank application	calendar application	chart application	Grid application	Search application	Form application	Control Form	Menu application	Tree menu	ReportPDF application
onExecute	onAfterDelete onAfterInsert onAfterUpdate onBeforeDelete onBeforeInsert onBeforeUpdate onScriptInit onLoad onRefresh onValidate onValidateFailure onValidateSuccess	onFooter onHeader onScriptInit	onClick onHeader onScriptInit onRecord	onFilterInit onFilterSave onFilterValidate	onAfterDelete onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onBeforeDelete onBeforeDeleteAll onBeforeInsert onBeforeInsertAll onBeforeUpdate onBeforeUpdateAll onClick onScriptInit onLoad onNavigate onLoadRecord onRefresh onValidate onValidateFailure onValidateSuccess	onClick onScriptInit onLoadAll onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onExecute onLoad	onApplicationInit onExecute onLoad	onFooter onHeader onScriptInit onRecord

sc_captcha_display("on/off")

Dynamically controls whether the **captcha/recaptcha** configured in the application is displayed.

To use the macro, the application must be previously configured with the resource.

Example

```
if ( $_SERVER['REMOTE_ADDR'] == '127.0.0.1' ) {
    sc_captcha_display("on");
} else {
    sc_captcha_display("off");
}
```

Macro Scope

Form application	Control Form
onScriptInit	onScriptInit
onLoad	onLoadAll

sc_changed({Field_Name})

 [Watch a tutorial](#)

This macro is used to check if the field name has been changed.

Ex. 1:

```
if (sc_changed({my_field}))
{
    Echo "Field have been changed";
}
```

Macro Scope

calendar application	Form application	Control Form
onBeforeUpdate	onBeforeUpdate	onRefresh
onValidate	onValidate	
onValidateFailure	onValidateFailure	
onValidateSuccess	onValidateSuccess	

sc_change_connection("Old_Connection", "New_Connection")

 [Watch a tutorial](#)

This macro dynamically change the application connections

Ex. 1: To change the connections:

```
sc_change_connection("Old_Concection01", "New_Connection01" ; "Old_Concection02", "New_Connection02");
```

Allows to change more then one application/connection in one command. Multiple connections can be passed as parameters that must be separated by a ";".

Ex. 2: Using variables:

```
sc_change_connection([Global_Connetion], [Test_Connection]);
```

The changes take effect in the following applications.

Ex. 3: Changing the application main connection

```
sc_change_connection({Password}, [Test] ; "My_Connection", [Global_Connection]);
```

The changes take effect in the following applications.

Ex. 4: To delete the exchange:

To recover your previous settings you can use the [sc_reset_change_connection\(\)](#) macro

Macro Scope

Blank application	calendar application	chart application	Grid application	Form application	Control Form	ReportPDF application
onExecute	onScriptInit onLoad	onHeader onScriptInit	onApplicationInit onScriptInit	onScriptInit onLoad onLoadRecord	onScriptInit onLoadAll	onHeader onScriptInit onRecord

sc_change_css("attribute", "value", "field_name")

This macro allows changing CSS attributes of application fields.

Parameter List

parameters	parameter values	Description
attribute_name	<p>The button name must be informed using double quotes, single quotes or variables.</p> <p>In this parameter is possible to use <code>sc_badge</code> that apply a predefined css in the text.</p> <p>Example In this example we are using the color attribute</p> <pre>sc_change_css('color', '#dcfce7');</pre>	<p>Required Attribute.</p> <p>Defines the CSS attribute that will be changed.</p>
value	<p>The button name must be informed using double quotes, single quotes or variables.</p> <p>When is used <code>sc_badge</code> at this parameter the attribute value should be one of the colors above: blue, brown, cyan, gray, green, orange, pink, purple, red, yellow and empty string</p> <p>If the attribute value be empty string, the badge will be removed</p> <p>Example In this parameter we define the value for the CSS attribute it should receive, in the example we are defining the color: <code>#dcfce7</code></p> <pre>sc_change_css('color', '#dcfce7');</pre>	<p>Required Attribute.</p> <p>Defines the value that the informed attribute will receive</p>
field_name	<p>The button name must be informed using double quotes, single quotes or variables.</p> <p>Example In this example we are defining the change in the font color of the field <code>fld_status</code></p> <pre>sc_change_css('color', '#dcfce7', 'status');</pre> <p>Example with sc_badge <pre>sc_change_css('sc_badge', 'green', 'field_name');</pre></p>	<p>Optional Attribute.</p> <p>Defines the field where the CSS will be applied, if no value is entered, the change will be made in all fields of the line.</p> <p>To use <code>sc_badge</code> is necessary to inform the field name, in other hand it will not apply css to any field.</p>

Example

Example of changing the font color and using the attribute `sc_badge`

```
switch({taskstatus}) {
case 'COMPLETED':
sc_change_css('color', '#dcfce7', 'taskstatus');
sc_change_css('sc_badge', 'green', 'taskstatus');
break;

case 'IN-PROGRESS':
sc_change_css('color', '#1e40af', 'taskstatus');
sc_change_css('sc_badge', 'blue', 'taskstatus');
break;

case 'NOT-STARTED':
sc_change_css('color', '#991b1b', 'taskstatus');
sc_change_css('sc_badge', 'red', 'taskstatus');
break;
}
```

Example of the macro with css attribute:

```
switch({taskstatus}) {
case 'COMPLETED':
sc_change_css('color', '#166534', 'taskstatus');
sc_change_css('background-color', '#dcfce7', 'taskstatus');
sc_change_css('padding-right', '0.6em', 'taskstatus');
sc_change_css('padding-left', '0.6em', 'taskstatus');
sc_change_css('border-radius', '14px', 'taskstatus');
sc_change_css('font-weight', 'bold', 'taskstatus');
sc_change_css('width', 'fit-content', 'taskstatus');
sc_change_css('display', 'block', 'taskstatus');
sc_change_css('padding-top', '0.2em', 'taskstatus');
sc_change_css('padding-bottom', '0.2em', 'taskstatus');
sc_change_css('font-size', '60%', 'taskstatus');
sc_change_css('margin', '10%', 'taskstatus');
break;

case 'IN-PROGRESS':
sc_change_css('color', '#1e40af', 'taskstatus');
sc_change_css('background-color', '#d9eaf7', 'taskstatus');
sc_change_css('padding-right', '0.6em', 'taskstatus');
sc_change_css('padding-left', '0.6em', 'taskstatus');
sc_change_css('border-radius', '14px', 'taskstatus');
sc_change_css('font-weight', 'bold', 'taskstatus');
sc_change_css('width', 'fit-content', 'taskstatus');
sc_change_css('display', 'block', 'taskstatus');
sc_change_css('padding-top', '0.2em', 'taskstatus');
sc_change_css('padding-bottom', '0.2em', 'taskstatus');
sc_change_css('font-size', '60%', 'taskstatus');
sc_change_css('margin', '10%', 'taskstatus');
break;

case 'NOT-STARTED':
sc_change_css('color', '#991b1b', 'taskstatus');
sc_change_css('background-color', '#fee2e2', 'taskstatus');
```

```

sc_change_css('padding-right', '0.6em', 'taskstatus');
sc_change_css('padding-left', '0.6em', 'taskstatus');
sc_change_css('border-radius', '14px', 'taskstatus');
sc_change_css('font-weight', 'bold', 'taskstatus');
sc_change_css('width', 'fit-content', 'taskstatus');
sc_change_css('display', 'block', 'taskstatus');
sc_change_css('padding-top', '0.2em', 'taskstatus');
sc_change_css('padding-bottom', '0.2em', 'taskstatus');
sc_change_css('font-size', '60%', 'taskstatus');
sc_change_css('margin', '10%', 'taskstatus');
break;
}

```

Macro Scope

Grid application

- onClick
- onRecord

sc_commit_trans("Connection")

 [Watch a tutorial](#)

This macro is used to confirm a transaction set in the database.

In form applications, there are events that perform transactions with the database (Ex: onAfterInsert, onAfterUpdate, onAfterDelete, onBeforeInsert, onBeforeUpdate, onBeforeDelete, etc...).

The transaction control of these events is done by Scriptcase itself if the connection provided is the same as the application.

However, if the user has to perform any type of redirection in these events, it is necessary to use the macro sc_commit_trans before the redirect to secure the transactions previously performed.

Ex: onAfterUpdate - Using redirection after update a record:

```
sc_commit_trans();
```

```
sc_redir('grid_main');
```

The "connection" parameter is optional, being necessary only if the command is executed in a different database specified to the application.

Macro Scope

Blank application	calendar application	chart application	Grid application	Search application	Form application	Control Form	Menu application	Responsive Menu	Tree menu	Report applicat
onExecute	ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterInsert onAfterUpdate onBeforeDelete onBeforeInsert onBeforeUpdate onScriptInit onLoad onRefresh onValidate onValidateFailure onValidateSuccess	onFooter onHeader onScriptInit	onClick onFooter onGroupBy onHeader onScriptInit onNavigate onRecord	onFilterInit onFilterRefresh onFilterSave onFilterValidate	ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onBeforeDelete onBeforeDeleteAll onBeforeInsert onBeforeInsertAll onBeforeUpdate onBeforeUpdateAll onClick onScriptInit onLoad onNavigate onLoadRecord onRefresh onValidate onValidateFailure onValidateSuccess	onBlur onChange onClick onFocus onScriptInit onLoadAll onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onExecute onLoad	onApplicationInit onExecute onLoad	onApplicationInit onExecute onLoad	onFooter onHeader onScriptInit onRecord

sc_concat()

 [Watch a tutorial](#)

This macro returns a string resulting from a definition of two or more values Can be used in the lookup of fields or events together with the macros sc_lookup() and sc_select()

Makes concat formatting according to your database.

Ex. 1: Use(Editing Lookup):

```
SELECT field1, sc_concat(field2,'-',field3) FROM table
```

Ex. 2: Using the macro with [sc_lookup](#):

```
sc_lookup(Dataset,"SELECT field1,sc_concat(field2, '-' ,field3) FROM table");
```

Macro Scope

Blank application	calendar application	chart application	Grid application	Search application	Form application	Control Form	Menu application	Responsive Menu	Tree menu	ReportPDF application

sc_confirm("Message")

 [Watch a tutorial](#)

This macro is used to confirm that the action must be really executed, preventing mistakes.

Valid only in the PHP programming code that runs when called through a toolbar button.

Parameter

This macro has only one parameter, which is the confirmation message that will be displayed.

Example:

```
sc_confirm("Do you really wish to execute this action??");
```

Macro Scope

Form application	Control Form
onClick	onClick

sc_connection_edit("Connetion_Name", \$arr_conn)

 [Watch a tutorial](#)

La conexión editada solo estará disponible en la próxima aplicación.

1º Parameter: Connection name to be edited.

2º Parameter: Array of items containing the connection information to be edited. Check out the indices of the array:

Indice	Description	Example
['server']	Database server (host)	<code>\$arr_conn['server'] = "127.0.0.1"</code>
['user']	Database username	<code>\$arr_conn['user'] = "root"</code>
['password']	Database password	<code>\$arr_conn['password'] = "secretpass123"</code>
['database']	Database name used in the connection	<code>\$arr_conn['database'] = "sc_samples"</code>
['persistent']	Defines if the connection is persistent or not	<code>\$arr_conn['persistent'] = "Y" / "N"</code>
['encoding']	Configure the connection encoding	<code>\$arr_conn['encoding'] = "utf8"</code>

Note:Is not required to use all the indices in the array, we can pass only the required ones.

Example:

```
$arr_conn = array();

$arr_conn['user'] = "admin2";
$arr_conn['password'] = "admin2pass";
$arr_conn['database'] = "sc_samples2";

sc_connection_edit("sc_connection", $arr_conn);
```

sc_connection_new("Connection_Name", \$arr_conn)

 [Watch a tutorial](#)

When used, the macro creates a new connection with the information inserted in its parameters. This connection is available throughout the current session Scriptcase and ceases to exist when the session is closed.

The new connection will only be available in the next application.

1º Parameter: Connection name.

Note: If there is a connection created within the Scriptcase with the same name, this macro has no effect. Connections created within the Scriptcase prevail. If you want to edit an existing

connection, see the documentation for the macro `sc_connection_edit`.

2º Parameter: Array of items containing the connection information. Check out the indices of the array:

Indice	Description	Example
['drive']	Driver of the database used for the connection (see table below)	<code>\$arr_conn['drive'] = "oci8"</code>
['server']	Database server (host)	<code>\$arr_conn['server'] = "127.0.0.1"</code>
['user']	Database username	<code>\$arr_conn['user'] = "root"</code>
['password']	Database password	<code>\$arr_conn['password'] = "secretpass123"</code>
['database']	Database name used in the connection	<code>\$arr_conn['database'] = "sc_samples"</code>
['persistent']	Defines if the connection is persistent or not	<code>\$arr_conn['persistent'] = "Y"</code> <code>/"N"</code>
['encoding']	Configure the connection encoding	<code>\$arr_conn['encoding'] = "utf8"</code>

Note: It is required that all items are filled, with the exception of items **['persistent']** and **['encoding']**.

sc_date(Date, "Format", "Operator", D, M, Y)

 [Watch a tutorial](#)

This macro has the aim to calculate the increment or decrement of dates. For its use are necessary some parameters as follows:

Parameter	Description
Date	Date field that contains the date to be modified.
Format	Formatting that the date field is.
Operator	"+" for increment and "-" for decrement.
D	Number of days to increment or decrement.
M	Number of months to increment or decrement.
Y	Number of Years to increment or decrement.

Ex. 1:
`{birthdate} = sc_date({birthdate}, "dd/mm/yyyy", "+", 30, 0, 0);`

Ex. 2:
`$new_date = sc_date({birthdate}, "yyyy-mm-dd", "-", 15, 3, 2);`

Ex. 3:
`{inclusion_dt} = sc_date(date('Ymd'), "yyyymmdd", "-", 0, 1, 1);`

OBS: *To be certified of the date format, before use the function, try it in any event:
 echo "form_date =". {name of the field date};*

Macro Scope

`sc_date_conv({Field_Date}, "Input_Format", "Output_Format")`

 [Watch a tutorial](#)

This macro converts the date field passed as a parameter with an input format to another field with an output format.

Check below the list of parameters for this macro and the accepted values.

Parameter	Values	Description
field_name	Example of how the parameter should be informed: {field_name}	This parameter must receive the name of the data field that will have the manipulated value
input_format	The string must have the same format used in the database. Example of how to enter the date string in the macro: "yyyy-mm-dd" Accepted values: <ul style="list-style-type: none"> ▪ Date string - For example "yyyy-dd-mm" ▪ db_Format - Retrieves the date format from the database. 	Receives the string with the current date format, saved in the database. If the format informed is different from the one used in the database, the macro will not work as expected.
output_format	The String must have the format in which the date will be displayed. Example of how to enter the date string in the macro: "yyyy/dd/mm/" Accepted options <ul style="list-style-type: none"> ▪ Date string - For example "yyyy-dd-mm" ▪ sc_format_region - Value formatted according to the regional configuration ▪ db_Format - Convert the date to the database's native value 	Receive the string with the desired date display format. If you want to use the format according to the regional configuration, the value sc_format_region in this parameter must be informed

For more information on the data strings consult the [PHP Manual](#)

Ex. 1: Converts the date from **"dd/mm/yyyy"** format to the **"yyyymmdd"** format.

```
{field_date} = sc_date_conv({field_date}, "dd/mm/aaaa", "aaaammdd");
```

Ex. 2: Converts the date from the **database native format** to **"dd/mm/yyyy"** format.

```
{field_date} = sc_date_conv({field_date}, "db_format", "dd/mm/aaaa");
```

Ex. 3: Converts the date from the **"dd/mm/yyyy"** format to the Database native format (**db_format**).

```
{field_date} = sc_date_conv({field_date}, "dd/mm/aaaa", "db_format");
```

Ex. 4: Converting the date from the database's native format (**db_format**) to the regional setting format (**sc_format_region**)

```
{field_date} = sc_date_conv({field_date}, "db_format", "sc_format_region");
```

Ex. 5: Converting the date from the **"yyyy-mm-dd"** to the regional Setting format (**sc_format_region**)

```
{field_date} = sc_date_conv({field_date}, "aaaa-mm-dd", "sc_format_region");
```

Macro Scope

Blank application	calendar application	chart application	Grid application	Search application	Form application	Control Form	ReportPDF application

sc_date_dif({Date1}, "Format Date1", {Date2}, "Format Date2")

 [Watch a tutorial](#)

Calculates the difference between two dates (passed as parameters) in days.

