This attribute defines the connection behavior when the origin application is accessed from a menu application, which in turn must be configured with the opening of items in tabs. See how to enable this feature in the applications of [menu](#) and [tree menu](#).

The attribute is available when using the *Link operation mode* defined as: **Open in another window** or **Open in another tab**.

When activated the destination application will open in a tab within the menu application. **When checking no** the target application will be opened in a **new window** or a **new browser tab**, according to the selected *Link operation*

mode.

Tab Title

Allows the developer to define a menu tab title where the target application will be displayed. If no value is informed, the tab will inherit the name of the called application.

This setting is available if the attribute **Open the application in a tab within the menu** is set to *Yes*. The text definition has no character restriction and can be done with a **fixed text** or using a **lang**, to create systems with multiple languages.

[See more details](#) about langs and about our [Data dictionary](#).

Tab Hint

Allows the developer to define a text to guide the end user in using the system. Help text will be displayed when hovering the mouse over the menu tab.

This setting is available if the attribute **Open the application in a tab within the menu** is set to *Yes*. The text definition has no character restriction and can be done with a **fixed text** or using a **lang**, to create systems with multiple languages.

[See more details](#) about langs and about our [Data dictionary](#).

Example of Hint in menu tab with destination application

Icon for the Tab when active

Defines the image that will be displayed on the menu tab when activated. If no image is informed, the tab will inherit the default image, defined in the [menu icons](#).

This setting is available if the attribute **Open the application in a tab within the menu** is set to *Yes*.

Example of active tab icon

Icon for the Tab when Inactive

Defines the image that will be displayed on the menu tab when activated. If no image is informed, the tab will inherit the default image, defined in the [menu icons](#).

This setting is available if the attribute **Open the application in a tab within the menu** is set to *Yes*.

Example of the inactive tab icon

Width

This attribute is available for configuration only when using the **Link operation mode** as *Modal*.

Defines the width of the modal where the form will open. This width refers to the horizontal space available for displaying the application.

This attribute obligatorily uses **pixels** as the measurement unit, therefore, only numbers must be informed to define the width. The width of the application displayed in the modal respects the definition of the **Table Width** attribute.

Example of the application opened in the modal

Height

This attribute is available for configuration only when using the **Link operation mode** as *Modal*.

Defines the height of the modal where the form will be displayed. This height refers to the vertical space available for displaying the application.

This attribute obligatorily uses **pixels** as the measurement unit, therefore, only numbers must be informed to define the width. The height of the application is calculated automatically and respects the number of fields selected for the application.

Example of the application opened in the modal

Form Properties

These properties are only available in links where the destination application is a form, this configuration block defines whether or not to display the **Update** (*Insert, Update and Delete*) and **Navigation** (*first, * previous, *next and last*) of the target form, according to the toolbar settings of the called application.

It is important to point out that the attributes in the Form Properties block do not override the toolbar settings of the called form, they only determine whether the buttons configured there will be displayed or not in the link.

This attribute is not available if the **Link Operation Mode** attribute is set to *Open in an iframe*. In this configuration, the form's buttons will be displayed on the toolbar of the link's source application. [Click here](#) for more details on the query toolbar.

Enable Insert Button

Sets whether or not to display the **Insert** button on the target form. For this, it is necessary that the button *include* is selected to be displayed in the settings of the [toolbar](#) of the application.

Enable Update Button

Sets whether or not to display the **Refresh** button on the target form. For this, it is necessary that the button *change* is selected to be displayed in the settings of the [toolbar](#) of the application.

Enable Delete Button

Sets whether or not to display the **Delete** button on the target form. For this, it is necessary that the button *Delete* is selected to be displayed in the settings of the [toolbar](#) of the application.

Enable Navigation Buttons

Determines whether or not to display the **Navigation Buttons** (*First, Back, Page Navigation, Next, Last*) configured in [toolbar](#) of the target form.

Keep the WHERE clause in the target application

This attribute is only available when enabling navigation buttons.

This attribute makes it possible for the **WHERE** clause of the source application (Query) to be maintained in the destination application. This means that the filters performed in the query will be inherited by the target form, enabling better quality in the records displayed for editing.

Grid Properties

Grid properties allow changing the behavior of the target application, without having to change the application.

It is important to point out that these configurations do not force the configurations in the destination application, they only change the previously made configurations. For example, if the target application has the filter module disabled, using **Initial mode** as *filter* in the connection will not have any effect.

These properties are only available on connections where the target application is a grid.

See below for more details on the attributes.

Initial Mode

Defines the opening module of the target application, which can be **Grid** or **search**. For this feature to work, the target application must have the modules enabled.

Number of Lines:

Defines the number of lines that will be displayed in the target application. If no value is informed, the configuration of the called application will be respected.

Number of Columns

Limits the number of columns displayed in the target application.

The entered value must be less than the number of columns displayed in the target application.

Paging

This attribute defines the type of pagination used in the application, which can be **Partial** where the developer defines the number of lines per page or **total** which displays all records on the same page.

Partial

Displays the target application with a limited number of records per page. The number of records per page can be defined in the **Number of Lines** attribute, if no value is informed, it will inherit the target application's configuration.

This attribute does not force partial pagination on the target application, only the navigation buttons configured on the toolbar.

Example of toolbar with partial pagination

Total

Forces the target application to display without paging, displaying all records on a single page. In this case the navigation buttons are removed.

Example of toolbar with full pagination

Display Header

Defines whether the target query header will be displayed. For the feature to work correctly, the application and destination must have header options configured.

Active Navigation Buttons

Determines whether or not to display the **Navigation Buttons** (*First, Back, Page Navigation, Next, Last*) configured in [toolbar](#) of the target application.

Iframe properties

This configuration block is available when using the **Link Operation Mode** set to *Open in an iframe*.

Position of the iframe relative to the main application

Defines the positioning of the iframe relative to the source application.

- **Below:** The iframe will be displayed below the source application.
- **Above:** The iframe will be displayed above the source application.
- **Right:** The iframe will be displayed on the right side of the source application.
- **Left:** The iframe will be displayed on the left side of the source application.

Iframe height

Defines the height of the iframe where the form will open. The attribute obligatorily uses pixels as the unit of measurement, therefore, we must inform only numbers in its definition. If no value is informed, the height will be based on the connection origin application.

Iframe width

Allows the width of the iframe to be set.

Defines the width of the iframe where the form will open. The attribute compulsorily uses pixels as the measurement unit, thus, only numbers must be informed to define the width.

Creating Ajax button

The **action button** of the *ajax* type creates an ajax event of the onClick type, allowing the execution of routines without the need to reload the application.

Example of the action button in the application

See below how to create and configure this type of button.

Creating one button

on the screen of [list of buttons](#) click **Create New Button**.

Button data

Then, select the **Type** and inform the **name** of the button.

The **name** field only allows numbers, unaccented letters and underscores.

Button visual settings

On this screen you must define the appearance of the button for displaying in your application.

Check out the detailed view configuration options below.

Display type

This attribute defines the display format which can be: **FontAewsome**, **Button**, **Image** or **text**.

Some display options are displayed according to the **type of display** used.

The options are:

FontAwesome

This is the default value of the attribute. In this setting, the button will be shown only how a font awesome icon.

See a font awesome example

Button

In this configuration, the button will be shown as a standard Scriptcase button, inheriting the button theme used in your application.

After selecting this option, another option (**Button format**) will be displayed and you will have to define how the button label will be displayed. In this attribute you can choose between:

- **FontAwesome** - The button will only display with FontAwesome.
- **Text** - The button will only display with text.
- **Font Awesome and text** - The button will appear with FontAwesome and text, with the text positioned to the right.
- **Text and Font Awesome** - The button will appear with FontAwesome and text, with the text positioned to the left.

See a button example**Image**

Using this option, you must upload or select an image in the Scriptcase image manager.

Example of action button as image**Text**

Using this option, the action bar button will be display how a link.

Example of action button as Text**ID**

This attribute defines the name to a button state.

No allowed the use langs or anytype variables in this attribute.

Font Awesome

Defines the font awesome that will be displayed in the button.

This option is displayed when selecting in the **Type of Display** attribute the valures:
FontAwesome or *Button*

Action button example as Font Awesome image**Image**

Defines the image that will be displayed in the application when selecting **Type of display** as *image*.

Click on the icon to open the [image manager] [link_gerenciator_img]{:target="_blank"} and select the desired image.

Text

The **text** attribute define text that will be display how a link in the action bar.

This option is displayed when selecting in the **Type of Display** attribute the valures: *Button* or *Text*

The text definition has no character restriction and can be done with a **fixed text** or using a **lang**, to create systems with multiple languages.

[See more details](#) about langs and about our [Data dictionary](#).

Color

Sets the color of the Font Awesome icon. Cif no value is informed, the icon assumes the color defined in the general configuration of the [action bar visual][link_editar_visual]{:target="_blank"}.

Displayed only when using **Type of display** as *FontAwesome*

Color (Hover)

Sets the color of the Font Awesome icon in hover state, when hovering the mouse over the icon.

Available when selecting **Display Type** as *FontAwesome*.

Color (Active)

Sets the color of the Font Awesome icon in the active state.

Available when selecting **Display Type** as *FontAwesome*.

Button Visual

This attribute defines the color of the button. You can select a color from the list or use the *Theme* option to inherit the button layout used in your application.

Only available when selecting **Display Type** as *Button*.

Button Visual (Hover)

This attribute sets the color of the button on button hover. You can select a color from the list or use the *Theme* option to inherit the button layout used in your application.

Only available when selecting **Display Type** as *Button*.

Hint

Defines the help text for the button.

The text definition has no character restriction and can be done with a **fixed text** or using a **lang**, to create systems with multiple languages.

[See more details](#) about langs and about our [Data dictionary](#).

Confirmation Message

The confirmation message is displayed after clicking the button and before that action is performed.

Confirmation Message example

The text definition has no character restriction and can be done with a **fixed text** or using a **lang**, to create systems with multiple languages.

[See more details](#) about langs and about our [Data dictionary](#).

Delete

Deletes a button state.

Botão Adicionar Estado

Adds a line for configuring a new state for ajax button.

These states can be manipulated using the macro [sc_actionbar_state](#) at ajax event.

After adding the desired states and configuring the appearance of the buttons, click on **Save button and configure ajax** to create the button and event.

Ajax Event

The ajax event will be created, which will be executed on the button's onClick.

In this event we must code the procedures that we want to carry out. Added some macros for handling the action buttons:

- [sc_actionbar_clicked_state](#) - Returns the current state of the ajax button created in the action bar.
- [sc_actionbar_state](#) - Changes the current state of the button to a new state.
- [sc_actionbar_disable](#) - Disables action bar buttons.
- [sc_actionbar_enable](#) - Enables action bar buttons, disabled by `sc_actionbar_disable` macro.
- [sc_actionbar_hide](#) - Hides an action bar button.
- [sc_actionbar_show](#) - Show action bar buttons, hidden by `sc_actionbar_disable` macro.

Edit Bar Visual

On this screen you can customize the defined action bar buttons padding, size of Font Awesome, color of items, links and your alignment.

Padding

Sets the spacing of the element's content to its border. This attribute applies to action bar buttons regardless of their type (*Link* or *Ajax*) or the display (*Font Awesome*, *image* and *text*).

You can use up to four space-separated values.

- One value - Applies to all edges
- Two values - Refers to the vertical and horizontal borders, respectively. *Three values - Refers to the Top, Horizontal, and Bottom borders, respectively.
- Four values - Refers to the top, right, bottom, and left edges, respectively.

Font Awesome Size

Sets the size, in pixels, of the action bar's Font Awesome icons.

This attribute is only applied to buttons configured with Font Awesome.

Font Awesome Color

This attribute defines the color of the Font Awesome icons created in the action bar, if no color has been defined in the individual button configuration.

The color set individually in the button settings overrides this setting.

Font Awesome Color (Hover)

Sets the color of the Font Awesome icon in hover state, when hovering the mouse over the link.

Font Awesome Color (Active)

Sets the font awesome icon color in active state for text buttons.

Link Color

In this attribute we define the color of the text displayed in the application when using the **type of display** as *text* in the creation of the button.

This attribute refers to action "buttons" configured as text.

Hover link color

Defines the text color in the hover state, when positioning the mouse over the link.

This attribute is only applied to buttons configured as *text* when creating the button.

Active link color

Sets the link color in the active state for text buttons.

This attribute refers to action “buttons” configured as text.

Vertical alignment

Sets the vertical alignment of the action bar buttons.

Override buttons

This attribute defines if the visual definitions, configured for Font Awesome (Padding, Vertical alignment, icon size and Color), should override the **Detail** and **Application Edit**

Group buttons

This feature allows you to group action bar buttons side by side.

This setting is only applied to icons where the attribute **Type of display** is defined as *Button*

Example of grouped buttons

Example of ungrouped buttons

Edit Column Label

This option allows to configure a label for the application's action bar column.

Example of a grid with the label action bar

Edit column labels

This feature allows you to set a label for the action bar column. This definition must be done differently for the left and right bar.

Label

This attribute defines the label displayed in the action bar column.

The text definition has no character restriction and can be done with a **fixed text** or using a **lang**, to create systems with multiple languages.

[See more details](#) about langs and about our [Data dictionary](#).

Font color

Sets the text color of the action bar column.

If no color is defined, the text color will be defined by the theme.

Example text color

Background Color

Sets the background color of the action bar column.

If no color is defined, the background color will be defined by the theme.

background color example

Horizontal Alignment

Defines the text placement of the action bar label.

- **Left** - Aligns the text to the left of the column.
- **Center** - Aligns the text to the center of the column.
- **Right** - Aligns the text to the right of the column.

If no color is defined, the text color will be defined by the theme.

Example right alignment of text

Example of aligning text to center (default)**bold text**

Defines if the label text will be displayed in bold or not.

Example of bold text**Example of non-bold text**

Charts

This application is designed for creating dynamic charts based on SQL or Procedures.

Inside the Scriptcase Charts can be created also within the Grid application, however the application Chart has more settings options to the end user within the application generated. The idea is to apply the concept of Business Intelligence so the final system users can apply their own settings within the generated charts.

The settings within the development area uses Drag and Drop for the charts creation. You can apply dimensions and metrics dynamically using different date periods and totals.

Dimensions

Dimensions are used to group the data into categories. You can choose more than one field as a dimension, each new field as a subcategory of the previous field.

To select a field, click on its name in the “Chart Fields” area and drag it to the “Dimensions” column.

Once selected the fields, you can sort them using the drag and drop to arrange the dimensions' final display. You can choose different periods to date fields and use the same date field more than once, with different periods. All the dimensions listed in “Dimensions” can be used by the system final user within the Chart application. You can also define whether dimensions will be displayed or not when you start the application by selecting the checkbox.

The screenshot displays the 'chart_orders' application window. On the left, a sidebar menu under 'CHART' has the 'Charts' option highlighted with a red box. The main area is titled 'CHART SETTINGS' and is divided into three sections: 'DIMENSIONS & METRICS', 'SORTING', and 'SEARCH'. The 'DIMENSIONS & METRICS' section is active and contains two columns: 'CHART FIELDS' and 'DIMENSIONS ?'. The 'CHART FIELDS' column lists various fields such as orderid, customerid, employeeid, orderdate, requireddate, shippeddate, shipvia, freight, priceorder, and shipcountry. The 'DIMENSIONS ?' column contains a list of selected dimensions: employeeid (checked), orderdate (checked with a 'Month' dropdown), and orderdate (unchecked). A red double-headed arrow points from the 'orderdate' field in the 'CHART FIELDS' column to the 'orderdate' dimension in the 'DIMENSIONS ?' column, indicating the drag-and-drop action.

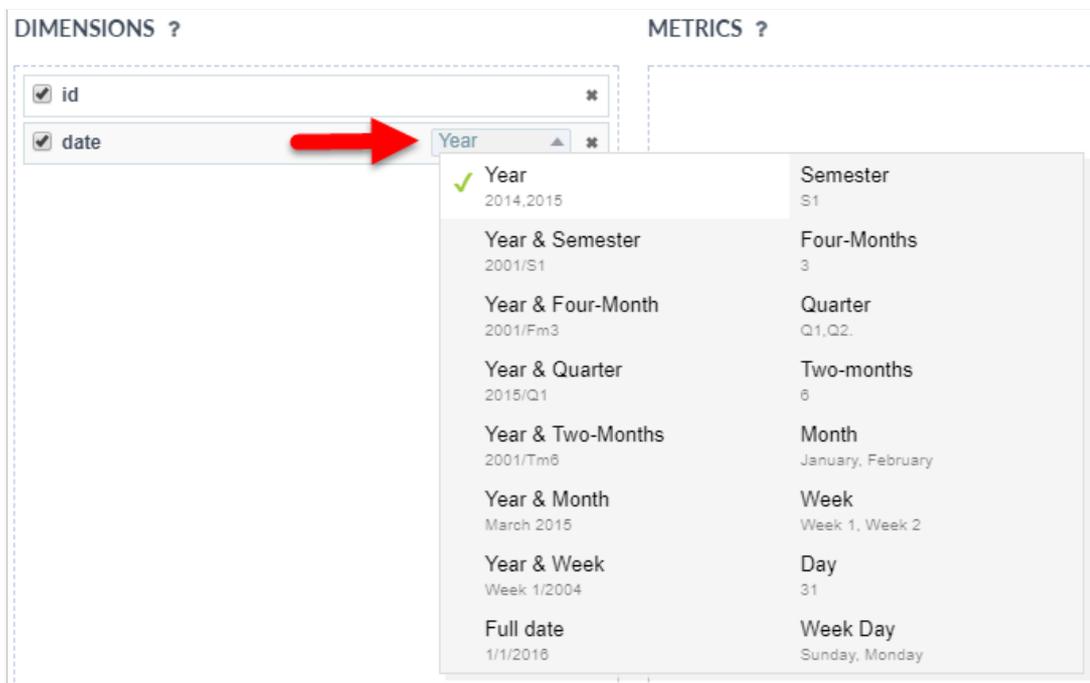

Chart dimensions.

Field settings

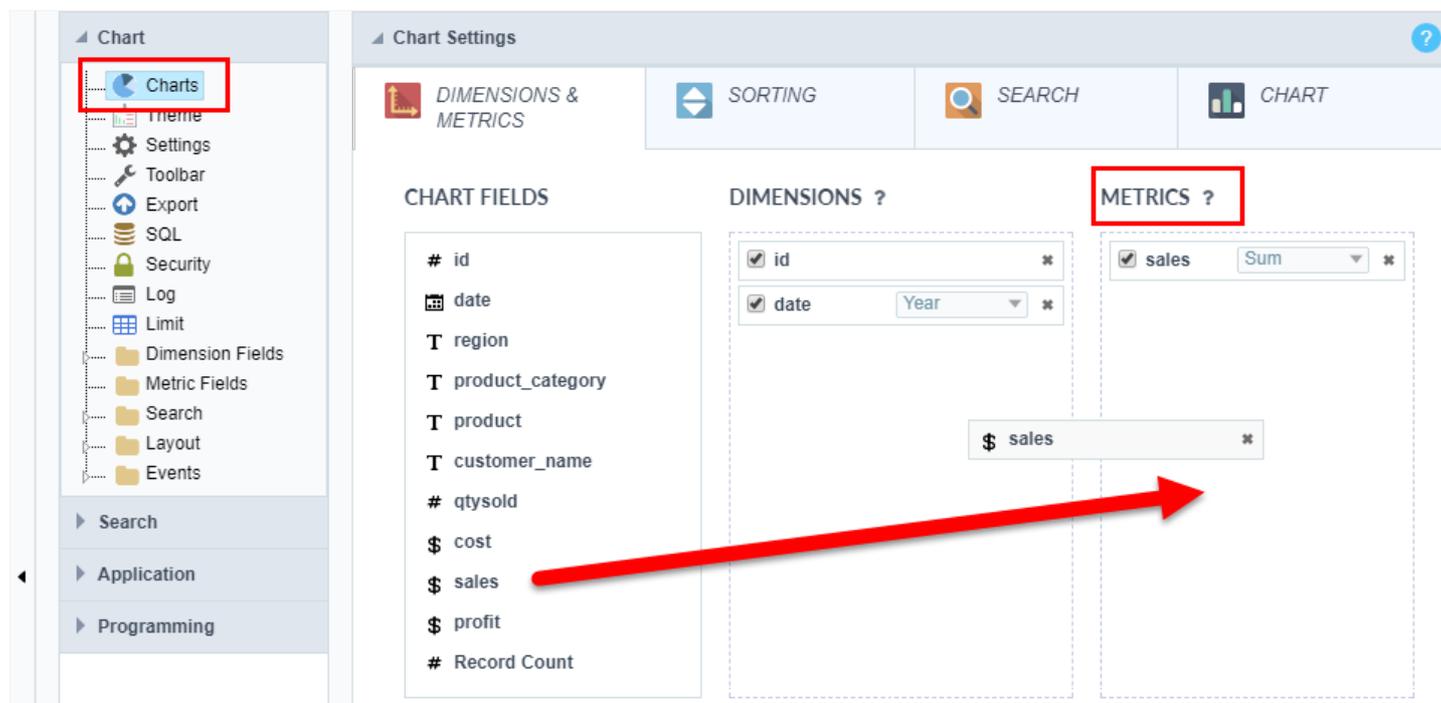

Metrics

The metric is used to quantitatively view the data grouped by dimensions. Choose the fields for the chart's metrics.