Parameter	Description
Date1	Date1 value or variable.
Format Date1	Value or Variable containing the date format stored on Date1.
Date2	Date2 value or variable.
Format Date2	Value or Variable containing the date format stored on Date2.

Ex. 1:
`{amount_days} = sc_date_dif({date1}, "aaaa-mm-dd", {date2}, "mm/dd/aaaa");`

Ex. 2:
`{amount_days} = sc_date_dif("2000-05-01", "aaaa-mm-dd", "04/21/2004", "mm/dd/aaaa");`
`{amount_days}` would be equal to -1451 (days)

Note: *Formats can be different but must be in days, months and years.*

Macro Scope

Blank application	calendar application	chart application	Grid application	Search application	Form application	Control Form	Menu application	Responsive Menu	Tree menu
onExecute	ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterInsert onAfterUpdate onApplicationInit onBeforeDelete onBeforeInsert onBeforeUpdate onScriptInit onLoad onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onFooter onHeader onScriptInit	onClick onApplicationInit onFooter onGroupBy onHeader onScriptInit onNavigate onRecord	onApplicationInit onFilterInit onFilterRefresh onFilterSave onFilterValidate	ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onApplicationInit onBeforeDelete onBeforeDeleteAll onBeforeInsert onBeforeInsertAll onBeforeUpdate onBeforeUpdateAll onClick onScriptInit onLoad onNavigate onLoadRecord onRefresh onValidate onValidateFailure onValidateSuccess	onBlur onChange onClick onFocus onApplicationInit onClick onScriptInit onLoadAll onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onExecute onLoad	onApplicationInit onExecute onLoad	onApplicationInit onExecute onLoad

sc_date_dif_2({Date1}, "Format Date1", {Date2}, "Format Date2", Option)

 [Watch a tutorial](#)

Calculates the difference between two dates (passed as parameters) returning the number of days, months, and years.

The result is returned in an array structure, where index 0 have the number of days, index 1 has the number of months and the index 2 have the number of years.

Parameter	Description
Date1	Date1 value or variable.
Format Date1	Value or Variable containing the date format stored on Date1.
Date2	Date2 value or variable.
Format Date2	Value or Variable containing the date format stored on Date2.
Option	1 = Doesn't consider the initial day; 2 = Considers the initial day.

Ex. 1:

```
$differences = sc_date_dif_2 ({date1}, "yyyy-mm-dd", {date2}, "mm/dd/yyyy", 1);
{dif_days} = $differences[0];
{dif_months} = $differences[1];
{dif_years} = $differences[2];
```

Ex. 2:

```
$differences = sc_date_dif_2 ("2000-05-01", "yyyy-mm-dd", "04/21/2004", "mm/dd/yyyy", 1);
$differences[0] = 20 (days)
$differences[1] = 11 (months)
$differences[2] = 3 (years)
```

Ex. 3: Using the option 2

```
$differences = sc_date_dif_2 ("2000-05-01", "yyyy-mm-dd", "04/21/2004", "mm/dd/yyyy", 2);
$differences[0] = 21 (days)
$differences[1] = 11 (months)
$differences[2] = 3 (years).
```

Note: *Formats between the two dates can be different but it must have days, months and years. You also need to know the internal format being returned for the macro to work correctly.*

Macro Scope

Blank application	calendar application	chart application	Grid application	Search application	Form application	Control Form	Menu application	Responsive Menu	Tree menu

sc_decode({My_Field})

[Watch a tutorial](#)

This macro returns the encrypted field or variable to its original value.

```

Ex. 1: Using a local variable:
{my_field} = sc_decode($field_crypt);
    
```

```

Ex. 2: Using an user variable:
$my_var = sc_decode($field_crypt);
    
```

Note: Scriptcase's owner, *Netmake*, isn't responsible by the cryptography algorithm integrity (it is an open-source algorithm)

Macro Scope

Blank application	calendar application	chart application	Grid application	Search application	Form application	Control Form	Menu application	Responsive Menu	Tree menu

sc_encode({My_Field})

[Watch a tutorial](#)

Returns the field or variable with the content encrypted.

Ex. 1: Encrypting a local variable:
`$field_crypt = sc_encode({my_field});`

Ex. 2: Encrypting an user variable:
`$field_crypt = sc_encode($my_var);`

Note: Netmake isn't responsible by the encrypting algorithm integrity, (The algorithm provided is open source).

sc_error_continue("Event")

[Watch a tutorial](#)

This macro deactivates the Scriptcase standard database error treatment message for the event passed as parameter allowing it to be substituted by the programmer customized error treatment.

It can be used in along with variable: {sc_erro_delete}, {sc_erro_insert} and/or {sc_erro_update}

The events to be passed as parameter are: insert, delete or update.

Ex. 1: Using on the event **onDelete** for the message returned by mssql, trigger treatment, which cancels the record exclusion, displays a error message in the format [Microsoft] [ODBC SQL Server Driver] [SQL Server] You can't erase the record.

```
sc_error_continue("delete");
if (!empty({sc_error_delete}))
{
$tmp = strrpos({sc_error_delete}, " ");
if ($tmp !== false)
{
{sc_error_delete} = substr({sc_error_delete}, $tmp 1);
}
}
sc_error_message({sc_error_delete});
sc_error_exit;
}
```

Macro Scope

calendar application	Form application	Control Form
onBeforeDelete	onBeforeDelete	
onBeforeInsert	onBeforeInsert	onScriptInit
onBeforeUpdate	onBeforeUpdate	

sc_error_delete

 [Watch a tutorial](#)

This variable returns a string with a database error message, which occurs by trying to exclude a record.

It is used when there is a need to treat these messages.

Like for example, in case of database validations via triggers or procedures that they return messages.

Ex. 1: Content of the variable **{sc_error_delete}**, returning an error message generated by database trigger using

MsSQL. "[Microsoft] [ODBC SQL Server Driver] [SQL Server] You can't erase this register."

Note: To access the database return error, sees the macro "**sc_error_continue**".

Macro Scope

calendar application	Form application
onAfterDelete	onAfterDelete

sc_error_exit(URL / My_Application, "Target");

 [Watch a tutorial](#)

The `sc_error_exit` macro interrupts code execution.

When used without a parameter, the macro uses a return, so when using it in a PHP method only the execution of the code in the method will be interrupted, returning to the originating event and executing the rest of the code. In this case, to interrupt the execution of the application event, the macro must also be used when returning the method.

This macro must be used after the macro `sc_error_message()`:

Parameters

It has two parameters that are not mandatory and the use or not of the parameters interferes with the functioning of the macro.

Parameter	Description	Parameter passing
app_name/URL	<p>This parameter is not mandatory.</p> <p>When informed, whenever the macro is triggered, the user will be redirected to the informed application or page, which can be opened in the same tab or in a new one, according to the target parameter.</p>	<p>The application name or URL must be enclosed in double or single quotation marks.</p> <p>Example with URL <code>sc_error_exit('www.scriptcase.com.br');</code></p> <p>Example with Application <code>sc_error_exit('app_Login');</code></p>
target	<p>This parameter is not mandatory.</p> <p>It defines whether the application/URL will be opened in the same tab or in a new one.</p> <p>Values can be:</p> <ul style="list-style-type: none"> • _blank - Which displays the application/URL in a new tab. • _self - Displays the application/URL in the same tab as the application. <p>If no value is entered, the _self will be used as the default.</p>	<p>This parameter must be entered in double or single quotes.</p> <p>Example opening the same tab <code>sc_error_exit('www.scriptcase.com.br');</code></p> <p>Example opening the same tab with target <code>sc_error_exit('www.scriptcase.com.br', '_self');</code></p> <p>Example opening new tab <code>sc_error_exit('app_Login', '_blank');</code></p>

Examples

Ex. 1: Displays only the error message.

```
sc_error_message("Error message");
sc_error_exit();
```

Ex. 2: Displays error messages and the "OK" button to redirect to the specified URL.

```
sc_error_message("Error message");
sc_error_exit(http://www.meusite.com);
```

Ex. 3: Displays error messages and the "OK" button to redirect to the informed Application.

```
sc_error_message("Error message");
sc_error_exit("my_application", "_blank");
```

Macro Scope

calendar application	Grid application	Search application	Form application	Control Form
ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterInsert onAfterUpdate onBeforeDelete onBeforeInsert onBeforeUpdate onValidate onValidateFailure onValidateSuccess	onClick	onFilterValidate	ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onBeforeDelete onBeforeDeleteAll onBeforeInsert onBeforeInsertAll onBeforeUpdate onBeforeUpdateAll onNavigate onValidate onValidateFailure onValidateSuccess	onBlur onChange onlick onFocus onScriptInit onLoadAll onRefresh onValidate onValidateFailure onValidateSuccess

`sc_error_insert`

 [Watch a tutorial](#)

This variable returns a string with the database error, that occurs when adding a record. It is used when is needed to treat these messages. For example, in the case of database validations via triggers or procedures that returns a message.

Ex. 1: Variable **{sc_erro_insert}**, returning an error message generated by database trigger the using MS SQL

"[Microsoft] [ODBC SQL Server Driver] [SQL Server] You cannot add this record."

Note: To access the return of the database error, see the macro "**sc_error_continue**".

Macro Scope

calendar application	Form application
onAfterInsert	onAfterInsert

sc_error_message("Text")

 [Watch a tutorial](#)

This macro generates an error message or error messages.

In "**Form and Control**" applications, the messages are presented together with other error messages found in the application, except when using the "**sc_error_exit**" macro.

In "**Grid and Menu**" applications the messages only will be presented through the "**sc_error_exit**" macro.

Ex. 1:

```
if ({discount} > 0.10 && [glo_usr] == 'operator')
{
sc_error_message("Discounting of " . {discount} . " above of the allowed one");
}
```

In this example, if the value in the discount field is over 0.10 and the user try to add or save this record, the operation is finished and the error message is presented. The command must finish with ";" (close parentheses and semicolon) used as a delimiter for the macro interpreter.

Macro Scope

Blank application	calendar application	Search application	Form application	Control Form
onExecute	ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterInsert onAfterUpdate onBeforeDelete onBeforeInsert onBeforeUpdate onValidate onValidateFailure onValidateSuccess	onFilterValidate	ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onBeforeDelete onBeforeDeleteAll onBeforeInsert onBeforeInsertAll onBeforeUpdate onBeforeUpdateAll onLoad onNavigate onValidate onValidateFailure onValidateSuccess	onBlur onChange onClick onFocus onScriptInit onLoadAll onRefresh onValidate onValidateFailure onValidateSuccess

sc_error_update

 [Watch a tutorial](#)

This variable returns a string with a database error message that occurs when updating a record. It is used when there is a need to customize these messages. For example, in the case of database validations via triggers or procedures that return message.

Ex. 1: Variable `{sc_error_update}`, returning an error message generate by a database trigger using MS SQL.

"[Microsoft][ODBC SQL Server Driver][SQL Server] You can't update this record."

Note: To have access to the return of database error see the macro "`sc_error_continue`".

Macro Scope

calendar application	Form application
onAfterUpdate	onAfterUpdate

`sc_event_hint('field_name', 'help message', maximum_width)`

The `sc_event_hint` macro allows the developer to define a help text (tooltip) for fields containing links created from the `onClick` event.

The macro is not available for events created from action bar buttons.

Parameters

The macro has three parameters, two of which are mandatory (`field_name` and `message`) and one optional (`maximum_width`). The parameters must be separated by a comma (,).

Parameter	Description	Example
	Mandatory parameter that receives the field name, as a string, where the help text (tooltip) will be displayed.	
<code>field_name</code>	The field name must be enclosed in double or single quotes, containing only the field name. This parameter does not accept the use of variables.	// Example of parameter definition. <code>sc_event_hint('field_name', 'Click for more information', 100);</code>

Parameter	Description	Example
message	<p>Mandatory parameter that receives the help text to be displayed when hovering over the link created in the Ajax event. The text will be displayed only in the field specified in the first parameter if an onClick event is configured.</p> <p>The parameter can be defined using:</p> <ul style="list-style-type: none"> • String (enclosed in double or single quotes) • PHP variable • Global variable • Lang 	<pre>// Defining the text using a string. sc_event_hint('field_name', 'Click for more information', 100); // Defining the text using a PHP variable. sc_event_hint('field_name', \$var_php, 100); // Defining the text using a global variable. sc_event_hint('field_name', [var_global], 100); // Defining the text using a Scriptcase lang. sc_event_hint('field_name', {lang_name}, 100);</pre>
maximum_width	<p>Optional parameter that defines the maximum width of the hint where the message will be displayed. When reaching the defined limit, the text will wrap to the next line.</p> <p>The size is defined in pixels and should only contain numbers.</p>	<pre>// Defining the text with a width limit. sc_event_hint('field_name', 'Click for more information', 100);</pre>
<p>Macro Scope</p> <p>Grid application</p> <p>Example of use</p> <p><code>onRecord</code></p>		
<p>Example 1: Using a lang</p> <pre>sc_event_hint("customerid", {lang_name});</pre>		

sc_exec_sql("SQL Command", "Connection")

Example 2: Using a PHP variable.

```
$var_msg_help = "Field help message";
sc_event_hint("customerid", &var_msg_help );
```

Example 3: With validation

```
if ( {person_type} == "F" ) {
    sc_event_hint(field,"Individual");
} else {
    sc_event_hint(field,"Company");
}
```

This macro allows to condition the circumstances that the SQL commands are executed.

The "Connection" parameter is optional. Required only, if the command is executed in a database different from the application.

```

Ex. 1:
if (sc_after_delete) {
sc_exec_sql("delete from mytable where key = {key_ant}");
}
    
```

Macro Scope

sc_exit(Option)

--

 [Watch a tutorial](#)

The macro `sc_exit` defines the application's behavior after executing a **PHP** or **RUN** button. This behavior varies depending on the parameter provided.

Its use is exclusive to buttons of type **PHP** or **RUN**

Parameter

Parameters	Examples	Description
No parameter	<code>sc_exit();</code>	The confirmation screen with the "OK" button will not be displayed, and the user will be redirected to the previous application (if it exists).
ok	<code>sc_exit(ok);</code>	The confirmation screen with the "OK" button will be displayed, and the user will be redirected to the previous application (if it exists).
sef	<code>sc_exit(sef);</code>	The confirmation screen with the "OK" button will not be displayed, and the user will return to the current application, executing the SELECT command of the application again.
ref	<code>sc_exit(ref);</code>	The confirmation screen with the "OK" button will not be displayed, and the user will return to the current application, refreshing the data with a refresh .
ok, sef	<code>sc_exit(ok,sef);</code>	The confirmation screen with the "OK" button will be displayed, and the user will return to the current application, executing the SELECT command of the application again.
ok, ref	<code>sc_exit(ok,ref);</code>	The confirmation screen with the "OK" button will be displayed, and the user will return to the current application, refreshing the data with a refresh .

Parameters for forms and control

The options below are for transaction control and are exclusively for PHP buttons in control and form applications.

Parameters	Examples	Description
No parameter	<code>sc_exit();</code>	Does not affect database transactions.
c	<code>sc_exit(c);</code>	Performs pending transactions.
r	<code>sc_exit(r);</code>	Does not perform pending transactions.

Example

Example of using `sc_exit` in a RUN button.

```

```

// Using in the onRecord event of the RUN button.
$update = "update orders set shipaddress = 'completed' where orderid = ". {orderid};
sc_exec_sql($update);
sc_exit(ref);

```

```

Macro Scope

calendar application	Form application	Control Form
onScriptInit	onClick onScriptInit	onClick onScriptInit

`sc_field_color("Field", "Color")`

 [Watch a tutorial](#)

This macro is used to change/restore a **grid field** text color dynamically.