To select a field, click on its name in the "Chart Fields" area and drag it to the "Metrics" column. Once selected the fields, you can sort them using the drag and drop to arrange the metrics' final display, you can also choose the total function according to the field data type.

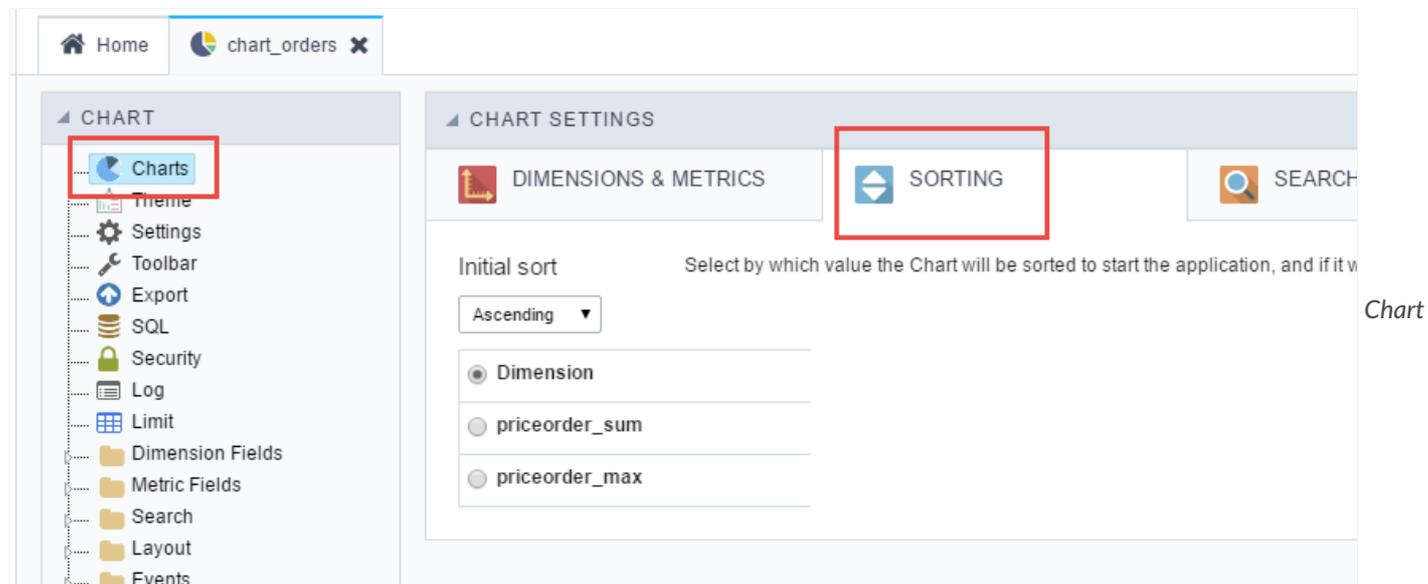

All the dimensions listed in "Metrics" can be used by the system final user within the Chart application. You can also define whether metrics will be displayed or not when you start the application by selecting the checkbox.

The checked field value is used to set the default field just when you are not using a combination or stacked chart types, that use more than one field. If you choose more than one field Scriptcase automatically sets a value multiple chart type (Combination). You can change the initial chart inside the option "Charts' type" within the "Settings". When you check a single value (bar, line, Spline, step, Area, pie, pyramid, funnel, Radar and Gauge) you have to click and choose only one field to appear as initial value during the first generation.

Sorting

You can select which chart value will be ordered to start the application, and if the sort will be “ascending” or “descending”.

sorting.

- **Initial sorting** : Using this option you can set the default sorting (ascending or descending). The system final user will also be able to customize it within the generated application.
- **Dimension** : Application starts with dimension fields sorting (ascending or descending according to the “Initial sorting”).
- **Metric** : Application starts with metric fields sorting (ascending or descending according to the “Initial sorting”).

Search

In the “Search” option you can choose the fields that will be used as static search on the chart, the application data will be initially filtered according to the settings you apply. The search values are chosen for each selected field during development, the final user will not be able to change that.

You are also able to apply other search options such as the Dynamic Search using the option “Search > Dynamic Search” (located on the left menu) and the “refined” search using the option “Chart > Search”. These two types are dynamic, it means that the end user will be able to manipulate them within the generated application.

CHART SETTINGS

DIMENSIONS & METRICS | **SORTING** | **SEARCH**

Available fields

- customerid
- freight
- orderdate
- employeeid
- orderid
- priceorder
- requireddate
- shipaddress
- shipcity
- shipcountry
- shipname

Selected fields

Choose the fields that will be used as are chosen for each selected field dur

To create runtime dynamic search, us option is located on the left menu.

Choose the search criteria for when r

Static search.

Chart options

In the 'Chart' tab, the developer defines the default settings for the generated chart, choosing the default chart type, color scheme, and other options. Below, each option is detailed.

Chart's type	2D Column ▾
Export Chart	<input type="checkbox"/>
Font size	<input type="text"/>
Abbreviated value	<input type="checkbox"/>
Subtitle	Defined by the theme ▾
Display Values	<input checked="" type="checkbox"/>
Exception for display	<input checked="" type="checkbox"/> Pie <input checked="" type="checkbox"/> Pyramid <input checked="" type="checkbox"/> Funnel
Chart Width	<input type="text" value="800"/>
Chart Height	<input type="text" value="600"/>
Values sorting	▾
Multi-series or Drill down	Drill down ▾
Grand Total	<input type="checkbox"/>
Trendline New	▾
Chart trendline type New	Fixed ▾
Initial value of the line New	<input type="text" value="0"/>
Final value of the line New	<input type="text" value="100000"/>
Bar - width (between 20 and 70)	<input type="text"/>
Bar - Value orientation	Vertical ▾
Bar - Value position	Inside ▾
Bar - Stacking	off ▾
Pie - Values format	Value ▾
Range of data	<input type="checkbox"/> Use interval
Pyramid - Values format	Value ▾

Chart Type

Defines the type of chart to be used, such as bar, pie, line, gauge, pyramid, tree map, among others.

Export Chart

Allows exporting the chart to different formats, such as **PNG, JPG, PDF, and SVG**, enabling storage, sharing, and printing of the presented data.

Font Size

Defines the font size used in the chart elements, such as titles, legends, and values.

Abbreviated Value

Determines if the values displayed in the chart should be abbreviated, such as:

- 1000 → 1K
- 1000000 → 1M

Legend

Shows or hides the chart legend, which identifies the data series presented.

Display Values

Enables or disables the display of values directly in the chart elements.

Exception for Display

Chart types that will not display values even when the option to show values is enabled.

Chart Width

Defines the chart width in pixels, ensuring a better visual fit.

Chart Height

Defines the chart height in pixels, allowing proper sizing.

Value Sorting

Controls the order of values displayed in the chart, which can be:

- Ascending
- Descending
- No sorting

Multi-Series or Drill Down

Allows defining whether the chart will use multiple data series or a Drill Down structure, enabling navigation between data levels.

- **Multi-Series:** Displays multiple data series in the same chart, allowing the comparison of different datasets.
- **Drill Down:** Enables data interaction, allowing the user to click on a chart element to view more detailed information at a new level.

Expanded Tooltip

Defines whether the tooltip (information displayed when hovering over elements) will expand to show more details.

Adaptive Y-Axis

Automatically adjusts the Y-axis scale according to the values displayed in the chart.

Grand Total

Adds a totalizer value to the chart, displaying the sum of the presented values.

Trend Line

Adds a trend line to the chart, helping to identify patterns and trends in the data.

Can be configured as:

- **Line:** Displays the data trend in line format.
- **Area:** Fills the area below the trend line, visually highlighting data variations.
- **No Value:** No trend line will be applied to the chart.

Trend Line Type

Defines the type of calculation applied to the trend line.

Note: This option is only displayed when the trend line is set as **Line**.

Can be configured as:

- **Fixed:** Displays a straight line at a predefined value.
- **Average:** Calculates and displays the line based on the average of the chart values.
- **Linear:** Applies a linear calculation to indicate the data trend over time.

Initial Line Value

Defines the numerical value where the trend line will be positioned when using the **Fixed** type.

This value represents a reference limit within the chart, aiding in data analysis.

Bars - Width (Between 20 and 70)

Controls the width of the bars in a bar chart, ranging from 20% to 70% of the available space.

Bars - Value Orientation

Defines whether the values in the bars will be displayed vertically or horizontally.

Bars - Value Positioning

Determines the position of values inside the bars:

- Inside
- Above

Bars - Stacking

Defines how bars are stacked in the chart.

- **Off:** Follows the default setting, displaying bars separately.
- **On:** Displays a standard stacked chart where values are summed vertically.
- **Percentage:** Generates a stacked chart where bars occupy **100%** of the available area, distributing values proportionally.

Pie - Value Format

Defines how values will be displayed in the pie chart, which can be:

- Absolute values
- Percentage (%)

Data Range

Available only for **Gauge** charts.

When enabled, a list of fields is displayed where the following must be defined:

- **Base Value:** The starting point for measurement.
- **Range:** The value range to be considered.
- **Color for each range:** Defines the color for each interval in the chart.

This configuration highlights different value zones within the Gauge, facilitating visual analysis.

Gauge - Show Scale Marks

Enables or disables the display of scale marks in the **Gauge** chart.

Pyramid - Value Format

Defines how values will be displayed in the **Pyramid** chart, as **Absolute value** or **Percentage**.

Tree Map - Title

Defines the main title of the **Tree Map** chart, improving data identification.

Chart settings interface

- **Responsive Desktop** : By checking this option the Chart will automatically adapt itself to the user's screen according to the size of the browser.
- **Chart title** : This option allows you to set a title for the chart.
- **Available chart types** : List of available chart types for user's choice within the final application via the button "Chart Types". The graphics checked will be available, if the developer does not want to display a chart type must do not check them in this interface.
- **Label for quantity** : Label the y-axis for generic values of the record count.
- **Label for summarization** : Label the y-axis for generic values of the summary functions - sum, average, weighted average, maximum and minimum.
- **Friendly URL** : This field allows you to change the URL that will be called by the application. Allowed characters are the same available on URLs: a-z, A-Z, 0-9, -_. This option can also be changed on the home screen, on the "Friendly URL"

column at the applications list.

- **Horizontal Alignment:** It allows to define the horizontal alignment of the application (Centered, Left, Right).
- **Vertical Alignment:** Allows you to define the initial vertical alignment of the application (Above, Centered and Below).
- **Margins :** Sets the application margins in pixels (up, down, right and left).
- **Refresh Interval :** Allows you to set a reload interval for the page, in seconds. When is set as zero, there will be no page reload.

Chart Toolbar

The application toolbar has two segments: Top and Bottom, in a way that is possible to define to display buttons into both areas. Those areas work independently, allowing them to display the same button, for example.

It's also possible to select the buttons and their position if the application is running on a mobile device.

Toolbar

Desktop

Here we must inform the toolbar settings for the "Classic Web Version" mode and which buttons are available in the application when accessed from a **Desktop** environment.

Mobile

Here we must inform the toolbar settings for the "Mobile Version" mode. That is which buttons are available in the application when accessed from a **Mobile** dispositive.

Configure the toolbar below for a "classic web version " and also for a "mobile version".

Group of buttons

Add Edit Delete

Navigation:

Buttons relative to the navigation of the application.

Next	Move to the next page that can be a single record or a list of records.
Previous	Returns to displays the previous page records or a single record.
First	Move to the First page or record
Last	Move to the Last page or record
Exit	Close the application
Navigation by page	Displays a "page-number" navigation bar. Example: 1 2 3 4 5
Reload	Displays a button to reload the query data

Export:

Groups the options relative to the generated exports. Scriptcase generates the following export formats:

PDF	Generates a complete Report with all the data of the application in a PDF format.
WORD	Generates a complete Report with all the data of the application in a WORD format.
XLS	Generates a complete Report with all the data of the application in an EXCEL format.
XML	Generates a complete Report with all the data of the application in an XML format.
CSV	Generates a complete Report with all the data of the application in a CSV format.
RTF	Generates a complete Report with all the data of the application in an RTF format.
Print	Creates an HTML with the records ready for printing.

Export by Email:

Groups the options relative to the emails exports. Scriptcase generates the following export formats:

PDF (Email)	Sends by Email a complete report with all the data of the application in a PDF format.
WORD (Email)	Sends by Email a complete report with all the data of the application in a WORD format.
XLS (Email)	Sends by Email a complete report with all the data of the application in an EXCEL format.
XML (Email)	Sends by Email a complete report with all the data of the application in an XML format.
CSV (Email)	Sends by Email a complete report with all the data of the application in a CSV format.
RTF (Email)	Sends by Email a complete report with all the data of the application in an RTF format.

Others:

Other options available in the Grid application.

Jump to	Move to the informed page.
Rows Limit	It is a Combobox that defines the number of rows per page.
Search	Goes to the Search Form to filter the records.
Dynamic Search	It displays the fields of the search to filter the records.
Columns	Allows to include or remove columns of the Grid on the fly.
Sorting Options	Allows selecting the order of the records based on the field.
Group By	Allows to select or change a Group By rule on the Grid.
Save Grid	Allows saving the current state of the application. For example, in the advanced search, you can save the search data for further use.
Quick Search	Allows to perform a quick search in the records of the application.
Gantt	It displays a Gantt chart, if it was previously set.
Summary	It displays a summary with the synthetical data of the records.
Form Buttons	It displays the Form Buttons when there's an Application Link from the Grid to a Form.
Languages	It displays a Combobox with the names available, defined in the project properties.
Themes	It displays a Combobox with the themes available, defined in the project properties.
Rows Counter	It displays the number of records retrieved by the application.
HelpCase	Displays a button to open the help page.

Separator:

-----	Displays a line separating the buttons, when used the Group Buttons.
-------	--

Toolbar Mobile

Toolbar

Configure the toolbar below for a "classic web version " and also for a "mobile version".

Add Edit Delete

Mobile toolbar - bottom

- Next/Previous
- First/Last
- Row Counter
- Page selection

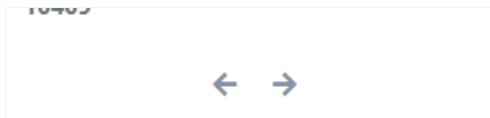

Top Mobile toolbar

It has the same options as the **Desktop** version, adding only the item "Copy from desktop", which, when clicked, makes a copy of the items from the upper toolbar of **Desktop** to **Mobile**.

Mobile toolbar - bottom

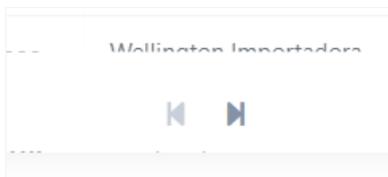

Next/Previous

Enables navigation to the next and previous page on mobile devices.

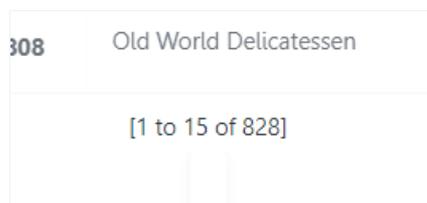

First/Last

Enables first and last page navigation on mobile devices.

Row Counter

Enables the record counter showing the application's total records

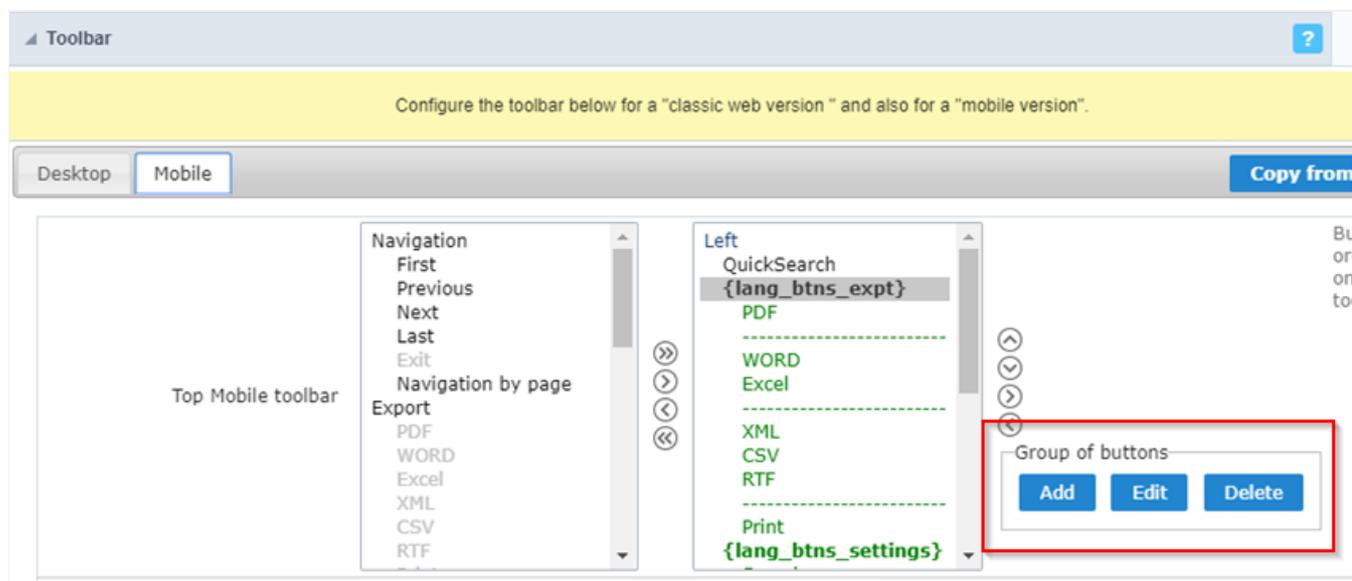

Page selection

Enables page navigation on mobile.

Buttons Group

The **Group** option allows you to group a set of buttons of the application toolbar to display them as a dropdown, for example.

Add

Add a new group of buttons.

Edit

Edit an existent group of buttons.

Delete

Delete the selected group of buttons.

When you press the **Add** or **Edit** option, you can see the settings to configure the grouper:

Edit

55553932	\$6,757.53
1515557700	\$1,071.70

Dropdown List Theme

Allows defining the Dropdown theme selecting between **Application theme** and **Button theme**.

Name

Allows defining a name for the button group.

Label

It is the displayed name for the button group in the application.

Hint\Title

Displays a hint to the end-user when the mouse is on the group of buttons.

Button Type

Allows displaying the button group as a Button, Image, or Link.

Image

Allows selecting an image for the button.

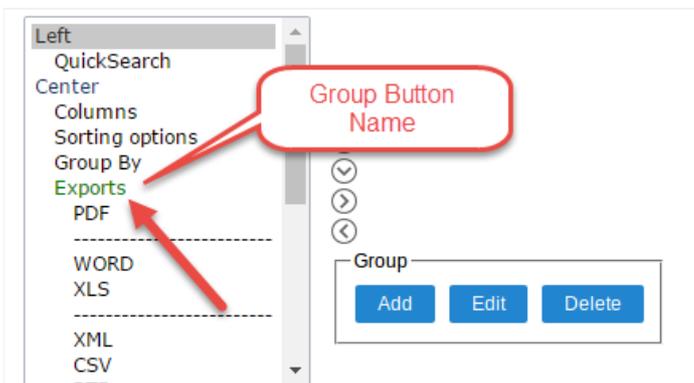

Display

Defines if the button displays only Text, only image, or both.

Display Position

Defines the position of the Text or Image (Text to the right, Image to the right).

After creating a button group, you need to move the grouped buttons below of the Button Group and then move them to the right. Like the image below:

Application Hotkeys

Scriptcase allows creating shortcut keys to your applications. You can select a predefined template or create specific actions for an application.

Application Hotkeys ?

ATTRIBUTE	VALUE	DESCRIPTION
Use hotkeys	<input checked="" type="checkbox"/>	Define if the application will use hotkeys
Hotkeys template	<div style="border: 1px solid #ccc; padding: 2px; display: inline-block;">SC_DefaultHotkeys</div> ▼ ↻ ✎	Select the hotkey template from previously created schemas

Clean
+

ACTION	KEYBINDING
No hotkeys configured	

Clean
+

Use hotkeys

Defines if the application uses hotkeys. When you enable this option, the default shortcut keys settings are disabled.

Hotkeys templat

Select the [hotkey template](#) previously created.

Action

Selects the triggered action when pressing the selected key.

Keybinding

Selects the keys responsible for executing the chosen action.

Add “+”

Adds a new action on the keys list.

Clear

It clears the selected hotkeys preference.

Chart Export Settings

PDF Settings

PDF Settings	
ATTRIBUTE	VALUE
PDF Orientation	Portrait
PDF Format	Letter (216 x 279 mm)
Print Type	Color
Generate Bookmarks	<input checked="" type="checkbox"/>
Page Numbers Format	Simple
Page numbering height	Top
Horizontal position of the page numbering	Right
Upper Margin	<input type="text"/>
Bottom Margin	<input type="text"/>
Right Margin	<input type="text"/>
Left Margin	<input type="text"/>
Print Background	<input checked="" type="checkbox"/>
JS execution time	200
Timeout for chart's image creation	150

PDF Orientation

Allows you to set whether to print in Portrait or Landscape orientation.

PDF Format

It allows you to define the PDF paper format (letter, A4, others).

Print Type

It allows you to set whether the print mode as colored or economical with no colors.

Generate PDF directly

Opens the generated the PDF without the need to display an intermediate page with a link to download the file.

PDF Chart depth output selection

It allows the end-user to decide on the fly the depth of the Group By to exports.

Selecting page break per level

It allows the end-user to define the break level to skip to the next page in the generated PDF.

Configurable PDF

It allows the end-user to configure the PDF parameters on the fly.

Generate bookmarks

Generate bookmarks automatically according to the Group By.

Page numbering format

Set the numbering format as Simple (1,2,3,4,5, ...), Full (1 / n, 2 / n, 3 / n, ...) or no numbering.

Page numbering height

It allows you to align the numbering vertically, at the top or bottom of the page.

Horizontal position of page numbering

It allows the horizontal alignment of page numbering (Left, Center, Right).

Print background

Allows you to print background in the PDF file.

JS Runtime

The maximum time, in seconds, of server waiting when running JS.

Timeout for chart's image creation

Set the timeout to wait for the chart image creation in the PDF

Other options	<input checked="" type="checkbox"/> Generate Bookmarks <input checked="" type="checkbox"/> Displays the header on all pages <input checked="" type="checkbox"/> Displays the title on all pages
Password	<input type="text" value="....."/>

Select columns

It allows the user has the option to choose the columns he wants to export at runtime.

The screenshot shows a dialog box titled 'Select Columns' with a 'PDF settings' tab. A dashed box on the left indicates the area where columns are selected. On the right, a list of columns is shown: 'Accountid', 'Accountdescription', and 'Accountorder'. The 'Accountid' column is highlighted, indicating it is selected.

Print settings ?		
ATTRIBUTE	VALUE	DESCRIPTION
Print Type	Both ▼	Define the print mode.
HTML Chart depth output selection	<input checked="" type="checkbox"/>	Allows the user to decide to what depth of the group by charts will be generated in the HTML.
Print Background	<input checked="" type="checkbox"/>	Display background in a HTML form.

Print Mode

It allows choosing the content to print. (Current Page or Full Report)

Print Background

Allows displaying the background in an HTML form.

RTF Settings

General settings	
ATTRIBUTE	VALUE
Select columns	<input type="checkbox"/>
Open RTF Directly	<input type="checkbox"/>

Select columns

This option allows the end-user to select which fields he wants to export to the file.

This is an identical screenshot to the one above, showing the 'Select Columns' dialog box with 'Accountid' selected.

Open RTF Directly

Opens the generated RTF file without the need to display an intermediate page with a link to download it.

Chart SQL Settings

SQL Settings

This interface allows configuring the related database settings, such as the SQL statement, the used database connection, case sensitive, and others.

ATTRIBUTE	VALUE	DESCRIPTION
SQL Select Statement	<pre>SELECT customerid, companyname, contactname, contacttitle, birthdate, country, regionid, stateid, city,</pre>	
Limit	<input type="text"/>	It sets the number of records to be retrieved from the SQL statement.
SQL Preparation	<input type="text"/>	
Connection	<input type="text" value="conn_example"/>	Connection name to access the database.
Use Customized Message	<input type="checkbox"/>	Use a customized error message when the application has no records.
No Records Message	<input type="text"/>	When the application has no records, it will display this customized text.
Font	<input type="text" value="Aa"/>	Font face of the error message.
Font Size	<input type="text" value="12"/>	Font size of the error message.
Font Color	<input type="text" value="#000000"/>	Font color of the error message.
Variable for Table	<input type="text"/>	Variable name used for replacing the table name. Please indicate the name of the table that will be replaced by the variable value.
Fields Variables	<div style="border: 1px solid black; padding: 5px;"> <p>Variable</p> <input type="text"/> <p>customerid</p> </div>	Variables for substitution of the field names on the application. For each dynamically determined field, inform the name of the variable and the field that will be substituted.
Case Sensitive	<input checked="" type="checkbox"/>	Use case sensitive.

Grid

SQL configuration

SQL Select Statement

It allows you to define the primary SQL of the application. You can edit this SQL to add or delete fields.

Limit

Lets you limit the display in the number of records retrieved by SQL query.

SQL Preparation

You can enter SQL commands or procedure names to execute them before the primary SQL of the application.

Connection

It allows defining the database connection of the application. You can change the connection to another one that has the same table.

Use Customized Message

Lets you define to display the “no records” message or not.

No Records Message

Lets you set the message when the application has no records.

Font

This option is available when using the “Use Customized Message” option. It lets you set the font for the message.

Font Size

This option is available when using the “Use Customized Message” option. It lets you to set the font size.

Font Color

This option is available when using the “Use Customized Message” option. It lets you to set the font color.

Variable for Table

It allows to use a variable to change a part of the string containing the table name.

Fill the first input with the name of the variable (replace to). The second input you should fill with the part of the name of the table you want to replace (replace from).

Fields Variables

It allows to use a variable to change a part of the string containing the field name.

Fill the first input with the name of the variable (replace to). The second input you should fill with the part of the name of the field you want to replace (replace from).

Case sensitive

It defines if the database connection uses case sensitive or not.

Chart Security

Use security

With this option enabled, when accessing the application, an “unauthorized user” message will be displayed, preventing access to the application.

When enabled, application access is only possible through the macro **sc_apl_status** or through **security module**.

[Click here](#) to access the macro documentation sc_apl_status.

In the development environment, the use of the above options for testing purposes may be suppressed, preventing the password being requested or access being blocked at each execution of the applications. To do this, disable the options “Enable security usage” and “Enable password usage” in the menu **Configuration > My Scriptcase**.

Security exit url

Defines which application the user will be redirected to after the “unauthorized user” warning.

Use password

When enabling the option, you will be asked to define a password for accessing the application.

When running the application using the active password, you will be asked for the password before accessing the application.

The password will be requested regardless of the “use security” setting or the use of the security module.

Request password only once

This option defines the behavior of the use password option.

When this option is enabled, the password will be requested only once per session.

When disabling, the password will be requested every time the application will be accessed.

Allow direct calling by URL

Allows an application to be called by typing the URL directly into browsers.

When disabled, when accessing the application by typing the URL directly, the invalid data error will be displayed. With this configuration, the application can only be accessed through a menu application, for example.

Chart Cookies

HttpOnly

These are cookies that can be set by the server or by javascript but cannot be accessed in any way by javascript.

With the HTTPOnly parameter enabled, it is very difficult to steal a session through XSS because the javascript cannot read the content of these cookies.

A widely exploited attack in XSS is the theft of user session cookies. Theft of cookies is carried out through a javascript command that sends cookies to an external URL where the attacking user has control.

This option is enabled by default in all applications.

Session ID

Enables the session id that will be stored in cookies on the client side. This option embeds the session id directly in the URLs

This option is enabled by default in all applications.

Cookie Secure

With this option enabled, cookies are protected and can only be transmitted via secure communication. Therefore, they cannot be accessed through Javascript.

The HttpOnly option must also be enabled.

Chart Headers

Desabilitar o Auditor XSS

XSS is short for Cross-Site Scripting, which is an attack that consists of sending HTML with malicious JavaScript to a website.

It is a security attack that consists of sending HTML with malicious JavaScript to a website. If the website displays this HTML with JavaScript without filtering the malicious JavaScript code, the cookies sent by the website can be stolen and sent to an attacking website, so that it can be used to forge user sessions and access the website's user account without permissions.

Strict-Transport-Security

HSTS forces browsers to use HTTPS in the domain where it is enabled, instead of using HTTP.

When enabled, the default value is "max-age = 31536000".

The HSTS policy is set for one year (31536000 seconds). This period specifies the time the browser will access the server via HTTP

X-Frame-Options

The HTTP X-Frame-Options response header can be used to indicate whether or not the browser should render the page in a `<frame>`, `<iframe>`, `<embed>` " or '". This header provides protection against clickjacking, known as 'click swipe' - this vulnerability can steal relevant information and data from the user.

X-Frame-Options does not allow the rendering of a page in a frame, ensuring that the content of your page is not embedded in other sites

- **SAMEORIGIN:** The SAMEORIGIN directive allows the page to be loaded in a frame from the same source as the page itself. This option must be used so that the application with clickjacking protection can be used in the menu application.
- **DENY:** This directive completely disables page loading in a frame.

If no option is selected, the application can be used on any `<frame>`, `<iframe>`,

or `<object>`, allowing the application to be incorporated into another website.

X-Content-Type-Options

X-Content-Type-Options is used to protect against MIME detection vulnerabilities. With this option enabled, it prevents browsers from interpreting the page content (sniffing) and executing the data as code / tag. These vulnerabilities can occur when uploading a text file with a javascript code and the browser reading the content that is in the file and executing, even though it is just text and not part of the code.

With this enabled, the HTTP X-Content-Type-Options header is defined, by default, as "no detection".

Referrer-Policy

no-referrer.

The Referer header will be omitted completely. No reference information will be sent with requests.

no-referrer-when-downgrade.

This is the default behavior when no policy is specified, or if the value provided is invalid.

origin.

Only send the origin of the document as a reference. For example, a document at `https://example.com/page.html` will send the reference `https://example.com/`.

origin-when-cross-origin.

Sends the origin, path and query string when performing a same-origin request, but only sends the origin of the document in other cases.

same-origin.

The reference will be sent to sources on the same site, but requests between sources will not send reference information.

strict-origin.

Only send the document source as a reference when the security protocol level remains the same (HTTPS → HTTPS), but do not send it to a less secure recipient (HTTPS → HTTP).

strict-origin-when-cross-origin.

Sends the source, path and query string when performing a request from the same source, only sends the source when the security protocol level remains the same during an inter-source request (HTTPS → HTTPS), and sends no header to recipients less secure (HTTPS → HTTP)

unsafe-url.

Sends the source, path and query chain when performing any request, regardless of security.

Feature-Policy

The value of this header is a policy or set of policies that you want the browser to respect for a particular source.

The source whitelist can take on several different values:

- ``*:`` The feature is allowed in top-level navigation contexts and in nested navigation contexts (iframes).
- ``self:`` The feature is allowed in top-level navigation contexts and nested navigation contexts from the same source. It is not allowed in documents of cross origin in nested browsing contexts.
- ``none:`` The feature is not allowed in top-level browsing contexts and is not allowed in nested browsing contexts.
- ``<origin (s)>:`` specific sources for which to enable the policy (for example `https://example.com`).

Example 1 - Using only one directive Let's say you want to prevent all content from using the geolocation API on your site. You can do this by submitting a restricted 'none' whitelist to the geolocation resource:

Feature-Policy: ``geolocation 'none``

Example 2 - Using more than one directive Functionalities within a policy are separated by semicolons.

Feature-Policy: `unsized-media 'none'; geolocation 'self' https://example.com; camera *;``

Directives

accelerometer

Controls whether the current document is allowed to collect information about the acceleration of the device

via the Accelerometer interface.

ambient-light-sensor

Controls whether the current document is allowed to collect information about the amount of light in the environment around the device through the AmbientLightSensor interface.

autoplay

Controls whether the current document is allowed to play the requested media automatically via the HTMLMediaElement interface. When this policy is disabled and there is no user action, the Promise returned by HTMLMediaElement.play () will reject it with a DOMException. The autoplay attribute on <audio> " and " elements will be ignored.

battery

Controls whether the use of the Battery Status API is allowed. When this policy is disabled, the Promise returned by Navigator.getBattery () will reject it with a NotAllowedError DOMException.

camera

Controls whether the current document is allowed to use inputs from video devices. When this policy is disabled, the Promise returned by getUserMedia () will reject it with a NotAllowedError DOMException.

display-capture

Controls whether or not the current document is allowed to use the getDisplayMedia () method to capture screen content. When this policy is disabled, the Promise returned by getDisplayMedia () will reject it with a NotAllowedError if permission is not obtained to capture the contents of the screen.

document-domain

Control whether the current document is allowed to place document.domain. When this policy is disabled, attempts to place document.domain will fail and cause a SecurityError DOMException to be thrown.

encrypted-media

Controls whether the current document is allowed to use the Encrypted Media Extensions (EME) API. When this policy is disabled, the Promise returned by Navigator.requestMediaKeySystemAccess () will reject it with a DOMException.

execution-while-not-rendered

Controls whether tasks should be performed in frames while they are not rendered (e.g. whether a frame is hidden or display: none).

execution-while-out-of-viewport

Controls whether tasks should be performed in frames while they are outside the visible viewing window.

fullscreen

Controls whether the current document is allowed to use Element.requestFullscreen (). When this policy is disabled, the returned Promise rejects it with a TypeError DOMException.

geolocation

Controls whether the current document is allowed to use the Geolocation interface. When the policy is disabled, calls to getCurrentPosition () and watchPosition () will cause function callbacks to be invoked with a PositionError of PERMISSION_DENIED.

gyroscope

Controls whether the current document is allowed to collect information about the orientation of the device through the Gyroscope interface.

layout-animations

Controls whether the current document is allowed to show layout animations.

legacy-image-formats

Controls whether the current document is allowed to show images in legacy formats.

magnetometer

Controls whether the current document is allowed to collect information about the orientation of the device through the Magnetometer interface.

microphone

Controls whether the current document is allowed to use inputs from audio devices. When this policy is disabled, the Promise returned by `MediaDevices.getUserMedia ()` will reject it with a `NotAllowedError`.

midi

Controls whether the current document is allowed to use the Web MIDI API. When this policy is disabled, the Promise returned by `Navigator.requestMIDIAccess ()` will reject it with a `DOMException`.

navigation-override

Controls the availability of mechanisms that enable the author of the page to take control over the behavior of spatial navigation, or to cancel completely.

oversized-images

Controls whether the current document is allowed to download and display large images.

payment

Controls whether the current document allows the use of the Payment Request API. When this policy is disabled, the `PaymentRequest ()` constructor will throw a `SecurityError DOMException`.

picture-in-picture

Controls whether the current document allows a video to be allowed to play in Picture-in-Picture mode via the corresponding API.

publickey-credentials-get

Controls whether the current document is allowed to use the Web Authentication API to retrieve already stored public key credentials, i.e. via `navigator.credentials.get ({publicKey: ..., ...})`.

sync-xhr

Controls whether the current document is allowed to make synchronous XMLHttpRequest requests.

usb

Controls whether the current document is allowed to use the WebUSB API.

vr

Controls whether the current document is allowed to use the WebVR API. When this policy is disabled, the Promise returned by `Navigator.getVRDisplays ()` will reject it with a `DOMException`. Keep in mind that the WebVR standard is in the process of being replaced by WebXR.

wake-lock

Controls whether the current document is allowed to use the Wake Lock API to indicate that the device should not go into a power saving mode.

screen-wake-lock

Controls whether the current document is allowed to use the Screen Wake Lock API to indicate whether or not the device should darken the screen.

xr-spatial-tracking

Controls whether or not the current document is allowed to use the WebXR Device API to interact with the WebXR session.

Content-Security-Policy

Content-Security-Policy is the name of an HTTP response header that modern browsers use to increase the security of the document (or web page).

The Content-Security-Policy header allows you to restrict resources such as JavaScript, CSS or just about anything the browser loads.

Directives**default-src**

The default-src directive defines the standard policy for fetching features such as JavaScript, Images, CSS, Fonts, AJAX requests, Frames, HTML5 Media. Not all directives go back to default-src. Refer to the Source List Reference for possible values.

DEFAULT-SRC Policy Example `default-src 'self' cdn.example.com;`

script-src

Defines valid JavaScript sources.

SCRIPT-SRC Policy Example `script-src 'self' js.example.com;`

style-src

Defines valid fonts for style sheets or CSS.

EXAMPLE__ STYLE-SRC POLICY `style-src 'self' css.example.com;`

img-src

Defines valid image sources.

Example of IMG-SRC Policy `img-src 'self' img.example.com;`

connect-src

Applies to XMLHttpRequest (AJAX), WebSocket, fetch (), `<a ping>` or EventSource. If not allowed, the browser emulates a 400 HTTP status code. **__Connect-SRC Policy Example__** `connect-src 'self';``

font-src

Defines valid fonts for font resources (loaded via @ font-face).

FONT-SRC Policy Example `font-src font.example.com;``

object-src

Defines valid plug-in sources, for example `<object>` or `<applet>`.

Example OBJECT-SRC Policy `object-src 'self';`

media-src

Defines valid audio and video sources, for example `<audio>`, HTML5, `<video>` elements.

Example of MEDIA-SRC Policy `media-src media.example.com;`

frame-src

Defines valid fonts for loading frames. In CSP, Level 2 `frame-src` has been deprecated in favor of the `child-src` directive. CSP Level 3, has not been replaced with `frame-src` and will continue to postpone `child-src` if not present.

Example FRAME-SRC `frame-src 'self';`

sandbox

Enables a sandbox for the requested resource similar to the `iframe` `sandbox` attribute. The sandbox applies a policy of the same origin, avoids pop-ups, plug-ins and blocks the execution of scripts. You can keep the `sandbox` value empty to keep all restrictions in place, or add values: `allow-forms` `allow-same-origin` `allow-scripts` `allow-popups` `allow-modals` `allow-orientation-lock` `allow-pointer-lock` `allow-presentation` `allow-popups-to-escape-sandbox` `allow-top-navigation`

Example of SANDBOX policy `sandbox allow-forms allow-scripts;`

report-uri

Instructs the browser to POST policy crash reports to this URI. You can also use `Content-Security-Policy-Report-Only` as the HTTP header name to instruct the browser to send reports only (does not block anything). This directive was discontinued at CSP Level 3 in favor of the `report-to` directive.