Ex. 1: Change the grid text field "customer_id" color.
`sc_field_color ("customerid", "#33FF66");`

Ex. 2: Change the "value_order" field text color, if the value is greater that 1000. Otherwise, use the default color.

```

if ({value_order} > 1000)
{
sc_field_color ("value_order", "#33FF66");
}
else
{
sc_field_color ("value_order", "");
}

```

Ex. 3: Using a local variable.
`sc_field_color ("customerid", {fld_color});`

Ex. 4: Using a global variable.
`sc_field_color ("customerid", [glo_color]);`

Macro Scope

Grid application	ReportPDF application
onScriptInit onRecord	onScriptInit onRecord

sc_field_disabled("Field_Name = True/False", "Parameter")

 [Watch a tutorial](#)

This macro is used to block a field to get any data that would be typed on it.

Fields that is going to be blocked should be followed by the option "true" (default) or "false".

The parameter is optional, "I" it's used only to block de addition of new records, "U" to block only the update, in case of the parameter has not been informed the Scriptcase will use both options.

Ex. 1: Blocks only one field for addition and update.

```
sc_field_disabled("Field_01");
```

Ex. 2: Unblocking a field for addition and update.

```
sc_field_disabled("Field_02=false");
```

Ex. 3: Blocks several fields, only for an update.

```
sc_field_disabled("Field_01; Field_02; Field_03", "U");
```

Ex. 4: Combination of the block and unblock of several fields, for addition and update.

```
sc_field_disabled("Field_01=true; Field_02=false; Field_03=true");
```

Macro Scope

calendar application	Form application	Control Form	ReportPDF application
onLoad	onLoad onNavigate	onLoadAll	onHeader

sc_field_disabled_record("Field_Name = True/False", "Parametre")

 [Watch a tutorial](#)

This macro has the objective to block the typing on determining fields in the lines of the Multiple Record form, Editable Grid, and Editable Grid View.

Fields that are supposed to be blocked should be applied the options, "true" (To block) or "false" (to unblock). If not informed, the default value is "true".

The optional parameter is using the "I" to block while inserting a new record and "U" to block while updating a record. If not informed, Scriptcase will block on both occasions by default.

Ex. 1: Blocking the field while including and updating.

```
sc_field_disabled_record("Field_01");
```

Ex. 2: Unblocking the field while including and updating.

```
sc_field_disabled_record("Field_02=false");
```

Ex. 3: Blocking the various fields only when updating.

```
sc_field_disabled_record("Field_01; Field_02; Field_03", "U");
```

Ex. 4: Combination of blocking and unblocking various fields while including and updating.

```
sc_field_disabled_record("Field_01=true; Field_02=false; Field_03=true");
```

The macro can also work within a condition, blocking a specific field on the record line.

Example 1:

```
if ({Filed_01} == 1)
{
sc_field_disabled_record("Field_03");
}
```

Example 2:

```
switch(trim([arr_apps][ {app_name} ]))
{
case 'form':
break;
case 'calendar':
sc_field_disabled_record("priv_export; priv_print");
break;
case 'cons':
sc_field_disabled_record("priv_insert; priv_delete; priv_update");
break;
default:
sc_field_disabled_record("priv_insert; priv_delete; priv_update; priv_export; priv_print");
break;
}
```

Macro Scope

Form application
onLoadRecord

sc_field_display({My_Field}, on/off)

 [Watch a tutorial](#)

This macro will display a specific field dynamically.
By default, all the fields are displayed ("on" condition").

```
Ex. 1:
if ({tp_customer} == "personal")
{
sc_field_display({company_name}, off);
}
else
{
sc_field_display({personal_name}, off);
}
```

Ex. 2: Using a local variable as second parameter

```
$var = "off";
sc_field_display({company_name}, $var);
```

Macro Scope

calendar application	chart application	Grid application	Form application	Control Form
ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterInsert onAfterUpdate onScriptInit onLoad onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onHeader onScriptInit	onScriptInit	ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onBeforeInsertAll onBeforeUpdateAll onScriptInit onLoad onNavigate onLoadRecord onRefresh onValidate onValidateFailure onValidateSuccess	onBlur onChange onClick onFocus onScriptInit onLoadAll onRefresh onValidate onValidateFailure

sc_field_init_off(Field1, Field2,...)

 [Watch a tutorial](#)

This macro is intended to inhibit the query fields on the initial load.
Fields inhibited by this macro can be enabled by using the "Columns" button.

```
Ex 01:
sc_field_init_off ({orderID}, {TotalValue});
```

Macro Scope

Grid application
onApplicationInit

sc_field_no_validate('field_name')

The macro can only be used in the onLoad event of Form, Control and Calendar applications. It allows ignoring the validations of the fields informed in the parameter, allowing the developer to dynamically "remove" the validations according to his business rule.

It is worth mentioning that **only the validations defined in the field configuration screen will be ignored by the macro**. Validations created by the developer in events, methods or libraries will not be considered.

Check some validations that will be ignored with the use of the macro.

- Field data types: Date, credit card, email, and zip code.
- Formatting text field values: Maximum, minimum value and characters allowed.
- Formatting numeric field values: Maximum and minimum value.
- Fields marked as mandatory.

See below for details about the macro parameter.

Macro Parameter

Parameter	Syntax	Description
field_name	<p>The parameter expects to receive the name of the fields in quotes (single or double) or in curly brackets {field_name}. It is also possible to enter two or more fields, in which case the names must be separated by a comma.</p> <p>Syntax with a field</p> <pre>// field name in quotes sc_field_no_validate('field_name');</pre> <pre>// field name in curly brackets sc_field_no_validate({field_name});</pre> <p>Syntax with two or more fields</p> <pre>// Two and more fields sc_field_no_validate({field_name1},{field_name2});</pre>	<p>This parameter is mandatory and must receive the name of the fields that will have the validation disregarded.</p> <p>It is possible to inform more than one field, in this case, the names must be separated by a comma.</p>

Lista de Exemplos

Removing validation from a field hidden by the macro sc_field_display.

```
sc_field_display({field1}, 'off');
sc_field_no_validate({field1});
```

Example using multiple fields in curly brackets.

```
sc_field_no_validate({field1}, {field2}, {field3});
```

Example using multiple fields with quotes.

```
sc_field_no_validate('field1', 'field2', 'field3');
```

Macro Scope

calendar application	Form application	Control Form
onLoad	onLoad onLoadRecord	onLoadAll

[Watch a tutorial](#)

This macro dynamically sets a form field attribute to 'ReadOnly'. Use this macro only to do it at 'runtime'. Otherwise set this parameter on / off on the form interface. section "Read-Only".

The on/off parameter its optional, used by an ajax event to define if a field is going to be read-only (On) or read-only (Off).

Ex. 1: To set a field as read only even when the form is in "Addition mode":

```
if (sc_btn_new)
{
  sc_field_readonly({my_field});
}
```

Ex. 2: To set a field as read only dynamically use:

```
sc_field_readonly({my_field});
```

Macro Scope

calendar application	Form application	Control Form
ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterInsert onAfterUpdate onScriptInit onLoad onRefresh onValidate onValidateFailure onValidateSuccess	ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onBeforeInsertAll onBeforeUpdateAll onScriptInit onLoad onNavigate onLoadRecord onRefresh onValidate onValidateFailure onValidateSuccess	onBlur onChange onClick onFocus onScriptInit onLoadAll onRefresh onValidate onValidateFailure

sc_field_style({My_Field}, "Background-Color", "Size", "Color", "Family", "Weight")

[Watch a tutorial](#)

This macro allows to dynamically modify the grid field style.

Parameter	Description
Field	Name
Background-Color (optional)	Field cell background Color
Size (optional)	Field font size
Color (optional)	Font Color
Family (optional)	Font family
Weight (optional)	Font weight

Ex. 1:
`sc_field_style({my_field}, '#33FF99', '15px', '#000000', 'Arial, sans-serif', 'bold');`

Macro Scope

Grid application
onRecord

sc_foot_hide()

 [Watch a tutorial](#)

This macro is intended to hide the application footer.

With no mandatory parameter, the macro is available in the following applications:

- Form
- Control
- Graphic
- Grid

In the Grid, in addition to its standard use (without parameters), it is possible to individually define the module where the display of the footer will be inhibited.

Below is the list of **unique grid parameters**

- **grid** - Hide only the footer of the grid module
- **res** or **sum** - Hide only the summary module footer
- **det** - Hides the detail module footer

Remembering that the parameters are not mandatory, in the case of the query, if no parameter is informed, the footer display will be inhibited in all modules.

Examples

Eg. no parameter - Default use of the macro, without passing a parameter, inhibits the display of the footer in the Form, Control, Graph and in all modules of the query.

```
sc_foot_hide();
```

Below are examples of using the macro with parameter, **exclusively for use in the grid**

Eg. using the 'grid' parameter - Inhibits the visualization of the footer only in the application module.

```
sc_foot_hide('grid');
```

Eg. using the 'sum' parameter - Inhibits the display of the footer only in the module in the application summary.

```
sc_foot_hide('res'); OR sc_foot_hide('sum');
```

Eg. using the 'det' parameter - Inhibits the visualization of the footer only in the module in the application summary.

```
sc_foot_hide('det');
```

Eg. using more than one parameter - Inhibits the visualization of the footer in the grid and application detail modules.

In this case the parameters must be separated by a comma.

```
sc_foot_hide('grid,det');
```

Macro Scope

chart application	Grid application	Form application	Control Form
onScriptInit	onScriptInit	onScriptInit	onScriptInit

 [Watch a tutorial](#)

This macro is used to format numerical values.

Parameter	Description
My_Field	Variable or field to format (The return is in the next variable).
Group_Symb	Integer values grouping symbol.
Dec_Symb	Decimals separator symbol.
Amount_Dec	Number of decimals to be displayed.
Fill_Zeros	Complete decimals with zeros (fill in) (S = yes and N = no).
Side_Neg	Negative sign position. (1 = left and 2 = right)
Currency_Symb	Monetary symbol to be displayed.
Side_Currency_Symb	Currency symbol position. (1 = left and 2 = right).

Ex. 1: Formatting an integer.

```
sc_format_num({my_value}, ',', '', '0', 'N', '1', '');
Input value = 001234567890
Output value = 1.234.567.890
```

Ex. 2: Formatting a negative value and truncating decimals.

```
sc_format_num({my_value}, ',', '', '0', 'N', '1', '');
Input value = 0012345678.90-
Output value = -12.345.678
```

Ex. 3: Formatting a value with 4 decimals and filling with zeros.

```
sc_format_num({my_value}, ',', '', '4', 'S', '1', '');
Input value = 0012345678.9
Output value = 12.345.678.9000
```

Ex. 4: Formatting a value with 2 decimals, filling with zeros and using monetary symbol.

```
sc_format_num({my_value}, ',', '', '2', 'S', '1', 'US$');
Input value = 0012345678.9
Output value = US$ 12.345.678,90
```

Ex. 5: Formatting a value with 2 decimals, filling with zeros.

```
sc_format_num({my_value}, ',', '', '2', 'S', '1', '');
Input value = .9
Output value = 0,90
```

`sc_format_num_region({My_Field}, "Qtde_Dec", "Insert_Zeros", "Monetary_Sym")`

[Watch a tutorial](#)

This macro has the objective to format numbers, using the regional settings

Parameter	Description
My_Field	Variable or field that has a value to be formatted (if the value is 0 the result will be the same as the variable).
Otdc_Dec	Amount of decimals that'll be displayed.
Insert_Zeros	Complete with the non existing decimals (Y = yes and N = no).
Monetary_Sym	Display monetary symbol (Y = yes and N = no).

Ex. 1: Formatting a value with 2 decimal spaces, inserting the zeros and the monetary value.

sc_format_num_region({my_value}, "2", "Y", "Y");
 Input value = 9
 Output value = R\$0,90

Macro Scope

sc_form_show'on' or 'off'

[Watch a tutorial](#)

This macro dynamically display or hide a form.
 By default, the form is displayed ("on" condition).

Ex. 1: Does not display the form.

sc_form_show = 'off';

Macro Scope

calendar application	Form application	Control Form
onScriptInit onLoad onValidate	onScriptInit onLoad onValidate	onScriptInit onLoadAll

sc_getfield("myField")

[Watch a tutorial](#)

This macro is used to assign objects (that represent the field's form) to a javascript variable, allowing the user to access the object properties. This macro will run on control and forms at the javascript events and methods.

EX:

Showing the value of the "client" field of a form cli_js = sc_getfield('cliente'); alert (cli_js.value);

Macro Scope

sc_get_groupby_rule()

 [Watch a tutorial](#)

This macro is used to retrieve the name of the Group By rule that is being used at this moment. The return value is a String containing the name of the rule.

Ex:

```
if (sc_get_groupby_rule() == "rule1")  
{  
[title] = "Sales X Region";  
}
```

Macro Scope

Grid application

```
onScriptInit  
onNavigate  
onRecord
```

sc_get_language

 [Watch a tutorial](#)

This macro returns the abbreviation of the language being used.

Ex. 1:

```
$my_language = sc_get_language();
```

 [Watch a tutorial](#)

This macro works in the form application only when it is configured to work as a step form. With this macro it is possible to identify the current stage that the end user is in and thus perform any necessary validation.

For the macro to work, the form must be configured with at least two steps or more. It has no parameters.

Example: Validation of unfilled fields.

```
if (sc_get_wizard_step() == 1) {
  if ( empty({contactname}) ) {
    sc_error_message("Fill the field Contactname");
  }
}
```

Macro Scope

Form application
onValidate

sc_groupby_label("My_Field")

 [Watch a tutorial](#)

This Macro dynamically modifies the field label displayed in the group by lines.

Ex. 1:
sc_groupby_label('state') = "state grouping";

Ex. 2:
sc_groupby_label('balance') = "balance total";

Macro Scope

Grid application
onGroupBy

sc_head_hide()

 [Watch a tutorial](#)

This macro is intended to hide the application header.

With no mandatory parameter, the macro is available in the following applications:

- Form
- Control
- Graphic
- Grid

In the Grid application, in addition to its standard use (without parameters), it is possible to individually define the module where the display of the header will be inhibited.

Below is the list of **unique grid parameters**

- **grid** - Hide only the header of the grid module
- **res** or **sum** - Hide only the summary module header
- **det** - Hides the detail module header

Remembering that the parameters are not mandatory, in the case of the grid application, if no parameter is informed, the header display will be inhibited in all modules.

Examples

Eg. no parameter - Default use of the macro, without passing a parameter, inhibits the display of the header in the Form, Control, Chart and in all modules of the Grid.

```
sc_foot_hide();
```

Below are examples of using the macro with parameter, **exclusively for use in the grid**

Eg. using the 'grid' parameter - Inhibits the header view only in the grid application grid module.

```
sc_foot_hide('grid');
```

Eg. using the 'sum' parameter - Inhibits the header view only in the grid application summary module.

```
sc_foot_hide('res'); or sc_foot_hide('sum');
```

Eg. using the 'det' parameter - Inhibits the header view only in the grid application detail module.

```
sc_foot_hide('det');
```

Eg. using more than one parameter - Inhibits the visualization of the header in the grid application and detail module.

In this case the parameters must be separated by a comma.

```
sc_foot_hide('grid,det');
```

Macro Scope

chart application	Grid application	Form application	Control Form
onScriptInit	onScriptInit	onScriptInit	onScriptInit

sc_hide_groupby_rule('group1', 'grop2', 'group3')

 [Watch a tutorial](#)

This macro is used to disable Group By rules in execution time.

The Group By rules ID should be informed as parameters in the macro.

This macro will only work if there are at least two group by, so using the macro, one group by will be disabled and other remains showing.

Ex:

```
if( [usr_login_group] == 'seller' ){
sc_hide_groupby_rule('rule_1', 'rule_2');
}
```

Macro Scope

Grid application
onApplicationInit

sc_image(Image01.jpg)

This macro is used to copy images in some events or Javascript commands to load images to an application.

All images used in the applications are automatically copied to each application.

Ex. 1:

```
sc_image (img1.gif, img2.jpg);
```

Note: The images must exist in the development environment images directory (../devel/conf/sys/img/img/).

sc_include("File", "Source")

 [Watch a tutorial](#)

The Scriptcase allows the user to catalog his PHP scripts to use in various applications.