Example REPORT-URI `report-uri / some-report-uri;`

child-src

Defines valid fonts for web workers and nested browsing contexts loaded using elements such as `<frame>` and `<iframe>`.

Example of FILHO-SRC Policy `child-src 'self'`

form-action

Defines valid fonts that can be used as an `<form>` HTML action.

Example action policy example `form-action 'self';`

frame-ancestors

Defines valid fonts for embedding the resource using `<frame>` `<iframe>` `<object>` `<embed>` `<applet>`. Setting this directive to `'none'` should be roughly equivalent to `X-Frame-Options: DENY FRAME-ANCESTORS`.
EXAMPLE POLICY `frame-ancestors 'none';`

plugin-types

Defines valid MIME types for plug-ins called via `<object>` and `<embed>`. To load one, `<applet>` you must specify `application / x-java-applet`.

PLUG-IN TYPES Policy Example ``plugin-types application / pdf;``

base-uri

Defines a set of allowed URLs that can be used in the attribute of an HTML basetag.

URI-BASE Policy Example ``` base-uri 'self'; ```

report-to

Defines a report group name defined by an HTTP Response Report-Header. See the reporting API for more information.

Example Report for Policy `report-to groupName;`

worker-src

Restricts URLs that can be loaded as Worker, SharedWorker or ServiceWorker.

WORKER-SRC Policy Example `worker-src 'none';``

manifest-src

Restricts URLs where application manifests can be loaded.

Example of MANIFEST-SRC Policy `manifest-src 'none';``

prefetch-src

Defines valid sources for pre-fetching and pre-rendering of requests, for example, through the linktag with `rel = "prefetch"` or `rel = "prerender"`:

`__ PREFETCH-SRC Policy Example__ prefetch-src 'none'``

navigate-to

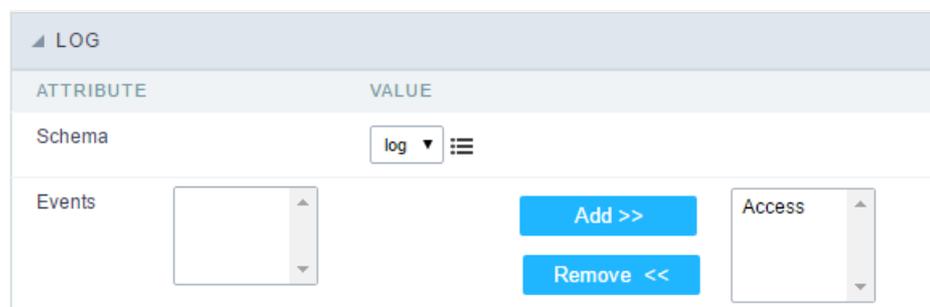

Restricts the URLs to which the document can navigate by any means. For example, when a link is clicked, a form is submitted or `window.location` is called. If `form-action` is present, this directive will be ignored for submitting forms. Implementation status

Navigation Policy Example ``navigate-to example.com``

Chart Log Configuration

This interface allows you to define a Log schema to the app. The Log schema tracks what the end-users are doing in the app. Those are the events it can tracks: Access, Insert, Update, and delete.

To learn how to create a Log schema [see here](#).

The screenshot shows a configuration interface for application logs. At the top, there is a header with a left-pointing triangle and the text 'LOG'. Below this is a table with two columns: 'ATTRIBUTE' and 'VALUE'. The first row has 'Schema' in the 'ATTRIBUTE' column and a dropdown menu with 'log' selected and a menu icon in the 'VALUE' column. Below the table, there are two empty dropdown menus, one on the left and one on the right. Between these dropdowns are two blue buttons: 'Add >>' and 'Remove <<'. The right dropdown menu has the word 'Access' visible at the top.

Application Log configuration

Schema Select an existing log schema for the application.

Events You can select just specific events to save in the log.

Chats - Fields Overview

The applications can have two types of fields.

Table Fields

Columns of the table connected to the application and their data types.

Example:

In a table with the following structure:

```
CREATE TABLE `orders` (
  `orderid` int(11) NOT NULL,
  `customerid` varchar(5) NULL DEFAULT NULL,
  `employeeid` int(11) NULL DEFAULT NULL,
  `orderdate` date NULL DEFAULT NULL,
  `requireddate` date NULL DEFAULT NULL,
  PRIMARY KEY (`orderid`) USING BTREE
);
```

These are the listed fields on left menu **Fields**:

Virtual Fields

Fields created inside application to assist in the development process.

How to create a virtual field

1. Inside an application, access the left menu **Fields** and click on **New Field** option.
2. Choose how many fields do you want to create:

1. Create the fields and define type, name and label for each one:

- **Type**: Data type of the field.
- **Name**: Internal name of the field. Used to identify the field on events and Scriptcase interface.
- **Label**: Title of the field displayed on the application.

Scriptcase **doesn't insert** virtual fields on the table after its creation.

Types of fields by applications

Application Table Fields Virtual Fields

Grid	<input type="text"/>	<input type="text"/>
Procedure	<input type="text"/>	<input type="text"/>
Chart	<input type="text"/>	<input type="text"/>
Form	<input type="text"/>	<input type="text"/>
Control	<input type="text"/>	<input type="text"/>
Calendar	<input type="text"/>	<input type="text"/>
Search	<input type="text"/>	<input type="text"/>
PDF Report	<input type="text"/>	<input type="text"/>

The applications **Menu**, **Tree Menu**, **Dashboard** and **Blank** were not listed because they haven't manage fields.

Chart - Text Field

General Settings

This type of field allows the developer to create quickly inputs to insert and update data, where the final user can inform its data to be allocated in its database.

Type of Data

Defines the type of the field in the application. In this case we should select **Text**.

Label

Defines the title that will be displayed in the field when the application is executed. The terminology used in the interface is fundamental to the system have a good usability, whe should use names and familiar terms to the final user of the application, instead of using terms from the system.

For example, this text field that has the name **customerid**, the client would have a much better understanding of the functionality of the field when we define the label as **Customer Name**.

Not only a fixed text, the **Label** attribute allows the use of langs to define the field's title, making it possible to use your application in a multi language project.

SQL Type

Informs the type of the field in the database.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select

command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Martial Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML, CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
 - **Default value** : Defines the default value, used in the cases where the select command does not return any values.
 - **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the

select command separated by the character in the "Separated by" field.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Chart - Multiple Lines Text Field

General Settings

Multiple Lines Text field configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Multiple Lines Text , you can inform a Text value to the field in multiple lines.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **SQL Type** : Informs the data type of field in the database.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

• Lookup Methods

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

• Lookup Method - Automatic

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced buy the curly brackets `{}`. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then `(;)`.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Martial Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
 - **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
 - **Summary** : Applies the lookup only for the summary (HTML and PDF).
 - **Both** : Applies to both the Grid and Summary.
 - **Default value** : Defines the default value, used in the cases where the select command does not return any values.
 - **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
 - **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Chart - Integer Field

General Settings

Data type:

It sets the application field type. When the field is set as Number, it is permissible to define formatting rules of integers.

Label:

It sets the title that will be displayed in the field when you run the application. The terminology used in the interface is fundamental for your system has a good usability. In this case, we recommend you to use names and terms familiar to the end user of the application, instead of using terms originated in the system.

Field Mask Input:

It sets the mask input for the field. There are two types of mask as described in the table below:

Character Description

X	It is overridden by any characters returned by the database. Filled is required and the value will be completed with leading zeros when there are fewer characters than the size of the mask.
Z	It is overridden by any characters returned by the database. Its filling is optional and when there are fewer characters than the mask size, nothing will be done about the characters that are missing. In addition the leading zeros will be suppressed. When used in conjunction with the X necessarily the use of this character is to the left of the mask.
9	It represents any numeric character (from 0-9)
A	It represents an alpha numeric character (A-Z,a-z)
*	It represents any alpha-numeric character (A-Z,a-z,0-9)entered by the user.

Mask Input Examples:

Field	Mask Input	Typed Value	Formatted Value
Phone Number	+99 99 9999 - 9999	123456789012	+12 34 5678 - 9012
Phone Number	(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
Phone Number	(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
Phone Number	(zz) xxxx - xxxx	12345678	() 1234 - 5678
Software Key (Letters only)	AAAA-AAAA-AAAA-AAAA	QWERTYUIASDFGHJK	QWER-TYUI-ASDF-GHJK
Software Key (Letters and numbers)	xxxx-xxxx-xxxx-xxxx	Q1W2E3R4T5Y6U7I8	Q1W2-E3R4-T5Y6-U7I8
License Plate	AAA - 9999	QWE1234	QWE - 1234
Scriptcase Serial Key	A999A999A999-**	D111H111G111DG2P	D111H111G111-DG2P
Multiple masks (Phone Number)	9999-9999;(99)9999-9999;	9999 999 9999	+99 99 9999-9999

Repeat value:

This option when enabled will allows you to repeat the field value if it is equal to the value of the previous record in the database.

Example:

Tipo SQL:

Reports the SQL type of the field as it is configured in the database.

Values Format

Use regional settings:

It allows you to apply regional settings to the number fields formatting. When this option is not selected it will be displayed the attributes group, minus sign and negative number format.

Digit grouping:

It allows you to define if the field displays the digit grouping separator.

Maximum Size:

It allows you to define the maximum size that will be used in the field of the application.

Minimum Value:

It allows you to define the minimum value that will be used in the field of the application.

Maximum Value:

It allows you to define the maximum value that will be used in the field of the application.

Grouping:

It allows you to define which character is used to separate thousands. This option is only available when the option to use regional settings is disabled.

Negative sign:

It allows you to define which character will be used for the display of negative numbers. This option is only available when the option to use regional settings is disabled.

Negative number format:

It allows you to define the placement of the negative sign in relation to value. This option is only available when the option to use regional settings is disabled.

Accept:

It allows to define if the field accept only negative values, positive-only or both.

Display Calculator:

This option when enabled will display a calculator to assist the end user to perform calculations.

Use Spin:

This option applies a Spin component to the number field. So the end user can increase or decrease the numbers using it. You will also be able to set a minor or major range for the spin.

Smaller increment for the Spin::

Sets the minimum range of the Spin component.

Greater increment for the Spin:

Sets the maximum range of the Spin.

Lookup Settings

The Lookup is a way used to provide the end user a list of values description/name where the items can be selected and used in the application. For example, for a field sex that in the database is represented with M or F values can be presented as male or female dynamically with the lookup. So you will be able to retrieve these values from a database table or manually, if the reference table does not exist.

Example:

Lookup Methods

There are two lookup methods available:

Manual: To use this method it is necessary to inform the selection conditions manually to the Lookup.

Automatic: To use this method it is necessary to use a lookup query from the database to access the reference table.

Editing-automatic lookup:

Select Command:

It sets the SQL command that will retrieve the value to display inside the Grid field. The command must have the following format

```
SELECT field_to_be_displayed FROM table WHERE key_field = {grid_field}
```

The Grid field must be always referenced between curly braces {}, So at run time, the field braces will be replaced by its value in the table.

Multiple Options:

When the Select command informed return multiple values, the option must be selected.

Delimiter:

It sets the tab of values returned by the Select command, this option should be filled when the "Yes" option is checked in the multiple attribute options.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

Use a specific connection:

This option allows you to select another existing connection in the project, other than the current connection, to select the values for the lookup.

Edit Lookup - Manual:

Lookup used to modify the display of the field with predefined values.

Lookup Types

It sets the operating mode of the lookup can be: single value, multiple values (delimiter), multiple values (position) and multiple values (binary).

Single value: it will be displayed only one value for the field. There is a direct replacement of the value stored in the Bank for a label defined in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value of "M" will be replaced by "Male".

Multiple Values (Delimiter):

By using this option it will be displayed multiple values for the selected field. The values must be separated by a delimiter to be informed. A replacement of parts from a string stored in the field, separated by a delimiter for values contained in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value S;M will be replaced by Sports and Movies.

Delimiter: Character used to separate the values within the same string.

Multiple Values (Position)

Allows you to recover information stored in a single string of the selected field. In order for this information to be retrieved must be informed, in addition to the label, the starting position and the number of bytes that each information occupies within the string.

As an example we will use a string to store Sex, Marital status and Hobby respectively. Sex occupies one byte, Status one byte and Hobby two bytes .

For this purpose we define the list as:

Label	Value	Start	Size
Male	M	1	1
Female	F	1	1
Married	M	2	1
Single	S	2	1
Study	ST	3	2
Sportes	SP	3	2
Reading	LE	3	2

Example: the string MMST would be presented in the query as: Male Married Study

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value M will be replaced by Male.

Start: : Starting position in the string where the information is recorded. The first position is always 1.

Size : Number of bytes that the information occupies in the string.

Multiple values (binary):

It allows you to retrieve several information stored in decimal form of the selected field.

As examples we will use the following list (although not informed in the interface of inclusion of values in the list, each item has a value assigned automatically according to the order):

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

To display the data, a decomposition of the decimal number stored in the bank is performed. For example, numbers 11 and 12 (written in the database) would be decomposed as follows:

$11 = 1 + 2 + 8 = (\text{Sports} - \text{Culture} - \text{Reading})$

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

$12 = 4 + 8 = (\text{Leisure} - \text{Reading})$

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

Label:

Text that will be displayed in the Grid.

Include Button:

Includes in the list the values populated in the Label and value fields.

Alter Button:

It changes the attributes of the selected item.

Delete Button:

Deletes the selected item.

Clean Button:

It cleans the fields

Save Button:

Allows the user to save the entire list, for later use using the Load Lookup definition option.

Load Lookup definition:

Allows you to load a predefined value list for use as a lookup.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

Chart - Decimal Field

General Settings

Decimal field configuration Interface.

Data Type

Define the field type to Decimal. It allows defining the Decimal number format.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

SQL Type

It informs the data type of field in the database.

Values Format

Use regional settings:

It allows you to apply regional settings to the number fields formatting. When this option is not selected it will be displayed the attributes group, minus sign and negative number format.

Digit grouping:

It allows you to define if the field displays the digit grouping separator.

Maximum Size:

It allows you to define the maximum size that will be used in the field of the application.

Minimum Value:

It allows you to define the minimum value that will be used in the field of the application.

Maximum Value:

It allows you to define the maximum value that will be used in the field of the application.

Grouping:

It allows you to define which character is used to separate thousands. This option is only available when the option to use regional settings is disabled.

Negative sign:

It allows you to define which character will be used for the display of negative numbers. This option is only available when the option to use regional settings is disabled.

Negative number format:

It allows you to define the placement of the negative sign in relation to value. This option is only available when the option to use regional settings is disabled.

Accept:

It allows to define if the field accept only negative values, positive-only or both.

Display Calculator:

This option when enabled will display a calculator to assist the end user to perform calculations.

Use Spin:

This option applies a Spin component to the number field. So the end user can increase or decrease the numbers using it. You will also be able to set a minor or major range for the spin.

Smaller increment for the Spin::

Sets the minimum range of the Spin component.

Greater increment for the Spin:

Sets the maximum range of the Spin.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter than (;).
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML, CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Chart - Percent Field

General Settings

Percentage field configuration Interface.

Data Type

Define the type of field to Percentage.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

SQL Type

It informs the data type of field in the database.

Values Format

Use regional settings:

It allows you to apply regional settings to the number fields formatting. When this option is not selected it will be displayed the attributes group, minus sign and negative number format.

Digit grouping:

It allows you to define if the field displays the digit grouping separator.

Maximum Size:

It allows you to define the maximum size that will be used in the field of the application.

Minimum Value:

It allows you to define the minimum value that will be used in the field of the application.

Maximum Value:

It allows you to define the maximum value that will be used in the field of the application.

Grouping:

It allows you to define which character is used to separate thousands. This option is only available when the option to use regional settings is disabled.

Negative sign:

It allows you to define which character will be used for the display of negative numbers. This option is only available when the option to use regional settings is disabled.

Negative number format:

It allows you to define the placement of the negative sign in relation to value. This option is only available when the option to use regional settings is disabled.

Accept:

It allows to define if the field accept only negative values, positive-only or both.

Display Calculator:

This option when enabled will display a calculator to assist the end user to perform calculations.

Use Spin:

This option applies a Spin component to the number field. So the end user can increase or decrease the numbers using it. You will also be able to set a minor or major range for the spin.

Smaller increment for the Spin::

Sets the minimum range of the Spin component.

Greater increment for the Spin:

Sets the maximum range of the Spin.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter than (;).
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML, CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Chart - Currency Field

General Settings

Currency field configuration Interface.

Data Type

Define the field type to Currency. It allows defining the currency number format.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

SQL Type

It informs the data type of field in the database.

Values Format

Use regional settings:

It allows you to apply regional settings to the number fields formatting. When this option is not selected it will be displayed the attributes group, minus sign and negative number format.

Digit grouping:

It allows you to define if the field displays the digit grouping separator.

Maximum Size:

It allows you to define the maximum size that will be used in the field of the application.

Minimum Value:

It allows you to define the minimum value that will be used in the field of the application.

Maximum Value:

It allows you to define the maximum value that will be used in the field of the application.

Grouping:

It allows you to define which character is used to separate thousands. This option is only available when the option to use regional settings is disabled.

Negative sign:

It allows you to define which character will be used for the display of negative numbers. This option is only available when the option to use regional settings is disabled.

Negative number format:

It allows you to define the placement of the negative sign in relation to value. This option is only available when the option to use regional settings is disabled.

Accept:

It allows to define if the field accept only negative values, positive-only or both.

Display Calculator:

This option when enabled will display a calculator to assist the end user to perform calculations.

Use Spin:

This option applies a Spin component to the number field. So the end user can increase or decrease the numbers using it. You will also be able to set a minor or major range for the spin.

Smaller increment for the Spin::

Sets the minimum range of the Spin component.

Greater increment for the Spin:

Sets the maximum range of the Spin.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter than (;).
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML, CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Chart - Percent(Calculated) Field

General Settings

Percentage field configuration Interface.

Data Type

Define the type of field to Percentage.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

SQL Type

It informs the data type of field in the database.

Values Format

Use regional settings:

It allows you to apply regional settings to the number fields formating. When this option is not selected it will be displayed the attributes group, minus sign and negative number format.

Digit grouping:

It allows you to define if the field displays the digit grouping separator.

Maximum Size:

It allows you to define the maximum size that will be used in the field of the application.

Minimum Value:

It allows you to define the minimum value that will be used in the field of the application.

Maximum Value:

It allows you to define the maximum value that will be used in the field of the application.

Grouping:

It allows you to define which character is used to separate thousands. This option is only available when the option to use regional settings is disabled.

Negative sign:

It allows you to define which character will be used for the display of negative numbers. This option is only available when the option to use regional settings is disabled.

Negative number format:

It allows you to define the placement of the negative sign in relation to value. This option is only available when the option to use regional settings is disabled.

Accept:

It allows to define if the field accept only negative values, positive-only or both.

Display Calculator:

This option when enabled will display a calculator to assist the end user to perform calculations.

Use Spin:

This option applies a Spin component to the number field. So the end user can increase or decrease the numbers using it. You will also be able to set a minor or major range for the spin.

Smaller increment for the Spin::

Sets the minimum range of the Spin component.