To catalog the scripts go to the ScriptCase main menu at **"Tools > Library"** and use the "upload" option existing in the interface.

When a script is cataloged, the user has the option of the context choice where it will be stored, global level (Scriptcase), group level or user level.

- **Public:** All the projects will have access.
- **Project:** Only the project users (the ones that will be logged at that time) will have access.
- **User:** Only the user (the ones that will be logged at that time) will have access.

The **sc_include** macro, the user must inform the **script name** that will be included and the **source**.

- **Script Name:** Script name to be included.

The Source context that the script was saved, that could be:

- **Sys or Blank:** Scriptcase global level.
- **Prj:** Group level.
- **Usr:** User level.

Ex. 1: Including a catalogued script to global level.

```
sc_include(my_script.php);
```

Ex. 2: Including a catalogued script to the group level.

```
sc_include(my_script.php, grp);
```

Ex. 3: Including a catalogued script to the user level.

```
sc_include(my_script.php, usr);
```

Macro Scope

Blank application	calendar application	chart application	Grid application	Search application	Form application	Control Form	Menu application	Responsive Menu	Tree menu	ReportPI applicati

sc_include_lib("Lib1", "Lib2", ...)

 [Watch a tutorial](#)

This macro is used to dynamically select the application libraries.

PHP Libraries	JavaScript Libraries
tcpdf	Jquery
fpdf_html	jquery_thickbox
excel	jquery_blockui
rtf	tiny_mce
phpspreadsheet	jquery_touch_punch
-	fusioncharts
-	jsmind
-	jkanban
-	orgchart

Ex. 1:

```
sc_include_lib ("tcpdf");
```

```
$pdf=new TCPDF();
$pdf->AddPage();
$pdf->SetFont('Helvetica','B',16);
$pdf->Cell(40,10,'Hello World!');
$pdf->Output();
```

Ex. 2:

```
?>
sc_include_lib ("jsmind");
< ?php
```

Macro Scope

Blank application	Grid application
onExecute	onScriptInit

`sc_include_library("Target", "Library Name", "File", "include_once", "Require")`

 [Watch a tutorial](#)

This macro includes a **PHP** file from a library in the application. You must have a library created in Scriptcase to make use of this macro. To create a library, go to "Tools -> Libraries".

Parameter	Description
Target	Tells you what the scope of the library. It can be "sys" for libraries of <i>Public</i> scope or "prj" for libraries of the <i>Project</i> scope.
Library Name	Name given to the library at the time of creation.
File	The absolute path within the library.
include_once (optional)	Make sure that the file will only be included once. If not informed, this value is set as "true".
Require (optional)	If the file or library does not exist, the application to be executed and returns an error. If not informed, the value is set as "true".

Ex: Including a file from a library:

```
sc_include_library("prj", "phpqrcode", "qrlib.php", true, true);
```

Macro Scope

Blank application	calendar application	chart application	Grid application	Search application	Form application	Control Form	Menu application	Responsive Menu	Tree menu
onExecute	ajaxFieldonBlur OnChange OnClick OnFocus onAfterDelete onAfterInsert onAfterUpdate onApplicationInit onBeforeDelete onBeforeInsert onBeforeUpdate onScriptInit onLoad onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onFooter onHeader onScriptInit	onScriptInit onRecord	onApplicationInit onFilterInit onFilterRefresh onFilterSave onFilterValidate	ajaxFieldonBlur OnChange OnClick OnFocus onAfterDelete onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onApplicationInit onBeforeDelete onBeforeDeleteAll onBeforeInsert onBeforeInsertAll onBeforeUpdate onBeforeUpdateAll onClick onScriptInit onLoad onNavigate onLoadRecord onRefresh onValidate onValidateFailure onValidateSuccess	onBlur onChange onClick onFocus onApplicationInit onScriptInit onLoadAll onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onExecute onLoad	onApplicationInit onExecute onLoad	onExecute onLoad

`sc_label("field_name")`

 [Watch a tutorial](#)

This macro allows dynamically changing the label of fields in grid, form, and control applications.

Parameters

The macro has only one mandatory parameter, which receives the name of the field whose label will be changed.

This parameter must be provided in quotes (double or single) or by a variable, as in the syntax examples below.

```
//Providing as a string
sc_label("customerid") = "New label for the field";
```

```
//Providing with a variable
$var_field = "field_name";
sc_label($var_field) = "New label for the field";
```

Examples

Ex. 1: User Registration

In this scenario, a single form is used to register employees and customers.

```
if ({user_type} == 'customer') {
  sc_label('field_id') = 'Customer ID';
} else {
  sc_label('field_id') = 'Employee ID';
}
```

Ex. 2: Event Registration

In an event registration form, the field labels can be changed to reflect the type of event (e.g., Conference, Workshop, Seminar).

```
if ({event_type} == 'conference') {
  sc_label('location') = 'Conference Location';
} else if ({event_type} == 'workshop') {
  sc_label('location') = 'Workshop Location';
} else if ({event_type} == 'seminar') {
  sc_label('location') = 'Seminar Location';
}
```

Macro Scope

    )

    [3] => objectclass
    [count] => 4
    [dn] => ou=scientists,dc=example,dc=com
  )
)
```

Macro Scope

calendar application	Form application	Control Form
onApplicationInit onValidate	onApplicationInit onValidate	onApplicationInit

`sc_idap_login($server, $version, $user, $password, $dn, $group, $port, $library)`

The `sc_ldap_login` macro is responsible for establishing the connection with the LDAP (Lightweight Directory Access Protocol) server, enabling connections to **Active Directory (AD)**. It also defines the behavior of other LDAP macros through the `$library` parameter, which specifies the library to be used (`LdapRecord` or `adLdap`).

Syntax

```
sc_ldap_login($server, $version = "", $user = "", $password = "", $dn = "", $group = "", $port, $library);
```

Parameters

Parameter	Description
<code>\$server</code>	IP address or hostname of the LDAP server.
<code>\$version</code>	LDAP protocol version to be used (example: 3). If left empty, the server's default version will be used.
<code>\$user</code>	Username for LDAP authentication. It must be in the format expected by the server, such as <code>cn=admin,dc=company,dc=com</code> or <code>user@company.com</code> .
<code>\$password</code>	Password of the user used for LDAP login.
<code>\$dn</code>	Distinguished Name (DN) that defines the search point for users. Example: <code>"dc=company,dc=com"</code> .
<code>\$group</code>	Optionally, a group can be specified to check the user's association.
<code>\$port</code>	Port used to connect to the LDAP server (389 for standard connections and 636 for secure SSL connections).
<code>\$library</code>	This parameter defines which library will be used for the LDAP connection. <ul style="list-style-type: none"> If the value 2 is provided, the macro will use the new library (<code>LdapRecord</code>), available from version 9.12 of Scriptcase. If the parameter is not provided, the macro will continue using the legacy library (<code>adLdap</code>). <p>This configuration allows older projects to continue functioning without modifications, while new implementations can benefit from the enhanced compatibility and security of LdapRecord.</p>

Example Usage

```
$server = "ldap.myserver.com";
$version = "3";
$user = "cn=admin,dc=company,dc=com";
$password = "password123";
$dn = "dc=company,dc=com";
$group = "";
$port = 389;
$library = 2; // Or leave empty to use the legacy "adLdap" library
```

```
sc_ldap_login($server, $version, $user, $password, $dn, $group, $port, $library);
```

Expected Return

```
Array
(
    [0] => Array
        (
            [sn] => Array
                (
                    [count] => 1
                    [0] => Newton
                )

            [0] => sn
            [objectclass] => Array
                (
                    [count] => 4
                    [0] => inetOrgPerson
                    [1] => organizationalPerson
                    [2] => person
                    [3] => top
                )

            [1] => objectclass
            [uid] => Array

sc_ldap_logout()

This macro is used to release the connection after using the macro `sc_ldap_login`.

Ex1:

```
sc_ldap_logout();
```

Macro Scope

calendar application	Form application	Control Form
onApplicationInit onValidate	onApplicationInit onValidate	onApplicationInit onValidate

sc_ldap_search(\$filter = 'all', \$attributes = array())

This macro is used to perform searches in the LDAP.

Parameter	Description
\$filter	'all' or 'member': 'all' returns all information that the logged user can see. 'member' returns the information about that member
\$attributes	Array of LDAP filter options.

Ex:

```
$result = sc_ldap_search($filter, array('mail', 'displayname'));
```

Expected Return

```
Array (
  [N] => Array (
    [objectclass] => Array
      (
        [count] => 4
        [0] => inetOrgPerson
        [1] => organizationalPerson
        [2] => person
        [3] => top
      )
    [0] => objectclass
    [cn] => Array
      (

        [0] => 314-159-2653
      )
    [5] => telephonenumber
    [count] => 6
    [dn] => uid=einstein,dc=example,dc=com
  )
)
```

Macro Scope

calendar application	Form application	Control Form
onApplicationInit onValidate	onApplicationInit onValidate	onApplicationInit onValidate

sc_ldap_users(\$filter = 'all', \$attributes = array())

The `sc_ldap_users()` macro is used to retrieve information about users stored on an **LDAP (Lightweight Directory Access Protocol)** server.

With this function, it is possible to retrieve **all attributes visible to the authenticated user** or filter only those they are part of, allowing for **efficient user and permission management**.

Parameters

Parameters	Description
filter	Defines the scope of the search in LDAP. It can be: "all" - Returns all information accessible to the authenticated user. "member" - Returns only the attributes of the specified users.
attributes	An array containing the desired attributes for the query. If omitted, the function returns all attributes available to the authenticated user.

Syntax

```
$users = sc_ldap_users( $filter = 'all', $attributes = array());
```

Expected Return

```
Array
(
    [0] => Array
        (
            [sn] => Array
                (
                    [count] => 1
                    [0] => Newton
                )

            [0] => sn
            [objectclass] => Array
                (
                    [count] => 4
                    [0] => inetOrgPerson
                    [1] => organizationalPerson
                    [2] => person
                    [3] => top
                )

            [1] => objectclass
            [uid] => Array
                (
                    [count] => 1
                    [0] => newton
                )

            [2] => uid
            [mail] => Array
                (
                    [count] => 1
                    [0] => newton@ldap.forumsys.com
                )

            [3] => mail
            [cn] => Array
                (
                    [count] => 1
                    [0] => Isaac Newton
                )

Macro Scope

.

sc_link(Column, Application, Parameters, "Hint", "Target", Height, Width)

 [Watch a tutorial](#)

Allows you to dynamically create a field connection between two applications.

Note: This macro is only available in Query.

Below is the list of macro parameters, which must be informed separated by commas.

Parameter	Value	Description
Column	<p>Accepts only string with or without quote protection.</p> <p>For example:</p> <pre>sc_link(customerid, form_customer, custom={customerid}, "Customer Data", "_self");</pre> <p>Accepted ways of passing the parameter:</p> <ul style="list-style-type: none"> customerid 'customerid' "customerid" 	<p>Mandatory parameter, where the name of the field that will be transformed into a link to the other application must be informed.</p> <p>Note: If the informed field already has a field link, the link defined in the macro will overwrite the interface link.</p>

Application	<p>Accepts strings with or without the protection of quotes, in addition to global or local variables.</p> <p>For example:</p> <pre>\$var_customer = 'form_customer';</pre> <pre>sc_link(customerid, \$var_customer, custom={customerid}, "Customer Data", "_self");</pre> <p>Accepted ways of passing the parameter:</p> <ul style="list-style-type: none"> form_customer 'form_customer' "form_customer" \$var_customer [glob_customer] 	<p>Required parameter, defines the target application of the call.</p> <p>In this parameter it is possible to use variables making it possible to change the target application, depending on your business rule.</p>
Parameters	<p>This parameter defines the value of the variable that will be available from the target application as a global variable.</p> <p>For example:</p> <pre>sc_link(customerid, form_customer, custom={customerid}, "Customer Data", "_self");</pre> <p>Accepted ways of passing the parameter:</p> <ul style="list-style-type: none"> custom = {customerid} custom = 'ALFKI' custom = \$var_customer custom - [glob_customer] 	<p>This parameter is not mandatory, but its use is necessary for the correct display of data in the target application. When not informed, the target application will display all data in the table.</p> <p>Retrieving the value in the target application In the target application of the connection, in the example on the side is the form_customer application, the custom must be retrieved as a global variable in the application's SQL.</p> <p>In this example, the following SQL statement has been added to the form (form_customer)</p> <pre>customerid = '{custom}'</pre> <p>For more details on global variable usage, access our online documentation.</p>
Hint	<p>Accepts string, with or without the protection of quotes, lang and global or local variables.</p> <p>For example:</p> <pre>sc_link(customerid, form_customer, custom={customerid}, "Customer Data", "_self");</pre> <p>Obs: To use commas and apostrophes in the text, it is necessary to protect with the scape "\"</p> <p>Accepted ways of passing the parameter:</p> <ul style="list-style-type: none"> "Help text\, with a comma" 'Customer Data' Customer Data {lang_text} [glob_txt] \$ var_txt 	<p>This parameter is not mandatory.</p> <p>Receives a text with some help or remark for the system user, the text is displayed whenever the mouse cursor passes over the link.</p> <p>It is possible to use langs for the definition of messages, allowing the translation of your system.</p> <p>Obs: To use commas and apostrophes in the text it is necessary to protect with the scape "\"</p>
Target	<p>This parameter accepts only string. Available values are listed below.</p> <p>For example:</p> <pre>sc_link(customerid, form_customer, custom={customerid}, "Customer Data", "modal", 850, 600);</pre> <p>Note: If omitted, the value "_self" will be assigned.</p> <p>Accepted ways of passing the parameter:</p> <ul style="list-style-type: none"> "_self" "_blank" "iframeT" "iframeL" "iframeR" "iframeB" "modal" 	<p>Defines the way to open the target application.</p> <ul style="list-style-type: none"> _self - Runs the target application on the same page, overlapping the query application; _blank - Runs the target application on another page (pop-up); iframeT - Displays the target application in an iframe above the query (Top); iframeL - The target application will be displayed in an iframe to the left of the query (Left) iframeR - The target application will be displayed in an iframe to the right of the query (Right); iframeB - The target application will be displayed in an iframe below the query (Bot); modal - Opens a new window and blocks any interaction in the main window; <p>When using any of the iframe or modal to open the application, it is possible to define the height and width by adding the values in the optional parameters below.</p>
Height	<p>This parameter accepts only numerical values and its unit of measurement is pixel.</p> <p>For example:</p> <pre>sc_link(customerid, form_customer, custom={customerid}, "Customer Data", "modal", 850, 600);</pre>	<p>Non-mandatory parameter, available only when using the iframe and modal parameter Target</p> <p>Defines the height of the iframe or modal where the target application will be displayed.</p> <p>Note: If omitted, the default value will be 440</p>

Width	<p>This parameter accepts only numerical values and its unit of measurement is pixel.</p> <p>For example:</p> <pre>sc_link(customerid, form_customer, custom={customerid}, "Customer Data", "iframeB", 850, 600);</pre>	<p>Non-mandatory parameter, available only when using the Iframe and modal parameter Target</p> <p>Defines the width of the iframe or modal where the target application will be displayed.</p> <p>Note: If omitted, the default value will be 630</p>
--------------	---	---

Examples

Ex. 1: Creates a link to the costumer.php application, on the Id field, passing the global variable [global_costumer] as and the product field (local variable) {Id} to the costumer.php application:

```
sc_link(Id, costumer.php, product={global_costumer}; Id={Id}, "Client Data", "_blank");
```

Ex. 2: Creating a dynamic link to another application depeding on the field valor {costumer_type} and opening it in a modal.

```
if ( {costumer_type} == "F" ) {
    sc_link (costumer_type, type_f.php, product={global_costumer}; Id={Id}, " Personal Data ", "modal", 500, 700);
} else {
    sc_link (costumer_type, type_a.php, product={global_costumer}; Id={Id}, " Company Data ", "iframeR");
}
}
```

Ex. 3: Creating a link to a URL. A redirect to the given URL will be performed.