Greater increment for the Spin:

Sets the maximum range of the Spin.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

- **Lookup Method - Automatic**

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT display_field FROM table WHERE key_field = {grid_field}
```

The Grid field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimiter.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter than (;).
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML, CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

It will be displayed only one value for the field. And it will replace the stored value from the table with the one defined on the item label.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Multiple Values (Delimiter)**

It can be displayed various values for the selected field. The values should be separated by a delimiter that will be informed. It is done a replacement on the parts of the field, separated by the delimiter, with the values contained in the list.

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in database would be stored the following value **MSRD**.

- **Label** : Text that will be displayed in the Grid.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.

Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

- **Label** : Text that will be displayed in the Grid.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use lookup in** :
- **Grid** : Applies the lookup to all the Grid formats (HTML, PDF, XML , CSV and RTF).
- **Summary** : Applies the lookup only for the summary (HTML and PDF).
- **Both** : Applies to both the Grid and Summary.
- **Default value** : Defines the default value, used in the cases where the select command does not return any values.
- **Display original and lookup value** : When selected **No**, its displayed on it the value from the select command. Otherwise, it will be displayed the original value of the field and the value returned from the select command separated by the character in the "Separated by" field.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Chart - Date Field

General Settings

Date field Configuration Interface.

Data Type

Define the type of field. When setting it to Date, you can inform its format into this field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Values Format

Use regional settings:

It allows you to apply regional settings to the number fields formatting. When this option is not selected it will be displayed the attributes group, minus sign and negative number format.

Digit grouping:

It allows you to define if the field displays the digit grouping separator.

Maximum Size:

It allows you to define the maximum size that will be used in the field of the application.

Minimum Value:

It allows you to define the minimum value that will be used in the field of the application.

Maximum Value:

It allows you to define the maximum value that will be used in the field of the application.

Grouping:

It allows you to define which character is used to separate thousands. This option is only available when the option to use regional settings is disabled.

Negative sign:

It allows you to define which character will be used for the display of negative numbers. This option is only available when the option to use regional settings is disabled.

Negative number format:

It allows you to define the placement of the negative sign in relation to value. This option is only available when the option to use regional settings is disabled.

Accept:

It allows to define if the field accept only negative values, positive-only or both.

Display Calculator:

This option when enabled will display a calculator to assist the end user to perform calculations.

Use Spin:

This option applies a Spin component to the number field. So the end user can increase or decrease the numbers using it. You will also be able to set a minor or major range for the spin.

Smaller increment for the Spin::

Sets the minimum range of the Spin component.

Greater increment for the Spin:

Sets the maximum range of the Spin.

Chart - Time Field

General Settings

Time field Configuration Interface.

Data Type

Define the type of field. When setting it to Time, you can inform a time format into this field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

SQL Type

It informs the data type of field in the database.

Values Format

Use regional settings:

It allows you to apply regional settings to the number fields formatting. When this option is not selected it will be displayed the attributes group, minus sign and negative number format.

Digit grouping:

It allows you to define if the field displays the digit grouping separator.

Maximum Size:

It allows you to define the maximum size that will be used in the field of the application.

Minimum Value:

It allows you to define the minimum value that will be used in the field of the application.

Maximum Value:

It allows you to define the maximum value that will be used in the field of the application.

Grouping:

It allows you to define which character is used to separate thousands. This option is only available when the option to use regional settings is disabled.

Negative sign:

It allows you to define which character will be used for the display of negative numbers. This option is only available when the option to use regional settings is disabled.

Negative number format:

It allows you to define the placement of the negative sign in relation to value. This option is only available when the option to use regional settings is disabled.

Accept:

It allows to define if the field accept only negative values, positive-only or both.

Display Calculator:

This option when enabled will display a calculator to assist the end user to perform calculations.

Use Spin:

This option applies a Spin component to the number field. So the end user can increase or decrease the numbers using it. You will also be able to set a minor or major range for the spin.

Smaller increment for the Spin::

Sets the minimum range of the Spin component.

Greater increment for the Spin:

Sets the maximum range of the Spin.

Chart - Date and Time Field

General Settings

Date and Time field Configuration Interface.

Data Type

Define the type of field. When setting it to Date and Time, you can inform its format into this field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Date format

It formats the date for the Group By.

SQL Type

It informs the data type of field in the database.

Values Format

Use regional settings:

It allows you to apply regional settings to the number fields formatting. When this option is not selected it will be displayed the attributes group, minus sign and negative number format.

Digit grouping:

It allows you to define if the field displays the digit grouping separator.

Maximum Size:

It allows you to define the maximum size that will be used in the field of the application.

Minimum Value:

It allows you to define the minimum value that will be used in the field of the application.

Maximum Value:

It allows you to define the maximum value that will be used in the field of the application.

Grouping:

It allows you to define which character is used to separate thousands. This option is only available when the option to use regional settings is disabled.

Negative sign:

It allows you to define which character will be used for the display of negative numbers. This option is only available when the option to use regional settings is disabled.

Negative number format:

It allows you to define the placement of the negative sign in relation to value. This option is only available when the option to use regional settings is disabled.

Accept:

It allows to define if the field accept only negative values, positive-only or both.

Display Calculator:

This option when enabled will display a calculator to assist the end user to perform calculations.

Use Spin:

This option applies a Spin component to the number field. So the end user can increase or decrease the numbers using it. You will also be able to set a minor or major range for the spin.

Smaller increment for the Spin::

Sets the minimum range of the Spin component.

Greater increment for the Spin:

Sets the maximum range of the Spin.

Chart Layout Setting

This module lets you editing display options for the application. You can apply visualization themes, organize blocks, define values, and the display format of the Header and Footer.

Layout Settings

ScriptCase creates an app by using default values defined per project, but you can change those values for a specific application on this interface.

▲ LAYOUT SETTINGS

Header Template	<input type="text" value="Flat"/>	Template name used for the application header.
Footer Template	<input type="text" value="Default"/>	Template name used for the application footer.
Button	<input type="text"/>	Use different buttons than what was defined in the color scheme.
Themes	<input type="text" value="Sc9_Rhino"/>	Use different themes from the one defined for the color scheme

Header

Captcha

Application Layout

Settings

Header Template

Allows choosing the look of the application Header.

Footer Template

Allows choosing the look of the application Footer.

Button

Allows choosing the button theme for the application.

Themes

Choose one of the selected themes in the project properties. It defines the look of the application, like colors, fonts, and others.

Header

Here we can define if we want to display the header or not, the application title, and fill the header variables. The header looks according to the selected template in the Layout settings interface.

▲ HEADER	
ATTRIBUTE	VALUE
Display Header	<input checked="" type="checkbox"/>
Insertion Title	<input type="text" value="{lang_othr_frmi_tit} - orders"/>
Update Title	<input type="text" value="{lang_othr_frmu_tit} - orders"/>
Header Variables	
SC_HEADER	<input type="text" value="Title"/>
SC_VALUE	<input type="text" value="Date"/> ?

Application Header Configuration

Display Header

This option determines if we want to display the header or not.

Title

Allows informing the title of the application.

Header Variables

We must fill the variable fields with one of the types available in the Combobox. Depending on the type, you need to associate content with it. Those are the types:

- **Field:** When you choose the option “**Field**”, it opens a Combobox to choose a field to associate the field value with the header. This option will be enabled in the applications that you can create a fields
- **Title:** It displays the value of “**Application Title**” in the header.
- **Date:** It displays the system’s date in “yyyy/mm/dd” format in the header. There are several display formats available, and you can change it by using the text field beside it. To access existing formats, click on the hint to see an explanation.
- **Image:** It displays a field to inform the name of an existing image in the server. You can select an image by clicking on the icon “**Choose Image**”, and you still can upload new images by using the button “**Upload**”. 
- **Value:** It displays the content of the text input. You can inform static texts and “**Global Variables**”. e.g. “Employee Name: [v_name]”.

Depending on the Application, you may have more than one title option.

Footer

FOOTER	
ATTRIBUTE	VALUE
Display Footer	<input type="checkbox"/>
Footer Variables	
NM_FOOTER_DATA	<input type="text"/>
NM_FOOTER_LOGO	<input type="text"/>
NM_FOOTER_TITLE	<input type="text"/>

Application Footer Settings

This page may change depending on the footer template chosen in the Layout Settings.

Display Footer

This option determines if we want to display the footer or not.

Footer Variables

We must fill the variable fields with one of the types available in the Combobox. Depending on the type, you need to associate content with it. Those are the types:

- **Field:** When you choose the option "**Field**", it opens a Combobox to choose a field to associate the field value with the header. This option will be enabled in the applications that you can create a fields
- **Date:** It displays the system's date in "yyyy/mm/dd" format in the header. There are several display formats available, and you can change it by using the text field beside it. To access existing formats, click on the hint to see an explanation.
- **Image:** It displays a field to inform the name of an existing image in the server. You can select an image by clicking on the icon "**Choose Image**", and you still can upload new images by using the button "**Upload**". 
- **Value:** It displays the content of the text input. You can inform static texts and "**Global Variables**". e.g. "Employee Name: [v_name]".

Chart´ Events Overview

Most Scriptcase applications, with the exception of Tabs and Dashboard applications, have events that can be used to create business rules, validations and changes to the application’s CSS, among other things.

When events are executed?

Each event is executed at a certain moment in the application and has an execution order, for this reason, they have different functions within the creation of a business rule and validations.

They can be triggered automatically, as in the case of the **onApplicationInit** and **onScriptInit** events, where they are executed when the application starts. Also, they can be triggered through user interaction, as with the **onNavigate** and **onValidate** events, which are executed when browsing the application or submitting a form, respectively.

For information about the timing of events execution or other information, access the documentation of the desired event.

how they work?

By default, the events already have handle for opening `<?php` and closing `?>` of PHP tags, so they are ready to receive PHP code and macros from Scriptcase.

However, it is possible to use other languages in the event, such as **JQuery**, **JavaScript**, **CSS** and **HTML**. For this, it is necessary to close the PHP tag `?>` of the event, so that the code can be added.

Remembering that it is necessary to reopen the event’s PHP tag `<?php`, otherwise the application will not run correctly.

When closing the PHP tag in a Scriptcase event, the executed language is HTML.

Example of using other languages:

onApplicationInit - Chart

It only occurs one time when the application loads. Before the application run SQL. It can be used for data processing or for checking variables. Ex: `if ([glo_var_department] != 'financial'){ sc_redir(app_x.php); }`

onScriptInit - Chart

This event occurs when the application is loaded, or reloaded. It occurs before the application runs the SQL statement, so using this event it is possible to modify the grid SQL statement dynamically, based on any logical condition. Macros frequently called on this event: `sc_select_field`, `sc_select_order`, `sc_select_where(add)`, etc

onHeader - Chart

This event is frequently used when it is required to display any calculated value on report's header Ex. In a customer report header it is required to display the customer balance on reports header. Create a field called fld_customer_balance on fields menu. sc_lookup(v_bal," select sum(debits) - sum(credits) from view_debits_credits where customer = '{field_customer}'");

onFooter - Chart

This event occurs on the application footer display, it is frequently used when it is required to display any calculated data on grids or report footer. Ex: `sc_lookup(ret," select sum({item_value}) from orders_items where id_order='{fld_id_order}' "); {fld_footer_total_field_a} = {ret[0][0]} * 0,1;` The field `{fld_footer_total_field_a}` must be created on fields menu

Code Editor

Scriptcase has Events to allow the developers to customize the application code. By using the events, the developers can program custom actions at a specific execution time (e.g. After a record is inserted, when it is loaded, upon submitting a Form, ...) and for a specific application type. In the events area you can use global and local variables, JavaScript, CSS, HTML, PHP codes and also Scriptcase macros.

Scriptcase code editor is used within events and has a series of shortcuts to help in the applications development.

At the top section of the editor, there are some options that allows us to change the editor theme or expand it, for example. These options can also be activated using the hotkeys.

- - Increases the area occupied by your code editor.
- - Expand the sides of the code editor.
- - Activates the search in the code editor.
- - Enables replace in the code editor.
- - Defines the code editor theme.

The hotkeys are available in all browsers compatible with Scriptcase.

[Click Here](#) to view the Scriptcase hotkeys documentation.

Chart Search Settings

With this interface, you can define general options of the Search Form.

Search configuration Interface.

Search Criteria

Allows to select the logical operator **AND** or **OR** to define the criteria of the search;

Display Condition

Gets the condition of the search available for the user to choose one. He can select "AND" or "OR" in a Combobox.

Use auto-complete in the fields

Automatically turns the field into an autocomplete according to the existing values in the database. If the user chooses **Yes**, the autocomplete will enable automatically in all inputs that contain a relationship. If the user decides **No**, so no autocompletes will be displayed. Otherwise, the option selected is **Defined in the field** it'll keep the settings for each field individually.

Chart Search Criteria Settings

With this interface, you can configure the conditions available for each field of the Search form.

 *Search configuration Interface.*

We can see the fields list on the left combo. On the right, the list of options for filtering the selected field. To select an option, click on one of them (Equal to, Beginning with, Contains, etc.) and then the button On/Off. The arrows, on the right, allows altering the order of the fields.

For the Date type fields, you can define special conditions for the search, accessing the field configurations, and editing the Special Conditions Settings.

Below the list are the buttons to enable the selected options:

- **On/Off:** Enables or disables the field or the option chosen.
- **All:** Marks all fields or options.
- **None:** Unmarks all the fields or options.

Chart Advanced Search Settings

Through the table below we set all the options that will be part of the application Grid Search.

Margins

Defines the position of the margins of the Search Form.

Keep Values

It keeps the searched values when the user returns to the search form.

Keep Columns and Order Selection

Set it to preserve the selected columns and sorting for each search, if they were changed by the user through the toolbar options.

Use Enter to

It allows you to define the action that the Enter Key has on the Search form. **Tabulate** enables you to navigate between fields, and **Submit** performs the search (activates the Search button).

Display Tags

Allows displaying as tags, the searches used for the Grid.

Display after filtering

Display tags only after performing an advanced search. If disabled, it will always display a tag, regardless of the advanced search.

Unify results

Sets the chars limit to group the result of the tags. This option should be used when the field type is multiple-select.

Treeview in the Tags

Sets the use of Treeview for tags.

Initial status of the Treeview

It sets the initial state of the Treeview. (If the app is using Treeview for tags)

Start open

It displays the tags.

Start close

It displays the full description of the tags as text.

Clear other filters after submit

After applying the advanced filter, all other filters will be deleted.

Interact with the dynamic filter

Apply the same filter in matching fields between Advanced and Dynamic Filter, when not showing the labels.

Highlight

Highlights the results in the query. It only works for “Exactly the same”, “Contains” and “Equal start” conditions.

To customize how the highlight will be displayed, you must access the theme editing tool .

- 1** - Access the **Layout > Application Themes** menu.
- 2** - Choose the desired theme and click **Advanced Mode**.
- 3** - Then look for the sub-item **Grid**, within the item of the same name.
- 4** - In this sub-item you will find the option “Line”, which contains the folders **Line Odd and Even** . In each of these folders you will find the option **Quicksearch highlight**, with the options for editing Text, Border and Background of the searched terms.

Select Fields for Advanced Search in Chart

Adding and Removing Application Fields

The fields must be configured using the selection buttons, located between the columns.

- - Move all fields to the right.
- - Moves only selected fields to the right
- - Moves only the selected fields to the left.
- - Move all fields to the left.

In the left column, there are the application fields that are not in use in the filter, while the right column shows all the selected fields and the order in which they will be displayed.

To add fields to the filter, select the fields you want in the filter and click the button.

To select fields in sequence, simply click on a field and drag. Pressing control (Ctrl) allows you to select multiple alternate fields.

Search and positioning

Field display order

The fields will be displayed in the application respecting the order defined in the right column.

The display order must be defined using the sort buttons and which will move the selected fields in the column.

Remembering that the fields must be positioned inside a block (**customers**) which must be inside a page (**Pag1**).

Check below the use of the buttons to order the fields

Save and Restore

Below the columns are two buttons:

- **Save** which records the current placement of fields in columns.
- **Restore** which reorganizes the fields returning to the last position saved.

Restoring the positioning of the fields to the last saved definition.

Chart Search Toolbar

Search Toolbar

The Search toolbar is divided in two parts: Top and Bottom, in a way that is possible to define the buttons that will be displayed in both bars. The selection of buttons in the top and bottom toolbar works independently, allowing the buttons to be displayed in both bars at the same time.

 *Toolbar Interface.*

Navigation:

Groups the options relative to the navigation buttons that can be displayed in the application.

- **Search:** Execute the search.
- **Clean:** Clean the all the search fields.
- **Edit:** Enable the **Save Tag** option.
- **Exit:** Exit the application.

Others:

Groups a diversity of options relative to the application.

- **Languages:** Displays a combobox with the names available, defined in the project properties.
- **Themes:** Displays a combobox with the themes available, defined in the project properties.
- **HelpCase:** Displays a button to redirect to the help page.

Separator

- : Displays a line separating the buttons, when used the Group Buttons.

Use in-line buttons:

Allows the alignment of the filter buttons next to the fields.

Inline buttons: Allows you to select which buttons will be displayed next to the field, and you can sort them according to your wishes. This option is available by enabling **Use buttons inline** in the button settings.

When activating the **Inline Buttons** option, the screen to configure the buttons will be displayed.

The buttons available in this in-line button option are the same as those shown in the standard toolbar described above.

This is the result when using a radio button on the line

Button Settings

 *Button Settings Interface.*

- **Hotkey:** Allows you to set keyboard hotkeys to a button.
- **Position of the in-line buttons:** Sets the positioning of the buttons to the right or left of the fields.
- **Column Quantity:** Sets the number of display columns of the buttons, allowing you to configure whether they will be displayed side-by-side or distributed in columns.

Options ![Options Interface.][barra_ferramentas_filtro_opcoes] *Options Interface.* * __Button Position(Top/Bottom)__ Positioning the buttons of the toolbar Top/Bottom. -->

Grid's Advanced Search Layout Overview

In events, blocks can be used with global variables, local, JavaScript code, CSS codes and Scriptcase macros.

onScriptInit - Advanced Search - Chart

This event occurs just once before it display the search form. It can be used to set some default values to the fields. For example: {company} = [glo_company]; Date fields are used differently, They use a suffix "day" for day, "month" for month and/or "year" for year. For example, The {Birth} field will be: {Birth_day}=date("d"); {Birth_month}=date("m"); {Birth_year}=date("Y");

onRefresh - Chart

onRefresh

This event occurs when the form application is reloaded, is possible to reload the form based on fields (select , radio, checkbox)

onSave - Advanced Search - Chart

This event occurs always that some search setting is saved in the filter application.

onValidade

This event occurs when the search form is submitted. Ex. in order to prevent some searches or to validate any search params if(strlen({name}) <= 0) { sc_error_message(" Please fill the name field before submit your search "); }

Chart's Advanced Search Layout Overview

On this module are available the features of editing, attributes and display of the application, in a way that you can apply display themes, organize blocks, define values and the format of the Header/Footer and etc.

Blocks

Conceptually a block is a “container” where you can position the fields of the Applications: Form, Control or Grid with Slide orientation.

By default, the applications created in ScriptCase are built with a only one block, with the same name as the application. You can add the amount of blocks that you want to organize in a more convenient way. The page below, observe that theirs a column Organization, and that is where you’ll define if the next block will be set beside or below the current one.

Application Block configuration

On the left side of each block there are two icons, first has the function to edit all the information relative to the block and the second is to delete the block.

- Organizing the position of the Blocks
 - See below how to modify the display order of the Blocks in one Page.

Click and drag the block that you desire to modify to its new position.

Application Block Display configuration

- See how to remove a block from display

Click on the block desired and drag it to the item “Blocks not Shown”. This way, you can also drag the block to another page if desired. See the images below.

Application Block Display configuration

Application Block Display configuration

- **Attributes**

- **Block**

- **Name** : Name of the Block.
- **Label** : Title of the block that’ll be displayed in the application.

- **Title**

- **Display** : Flag that controls the title display of the block.

- **Label**

- **Display** : Flag that controls id the label of the fields will be displayed in the block.
- **Position** : Options to display label :
 - **Above** : The label will be displayed above the field.
 - **Beside** : The label will be displayed beside the field.
 - **Below** : The label will be displayed below the field.

- **Fields**

- **Columns** : Amount of columns that are displayed side by side in the block.
- **Position** : The way that the fields are displayed in the block :
 - **Below** : The fields are displayed one below the other respecting the amount of columns.
 - **Beside** : The fields are displayed one beside the other respecting the amount of columns.
 - **Line** : The fields are displayed one beside the other without the tabulation.

- **Organization**

- **Next** : The way that the blocks are displayed in the page:
 - **Below** : Indicates that the next block will be placed below the current one.
 - **Beside** : Indicates that the next block will be placed beside the current one.
 - **Tabs** : Indicates that the next block will be placed in a different tab then the current one.
- **Width** : Specifies the width that block will occupy in pixels or percentage, in case the value is in percentage, inform the (%).
- **Collapse** : Enables the option to close the block.

- Create New Block

To include new blocks in an Application, click on the button . Next, you’ll see the following interface to define the name and label of the block. At the end click on Create.

- **Attributes**

- **Name** : Name of the Block.
- **Label** : Title of the block that'll be displayed in the application.

- Edit Blocks

To edit a block just click on the icon , that is on the left side of the block. Next, you'll see the following interface to define the parameters of the blocks. At the end click on save.

- 
- **Name** : Name of the block.
 - **Title** : Block title for display.
 - **Display Title** : This option, when active, allows to display the block title.
 - **Title Font** : Font applied to the block title.
 - **Font Size** : Size of the font applied to the block title.
 - **Font Color** : Font color for the block title.
 - **Background Color** : Background Color of the block title.
 - **Background image** : Background image for the block title.
 - **Title Height** : Height in pixels of the block title line.
 - **Horizontal Alignment** : Horizontal Alignment of the block title (Left, Center and Right).
 - **Vertical Alignment** : Vertical Alignment the block title (Top, Middle and Bottom).
 - **Display Label** : Display the labels of the fields in the block.
 - **Columns** : Amount of field columns in a block.
 - **Columns Width** : How the width of the block is defined.
 - **Label Color** : Color of the field labels.
 - **Fields Organization** : How the fields are organized in the block.
 - **Label Position** : Position of the field labels relating to the data.
 - **Next Block** : Position of the next block relating to the current block.
 - **Border Color** : Border color for the block.
 - **Border Width** : Border Width for the block.
 - **Block Width** : Width for the block.
 - **Block Height** : Height for the block.
 - **Cell Spacing** : Cell Spacing in the block.
 - **Collapse** : Enables the option to close the block.

Settings

On this interface, you can define the theme for display of a specific application, this being because ScriptCase uses a Standard Definition of Values per project, that besides the Display Theme, allows to define values for other attributes on a Project level.

Header Template:

Allows to choose the template that's going to be used as the Header of the application.

Footer Template:

Allows to choose the template that's going to be used as the Footer of the application.

Button:

Allows to choose the button theme for the application.

Themes:

Choose one of the existing themes, it'll load the display mode (colors ,fonts, etc.) that'll be part of the application.

Header & Footer

Header

In this block, it's the definition of the variables content that'll be part of the header.

This page may change depending on the header format chosen in the Layout Settings.

Display Header:

This option determines if the header will display.

Title:

Allows to inform the title displayed in the application.

Header Variables:

The field variables can be informed with anyone of displayed in the Combo box. Depending on the type, it'll be necessary to associate the content with the field. Below there are the types of content:

- **Field** : When you choose the option "**Field**", it'll open a Combo box beside to choose the field you want. Selecting the desired field, it'll associate the value of the field with the header.
- **Title** : This option when selected it'll display in the header the value informed in the "**Application Title**".
- **Date** : When selected the "**Date**" type, it'll display the system's date in the header. There are a diversity of formats using the date and time of the server. The format can be informed in the text field that appears beside the field. To access the existing formats, click on the icon and you'll view a page display the formats.
- **Image** : When selecting the image type, it displays a field to inform the name of the existing image in the server. To locate the images existing and selecting one, click the icon "**Choose Image**" and to upload new images click on the button "**Upload**" .
- **Value** : When selecting the type "**Value**", the content informed in the text field that appears beside, it'll be displayed in the header, you can inform texts and "**Global Variables**". e.g. "Employee Name: [v_name]".

Depending on the Application, you may have more than one title option.

Footer

This page may change depending on the footer format chosen in the Layout Settings.

Display Footer:

This option determines if the footer will display.

Footer Variables

The field variables can be informed with anyone of displayed in the Combo box. Depending on the type, it'll be necessary to associate the content with the field. Below there are the types of content:

- **Field** : When you choose the option "**Field**", it'll open a Combo box beside to choose the field you want. Selecting the desired field, it'll associate the value of the field with the footer.
- **Date** : When selected the "**Date**" type, it'll display the system's date in the footer. There are a diversity of formats using the date and time of the server. The format can be informed in the text field that appears beside the field. To access the existing formats, click on the icon and you'll view a page display the formats.
- **Image** : When selecting the image type, it displays a field to inform the name of the existing image in the server. To locate the images existing and selecting one, click the icon "**Choose Image**" and to upload new images click on the button "**Upload**".
- **Value** : When selecting the type "**Value**", the content informed in the text field that appears beside,

it'll be displayed in the footer, you can inform texts and "**Global Variables**". e.g. "Employee Name: [v_name]".

Chart Search Settings

On this screen, the general behavior of the dynamic filter in the application will be defined.

Filter type

Defines the type of filter that will be used in the application.

Filter Builder

Allows the end user to create filters during the use of the application, combining different conditions and logical operators (AND/OR) to create more robust filters and generate more qualified reports.

Below is an example of how the filter builder works.

The user can add multiple fields or nested conditions to combine the use of logical operators.

Dynamic filter

Allows the end user to build filters during the use of the application by adding the fields that should compose the filter according to their needs, within the same logical operator.

Below is an example of how the dynamic filter works.

The user must select the logical operator that will be used for all filter fields: All conditions (AND) or any condition (OR).

Use the ENTER key for

This attribute defines the behavior of the ENTER key when the filter screen is being displayed.

Chart Filter Builder Settings

Enable/Disable

This attribute defines whether the user can disable fields or nestings in the filter builder, keeping them disabled until the application is reloaded.

Example of the disable button

Display filter condition

Defines whether the filter condition will be displayed while the user builds their filter.

When enabled, the condition is assembled as the user adds the filter's conditions and logical operators. When disabled, this condition will not be displayed.

Modal Filter

Defines the location where the filter builder will open in the application.

When enabled, the filter will open in a modal. If disabled, the filter will be displayed in a div below the application's toolbar. See below for examples of both behaviors.

Opening in a modal

Div below the toolbar

Save Search in Filter Build (Chart)

This feature allows the end-user to save his searches in a profile. You can create some rules, like to save the searches by user login.

Select Fields for Filter Build in Chart

On this screen, the fields that will be available for use in the dynamic filter must be defined.

In the **left column**, all application fields and the **Search** field are displayed, which helps in locating the fields. In the **right column** are the fields selected to be displayed in the filter.

Adding and Removing Application Fields

The fields must be configured using the selection buttons, located between the columns.

- - Move all fields to the right.
- - Moves only selected fields to the right
- - Moves only the selected fields to the left.
- - Move all fields to the left.

In the left column, there are the application fields that are not in use in the filter, while the right column shows all the selected fields and the order in which they will be displayed.

To add fields to the filter, select the fields you want in the filter and click the button.

To select fields in sequence, simply click on a field and drag. Pressing control (Ctrl) allows you to select multiple alternate fields.

Search and positioning

Field display order

The fields will be displayed in the application respecting the order defined in the right column.

The display order must be defined using the sort buttons and which will move the selected fields in the column.

Remembering that the fields must be positioned inside a block (**customers**) which must be inside a page (**Pag1**).

Check below the use of the buttons to order the fields

Save and Restore

Below the columns are two buttons:

- **Save** which records the current placement of fields in columns.
- **Restore** which reorganizes the fields returning to the last position saved.

Restoring the positioning of the fields to the last saved definition.

Select Fields for Dynamic Search in Chart

On this screen, the fields that will be available for use in the dynamic filter must be defined.

In the **left column**, all application fields and the **Search** field are displayed, which helps in locating the fields. In the **right column** are the fields selected to be displayed in the filter.

Adding and Removing Application Fields

The fields must be configured using the selection buttons, located between the columns.

- - Move all fields to the right.
- - Moves only selected fields to the right
- - Moves only the selected fields to the left.
- - Move all fields to the left.

In the left column, there are the application fields that are not in use in the filter, while the right column shows all the selected fields and the order in which they will be displayed.

To add fields to the filter, select the fields you want in the filter and click the button.

To select fields in sequence, simply click on a field and drag. Pressing control (Ctrl) allows you to select multiple alternate fields.

Search and positioning

Field display order

The fields will be displayed in the application respecting the order defined in the right column.

The display order must be defined using the sort buttons and which will move the selected fields in the column.

Remembering that the fields must be positioned inside a block (**customers**) which must be inside a page (**Pag1**).

Check below the use of the buttons to order the fields

Save and Restore

Below the columns are two buttons:

- **Save** which records the current placement of fields in columns.
- **Restore** which reorganizes the fields returning to the last position saved.

Restoring the positioning of the fields to the last saved definition.

Chart Fields Overview

The applications can have two types of fields.

Table Fields

Columns of the table connected to the application and their data types.

Example:

In a table with the following structure:

```
CREATE TABLE `orders` (
  `orderid` int(11) NOT NULL,
  `customerid` varchar(5) NULL DEFAULT NULL,
  `employeeid` int(11) NULL DEFAULT NULL,
  `orderdate` date NULL DEFAULT NULL,
  `requireddate` date NULL DEFAULT NULL,
  PRIMARY KEY (`orderid`) USING BTREE
);
```

These are the listed fields on left menu **Fields**:

Virtual Fields

Fields created inside application to assist in the development process.

How to create a virtual field

1. Inside an application, access the left menu **Fields** and click on **New Field** option.
2. Choose how many fields do you want to create:

1. Create the fields and define type, name and label for each one:

- **Type**: Data type of the field.
- **Name**: Internal name of the field. Used to identify the field on events and Scriptcase interface.
- **Label**: Title of the field displayed on the application.

Scriptcase **doesn't insert** virtual fields on the table after its creation.

Types of fields by applications

Application Table Fields Virtual Fields

Grid	<input type="text"/>	<input type="text"/>
Procedure	<input type="text"/>	<input type="text"/>
Chart	<input type="text"/>	<input type="text"/>
Form	<input type="text"/>	<input type="text"/>
Control	<input type="text"/>	<input type="text"/>
Calendar	<input type="text"/>	<input type="text"/>
Search	<input type="text"/>	<input type="text"/>
PDF Report	<input type="text"/>	<input type="text"/>

The applications **Menu**, **Tree Menu**, **Dashboard** and **Blank** were not listed because they haven't manage fields.

Text

General Settings

This type of field allows the developer to create quickly inputs to insert and update data, where the final user can inform its data to be allocated in its database.

Type of Data

Defines the type of the field in the application. In this case we should select **Text**.

Label

Defines the title that will be displayed in the field when the application is executed. The terminology used in the interface is fundamental to the system have a good usability, whe should use names and familiar terms to the final user of the application, instead of using terms from the system.

For example, this text field that has the name **customerid**, the client would have a much better understanding of the functionality of the field when we define the label as **Customer Name**.

Not only a fixed text, the **Label** attribute allows the use of langs to define the field's title, making it possible to use your application in a multi language project.

SQL Type

Informs the type of the field in the database.

Field Behavior

Use autocomplete:

Field automatically turns into autocomplete according to existing values in the database.

Use Select2

Uses the new component for data selection, allowing searches within the select comboBox.

Width for the Select2

Sets a width for the area in the Select2.

Amount of characters

Sets the amount of characters to start the search.

Amount of rows

Sets the maximum number of rows to list the search result.

Width:

Defines a width in pixels for a result box.

Search options:

Defines the validation that will be made to fetch the search result.

Start equals to: Will return the records with the same start value as in the database.

Any part: Will return the records when exist the character in any part of the record.

End equals to: Will return the records with the same final value as in the database.

Position between values:

Defines the position that objects will be displayed.

Text Between Values

Text that will appear when using a filter condition between two values.

OnChange Submit:

Submit search on this field changing.

Show Condition:

To show or not the search condition. It only works if the search has at least one condition.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.

- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Integer

Data type:

It sets the application field type. When the field is set as Number, it is permissible to define formatting rules of integers.

Label:

It sets the title that will be displayed in the field when you run the application. The terminology used in the interface is fundamental for your system has a good usability. In this case, we recommend you to use names and terms familiar to the end user of the application, instead of using terms originated in the system.

Field Mask Input:

It sets the mask input for the field. There are two types of mask as described in the table below:

Character Description

X	It is overridden by any characters returned by the database. Filled is required and the value will be completed with leading zeros when there are fewer characters than the size of the mask.
Z	It is overridden by any characters returned by the database. Its filling is optional and when there are fewer characters than the mask size, nothing will be done about the characters that are missing. In addition the leading zeros will be suppressed. When used in conjunction with the X necessarily the use of this character is to the left of the mask.
9	It represents any numeric character (from 0-9)
A	It represents an alpha numeric character (A-Z,a-z)
*	It represents any alpha-numeric character (A-Z,a-z,0-9)entered by the user.

Mask Input Examples:

Field	Mask Input	Typed Value	Formatted Value
Phone Number	+99 99 9999 - 9999	123456789012	+12 34 5678 - 9012
Phone Number	(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
Phone Number	(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
Phone Number	(zz) xxxx - xxxx	12345678	() 1234 - 5678
Software Key (Letters only)	AAAA-AAAA-AAAA-AAAA	QWERTYUIASDFGHJK	QWER-TYUI-ASDF-GHJK
Software Key (Letters and numbers)	xxxx-xxxx-xxxx-xxxx	Q1W2E3R4T5Y6U7I8	Q1W2-E3R4-T5Y6-U7I8
License Plate	AAA - 9999	QWE1234	QWE - 1234
Scriptcase Serial Key	A999A999A999- **	D111H111G111DG2P	D111H111G111-DG2P
Multiple masks (Phone Number)	9999-9999;(99)9999-9999;	9999 999 9999	+99 99 9999-9999

Repeat value:

This option when enabled will allows you to repeat the field value if it is equal to the value of the previous record in the database.

Example:

Tipo SQL:

Reports the SQL type of the field as it is configured in the database.

Use regional settings:

It allows you to apply regional settings to the number fields formatting. When this option is not selected it will be displayed the attributes group, minus sign and negative number format.

Digit grouping:

It allows you to define if the field displays the digit grouping separator.

Maximum Size:

It allows you to define the maximum size that will be used in the field of the application.

Minimum Value:

It allows you to define the minimum value that will be used in the field of the application.

Maximum Value:

It allows you to define the maximum value that will be used in the field of the application.

Grouping:

It allows you to define which character is used to separate thousands. This option is only available when the option to use regional settings is disabled.

Negative sign:

It allows you to define which character will be used for the display of negative numbers. This option is only available when the option to use regional settings is disabled.

Negative number format:

It allows you to define the placement of the negative sign in relation to value. This option is only available when the option to use regional settings is disabled.

Accept:

It allows to define if the field accept only negative values, positive-only or both.

Display Calculator:

This option when enabled will display a calculator to assist the end user to perform calculations.

Use Spin:

This option applies a Spin component to the number field. So the end user can increase or decrease the numbers using it. You will also be able to set a minor or major range for the spin.

Smaller increment for the Spin::

Sets the minimum range of the Spin component.

Greater increment for the Spin:

Sets the maximum range of the Spin.

Lookup Settings

The Lookup is a way used to provide the end user a list of values description/name where the items can be selected and used in the application. For example, for a field sex that in the database is represented with M or F values can be presented as male or female dynamically with the lookup. So you will be able to retrieve these values from a database table or manually, if the reference table does not exist.

Example:

Lookup Methods

There are two lookup methods available:

Manual: To use this method it is necessary to inform the selection conditions manually to the Lookup.

Automatic: To use this method it is necessary to use a lookup query from the database to access the reference table.

Editing-automatic lookup:

Select Command:

It sets the SQL command that will retrieve the value to display inside the Grid field. The command must have the following format