```
sc_link (my_field, http://www.scriptcase.com, "hint of the link", "_blank");
```

Macro Scope

Grid application

onRecord

sc_log_add("action", "description")

 [Watch a tutorial](#)

This macro is intended to add a record to the log table, thereby making the message and/or the name of the action customizable to the developer. The macro parameters can use PHP variables.

Ex:

```
sc_log_add ("access", "Application has been accessed by the user trial");
```

Macro Scope

Blank application	calendar application	Grid application	Form application
onExecute	onValidate	onScriptInit	onValidate

sc_log_split({description})

 [Watch a tutorial](#)

This macro is intended to provide access to the information written in the last insertion in the log table, allowing the manipulation of the data before and after the record update returning it in an array mode. The information is stored in the "description" field of the log table in the string format with delimiters.

Ex:

```
$arr_description = sc_log_split({description});
```

```
Input: -> keys fields Array ( [clientid] => ANTON ) [fields] => Array ( [old] => Array ( [CEP] => 50710500 [Address] => Rua Desembargador Joao Paes 657 [City] => Farol [State] => RS ) [new] => Array ( [CEP] => 53230630 [Address] => Avenida Presidente Kennedy, 1001 [City] => Peixinhos [State] => PE ) )
```

Macro Scope

Blank application	calendar application	Grid application	Form application
onExecute	onLoad	onScriptInit	onLoad

sc_lookup(Dataset, "SQL Command", "Connection")

 [Watch a tutorial](#)

This macro allows the user to **execute SQL commands** and returns the result to the "dataset" variable. The "dataset" structure **is an array** (line/column).

The "**connection**" parameter is optional. Use when the command is executed in a database different from that specified for the application.

Note: The connection parameter does not accept variable. You must enter the name of the connection that the SQL command will execute.

Ex. 1:

```
sc_lookup(dataset, "select customer_id, customer_name, credit_limit from customers" );
```

To have access to the first line (Dataset), use :

```
{customer_id} = {dataset[0][0]};
{customer_name} = {dataset[0][1]};
{credit_limit} = {dataset[0][2]};
```

To have access to the second line (Dataset), use :

```
{customer_id} = {dataset[1][0]};
{customer_name} = {dataset[1][1]};
{credit_limit} = {dataset[1][2]};
```

If occurs **error in the execution of the SQL command**, the variable attributed to the dataset will return as "**false**" and the error message will be available in the "**dataset_error**" variable. It is also important to verify the select returned data, to prevent access to non-existent variables, once the output array only will be created if the select command returns data.

Ex. 2:

```
sc_lookup(my_data, "select customer_id, customer_name, credit_limit from customers");
if ({my_data} === false)
{
  echo "Access error. Message=". {my_data_error} ;
}
elseif (empty({my_data}))
{
  echo "Select command didn't return data";
}
else
{
  {customer_id} = {my_data[0][0]};
  {customer_name} = {my_data[0][1]};
  {credit_limit} = {my_data[0][2]};
}
```

Ex. 3: The SQL command also can be composed of application fields (local variables) or of global variables:

```
sc_lookup(dataset, "select order_value from orders where clientid = '{customer_id}' and salesman_id = [var_glo_salesman]");
```

Note: The command must always be finished with a semicolon ";".

Note2: For a big result returned in the dataset we recommend the use of the macro `sc_select` instead of this one.

Macro Scope

sc_lookup_field(Dataset, "SQL Command", "connection_name")

--

This macro allows the developer to **execute a SELECT command at a time** and have access to the data returned through the dataset parameter, in array format: {dataset[line_number][field_name]}.

To run commands that return a large amount of data, we recommend using `sc_select` macro for better performance.

Unlike the macro `sc_lookup`, where we inform the index {dataset[0][0]}, in the macro `sc_lookup_field` we must inform the name of the column that we want to retrieve the data {dataset[0][field_name]}

The way of assembling the return array, where we must inform the column name, makes this macro incompatible with the following databases: **MSSQL Server, Access** and **DB2**. In these cases, we recommend using the `sc_lookup` macro.

See below for details on the macro parameters.

Parameter	Description	Examples
dataset	<p>This parameter is mandatory and must be informed without spaces or special characters and does not accept variables.</p> <p>It defines the name of the variable that will receive the return of the SELECT command executed by the macro.</p> <p>In case of error in the execution of the SQL command, this parameter will return false and the error message will be available in the variable "dataset_error".</p> <p>Below is a simple example of validation and error message display.</p> <pre>if ({meus_dados} === false) { echo "Access error. Message = " . {meus_dados_error}; }</pre>	<pre>sc_lookup_field("my_dataset", "select field_01, field_02, field_03 from tb_name");</pre> <p>When executing the command print_r({my_dataset}); we will get the following return:</p> <pre>Array ([0] => Array ([field_01] => 1 [field_02] => OFFICE EQUIPMENT) [1] => Array ([field_01] => 2 [field_02] => FIXED TELEPHONY))</pre> <p>In the example above, the command returned two record lines and in each line two columns (field_01 and field_02).</p> <p>The recovery of the value should take place as follows.</p> <pre>{my_dataset[line_number][column_name]}</pre>
SQL Command	<p>This parameter is mandatory and can be defined by informing the command directly in the macro protected with quotes (double or single) or using a variable (local or global).</p>	<pre>// Command directly in the Macro sc_lookup_field("retorno_select", "select field_01, field_02, field_03 from tb_name");</pre> <pre>// Sample with variable \$comando_select = "select field_01, field_02, field_03 from tb_name" sc_lookup_field("retorno_select", \$comando_select);</pre>
Connection	<p>The "connection" parameter is optional, and must be informed if the command is executed in a database different from the one specified for the application.</p> <p>Furthermore, this parameter does not accept the use of variables, being necessary to type the name of the connection for the macro to run correctly.</p>	<pre>// Sample of using the connection parameter sc_lookup_field("retorno_select", "select field_01, field_02, field_03 from tb_name", "nome_conexao");</pre>

Examples

Example 1: Access multiple lines

```
sc_lookup_field(my_dataset, "select field_01, field_02, field_03 from tb_name");
```

//To access the first line (dataset), we must inform:

```
{field_01} = {my_dataset[0]['field_01']};
{field_02} = {my_dataset[0]['field_02']};
{field_03} = {my_dataset[0]['field_03']};
```

//To access the second line (dataset), we must inform:

```
{field_01} = {my_dataset[1]['field_01']};
{field_02} = {my_dataset[1]['field_02']};
{field_03} = {my_dataset[1]['field_03']};
```

Example 2: With data validation:

```
$comando_sql = "select field_01, field_02, field_03 from tb_name";
```

```
sc_lookup_field(my_dataset, $comando_sql);
```

```
if ( {my_dataset} === false ) {
    echo "Access error. Message = " . {my_dataset_error};
} elseif ( empty({my_dataset}) ) {
    echo "select command did not return data ";
} else {
    {clienteid} = {my_dataset[0]['field_01']};
    {nomecliente} = {my_dataset[0]['field_02']};
    {limitecred} = {my_dataset[0]['field_03']};
}
```

Example 3: Using the connection parameter

```
$comando_sql = "select field_01, field_02 from tb_name where field_03 = '{field_03}' and field_02 = [var_global]"
```

```
sc_lookup_field(my_dataset, $comando_sql, "conn_name");
```

Example 4: Using local and global variables in the macro command

```
$comando_sql = "select field_01, field_02 from tb_name where field_03 = '{field_03}' and field_02 = [var_global]"
```

```
sc_lookup_field(my_dataset, $comando_sql);
```

sc_mail_send(SMTP, Usr, Pw, From, To, Subject, Message, Mens_Type, Copies, Copies_Type, Port, Connection_Type, Attachment, SSL)

 [Watch a tutorial](#)

This macro is used to send emails.

Parameter	Description
SMTP	SMTP server name or IP address. (String or Variable that contains the server name)
Usr	SMTP username. (String or Variable that contains the username)
Pw	SMTP password. (String or Variable that contains the password)
From	From email. (String or Variable that contains the email)
To	List of the emails that will receive the message, it could be a string or variable that contains one or more emails separated by ";" or one variable that contains one array of emails.
Subject	Message subject. (String or Variable that contains the subject)
Message	Message body. (String or Variable that contains the message)
Mens_Type	Message format: (T) Text or (H) HTML.
Copies	List of the emails that will receive the message, it could be a string or variable that contains one or more emails separated by ";" or one variable that contains one array of emails.
Copies_Type	Type copies: BCC (Hidden copies) or CCC (Regular copies).
Port	The port used by your e-mail server. Use the port 465 for the security type SSL, and the port 587 for the security type TLS or the port 25 for no security. If not informed, Scriptcase will set the default port: 25
Connection_Type	Indicating a secure connection. Use S for SSL, T for TLS or N for non-secure connections. If not informed, Scriptcase will set the default value: N .
Attachment	Absolute path of the file that will be attached in the email
SSL	Optional parameter to add SSL settings. If you need to add more than one setting, use ";" for separate them. Ex: \$ssl = 'allow_self_signed=false;verify_peer=false';
Reply_to	It is the email address the reply message is sent to, when you want the reply to go to an email address other than the From address.

Note: To use safe connection **its required** to have the PHP "**php_openssl**" extension enable.

Example 1: Sending e-mail with reply_to parameter

To use the replay_to parameter, you must include all the other parameters before it, just inform them empty.

```
sc_mail_send('smtp.meuserver.com.br', 'usr', 'pw', 'from@netmake.com.br', 'to@netmake.com.br', 'test sending of e-mail', 'message', 'H', 'abc@cop.com.br;zyx@cop.com.br', 'CCC', '587', '', 'c:/teste/arq.txt', 'reply@netmake.com.br');
```

Example 2: Using variables and defining the port.

```
sc_mail_send([glo_smtp], [usuar], [glo_pw], {from}, {to}, {subject}, {message}, 'T', [glo_copias], 'CCC', '419', 'S', {attached});
```

Example 3: No user and password.

The amount of emails sent will be stored at the special variable `sc_mail_count`.

If any error happens when the Scriptcase try to send the email, the variable `sc_mail_ok` will receive "**false**" and the error message will be stored on the variable `sc_mail_errro`.

```
sc_mail_send([glo_smtp], "", "", 'from.netmake.com.br', {to}, {subject}, {message}, 'H', "", "", [glo_att]);
```

Example 4: Email validation with {sc_mail_ok}

```
sc_mail_send([glo_smtp], "", "", 'from@netmake.com.br', {to}, {subject}, {message}, 'H');
```

```
if ({sc_mail_ok}) {
```

```
echo "sent {sc_mail_count} e-mail(s) with success!";
```

```
} else {
    sc_error_message({sc_mail_erro});
}
```

Example 5: Sending attached files

```
//Defining macro parameters in variables
$mail_smtp_server = 'smtp.gmail.com'; // SMTP Server
$mail_smtp_user = 'doc@gmail.com.br'; // SMTP access user
$mail_smtp_pass = 'password'; // Password for the SMTP user entered above
$mail_from = 'doc@gmail.com.br'; // Message origin email
$mail_to = 'doc@gmail.com.br'; // Email of message recipient
$mail_subject = 'Subject'; // Email subject
$mail_message = 'Email body'; // Email body
$mail_format = 'T'; // Email body format: T (Text only) or H (For text and HTML)
$mail_copies = ''; // Parameter that defines the copied emails.
$mail_tp_copies = ''; // Copy type: BCC (For blind copy) or CCC (For normal copy)
$mail_port = '465'; // Sending server port
$mail_tp_connection = 'S'; // Use or not of secure connection: Y (Secure connection) or N (Insecure connection)
$mail_attachments = 'c:/teste/arq.txt' // Directory of the file that will be sent as an attachment
```

```
//Macro with variables
sc_mail_send($mail_smtp_server,
    $mail_smtp_user,
    $mail_smtp_pass,
    $mail_from,
    $mail_to,
    $mail_subject,
    $mail_message,
    $mail_format,
    $mail_copies,
    $mail_tp_copies,
    $mail_port,
    $mail_tp_connection,
    $mail_attachments);
```

Example 6: Sending multiple files as attachments

```
//Parâmetros do e-mail
$mail_smtp_server = 'smtp.gmail.com'; // SMTP Server
$mail_smtp_user = 'doc@gmail.com.br'; // SMTP access user
$mail_smtp_pass = 'password'; // Password for the SMTP user entered above
$mail_from = 'doc@gmail.com.br'; // Message origin email
$mail_to = 'doc@gmail.com.br'; // Email of message recipient
$mail_subject = 'Subject'; // Email subject
$mail_message = 'Email body'; // Email body
$mail_format = 'T'; // Email body format: T (Text only) or H (For text and HTML)
$mail_copies = ''; // Parameter that defines the copied emails.
$mail_tp_copies = ''; // Copy type: BCC (For blind copy) or CCC (For normal copy)
$mail_port = '465'; // Sending server port
$mail_tp_connection = 'S'; // Use or not of secure connection: Y (Secure connection) or N (Insecure connection)
// Array of the file that will be sent as an attachment.
$mail_attachments = array('C:\Program Files\NetMake\v9-php81\wwwroot\scriptcase\file\img\color.png','C:\Program Files\NetMake\v9-php81\wwwroot\scriptcase\file\img\test.txt');
```

```
//Macro with variables
sc_mail_send($mail_smtp_server,
    $mail_smtp_user,
    $mail_smtp_pass,
    $mail_from,
    $mail_to,
    $mail_subject,
    $mail_message,
    $mail_format,
    $mail_copies,
    $mail_tp_copies,
    $mail_port,
    $mail_tp_connection,
    $mail_attachments);
```

sc_make_link(Application, Parameters)

 [Watch a tutorial](#)

This macro creates a string containing a link to other Scriptcase applications (when writing HTML code).

Parameter	Description
Application	Name of the application to establish the link.
Parameters	Parameters necessary so-called application. In the format: "=" (the attribution sign) . More than one parameter must be separated by ";" (semicolon).

Ex. 1: Creating a string with a link for the datacli.php application, without parameters passage.

```
$string_link = sc_make_link(datacli.php);
```

Ex. 2: Creating a string with a link for the application datacli.php, with parameters passage.

```
$string_link = sc_make_link(datacli, parm1={company};parm2=[glo_office]);
```

Macro Scope

Blank application	chart application	Grid application	Control Form
onExecute	onFooter onHeader onScriptInit	onScriptInit onNavigate onRecord	onValidate onValidateSuccess

sc_master_value("Object", "Value")

 [Watch a tutorial](#)

Update data in the **master** application, in real-time, according to changes made in a given field of the **detail** application.

Parameter	Description
Object	Object name to be updated in the master Application. It's not necessary the { } in a field name.
Value	Object value. The value can be a field or a variable.

Ex. 1:

```
sc_lookup(result,"SELECT SUM(Total) FROM adm_order_items WHERE OrderID = '{OrderID}'");
```

```
//Using sc_format_num() to format the value that will be updated in the master application
$value = sc_format_num({result[0][0]}, ',', '.', 2, 'S', 1, '');
sc_master_value('OrderPrice', $value);
```

** If the value, that will be sent to the master, be numeric, you have to use the **sc_format_num()** to format it. To see the macro documentation, [click here](#).*

Macro Scope

calendar application	Form application	Control Form
onAfterDelete onAfterInsert onAfterUpdate onApplicationInit onBeforeDelete onBeforeInsert onBeforeUpdate onScriptInit onLoad onRefresh onValidate onValidateFailure	onAfterDelete onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onApplicationInit onBeforeDelete onBeforeInsert onBeforeUpdate onScriptInit onLoad onNavigate onLoadRecord onRefresh onValidate onValidateFailure	onScriptInit onLoadAll onRefresh

sc_menu_delete(Id_Item1)

 [Watch a tutorial](#)

This macro removes menu items passed as parameters. It can be used in menu applications or tree menu.

Observe that the parameters used in this macro are the "ID" of the items.

If a menu item is removed and it has "nodes", they will be hidden too.

Macro Scope

Menu application	Responsive Menu	Tree menu
onApplicationInit onLoad	onApplicationInit onLoad	onApplicationInit onLoad

sc_menu_disable(Id_Item1)

 [Watch a tutorial](#)

This macro deactivates menu items passed as parameters. Can be used in menu applications or tree menus.

The parameters passed are items $i_{i-1}IDi_{i-1}$. Menu items are deactivated recursively (when a submenu item is deactivated its $i_{i-1}nodesi_{i-1}$ are also deactivated).

Macro Scope

Menu application	Responsive Menu	Tree menu
onApplicationInit onLoad	onApplicationInit onLoad	onApplicationInit onLoad

sc_menu_force_mobile(boolean)

 [Watch a tutorial](#)

This Macro is used to force the creation of menus to mobile devices.

The parameter (true or false) is optional. If no value is passed, it will use the value "true" (enable mobile mode)

i_{i-1}

Ex1:

sc_menu_force_mobile(true);

Ex2:

sc_menu_force_mobile(false);

Macro Scope

Menu application	Responsive Menu	Tree menu
onLoad	onLoad	onApplicationInit onLoad

sc_menu_item

 [Watch a tutorial](#)

This macro is only available for menu applications and it has the objective of giving access to a menu item that was selected, this way the user can take decisions before running the application.

⌋½

Ex. 1: To clean global variable.

```
if ({sc_menu_item} == "item_1")
{
sc_reset_global([global1], [global2]);
}
```

Ex. 2: If an application requires a global variable another application can initialize it accordingly.

```
if ({sc_menu_item} == "item_5" && (!isset([glo_employ]) || empty([glo_employ])))
{
sc_redir(apl_inf_emp);
}
```

⌋½

Ex. 2: Use the button on the toolbar menu.

```
if ({sc_menu_item} == "btn_1")
{
sc_apl_conf("form_customer", "start", "new");
}
```

⌋½

Macro Scope

Menu application	Responsive Menu	Tree menu
onExecute	onExecute	onApplicationInit onExecute

`sc_redir('app_name/url', parameter01; parameter02, 'target', 'error', 'modal_height', 'modal_width')`

[Watch a tutorial](#)

The **sc_redir** macro is used to create dynamic redirects between two applications or between an application and a URL, allowing the passing of parameters and control over how the destination application will be opened using the **target** parameter.

In form applications, the **sc_redir** macro can be used in events that depend on database updates, such as: **onAfterInsert**, **onAfterUpdate**, **onAfterDelete**, **onBeforeInsert**, **onBeforeUpdate**, and **onBeforeDelete**.

However, in these events, the **sc_commit_trans()** macro must be used before **sc_redir** to confirm the transaction; otherwise, the redirection will occur without the table changes being applied.

Parameters

Parameter	Description	Examples
app_name/url	Receives the name of the destination application or URL to which the user will be redirected. The values must be enclosed in double or single quotes.	sc_redir('app_name');
parameter_to_send	Allows passing values to the destination application in the format: parameter_name='value'. You can use an application_field, variable or inform a fixed value. If more than one parameter is passed, use a semicolon (;) as a delimiter. Values should be retrieved as global variables in the destination application.	sc_redir('app_name', parm1=50); Two parameters passed: sc_redir('aplx', parm1={clientid}; parm2="xxx"); In 'aplx', values retrieved as global variables: [parm1] and [parm2].
target	Defines how the destination application/URL will be displayed. <ul style="list-style-type: none"> _self: Opens the destination in the same tab (default if no value is specified). _blank: Opens the destination in a new tab. _parent: Opens the destination in the parent window, if the current page is in an iframe. modal: Opens the destination in a modal window (this option is unavailable when using the macro in a Run button) 	Specifying target without parameters: sc_redir('app_name', '_blank');
error	Defines the behavior of the redirection in case of an error in the application. <ul style="list-style-type: none"> 'E': Blocks the redirection if an error occurs. 'F': Forces the redirection even if an error occurs. 	sc_redir('app_name', '', 'E');
modal_height	Defines the height of the modal in pixels. This parameter is mandatory when using modal in the target parameter.	sc_redir('app_name', 'modal', '800', '600');
modal_width	Defines the width of the modal in pixels. This parameter is mandatory when using modal in the target parameter.	sc_redir('app_name', 'modal', '800', '600');

Usage Examples

Example 1 - Simple redirection without parameters.

```
//Since only the application was specified, it will open in the same tab.
sc_redir('aplx');
```

Example 2 - Redirection with parameter passing.

Four parameters are being sent to the destination application; these values must be retrieved as global variables: [parm1], [parm2], [parm3], [parm4].
if (empty(\$variable)) { \$variable = "documentation"; }

```
sc_redir('aplx', parm1={clientid}; parm2="xxx"; parm3=$variable; parm4=10);
This macro has the objective to delete all modifications effected by the sc_apl_conf macro.
The property parameter is optional, if it's passed it will only erase the modification from that specific application.
```

```
//In this case, since no parameters are being sent to the destination application, the space should be left blank to specify the target.
sc_redir('aplx', ' ');
Ex. 1: Deleting the modifications of the "my_application" application, property
```

```
"start"
Example 4 - Using modal for the target parameter.
sc_reset_apl_conf("my_application", "start");
```

```
//It is mandatory to define the width and height when specifying modal in the target parameter.
//Only the values should be provided.
sc_redir('aplx', "modal", "800", "600");
Ex. 2: Deleting the modifications of the "my_application" application.
sc_reset_apl_conf("my_application");
```

Example 5 - Example of use in form database transaction events.

```
//The sc_commit_trans macro must be used before sc_redir to confirm the transaction.
sc_commit_trans();
Ex. 3: Deleting the modifications of all the applications.
sc_redir('aplx', parm1={clientid});
sc_reset_apl_conf();
```

Example 6 - Redirection to a URL.

sc_reset_connection_new

[Watch a tutorial](#)

This macro undoes the connections made by the macro "sc_connection_new".

sc_reset_connection_new();

Macro Scope

Blank application	calendar application	chart application	Grid application	Search application	Form application	Control Form	Menu application	Responsive Menu	Tree menu	Re ap
onExecute	ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterInsert onAfterUpdate onApplicationInit onBeforeDelete onBeforeInsert onBeforeUpdate onCalendarApplicationInit onCalendarScriptInit onScriptInit onLoad onValidateSuccess	onApplicationInit onFooter onHeader onScriptInit	onScriptInit	onApplicationInit onFilterInit onFilterRefresh onFilterSave onFilterValidate	ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onApplicationInit onBeforeDelete onBeforeDeleteAll onBeforeInsert onBeforeInsertAll onBeforeUpdate onBeforeUpdateAll onClick onScriptInit onLoad onNavigate onLoadRecord onValidateSuccess	onBlur onChange onClick onFocus onApplicationInit onApplicationInit onScriptInit onLoadAll onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onExecute onLoad	onApplicationInit onExecute onLoad	onExecute onLoad	on on on on

sc_reset_global([Global_Variable1], [Global_Variable2] ...)

[Watch a tutorial](#)

This macro is used to delete global variables, stored in the PHP session.

Ex. 1:

```
sc_reset_global ([Login], [Pass]);
```

Macro Scope

Blank application	calendar application	chart application	Grid application	Search application	Form application	Control Form	Menu application	Responsive Menu	Tree menu	...
onExecute	ajaxFieldonBlur Onchange OnClick OnFocok onAfterDelete onAfterInsert onAfterUpdate onApplicationInit onBeforeDelete onBeforeInsert onBeforeUpdate onCalendarApplicationInit onScriptInit onLoad onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onFooter onHeader onScriptInit	onClick onApplicationInit onGroupBy onHeader onScriptInit onRecord	onApplicationInit onFilterInit onFilterRefresh onFilterSave onFilterValidate	ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onApplicationInit onBeforeDelete onBeforeDeleteAll onBeforeInsert onBeforeInsertAll onBeforeUpdate onBeforeUpdateAll onClick onScriptInit onLoad onNavigate onLoadRecord onRefresh onValidate onValidateFailure onValidateSuccess	onBlur onChange onClick onFocus onApplicationInit onClick onScriptInit onLoadAll onValidate onValidateFailure onValidateSuccess	onApplicationInit onExecute onLoad	onApplicationInit onExecute onLoad	onLoad	o o o o

sc_reset_menu_delete

[Watch a tutorial](#)

This macro its used to restore a menu item, deleted by the macro "sc_menu_delete".

Ex. 1:

```
sc_reset_menu_delete();
```

Macro Scope

Menu application	Responsive Menu	Tree menu
onApplicationInit onLoad	onApplicationInit onLoad	onApplicationInit onLoad

sc_reset_menu_disable

[Watch a tutorial](#)

This macro has the objective to enable a menu item, disabled by the macro "sc_menu_disable".

Ex. 1:

```
sc_reset_menu_disable();
```

Macro Scope

Menu application	Responsive Menu	Tree menu
onApplicationInit onLoad	onApplicationInit onLoad	onApplicationInit onLoad

sc_rollback_trans("Connection")

Watch a tutorial

This macro is used to cancel a transaction set in the database.

The "Connection" parameter is optional, use only if the command is executed in a different data base from the specified to the application.

Macro Scope

Blank application	calendar application	chart application	Grid application	Search application	Form application	Control Form	Menu application	Responsive Menu	Tree menu	ReportPDF application
onExecute	ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterInsert onAfterUpdate onBeforeDelete onBeforeInsert onBeforeUpdate onScriptInit onLoad onRefresh onValidate onValidateFailure onValidateSuccess	onHeader onScriptInit	onClick onFooter onGroupBy onHeader onScriptInit onNavigate onRecord	onFilterInit onFilterRefresh onFilterSave onFilterValidate	ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onBeforeDelete onBeforeDeleteAll onBeforeInsert onBeforeInsertAll onBeforeUpdate onBeforeUpdateAll onClick onScriptInit onLoad onNavigate onLoadRecord onRefresh onValidate onValidateFailure onValidateSuccess	onBlur onChange onClick onFocus onLoadAll onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onExecute onLoad	onApplicationInit onExecute onLoad	onExecute onLoad	onHeader onRecord

sc_script_name

[Watch a tutorial](#)

This macro is available to the MENU applications to access the application name that was selected in the menu. It allows the user to make decisions before executing the application if a pre-process is required to that application.

Ex. 1: To clean global variables.

```

if ({{sc_script_name}} == "apl1")
{
    sc_reset_global([global1], [global2]);
}
    
```

Macro Scope

Menu application	Responsive Menu	Tree menu
onExecute	onExecute	onExecute

sc_select(dataset, "SQL Command", "Connection")

This macro executes the SQL commands passed as parameter and access the "dataset" in the command.

Different from sc_lookup macro, this macro doesn't manipulate the dataset (the user is responsible for all the manipulation).

If an error occurs in the sql command execution, the variable attributed to the database returns as "false" and the error message is available in the "dataset_error" variable.

The connection parameter is optional, use only if the command is executed in a data base different from the specified in the application. **In this parameter it is not possible to use variables.**

```

Ex. 1:
sc_select(my_data, "select clientId, clientName, limitedcred from costumers");
if ({my_data} === false)
{
echo "Access error. Message =". {my_data_erro};
}
else
{
while (!{my_data}->EOF)
{
{clientName} = {my_data}->fields[1];
{my_data}->MoveNext();
}
{my_data}->Close();
}

```

Ex. 2: The SQL command can be passed as application fields (local variables) or of global variables.

```

sc_select(dataset,"select price order from order where clientId = '{clientId}' and cod_Seller = [var_glo_seller]");

```

Note: The command must always be finished with semicolon";".

Macro Scope

Blank application	calendar application	chart application	Grid application	Search application	Form application	Control Form	Menu application	Responsive Menu	Tree menu	ReportPDF application

sc_select_field({Field})

 [Watch a tutorial](#)

This macro modify dynamically the SELECT:
Is possible to modify dynamically the grid fields through the dynamic modification of the original select.

Ex. 1:

A table with the columns year and the months from January to December is used to create a grid using a parameter, displays the years and only a specific month. Passing the parameter as a global variable named "show_month", in the application is found the following structure:

Select Clause: select year, pair_month from table

```
sc_select_field(pair_month) = [show_month];
sc_label(pair_month) = [show_month];
Modify the select, and the grid column label.
```

It is possible, during the grid execution time, modify the grid ORDER BY clause.
At least one ORDER BY is required in the original grid SQL command to allow the substitution execution during the grid time.

Ex. 2: Select Clause: select code, name, value from table order by code. To change the order, from code to name, use: `sc_select_order("code") = "name";`

Note: *This command must be in the context of the event "onInit";*

Macro Scope

chart application	Grid application
onScriptInit	onScriptInit

`sc_select_order("Field")`

 [Watch a tutorial](#)

It is possible, during the grid execution time, to modify the grid ORDER BY clause.
At least one ORDER BY is required in the original grid SQL command to allow the substitution during the grid execution time.

Ex. 1: Select Clause: SELECT code, name, price FROM table ORDER BY code

To change the order from code to name, we will have:
`sc_select_order("code") = "name";`

Ex. 2: Select Clause: SELECT code, name, price, date FROM table ORDER BY code, name, price

To change the order from name to date, we will have:
`sc_select_order("name") = "date";`

Note: *This command must be in the context of "process before the select".*

Macro Scope

chart application	Grid application
onScriptInit	onHeader onScriptInit

`sc_select_where(add)`

 [Watch a tutorial](#)

This is possible, during grid execution time to add a field/condition to the search WHERE clause.

Ex. 1: It adds the content between the quotes (") in the grids select.

```
if (empty({sc_where_current}))
{
sc_select_where(add) = "where campoX > [global]";
}
else
{
sc_select_where(add) = "AND campoX > [global_variable]";
}
```

Note: This command must be in the context of "process before the select".

Macro Scope

chart application	Grid application
onScriptInit	onHeader onScriptInit

sc_send_mail_api(\$arr_settings)

 [Watch a tutorial](#)

This macro allows dynamic sending of embedded emails with the **Mandrill** and **Amazon SES** APIs. It is also possible to send e-mail using the **SMTP** protocol.

This macro uses the same mandrill parameters to send e-mail, regardless of the Gateway (Changer, Amazon SES or SMTP) selected. [click here](#) and see the list of parameters that can be used.

This macro contains a single parameter "**\$arr_settings**", which receives an array with the email sending information.

For more information on the parameters the mandrill [click here](#)

Parameter	Description
\$arr_settings	Array with information for use of APIs.

Array indices	Description
profile	Name of some API already configured in "Tools> API", as can be seen in Example 1. When informing a profile, the settings index should not be informed.
settings	E-mail sending server settings. The information must conform to the API used. Note: When informing the settings, the Profile index is disregarded.
message	Message that will be sent by email. Subject, body, to, etc.

Example 1: Sending e-mail using a pre-configured Profile in "Tools> API".

```
if({api_type} == 'smtp'){
$var_config = array(
'profile' => 'yahoo_example',

'message' => [
'html' => {email_body},
'text' => "",
'to' => $arr_merge,
'subject' => {subject}
]
);
}
```

```
sc_send_mail_api($var_config);
```

Example 2: Sending e-mail via SMTP

```
$smtp_server = "smtp.mail.yahoo.com";
$smtp_port = "465";
$smtp_user = "scriptcase.export";
$smtp_password = "scriptcase.export";
$from_email = "scriptcase.export@yahoo.com";
$from_name = "Scriptcase Export";
```

```
if ( {api_type} == 'smtp' ){
$var_config = array(

'profile' => "",

'settings' => [
'gateway' => 'smtp',
'smtp_server' => $smtp_server,
'smtp_port' => $smtp_port,
'smtp_user' => $smtp_user,
'smtp_password' => $smtp_password,
'from_email' => $from_email,
'from_name' => $from_name
],

'message' => [
'html' => {email_body},
'text' => "",
'to' => $arr_merge,
'subject' => {subject}
]
);
}
```

```
}
sc_send_mail_api($var_config);
```

Example 3: Sending email using Mandrill API

```
if({api_type} == 'mandrill'){
$var_config = array(
'settings' => [
'gateway' => 'mandrill',
'api_key' => {api_key},
'from_email' => {from_email},
'from_name' => {from_name}
],
'message' => [
'html' => {email_body},
'text' => "",
'to' => array($arr_merge),
'subject' => {subject}
]
);
}
sc_send_mail_api($var_config);
```

Example 4: Sending email using Amazon SES API

```
if({api_type} == 'ses'){
$var_config = array(
'settings' => [
'gateway' => 'ses',
'region' => {ses_region},
'api_key' => {api_key},
'api_secret' => {ses_secret},
'from_email' => {from_email}
],
'message' => [
'html' => {email_body},
'text' => "",
'to' => array($arr_merge),
'subject' => {subject}
]
);
}
sc_send_mail_api($var_config);
```

Macro Scope

```
sc_send_notification('title', 'message', 'destiny_type', 'to', 'from', 'link', 'dtxpire', 'profile')
```

The macro `sc_send_notification` allows sending notifications to system users dynamically.

Parameter Description

Parameter	Description	Example
<code>title =></code>	Mandatory parameter that receives the title of the notification that will be sent. The text can be provided in quotes, using variables or langs.	Using variable <code>\$title_not = "message title";</code> <code>'title' => \$title_not</code> Direct text in the macro or with lang <code>'title' => 'message title'</code> OR <code>'title' => {lang_notification</code>
<code>message =></code>	Mandatory parameter that receives the body of the notification message that will be sent. This parameter allows the use of texts with or without HTML formatting and can be provided in quotes, variables, or lang.	Using variable <code>\$msg_not = "Notification message body";</code> <code>'message' => \$msg_not</code> Direct text in the macro <code>'message' => 'Notification message body'</code>
<code>destiny_type =></code>	Mandatory parameter that defines what data must be provided in the <code>to</code> parameter for sending the notification. The values that must be provided are: <ul style="list-style-type: none"> 'user' - Defines that the <code>to</code> parameter must receive the login of the users who should receive the notification message. 'group' - Defines that the <code>to</code> parameter must receive the names of the groups, from the security module, that should receive the notification message. This option is only available in systems that use the security module by group. 'all' - Defines that all system users should receive the notification message. In this case, the to parameter must be passed as empty. 'profile' - Defines that the <code>to</code> parameter must receive the names of the profiles created in the notification system, in the Send Notification application, that should receive the message. 	Example of how the parameter should be provided <code>'destiny_type' => 'user'</code> Accepted values are: user, group, all and
<code>to =></code>	Defines the system users who should receive the notification, within the universe defined in the <code>destiny_type</code> parameter. <ul style="list-style-type: none"> When specifying <code>destiny_type => 'user'</code> - The developer must provide a list of the logins of the users who should receive the notification. The provided values must be separated by semicolons (;). When specifying <code>destiny_type => 'group'</code> - The developer must provide the list of user groups, from the security module, that should receive the notification. When specifying <code>destiny_type => 'all'</code> - In this case, all system users should receive the notification, and the <code>to</code> parameter must receive an empty value. <code>destiny_type => 'profile'</code> - The developer must provide the names of the profiles created in the notification system, in the Send Notification application, that should receive the message. <p>In all cases, the provided values must be separated by semicolons (;)</p>	Example when using <code>destiny_type => 'user'</code> <code>'to' => 'joao;pedro;carlos'</code> Example when using <code>destiny_type => 'group'</code> <code>'to' => 'employees;administrators'</code> Example when using <code>destiny_type => 'all'</code> <code>'to' => ''</code> Example when using <code>destiny_type => 'profile'</code> <code>'to' => 'sending_group_name1;sending_group_name2'</code>
<code>from =></code>	Mandatory parameter that defines the system user sending the notification. This parameter accepts only one value at a time and can be defined by directly providing a user's name or through a variable.	<code>'from' => 'admin'</code>
<code>link =></code>	Optional parameter that receives a link to access an application in the system or an external URL. The text can be provided in quotes, using variables.	Providing an external URL <code>'link' => 'https://scriptcase.com.br/'</code> Providing an application from the system <code>'link' => 'app_name'</code>
<code>dtexpire =></code>	Optional parameter that defines the date and time when the notification will expire and will no longer be displayed in the quick access icon of the menu. Upon reaching the date, the user will only be able to access the message through the inbox application. The date and time format must be: YYYY-MM-DD HH:MM:SS	<code>'dtexpire' => '2024-10-02 23:59:59'</code>
<code>profile =></code>	Mandatory parameter that must receive the name of the profile that the developer specified when creating the notification module in the Scriptcase interface.	<code>'profile' => 'samples_notification'</code>

Example

```
$title = 'New user';
$msg = "User: ' . $struser . ' registered in the system";
```

```
sc_send_notification([
  'title' => $title,
  'message' => $msg,
  'destiny_type' => 'user',
  'to' => 'admin',
  'from' => 'admin',
  'link' => "",
  'dtexpire' => '2024-10-02 23:59:59',
  'profile' => 'samples_profile_name',
]);
```

sc_seq_register

[Watch a tutorial](#)

This macro provides the record (being processed) grid sequential number. It can be used, only in **onRecord** event.

Ex. 1:

```
if({sc_seq_register} == 10) {
// last line of the page
{total} = {sum_total};
}
```

Macro Scope

Grid application

onRecord

sc_set_export_name ("export_type", "file_name")

The files resulting from the exports made in the query are stored in the directory **tmp** (temporary) specified in the tool's settings.

Both in development and in production, files are stored with the prefix **sc_** and a unique key. After a while, files with the prefix **sc_** will be deleted.

To prevent the exported files from being deleted, it is possible to use this macro to rename them.

Parameter List

Parameter	Value	Description
"export_type"	String containing the export type, which must be protected by quotation marks. Example of use in the macro: "csv" List of supported values: <ul style="list-style-type: none"> • csv • json • pdf • rtf • xml • xls • word 	Mandatory parameter , where we must inform the type of file we want to rename. This parameter does not accept variables.
"filename"	String containing the name the file will receive. Example of use in the macro: "New file name" Supported values <ul style="list-style-type: none"> • String with the name • Global variable 	Mandatory parameter, where we must inform the name that the file will receive.

See below some examples of using the macro:

Example 1 - Defining a name for a PDF file

```
sc_set_export_name ("pdf", "meu_arquivo_pdf.pdf");
```

Example 2 - Defining a file name by passing the value through a global variable.

```
sc_set_export_name ("json", [glo_nome_json]);
```

Macro Scope

chart application	Grid application
onScriptInit	onApplicationInit onScriptInit

```
sc_set_fetchmode(parm);
```

[Watch a tutorial](#)

This macro allows to change the type of return from the dataset of the select commands. The macro will be processed before running the SQL command. Informing the parameter, the dataset will return the index or the name of the column.

parm = 0 : Returns an array with the index and the name of columns (Scriptcase's Default)
parm = 1 : Returns an array only with indexes of the columns

Example 1: Returning an array with the name of the columns.

```
sc_set_fetchmode(0);
sc_select(my_data, "SELECT customerid, stateid, birthdate, creditlimit FROM customers where customerid = 'ALFKI'");

while (!$my_data->EOF){
    $meus_dados->fields['customerid'];
    $customer = $my_data->fields['stateid'];
    $customer = $my_data->fields['birthdate'];

    $my_data->MoveNext();
}
$my_data->Close();
```

Example 2: Returning an array with the index of the columns.

```
sc_set_fetchmode(1);
sc_select(my_data, "SELECT customerid, stateid, birthdate, creditlimit FROM customers where customerid = 'ALFKI'");

while (!$my_data->EOF){
    $my_data->fields[1];
    $customer = $my_data->fields[2];
    $customer = $my_data->fields[3];

    $my_data->MoveNext();
}
$my_data->Close();
```

Macro Scope

sc_set_focus('Field')

[Watch a tutorial](#)

This macro is used to set the focus to a specific field in a form application.

Ex. 1:
 sc_set_focus('name');

Macro Scope

calendar application	Form application	Control Form
OnClick	OnClick	onApplicationInit
onLoad	onLoad	onScriptInit
onRefresh	onRefresh	onLoadAll
onValidateSuccess	onValidateSuccess	onRefresh

sc_set_global(\$variable_01) or ({My_Field})

[Watch a tutorial](#)

This macro is used to register global variables. Create a session variable with the same name and content of the local variable.

NOTE: This macro will be discontinued soon. You should use the method of creating global variables using brackets. Ex: [var_glo_user] = "test";

Ex. 1: Registering a users variable.

```
$my_var = "mary";
sc_set_global($my_var);
```

Creates a session variable with the name "my_var" with the "mary" content.

½

Ex. 2: To register a field value as a session variable.

```
sc_set_global({fieldname});
```

Note: This macro doesn't attribute values. Only register the session variables from PHP.

Macro Scope

Blank application	calendar application	chart application	Grid application	Search application	Form application	Control Form	Menu application	Responsive Menu	Tree me
onExecute	ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterInsert onAfterUpdate onApplicationInit onBeforeDelete onBeforeInsert onBeforeUpdate onCalendarApplicationInit onScriptInit onLoad onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onFooter onHeader onScriptInit	onClick onApplicationInit onFooter onGroupBy onHeader onScriptInit onRecord	onApplicationInit onFilterInit onFilterRefresh onFilterSave onFilterValidate	ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onApplicationInit onBeforeDelete onBeforeDeleteAll onBeforeInsert onBeforeInsertAll onBeforeUpdate onBeforeUpdateAll onClick onScriptInit onLoad onLoadRecord onRefresh onValidate onValidateFailure onValidateSuccess	onBlur onChange onClick onFocus onApplicationInit onClick onScriptInit onLoadAll onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onExecute onLoad	onApplicationInit onExecute onLoad	onApplicat onExecut onLoad

sc_set_groupby_rule

[Watch a tutorial](#)

This macro is used to select a GROUP BY rule in execution time in the onApplicationInit event.

Ex:
 sc_set_groupby_rule = "rule id";

Macro Scope

Grid application
onApplicationInit

sc_set_language('String Language')

[Watch a tutorial](#)

This macro allows us to define the application language dynamically.

Ex. 1: Changes the language to English.

```
sc_set_language('en_us');
```

Ex. 2: Changes the language to Spanish.

```
sc_set_language('es');
```

It still allows to define the language and regional settings of the applications using a delimiter ";" between the parameters.

Ex. 1: Changing the language to English and regional settings to Canada.

```
sc_set_language('en_us;en_ca');
```

Ex. 2: Changing the language to Spanish and regional settings to Mexico.

```
sc_set_language('es;es_mx');
```

Ex. 3: Changing the language to Germanian and regional settings to Luxembourg.

```
sc_set_language('de;de_lu');
```

Ex. 4: Changing the language to Slovak and regional settings to Slovak Republic.

```
sc_set_language('sk;sk_sk');
```

sc_set_theme('String Theme')

 [Watch a tutorial](#)

This macro allows to dynamically change the theme that will be used in the applications.

When used, the theme is changed in the session, causing all applications accessed later to receive the informed theme.

Parameter

This macro has only one parameter, which must be named after the theme that will be applied. This parameter can be passed in two ways.

Example 1 - String with the name of the theme.
`sc_set_theme ('BlueBerry');`

Example 2 - Local variable receiving the value of a field or a global variable.
`$ set_theme = {field_name};`
`sc_set_theme ($ set_theme);`

[sc_site_ssl](#)

 [Watch a tutorial](#)

This macro is used to verify if the used site is a safe site. (https protocol)

Ex. 1: Using an affirmative.

```
if (sc_site_ssl)
{
echo "ok - Safe site";
}
```

Ex. 2: Using a negative.

```
if (!sc_site_ssl)
{
echo "Warning - Unsafe site";
}
```

Ex. 3: Redirecting if the site isn't safe.

```
if (!sc_site_ssl)
{
sc_redir("http://www.erro_page.com/");
}
```

Note: This macro works only on the web server IIS.

sc_sql_injection({My_Field}) or (\$My_Variable)

 [Watch a tutorial](#)

This macro is used to protect the field/variable against "SQL injection" attempts.

Macro used for protection against "SQL injection" in commands generated by the developer when using the macros: sc_lookup, sc_select, or sc_exec_sql.

Ex. 1: Protecting a local variable:

```
$field_protect = sc_sql_injection({my_field});
```

Ex. 2: Protecting an user variable:

```
$field_protect = sc_sql_injection($my_var);
```

Note: that all database accesses, generated for the Scriptcase, have protection against "sql injection".

Macro Scope

sc_sql_protect(Value, "Type", "Connection")

 [Watch a tutorial](#)

This macro will protect the value passed as a parameter according to the user database, the "Connection" parameter is optional, if not informed Scriptcase will use the default connection.

The "Type" parameter so far can only use the "Date" value.

Ex 01: In this example we will protect the dates passed as parameter so this way it can be correctly interpreted to the ACCESSED database.

```
sc_select_where(add) = " AND news_noticias.noticia_data_pub  
BETWEEN ".sc_sql_protect($data_inicial, "date")." AND ".sc_sql_protect($data_final, "date")."";
```

Macro Scope

Blank application	calendar application	Grid application	Search application	Form application	Control Form	ReportPDF application

sc_statistic (arr_val, tp_var)

This macro calculates and returns an array with the reported statistical values from an array of numeric values.

Two parameters are required for using the macro.

Parameter	Value	Description
arr_val	This parameter accepts only variables. Example of use: \$arr_val = array (5230,01,8374,625.45,8926.34,7000,523.78); sc_statistic (\$arr_val, \$type);	Variable containing an array with the numeric input values. Parameter required.
tp_var	This parameter accepts the value or a variable. Example using value: sc_statistic (\$arr_val, 'P'); Example using a variable: \$type = 'P'; sc_statistic (\$arr_val, \$type); List of values accepted in the parameter. <ul style="list-style-type: none">• P• A	This parameter defines the type of calculation of the variance (index 2) and standard deviation (index 3) of the array. Accepted values are P and A <ul style="list-style-type: none">• P = Population• A = Sampling Parameter required.

This macro returns the calculation in an array with 10 positions, where each position is related to a statistical data.

Check below what each index will return.

Values returned in each index of the array:

Index	Value
[0]	Arithmetic mean
[1]	Median
[2]	Variance
[3]	Standard deviation
[4]	Amplitude
[5]	Number of different values
[6]	Number of array values
[7]	Number of Null values
[8]	Lowest value
[9]	Highest value

Example of using the macro

```
$arr_val = array (5230.01,8374,625.45,8926.34,7000,523.78,523.78,6897.21,987.56,987.56,8729,63);
```

```
$arr_stat = sc_statistic ($arr_val, 'P');
```

Macro return:

```
Array
(
    [0] => 4072.3075
    [1] => 3108.785
    [2] => 12817792.489302
    [3] => 3580.1944764638
    [4] => 8863.34
    [5] => 10
    [6] => 12
    [7] => 12
    [8] => 63
    [9] => 8926.34
);
```

sc_text_style({my_field}, 'Background-Color', 'Size', 'Color', 'Family', 'Weight')

[Watch a tutorial](#)

This macro allows you to modify the text style of a grid field dynamically.

Parameter	Description
Field	Name
Background-Color (optional)	Text cell background Color
Size (optional)	Text font size
Color (optional)	Text Color
Family (optional)	Text family
Weight (optional)	Text weight

Ex. 1:
`sc_text_style({my_field}, '#33FF99', '15px', '#000000', 'Arial, sans-serif', 'bold');`

Macro Scope

Grid application

onRecord

```
sc_time_diff({datetime_01}, "Date_01 Format", {datetime_02}, "Date_02 Format")
```

 [Watch a tutorial](#)

sc_time_diff({datetime_01}, "Date_01 Format", {datetime_02}, "Date_02 Format");

This macro calculates the difference between hour, minutes, and seconds for two DateTime/time values.

The result will be returned in an array, with the dimensions [0], [1] and [2] containing hours, minutes, and seconds, respectively.

Parameter	Description
datetime_01	Value or variable for datetime_01
Date_01 Format	Value or variable to specify the format of datetime_01
datetime_02	Value or variable for datetime_02
Date_02 Format	Value or variable to specify the format of datetime_02

Ex. 1: General Format

```
{differences} = sc_time_diff({datetime_01}, "Date_01 Format", {datetime_02}, "Date_02 Format");
```

```
{diff_hours} = {differences[0]};
{diff_minutes} = {differences[1]};
{diff_seconds} = {differences[2]};
```

Ex. 2: Returning positive values

```
{differences} = sc_time_diff("2012-07-25 05:33:45", "yyyy-mm-dd hh:ii:ss", "2012-07-21 15:22:57", "yyyy-mm-dd hh:ii:ss");
```

```
{differences[0]} would be equal to 86 (hours);
{differences[1]} would be equal to 10 (minutes);
{differences[2]} would be equal to 48 (seconds);
```

Ex. 3: Returning negative values

```
{differences} = sc_time_diff("2012-07-21 15:22:57", "yyyy-mm-dd hh:ii:ss", "2012-07-25 05:33:45", "yyyy-mm-dd hh:ii:ss");
```

```
{differences[0]} would be equal to -86 (hours);
{differences[1]} would be equal to -10 (minutes);
{differences[2]} would be equal to -48 (seconds);
```

Ex. 4: Considering only the hours' format - Positive return

```
{differences} = sc_time_diff("18:14:55", "hh:ii:ss", "10:55:22", "hh:ii:ss");
```

```
{differences[0]} would be equal to 7 (hours);
{differences[1]} would be equal to 19 (minutes);
{differences[2]} would be equal to 33 (seconds);
```

Ex. 5: Considering only the hours' format - Negative return

```
{differences} = sc_time_diff("10:55:22", "hh:ii:ss", "18:14:55", "hh:ii:ss");
```

```
{differences[0]} would be equal to -7 (hours);
{differences[1]} would be equal to -19 (minutes);
{differences[2]} would be equal to -33 (seconds);
```

[Watch a tutorial](#)

This macro is used to truncate numerical values that exceed the decimals amount specified.

Parameter	Description
My_Field	Variable with value to format (return in the same variable).
Decimal_Number	Amount of decimals to display.

Ex. 1:
`sc_trunc_num({my_value}, 2);`

Input value = 1250.235
 Output value = 1250.23

Input value = 1250.2
 Output value = 1250.20

Input value = 1250
 Output value = 1250.00

`sc_url_library("Target", "Library Name", "File")`

 [Watch a tutorial](#)

This macro will return the file path, inside a library, to be used on the Scriptcase applications. It is necessary to have a library created on Scriptcase to use this Macro. To create a library, go to the "Tools > Library" Menu.

Parameter	Description
Target	Tells you what the scope of the library. It can be "sys" for libraries of <i>Public</i> scope or "prj" for libraries of the <i>Project</i> scope.
Library Name	Given name to the library at the time of creation.
File	The absolute path within the library.

Ex. 1 - Importing CSS files from a library:

```
<*link rel="stylesheet" type="text/css" href="<?*php echo sc_url_library('prj', 'bootstrap-3.3.2-dist', 'css/style1.css'); ?>" />
```

Ex. 2 - Importing a JS file from a library:

```
<*script type="text/javascript" src="<?*php echo sc_url_library('prj', 'bootstrap-3.3.2-dist', 'js/bootstrap.js'); ?>">
```

NOTE: Note that you need to remove the asterisk (*) form the examples above to use it.

Macro Scope

Blank application	calendar application	chart application	Grid application	Search application	Form application	Control Form	Menu application	Responsive Menu	Tree menu
onExecute	ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterInsert onAfterUpdate onApplicationInit onBeforeDelete onBeforeInsert onBeforeUpdate onCalendarApplicationInit onScriptInit onLoad onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onFooter onHeader onScriptInit	onScriptInit	onApplicationInit onFilterInit onFilterRefresh onFilterSave onFilterValidate	ajaxFieldonBlur Onchange OnClick OnFocus onAfterDelete onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onApplicationInit onBeforeDelete onBeforeDeleteAll onBeforeInsert onBeforeInsertAll onBeforeUpdate onBeforeUpdateAll onClick onScriptInit onLoad onNavigate onLoadRecord onRefresh onValidate onValidateFailure onValidateSuccess	onBlur onChange onClick onFocus onApplicationInit onClick onScriptInit onLoadAll onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onExecute onLoad	onApplicationInit onExecute onLoad	onExecute onLoad

`sc_user_logout('variable_name', 'variable_content', 'apl_redir.php', 'target')`

This macro is used to log the user out to the system.
 If the target is not informed, the default value is "_top".

Ex:
 sc_user_logout('usr_login', 'admin', 'ctrl_login.php', '_self');

Macro Scope

Blank application	calendar application	chart application	Grid application	Form application	Control Form	ReportPDF application
onExecute	onAfterDelete onAfterInsert onAfterUpdate onBeforeDelete onBeforeInsert onBeforeUpdate onScriptInit onLoad onValidate onValidateSuccess	onHeader onScriptInit	onScriptInit	onAfterDelete onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onBeforeDelete onBeforeDeleteAll onBeforeInsert onBeforeInsertAll onBeforeUpdate onBeforeUpdateAll onScriptInit onLoad onNavigate onLoadRecord onValidate onValidateSuccess	onScriptInit onLoadAll onValidate onValidateSuccess	onHeader onScriptInit onRecord

sc_warning'on' or 'off'

 [Watch a tutorial](#)

This macro dynamically enables or disables the display of warning messages.

Warning messages are generated in situations such as referencing a non-existent variable, an undefined array item, or other similar conditions. This does not resolve the underlying issue but hides or shows the warnings.

Ex. 1: To deactivate the message (do not display).
 sc_warning = 'off';

Macro Scope

sc_webservice("Method", "URL", "Port", "Send Method", "Parameters Array", "Setting's Array", "Timeout", "Return")

 [Watch a tutorial](#)

This macro is used to communicate with a web service.

Parameter	Description
Method	Informs what method will be used to access the web service. Ex: <i>file_get_contents</i> or <i>curl</i> .
URL	URL used to access the web service.
Port	Port used to access the web service.
Send Method	Defines the request method of the web service. It can be <i>GET</i> ou <i>POST</i> .
Parameters Array	Parameter's array used to access the web service, varying according to the accessed service.
Settings's Array(optional)	Parameter's array for configuration of the access method used.
Timeout(optional)	Service's access timeout.
Return(optional)	Web service's return method. When it is set as "True", the return from the web service comes as an array, if it is set as "False" it will return as the original web service format. Default: True

```
$parms = array(
'METHOD' => 'GetBalance',
'RETURNALLCURRENCIES' => 1,
'VERSION' => urlencode(51.0),
'USER' => urlencode({paypal_api_login}),
'PWD' => urlencode({paypal_api_password}),
'SIGNATURE' => urlencode({paypal_api_key})
);
$parms = http_build_query($parms);
```

Ex1 - Using the macro *file_get_contents*:
`sc_webservice('file_get_contents', $webservice_url, $_SERVER["SERVER_PORT"], "POST", $parms, array(), 30);`

Ex2 - Using the macro with CURL:
`$response = sc_webservice("curl", {paypal_type}, 80, "POST", $parms, array(CURLOPT_RETURNTRANSFER => true, CURLOPT_SSL_VERIFYPEER=>false), 30);`

Macro Scope

Blank application	calendar application	chart application	Grid application	Search application	Form application	Control Form	Menu application	Responsive Menu	Tree menu
onExecute	ajaxFieldonBlur OnChange OnClick OnFocus onAfterDelete onAfterInsert onAfterUpdate onApplicationInit onBeforeDelete onBeforeInsert onBeforeUpdate onScriptInit onLoad onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onFooter onHeader onScriptInit	onScriptInit	onApplicationInit onFilterInit onFilterRefresh onFilterSave onFilterValidate	ajaxFieldonBlur OnChange OnClick OnFocus onAfterDelete onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onApplicationInit onBeforeDelete onBeforeDeleteAll onBeforeInsert onBeforeInsertAll onBeforeUpdate onBeforeUpdateAll onClick onScriptInit onLoad onNavigate onLoadRecord onRefresh onValidate onValidateFailure onValidateSuccess	onBlur onChange onClick onFocus onApplicationInit onClick onScriptInit onLoadAll onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onExecute onLoad	onApplicationInit onExecute onLoad	onExecute onLoad

[sc_where_current](#)

 [Watch a tutorial](#)

Variable to reference the application where clause plus the filter selections (if any). Reflects the where clause currently used.

Ex. 1:

```
$save_current_where = {sc_where_current};
```

Macro Scope

chart application	Grid application	ReportPDF application
onFooter onHeader onScriptInit	onClick onFooter onGroupBy onHeader onScriptInit onNavigate onRecord	onFooter onHeader onScriptInit onRecord

sc_where_filter

 [Watch a tutorial](#)

This macro is used to retrieve the content generated by the "filter", according to its selections. These are the data that will be added to the application original where clause after filter submission.

Ex. 1:

```
$save_current_filter = {sc_where_filter};
```

Macro Scope

chart application	Grid application	ReportPDF application
onFooter onHeader onScriptInit	onClick onFooter onGroupBy onHeader onScriptInit onNavigate onRecord	onFooter onHeader onScriptInit onRecord

sc_where_orig

 [Watch a tutorial](#)

It allows the developer to recover the application's original WHERE clause, inserted directly into the query in the SQL menu or when creating the query.

Because it is a value recovery macro, it has a different syntax from other macros. we develop applications between curly brackets: {sc_where_orig}

The value retrieved by the macro is not affected by filters performed in the application or any changes made to the application through the macro sc_select_where(add).

See below some examples of the macro

Example 1 - Retrieving the WHERE clause value from the application's SQL

Macro Scope

chart application	Grid application	Search application	ReportPDF application
onFooter onHeader onScriptInit	onClick onFooter onGroupBy onHeader onScriptInit onNavigate onRecord	onApplicationInit onFilterInit onFilterRefresh onFilterSave onFilterValidate	onFooter onHeader onScriptInit onRecord

sc_zip_file("File", "Zip")

[Watch a tutorial](#)

This macro is used to generate ZIP files from a list of files and/or directories. The file parameter must be one of the following:

- Filename
- Directory name
- A variable containing an array, which contains files and/or directories list.
- A variable a file or a directory name.
- A variable containing an array, which contains files and/or directories list.

The zip parameter must contain the name of the zip file generated or the path to the file.

Ex. 1: Single file compressing.

```
sc_zip_file("/test/sample.htm", "/tmp/test.zip");
```

Ex. 2: Single directory compressing.

```
sc_zip_file("/test", "/tmp/test.zip");
```

Ex. 3: Multiple files and directories in an array.

```
$prep = array();
$prep[] = "/test/sample.htm";
$prep[] = "/test";
sc_zip_file($prep, "/tmp/test.zip");
```

Macro Scope

Blank application	calendar application	chart application	Grid application	Search application	Form application	Control Form	Menu application	Responsive Menu	Tree menu	Re ap
onExecute	onAfterDelete onAfterInsert onAfterUpdate onApplicationInit onBeforeDelete onBeforeInsert onBeforeUpdate onScriptInit onLoad onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onFooter onHeader onScriptInit	onScriptInit	onApplicationInit onFilterInit onFilterSave onFilterValidate	onAfterDelete onAfterDeleteAll onAfterInsert onAfterInsertAll onAfterUpdate onAfterUpdateAll onApplicationInit onBeforeDelete onBeforeDeleteAll onBeforeInsert onBeforeInsertAll onBeforeUpdate onBeforeUpdateAll onClick onScriptInit onLoad onNavigate onLoadRecord onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onClick onScriptInit onLoadAll onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onExecute onLoad	onApplicationInit onLoad	onApplicationInit onExecute onLoad	on/ on/ on/ on/

Authentication Variables

--

 [Watch a tutorial](#)

These variables must be defined on applications with PDF export on environments with integrated authentication.

Variables	Description
[sc_pdf_usr]	Authentication User.
[sc_pdf_pw]	Authentication Password

Ex. 1: On a login application, it is possible to set these variables from the info given by the user:

```
[sc_pdf_usr] = {login_usr};  
[sc_pdf_pw] = {senha_usr};
```

Macro Scope

Grid application	Form application
onApplicationInit onFooter onGroupBy onScriptInit	onScriptInit

Database Variables

Global variables containing database access values used by main connection.

Variables	Description
sc_glo_server	Server name.
sc_glo_db	Database name.
sc_glo_db_type	Database type (mssql, oracle, mysql, etc).
sc_glo_user	Connected user name.
sc_glo_pass	Database password access.
sc_glo_cript_pass	Encrypted password (S/N).
sc_glo_decimal_db	Used decimal separator (point or comma).

Ex. 1:
`$my_database = [sc_glo_db];`

These variables only reference the values without updating it (it is not possible to attribute/modify the values). To define user and the password to connect to the database, use the following variables:

Variables	Description
sc_db_master_usr	User login to be used.
sc_db_master_pass	Password to be used.
sc_db_master_cript	Encrypted password (S/N) (see sc_encode macro).

Important: *These variables only take effect during next application execution remaining valid during all the session (unless modified).*

Ex. 2: An application type "control" with a form created with information "login" and encrypted "password". These data must be used to connect to the database, during the system applications execution.

```
$temp_pass = sc_encode({password});
[sc_db_master_usr] = {login};
[sc_db_master_pass] = $temp_pass;
[sc_db_master_cript] = "S";
```

Macro Scope

Blank application	calendar application	chart application	Grid application	Search application	Form application	Control Form	Menu application	Responsive Menu	Tree menu	ReportPDF application
onExecute	ajaxFieldonBlur Onchange OnClick OnFocus	onFooter onHeader onScriptInit	onFooter onGroupBy onHeader onScriptInit onNavigate onRecord	onFilterInit onFilterRefresh onFilterSave onFilterValidate	ajaxFieldonBlur Onchange OnClick OnFocus	onBlur onChange onClick onLoadAll onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onExecute onLoad	onApplicationInit onExecute onLoad	onExecute onLoad	onFooter onHeader onScriptInit onRecord

Totalling Variables

Blank application	calendar application	chart application	Grid application	Search application	Form application	Control Form	Menu application	Responsive Menu	Tree menu	ReportPDF application
onExecute	ajaxFieldonBlur Onchange OnClick OnFocus	onFooter onHeader onScriptInit	onFooter onGroupBy onHeader onScriptInit onNavigate onRecord	onFilterInit onFilterRefresh onFilterSave onFilterValidate	ajaxFieldonBlur Onchange OnClick OnFocus	onBlur onChange onClick onLoadAll onRefresh onValidate onValidateFailure onValidateSuccess	onApplicationInit onExecute onLoad	onApplicationInit onExecute onLoad	onExecute onLoad	onFooter onHeader onScriptInit onRecord

During group by and summary processing, Scriptcase generates total variables to each group level.

The routines are defined in event “**onGroupBy**” determining the break levels and available to each record. Totals special variables are then referenced substituting the group name for the key word “groupby”, as in:

Variables	Description
{count_ger}	Records total amount.
{sum_parcel}	Will show the total sum for the field "Parcel"
{sum_balance}	Will show the total sum for the field "Balance"
{count_groupby}	Current Group records total.
{sum_groupby_parcel}	Current Group level sum for the field "Parcel".
{sum_groupby_balance}	Current Group level sum for the field "Balance".

Ex. 1: In an application with a group by state and city that totalizes a balance field, in the group totals, is possible to display the average (avg) instead of the balance as follows.

```
{sum_groupby_balance} = {sum_groupby_balance} / {count_groupby};
```

Macro Scope

chart application	Grid application	ReportPDF application
onFooter onHeader	onFooter onGroupBy onRecord	onFooter onHeader onRecord

Totalling Variables (group by)

During the group by processing, Scriptcase generates total variables to each group level. The routines are defined in event “**onGroupBy**” determining the group levels. Totals special variables are then referenced substituting the group name for the key word “**quebra**”, as in:

Variable	Description
{count_ger}	Records total amount.
{sum_parcel}	Field “parcels” total.
{sum_balance}	Field “Balance” total.
{count_quebra}	Current group level records total.
{sum_quebra_parcel}	Current group level field “parcels” total.
{sum_quebra_balance}	Current group level field “Balance” total.

Ex. 1: In an application with a group by state and city and that totalizes a balance field, in the group totals, is possible to display the average (avg) instead of the balance as follows.

```
{sum_quebra_balance} = {sum_quebra_balance} / {count_quebra};
```

Macro Scope