```
SELECT field_to_be_displayed FROM table WHERE key_field = {grid_field}
```

The Grid field must be always referenced between curly braces {}, So at run time, the field braces will be replaced by its value in the table.

Multiple Options:

When the Select command informed return multiple values, the option must be selected.

Delimiter:

It sets the tab of values returned by the Select command, this option should be filled when the "Yes" option is checked in the multiple attribute options.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

Use a specific connection:

This option allows you to select another existing connection in the project, other than the current connection, to select the values for the lookup.

Edit Lookup - Manual:

Lookup used to modify the display of the field with predefined values.

Lookup Types

It sets the operating mode of the lookup can be: single value, multiple values (delimiter), multiple values (position) and multiple values (binary).

Single value: it will be displayed only one value for the field. There is a direct replacement of the value stored in the Bank for a label defined in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value of "M" will be replaced by "Male".

Multiple Values (Delimiter):

By using this option it will be displayed multiple values for the selected field. The values must be separated by a delimiter to be informed. A replacement of parts from a string stored in the field, separated by a delimiter for values contained in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value S;M will be replaced by Sports and Movies.

Delimiter: Character used to separate the values within the same string.

Multiple Values (Position)

Allows you to recover information stored in a single string of the selected field. In order for this information to be retrieved must be informed, in addition to the label, the starting position and the number of bytes that each information occupies within the string.

As an example we will use a string to store Sex, Marital status and Hobby respectively. Sex occupies one byte, Status one byte and Hobby two bytes .

For this purpose we define the list as:

Label	Value	Start	Size
Male	M	1	1
Female	F	1	1
Married	M	2	1
Single	S	2	1
Study	ST	3	2
Sportes	SP	3	2
Reading	LE	3	2

Example: the string MMST would be presented in the query as: Male Married Study

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value M will be replaced by Male.

Start: : Starting position in the string where the information is recorded. The first position is always 1.

Size : Number of bytes that the information occupies in the string.

Multiple values (binary):

It allows you to retrieve several information stored in decimal form of the selected field.

As examples we will use the following list (although not informed in the interface of inclusion of values in the

list, each item has a value assigned automatically according to the order):

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

To display the data, a decomposition of the decimal number stored in the bank is performed. For example, numbers 11 and 12 (written in the database) would be decomposed as follows:

$11 = 1 + 2 + 8 = (\text{Sports} - \text{Culture} - \text{Reading})$

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

$12 = 4 + 8 = (\text{Leisure} - \text{Reading})$

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

Label:

Text that will be displayed in the Grid.

Include Button:

Includes in the list the values populated in the Label and value fields.

Alter Button:

It changes the attributes of the selected item.

Delete Button:

Deletes the selected item.

Clean Button:

It cleans the fields

Save Button:

Allows the user to save the entire list, for later use using the Load Lookup definition option.

Load Lookup definition:

Allows you to load a predefined value list for use as a lookup.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.

- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.

- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Decimal

General Settings

Decimal field Configuration Interface.

Data Type

Define the field type to Decimal. It allows defining the Decimal number format.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Accumulated

It defines the field to accumulate values of another field. This option is only available for virtual fields.

Accumulator field

It is available when the option "Accumulated" is enabled. This configuration defines which field will accumulate the values. The field should be Integer, Currency, or Decimal.

Grid Mask

It defines a mask for the field value. There is two types of masks:

Character	Description
X	It sets the placeholder to any character for replacing. If the entered number of characters is less than the mask size, It completes the field value with zeros (Filling full-size field entry is required).
Z	It sets the placeholder to any character for replacing, but it suppresses zeros at field left (Complete field filling is optional). Use it on the left when combined with the X mask.

Mask Examples

Mask	Field Value	Formatted Value
(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
(zz) xxxx - xxxx	1234567890	(12) 3456 - 7890
(zz) xxxx - xxxx	12345678	() 1234 - 5678
(zz) xxxx - xxxx	0012345678	() 1234 - 5678

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Field Behavior

Use autocomplete:

Field automatically turns into autocomplete according to existing values in the database.

Use Select2

Uses the new component for data selection, allowing searches within the select comboBox.

Width for the Select2

Sets a width for the area in the Select2.

Amount of characters

Sets the amount of characters to start the search.

Amount of rows

Sets the maximum number of rows to list the search result.

Width:

Defines a width in pixels for a result box.

Search options:

Defines the validation that will be made to fetch the search result.

Start equals to: Will return the records with the same start value as in the database.

Any part: Will return the records when exist the character in any part of the record.

End equals to: Will return the records with the same final value as in the database.

Position between values:

Defines the position that objects will be displayed.

Text Between Values

Text that will appear when using a filter condition between two values.

OnChange Submit:

Submit search on this field changing.

Show Condition:

To show or not the search condition. It only works if the search has at least one condition.

Values format

Decimal Field Format of Values with Regional Settings.

- **Regional Settings** : Allows to apply the Regional Settings to format the number of the field. When not enabled, the attributes Digit Grouping Separator, Decimal Separator, Negative sign and Negative number format.
- **Decimal Precision** : Defines the amount of decimal places for the field.
- **Digit grouping** : Defines if the field will display the digits separator.
- **Decimal Separator** : Defines the decimal separator.
- **Accept** : Determines if the field, will accept only negative, positive or both numbers.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.

- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Currency

General Settings

Currency field Configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Currency, you can currency values to the field.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Currency Field Behavior Interface of the Search Configuration.

- **Use auto-complete** : The field behaves as an auto-complete according to the values existing in the database.
- **Amount of characters** : Sets the amount of characters to start the search.
- **Amount of rows** : Sets the maximum number of rows to list the search result.
- **Width** : Sets the width in pixels for the result box.
- **Search options** : Defines the validation that will be made to fetch the search result.
- **Position between values** : This option sets the position that objects will be displayed.
- **Text between values** : Text that will appear between values.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Values format

Currency Field Format of Values with Regional Settings.

- **Regional Settings** : Allows to apply the Regional Settings to format the number of the field. When not enabled, the attributes Digit Grouping Separator, Decimal Separator.
- **Decimal Precision** : Defines the amount of decimal places for the field.
- **Digit grouping** : Defines if the field will display the digits separator.
- **Decimal Separator** : Defines the decimal separator.
- **Accept** : Determines if the field, will accept only negative, positive or both numbers.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).

- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Date

General Settings

- **Data Type** : Define the type of field for the application. When set to Date, you can inform a date.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Watermark**: Displays a watermark in the field input.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the datatype of field in the database.

Values format

- **Regional Settings** : Allows to apply the Regional Settings to format the dates of the field. When not enabled, it will be displayed the date separator attribute.
- **Date separator** : Allows you to inform the separator symbol for the date.
- **Display** : Select the format of the day for display.
- **Internal Format** : Allows to define the format the field when the SQL type is different from **Date**. You need to use the characters **A**, **M** and **D** that correspond to **Year**, **Month** and **Day**.
- **Use Combo-box** : Allows you to select the date using a combo-box.
 - **Year as Combo** : Allows to use the year combo to select the date.
 - **Initial Year** : First year displayed in the combo.
 - **Actual Year +** : Display the current plus the amount of years informed.
- **Month in full textual** : Displays the Month format in Full.
- **Display Calendar** : Enables the a calendar icon beside the field, this allows to select the date from a calendar with the format already setup.
 - **New Calendar** : Defines if the JQuery calendar (New Calendar) is going to be displayed or the old format.
 - **Years Limit** : Amount of years displayed in the calendar.
 - **View week number** : Displays the number of the week in the application.
 - **Additional months** : Displays the additional months of the calendar.
 - **Show Combo year and month** : Displays the year and month of the calendar in the combo box.

Field Behavior

- **Position between values** : This option sets the position that objects will be displayed.
- **Text between values** : Text that will appear between values.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Special Conditions

- **All Period** : Searches for all periods of dates.
- **Today** : Searches in today's date.
- **Yesterday** : Searches in yesterday's date.
- **Last 7 days** : Searches the last 7 days. Ex: ((01/01/2017 01/07/2017)).
- **This month** : Searches the dates from the first day of the current month.
- **Last month** : Searches the dates from the first day of lasts month.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of

Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Time

General Settings

Time field Configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Time, you can inform a time to this field.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Values format

Time Field Format of Values with Regional Settings.

- **Regional Settings** : Allows to apply the Regional Settings to format the dates of the field. When not enabled, it will be displayed the date separator and time separator attributes.
- **Time separator** : Allows you to inform the separator symbol for the time.
- **Display** : Select the format of the time for display.
- **Internal Format** : Allows to define the format the field when the SQL type is different from **TIME**. You need to use the characters **HH**, **II**, and **SS** that correspond to **Day**, **Hour**, **Minutes** and **Seconds**.

Field Behavior

Time Field Behavior Interface of the Search Configuration.

- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.

- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Datetime

General Settings

Datetime field Configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Datetime, you can inform a date and time to this field.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Values format

Datetime Field Format of Values with Regional Settings.

- **Regional Settings** : Allows to apply the Regional Settings to format the dates of the field. When not enabled, it will be displayed the date separator and time separator attributes.
- **Date separator** : Allows you to inform the separator symbol for the date.
- **Time separator** : Allows you to inform the separator symbol for the time.
- **Display** : Select the format of the day/time for display.
- **Internal Format** : Allows to define the format the field when the SQL type is different from **DATETIME**. You need to use the characters **A, M, D, HH, II, and SS** that correspond to **Year, Month, Day, Hour, Minutes** and **Seconds**.
- **Use Combo-box** : Allows you to select the date using a combo-box.
 - **Year as Combo** : Allows to use the year combo to select the date.
 - **Initial Year** : First year displayed in the combo.
 - **Actual Year +** : Display the current plus the amount of years informed.
- **Month in full textual** : Displays the Month format in Full.
- **Display Calendar** : Enables the a calendar icon beside the field, this allows to select the date from a calendar with the format already setup.
 - **New Calendar** : Defines if the JQuery calendar (New Calendar) is going to be displayed or the old format.
 - **Years Limit** : Amount of years displayed in the calendar.
 - **View week number** : Displays the number of the week in the application.
 - **Additional months** : Displays the additional months of the calendar.
 - **Show Combo year and month** : Displays the year and month of the calendar in the combo box.

Field Behavior

Date Field Behavior Interface of the Search Configuration.

- **Position between values** : This option sets the position that objects will be displayed.
- **Text between values** : Text that will appear between values.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Special Conditions

Datetime Field Special Conditions.

- **All Period** : Searches for all periods of dates.
- **Today** : Searches in todays date.
- **Yesterday** : Searches in yesterdays date.
- **Last 7 days** : Searches the last 7 days. Ex: ((01/01/2017 01/07/2017).
- **This month** : Searches the dates from the first day of the current month.
- **Last month** : Searches the dates from the first day of lasts month.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.

Select

General Settings

Select field Configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Select, you can select multiple option from a combo box (Select Field).
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Select Field Behavior Interface of the Search Configuration.

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Search Lookup

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

• Lookup Methods

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

Selecting the lookup type.

◦ Lookup Method - Automatic

Lookup used to list the values that will be displayed on the Checkbox field. These values will be recovered dynamically using the Select command.

Automatic Lookup Interface.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the `key_field` will be stored in the table field.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimitation.

- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Height** : Defines the height for the select object.
- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to

a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.
- **Link** : Allows to create a link to another form allowing to manipulate the list displayed on the select field. After the manipulation, the select object it updated automatically.

◦ **Lookup Method - Manual**

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

Manual Lookup Interface.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

Setting up Single Value Lookup

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Default** : With this option enabled, the selected item will be inserted to the table when committed.
- **Height** : Defines the height for the select object.

- **Multiple Values (delimiter)**

You can store various values for the select field. The values are separated by the informed delimiter. For example: the combination **Sport, Cinema** and **Tourism** selected in form will be stored like **E;C;T** in case the delimiter is ; (semi coma).

Setting up Multiple Values (delimiter)

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Height** : Defines the height for the select object.

- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of

bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in the database would be stored the following value **MSRD**.

Setting up Multiple Values (position)

- **Label** : Text that will be displayed in the item list of the select field.
 - **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
 - **Negative** : Value to be saved in the table in case there is not any valued selected on the field.
 - **Start** : Starting position of the string that is going to be stored. The first position is always 1.
 - **Size** : Amount of bytes that is going to occupy in the string.
 - **Height** : Defines the height for the select object.
- **Multiple Values (binary)**

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute	Value	Lookup	Description
1		Sports	
2		Culture	
4		Pleasure	
8		Reading	
16		Music	

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute	Value	Lookup	Description
1		Sports	
2		Culture	
4		Pleasure	
8		Reading	
16		Music	

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute	Value	Lookup	Description
-----------	-------	--------	-------------

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

Editing Lookup Configuration Multiple Values (Binary)

- **Label** : Text that will be displayed in the item list of the select field.
- **Height** : Defines the height for the select object.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

Displaying the original lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Lookup Method - Actual value

This lookup is used to list all the values in the selected field.

This lookup will apply a “distinct” to your SQL query.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.

- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Double Select

General Settings

Double Select field Configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Double Select, your allowed to have multiple options selected.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Double Select Field Behavior Interface of the Search Configuration.

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Search Lookup

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or F can be presented like Male or Female or in a dynamic way, getting these values from the database.

Lookup Settings Display for the field.
Automatic Lookup Interface..

- **SQL Select Statement** : Defines the SQL command that will get the values displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the `key_field` will be stored in the table field.
- **Height** : Set the height(lines) of the field interface.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter than (;).
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Selects another specific connection existing in the project. The select command will be done on the second connection.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**

- **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Check box

General Settings

Check box field Configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Check box, your allowed to have multiple options selected.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Check box Field Behavior Interface of the Search Configuration.

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Search Lookup

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or F can be presented like Male or Female or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

• Lookup Methods

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query). *Selecting the lookup type.*

◦ Lookup Method - Automatic

Lookup used to list the values that will be displayed on the CheckBox field. These values will be recovered dynamically using the Select command.

Automatic Lookup Interface.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the `key_field` will be stored in the table field.

- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Option check all** : Displays two options on the field to check and uncheck all.

- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Selects another specific connection existing in the project. The select command will be done on the second connection.

◦ **Lookup Method - Manual**

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

Manual Lookup Interface.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).

- **Single Value** :

Setting up Single Value Lookup

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Default** : With this option enabled, the selected item will be inserted to the table when committed.
- **Columns** : Set the amount of columns, for the list of items.

- **Multiple Values (delimiter)**

You can store various values for the checkBox field. The values are separated by the informed delimiter. For example: the combination **Sport, Cinema** and **Tourism** selected in form will be stored like **E;C;T** in case the delimiter is ; (semi coma).

Setting up Multiple Values (delimiter)

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Columns** : Set amount of columns, for the list of items.

- **Multiple Values (position)**

Stores a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Martial Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man, Single** and **Read**, in the database would be stored the

following value **MSRD**.

Setting up Multiple Values (position)

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Negative** : Value to be saved in the table in case there is not any valued selected on the field.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.
- **Columns** : Set the amount of columns, for the list of items.

▪ **Multiple Values (binary)**

Stores a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

Setting up Multiple Values (Binary)

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Columns** : Allows you to inform the amount of columns, for the list of items.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Saves all the items of the list, to use on other fields, just click on Load lookup definition.

- **Load lookup definitions** : Refreshes the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Option check all** : Displays two options on the field to check and uncheck all.

- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

• CSS of the Title

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

• CSS of the Field

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

• CSS of the Input Object

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio,

- Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Radio

General Settings

Radio field Configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Radio, your allowed to select one of the options listed.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Radio Field Behavior Interface of the Search Configuration.

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Search Lookup

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

• Lookup Methods

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query). *Selecting the lookup type.*

◦ Lookup Method - Automatic

Lookup used to list the values that will be displayed on the Checkbox field. These values will be recovered dynamically using the Select command.

Automatic Lookup Interface.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the `key_field` will be stored in the table field.

- **Columns** : Allows you to inform the amount of columns, for the list of items.

- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.

- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

◦ **Lookup Method - Manual**

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

Manual Lookup Interface.

- **Label** : Text that will be displayed in the item list of the radio.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Default** : With this option enabled, the selected item will be inserted to the table when committed.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

Displaying the original lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

-
- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
 - **Help Type**
 - **Pop-up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Text Auto-Complete

General Settings

Text Auto-Complete field Configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Text auto complete, you can inform a value based on the select statement of the lookup settings and it will manipulate an internal Text for the data.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Text Auto-Complete Field Behavior

Interface of the Search Configuration.

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **Case Settings** : Allows to convert the letters of the field when losing the focus. The options are:
 - **Upper Case** : All in Upper Case.
 - **Lower Case** : All in Lower Case.
 - **Capitalize first word** : Capitalizes the first letter of the word.
 - **Capitalize all words** : Capitalizes the first letter of all the words.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Search Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field.
- **Rows** : Allows to define the amount of records displayed in the field.
- **Width** : Defines the width the size of capture box (Capture Text).
- **Search options** : Allows to define the search settings of the field(Start equal to, Any part and End equals to).
- **Capture Text** : When not enabled, you will only view the field to inform the data. See an example below. *lookup Settings configuration Interface.*
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

lookup Settings validation configuration Interface.

- **Show label with the description** : Displays a label with the description.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

-
- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.

Number Auto-Complete

General Settings

![[Number Auto-Complete Field Behavior Interface of the Search Configuration.]][[filtro_cons_número_auto]]
Number Auto-Complete Field Behavior Interface of the Search Configuration.

- **Data Type** : Define the type of field for the application. When set to Number auto complete, you can inform a value based on the select statement of the lookup settings and it will manipulate an internal number for the data.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Number Auto-Complete Field Behavior Interface of the Search Configuration.

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **Position between values** : This option sets the position that objects will be displayed.
- **Text between values** : Text that will appear between values.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Values format

Number Auto-Complete Field Format of Values with Regional Settings.

- **Regional Settings** : Allows to apply the Regional Settings to format the number of the field. When not enabled, the attributes Digit Grouping Separator, Decimal Separator, Negative sign and Negative number format.
- **Decimal Precision** : Defines the amount of decimal places for the field.
- **Digit grouping** : Defines if the field will display the digits separator.
- **Decimal Separator** : Defines the decimal separator.
- **Accept** : Determines if the field, will accept only negative, positive or both numbers.

Search Lookup

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field.
- **Rows** : Allows to define the amount of records displayed in the field.
- **Width** : Defines the width the size of capture box (Capture Text).
- **Search options** : Allows to define the search settings of the field(Start equal to, Any part and End equals to).
- **Capture Text** : When not enabled, you will only view the field to inform the data. See an example below. *lookup Settings configuration Interface.*
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

lookup Settings validation configuration Interface.

- **Show label with the description** : Displays a label with the description.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps

the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Date Comparison

Special field that allows you to change the functioning of a date type field in the summary filter, enabling the comparison of metrics over time. To use this type of field, it is necessary to have a date type field created, and later change its type to Date Comparison.

It is only available in the advanced filter and its operation is exclusive to the query summary module.

Example of the field in the summary filter

Example of the Generated summary

When using the comparison, the summary will be assembled showing the values for the periods informed.

General Configuration

In this block are the general settings of the field, and where it will be 'transformed' into a comparative data field, simply access the settings of a data field and change the *Data* type to **Date comparison**

Data type of the field.

This attribute defines the type of field in the application. This definition implies the configuration options that will be displayed to the developer as well as the behavior of the field when running the application.

During the application creation process, Scriptcase maps the fields of the table(s) used and defines the data type of the fields according to their SQL type.

For example

Fields of type varchar in the table will be defined as text in the **Data Type** attribute.

It is possible to change the field's data type, however it is important to take into account the **SQLType**, displayed in the General Configuration block, to define the field's data type.

Search Label

Defines the title of the column displayed in the executed application and can be defined using: Lang, Text or Global variable.

Lang

The use of lang in the attribute definition is recommended for creating multilingual systems. The langs must be previously defined using the option [Traduzir aplicações](#) or through [Dicionário de Dados](#).

Fixed text

In this case, the column title will not be changed due to user interaction, such as changing the application language, for example.

It is a good option for systems created with just one language.

Global variable

The use of global variables allows you to change the column title according to your system business rule.

We also provide the macro [sc_label](#) which allows you to change the column title regardless of how the label attribute was defined.

Example of a column title

Use same label used on the Grid

This option, when activated, allows you to use the title of the field defined in the grid, in this case the value defined in the **Label filter** attribute will be disregarded.

Value Formatting

Regional Settings

Allows you to apply regional date formatting settings to the field, according to the application language. When disabling the use of *regional settings*, some settings will be displayed such as: **Date separator**, **First Day** and **Display**.

Check below for more details about each configuration option.

It is possible to change regional settings in general, allowing the use of the option and the same configuration in all your projects, according to the language used. For this configuration, access the Menu *Locales* > [Configurações Regionais](#)

Date separator

Defines the character that will be used to visually separate the parts of the date (day, month and year). The characters normally used are: slashes ("/"), hyphens ("-") and periods (.).

Alguns exemplos

- **slashes (/):** 25/10/2023
- **hyphens (-):** 25-10-2023
- **periods (.):** 25.10.2023

This option will be displayed if the **Use regional settings** attribute is disabled.

First day

Defines the first day of the week to be displayed in the calendar in the date field, for selecting dates.

First day change example

In this example, the *First day* was defined as Monday, changing the order in which the days of the week are displayed in the field calendar.

This option will be displayed if the **Use regional settings** attribute is disabled.

Display

Defines the date display format by selecting one of the listed formats.

The options are:

- dd-mm-aaaa
- mm-dd-aaaa
- aaaa-mm-dd

This option will be displayed if the **Use regional settings** attribute is disabled.

View week number

Defines whether the number of weeks will be displayed in the date field calendar.

Example of a calendar with number of weeks

Special Conditions

Defines the special conditions that will be displayed in the date field calendar, see the example below.

Example of special conditions in the date field calendar

If no interval is enabled, the calendar in the date field will not have any special conditions.

Example of the date field without special conditions

Select Values

In this attribute, the special conditions that will be listed as an option in the application must be defined. The predefined intervals are grouped according to the period they refer to. For example, the condition *Last week* is in the tab **Week**.

In each of the tabs it is also possible to create personalized intervals using the button [Add new range](#).

In the tab , all selected ranges will be listed, so that the display order can be changed according to the user's needs.

Sorting tab

In this tab, all selected conditions will be listed, allowing the intervals to be reordered according to the system's needs. You can also remove conditions one by one or using the button **Remove all**.

Add New Range

Clicking on *add new range* will open a screen with some options for adding new ranges. To add an interval, we must select the type (next or last) and enter the period (value).

For example, adding a range in the year tab, defined *Last* in the attribute as **Type** and reporting 2 in the attribute **Value** a range will be created: **Last two years**

This button is available on the **Year, Quarter, Month, Week** and **Day** tabs.

Type

Defines whether the created interval will refer to a future period (next) or a previous period (last).

- **Next** - Defines that the created interval will refer to a future date, for example, **Next year**.
- **Last** - Defines that the range will refer to a previous date, for example, **Last Year**.

Value

Sets the amount of time for the interval.

This field only accepts positive integer values greater than zero.

Title

Defines the text that will be displayed in the application. When creating a new range, a lang is automatically

generated, it is also possible to use a fixed text.

Include Current

This option changes how the created interval works, adding the current period to the interval.

For example, adding an interval to the year tab, defining *Next* in the **Type** attribute and entering 2 in the **Valor** attribute and checking the **Include current** option will create an interval: **Next 2 years from current**.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse

leaves the help icon.

- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Application Settings (Chart)

Settings

Navigation

This interface allows defining the navigating behavior of the application

NAVIGATION	
ATTRIBUTE	VALUE
Exit URL	<input type="text"/> 
Close on Exit	<input type="checkbox"/>
Redirect URL	<input type="text"/> 
Redirect Variable	<input type="text"/>

Navigation Interface.

Exit URL

URL to where the user goes when he clicks on the “exit” button.

Close on Exit

Close the browser window when the user clicks on the “exit” button.

Redirect URL

Redirect to another URL in case there aren't any global variables available.

Redirect Variable

Creates a variable with the application name and sends it to the redirected application.

Global Variables

This screen shows all global variables used in the application

The global variable is an external parameter required for running the application. The application can include global variables in the WHERE clause, field definitions and names, event programming, and so on.

You can define global variables by using square brackets ([variable]). You can pass the parameters to the application through one of the methods: Session, Post, and Get

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(“) instead of the brackets([]) because of the conflict with the of Global Variables syntax{:target=”_blank”} Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

APPLICATION	
 Settings	
 Navigation	
 Messages	
 Global Variable	

Global variables Interface.

Example:

```
Select CustomerID, CustomerName from Customers WHERE CustomerID = '[v_customerid]'
```

We do not recommend using session variables (global variables) with the same name as the table fields.

In this case, the variable **v_customerid** is displaying in the global variables configuration.

VARIABLE SETTINGS	
ATTRIBUTE	VALUE
global	<div style="border: 1px solid black; padding: 5px;"> <p>Scope</p> <p><input type="checkbox"/> SESSION</p> <p><input checked="" type="checkbox"/> POST</p> <p><input checked="" type="checkbox"/> GET</p> </div> <div style="border: 1px solid black; padding: 5px; margin-top: 5px;"> <p>Settings</p> <p><input type="checkbox"/> Optional</p> </div> <div style="border: 1px solid black; padding: 5px; margin-top: 5px;"> <p>Type</p> <p><input type="radio"/> Out</p> <p><input checked="" type="radio"/> In</p> </div>

Global variables configuration Interface.

Attribute

It shows the variable's name in the application.

Value

Defines the behavior of the variables, divided into three blocks, they are:

Scope

Defines how the application receives the variable. A variable defined as the POST method in the app does not receive value if it comes with the GET method. Those are the methods available:

- **Session:** Defines that the variable must be created as a PHP session variable by another application.
- **GET:** Defines that the variable must be passed by the URL, that is, visible by the browser.
- **POST:** Defines that the variable must be passed through the POST method of an HTML form.

Settings

- **Optional:** Check it to don't validate the variable at runtime.

Type (In / Out)

Defines whether the variable comes from another application (In), or it is starting in the current app (Out).

Description

Indicates where the application is using the variable.

Chart Programming

In this version of ScriptCase is incorporated the concept of programming, with the use of attributes, methods, resources and libraries. In the previous version it was already possible to create business rules in applications using this concept the big difference now is that this can be done in a more organized, facilitating both the development as the understanding of the rule by another developer.

Attributes

The attributes are variables that has the global scope declared in the application. An attribute that can be referenced in all the methods and the application's events.

Attributes configuration interface.

Attribute Name : This field allows to inform the attributes name, after typing the name just click on **include**. In case you want to **update** click on the attributes name (located on the buttons' right side), do the necessary modifications and click on update. In case it is necessary to **delete** an attribute, it is necessary to do same process as the update, but when selecting the attribute, it is necessary to click on the delete button. The **clear** button, as the name suggests, it clears the list of all the attributes listed on the right.

Internal Libraries

To use the internal libraries just select the correspondent (Project Libraries for example). This process allows the methods existing in the library, to be visible in all the application's Events and Methods.

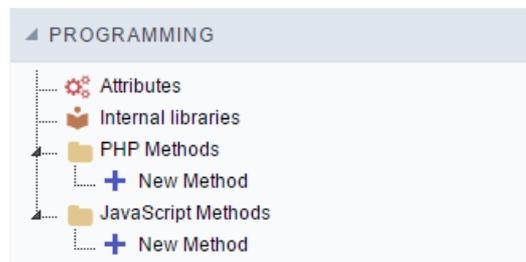

See how to manage the libraries by [clicking here](#).

Internal Libraries management Interface

PHP Methods

Methods are function or procedures declared by the developer, that helps when applying the routines. Using methods in the applications allows to reuse your code throughout the application, optimizing the development experience.

Creating a new method

- Give the method a name and click Create. As in the image below.

PHP methods are incorporated into the same class, so it is not possible to use two functions with the same name even when used in different methods.

A screenshot of a dialog box titled 'New Method - PHP'. It has a text input field labeled 'Name' containing the text 'new_method'. Below the input field is a blue button labeled 'Create'.

- Methods can receive parameters.

A screenshot of a code editor showing a function definition. The function is named 'new_method' and contains the code 'echo "Hello World!!!";'. The editor has a toolbar with icons for function, search, and refresh, and a 'Theme' dropdown set to 'default'.

- Add the amount of variables:

A screenshot of a dialog box titled 'Definition of the parameters of the method:'. It shows the method name 'new_method' and a list of parameters. The list is empty, with the text 'No defined parameter.' below it. At the bottom, there is an 'Add' button, a text input field containing '1', the text 'Parameter(s)', a 'Cancel' button, and a 'Save' button.

- Defining the variables:

A screenshot of a dialog box titled 'Insertion of Parameters'. It has a table with three columns: 'Name', 'Type', and 'Value Standard'. The 'Type' column has a dropdown menu open, showing three options: 'For Value', 'For Value', and 'For References'. Below the table are three buttons: 'Save', 'Back', and 'Cancel'.

Name	Type	Value Standard
	For Value	
	For Value	
	For References	

- **Name** : Type in the variable's name.

- **Type** : Selecting the type of variables: For Value or For Reference.
- **Value Standard** : The parameter's value used to initialize when calling the method.

References allows to create a second name for a variable that you can use to read and modify the variable's original information.

- Editing a parameter:

The screenshot shows a dialog box titled "Definition of the parameters of the method:". The main area contains the text "new_method". Below this is a "Parameters" list box containing "\$test = test". To the right of the list box are two circular arrows (up and down) for navigation. Below the list box are three icons: a checked checkbox, an unchecked checkbox, a pencil (edit), and a red X (delete). At the bottom of the dialog, there is an "Add" button, a text input field containing "1", the label "Parameter(s)", a "Cancel" button, and a "Save" button.

- : Checking all the parameters in the parameter list.
- : Uncheck all the parameters in the parameter list.
-  : Edit the selected parameter of the list.
-  : Deletes the selected variable of the list.

Chart Theme

Preview

In this area you can customize the chart themes, you will be able to preview how it will look like according to each chart type.

If you customize the theme using this area, it will available only for the current application only. If you need to customize the theme and apply to other application, project and users, then you will need to use the “Chart themes” option within the main menu “Layout > Chart themes”. There you will find the same interface with the option to save the changes as “user level, project level or Scriptcase level”

- **Background color :** Selects the color of the canvas, and may report a value hexadecimal or choose picker.

- **New color** : Adds a new color option.
- **Background alpha** : Selects the background transparency.
- **Border use** : Not informed, use or do not use.
 - **Not informed**: This option will use the default option of the theme.
 - **Use** : Selects the border as active, you will need to set the width.
 - **Do not use** : To remove or to do not use the border.
- **Color** : Selects the canvas color, and may report a hexadecimal value or select using the color picker.
- **Width** : Sets the border width in pixels.
- **Opacity**: Sets the canvas transparency.

Title

Options to configure the formatting of the title.

Title

- **Title font** : Selects the font, size, color, and formatting of the title.
- **Subtitle font** : Selects the font, size, color and format of the subtitle to left, center or right.
- **Alignment** : Selects the position of the title and subtitle.
- **Show on top** : If this option is selected the title and the subtitle will be positioned above the chart, otherwise will be positioned below.

Axes

This option configures the formatting of the texts of the x and y axis

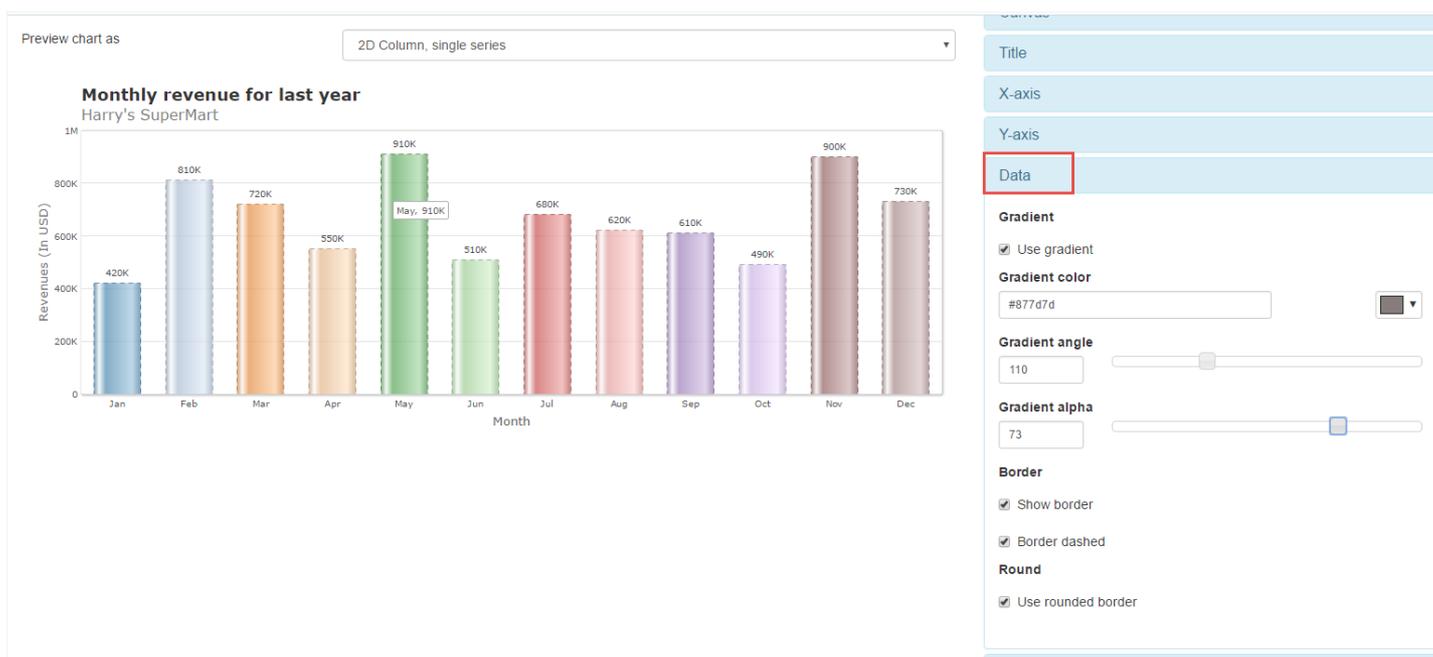

Axes

- **Font** : Selects the font, size, color, and formatting of the axis.
- **Background color** : Selects the background color, and may report a hexadecimal value or select using the color picker.
- **Background alpha** : Selects the transparency of the background color of the axis.
- **Border Color** : Selects the color, and may report a hexadecimal value or select using the color picker.
- **Border width** : Sets the width in pixels.
- **Border alpha**: Sets the transparency.
- **Border dashed**: If this option is selected, the border is dashed, this option is only valid if the option "Display" is checked.

Data

Options to set the chart's data (bank records).

Data

- **Use gradient** : Enables the data gradient.
- **Gradient color** : Selects the gradient color, and may add a hexadecimal value or select using the color picker.
- **Gradient angle** : Selects the angle of the gradient.

- **Gradient alpha** : Selects the gradient transparency.
- **Show border** : If this option is selected is activated the border in the data.
- **Border dashed** : If this option is selected, the border is dashed, this option is only valid if the option “Display” is checked.
- **Use rounded border** : This option leaves the rounded border.

Palette

Options to choose the colors of each chart palette.

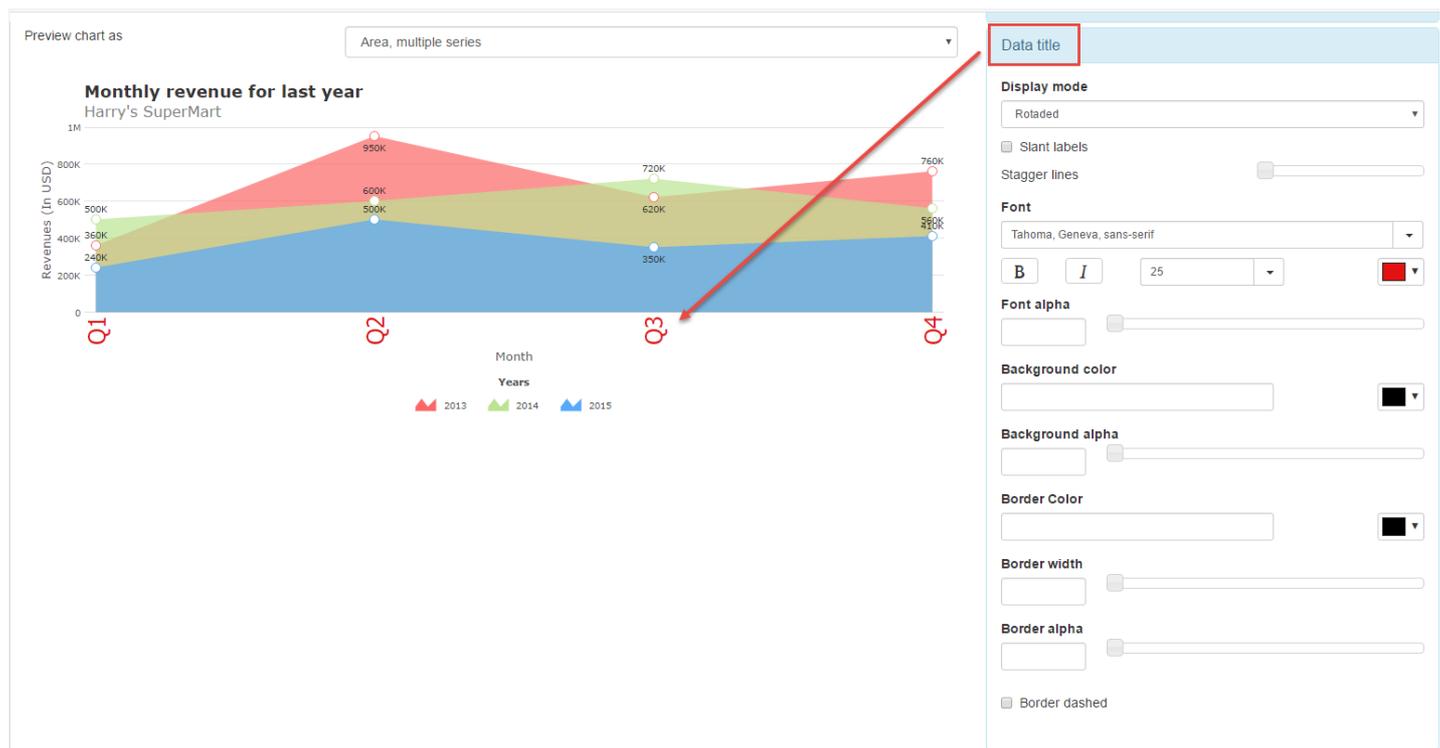

palette

- **Colors palette** : Select the color of each chart palette.

Data title

Options to configure title formatting of data.

Data title

- **Display mode** : Selects the display mode to “automatic”, “rotated”, “line break”, “in levels” and “None”, if the Automatic option is selected, select the default option.
- **Slant labels** : Selects the number of levels to the data.
- **Font** : Selects the font, and your formatting such as bold, italic, size and color of data.
- **Font alpha** : Selects the transparency of data title font.
- **Background color** : Select the background color, and may add a hexadecimal value or select using the color picker.
- **Background alpha** : Selects the transparency of the background color of the title of data.
- **Border width** : Sets the width in pixels.
- **Border alpha**: Sets the transparency.
- **Border dashed**: If this option is selected, the border is dashed, this option is only valid if the option “Display” is checked.

Data values

Options to configure the formatting of data values.

Data values

- **Font** : Selects the font, and your formatting such as bold, italic, size and color of the data values.
- **Font alpha** : Select the transparency of the source of the data values.
- **Background color** : Select the background color, and may add a hexadecimal value or select using the color picker.
- **Background alpha** : Selects the transparency of the background color of the title of data.
- **Border Color** : Selects the border color for the data values.
- **Border width** : Selects the border width for the data values.
- **Border alpha** : Selects the transparency of the color of the border of the data values.
- **Border dashed** : If this option is selected, the border is dashed, this option is only valid if the option “Display” is checked.

Div Lines and Grids

Options to configure the Division of horizontal and vertical lines on the graph.

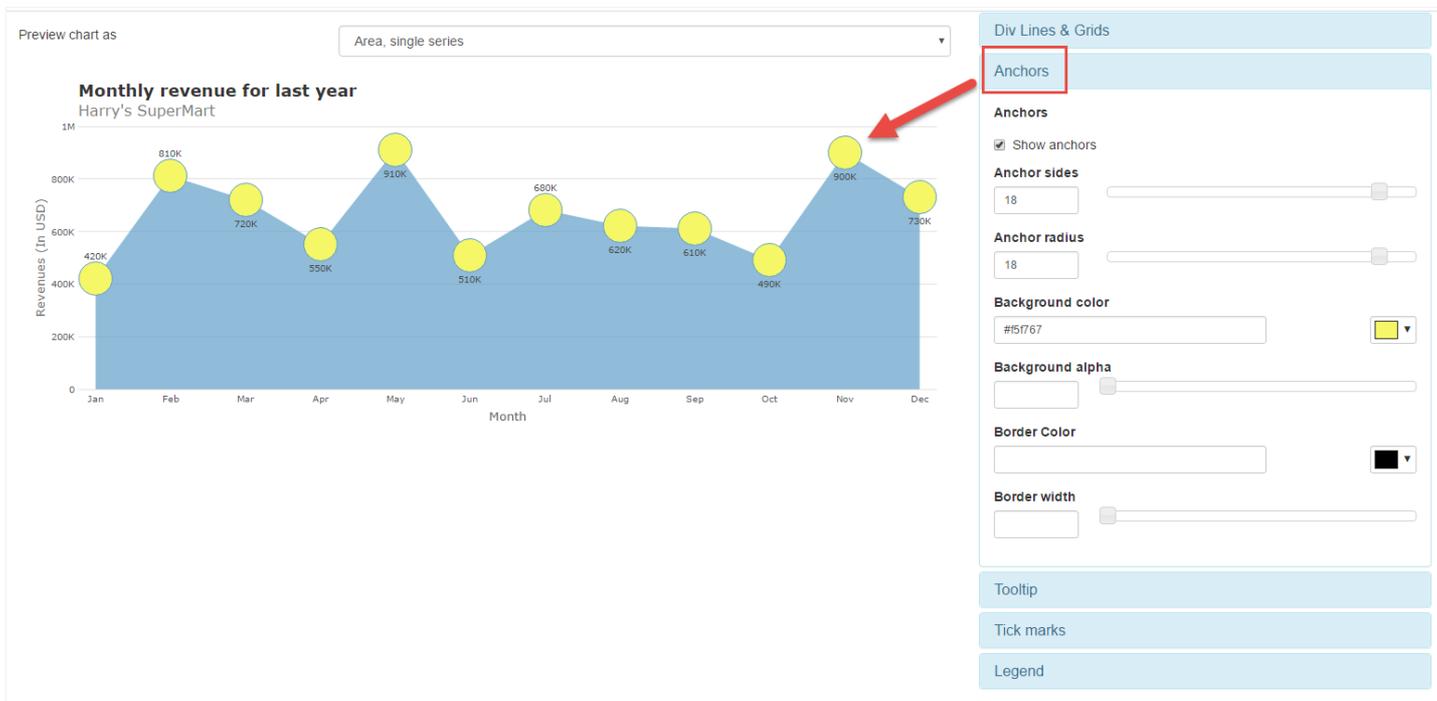

Div Lines and Grids

- **Amount of horizontal lines** : Selects the amount of horizontal lines that will be shown in the chart.
- **Horizontal line color** : Selects the horizontal line color.
- **Horizontal line thickness** : Selects the thicker horizontal line.
- **Horizontal line alpha** : Selects transparency horizontal line
- **Horizontal line dashed** : If this option is selected will horizontal line plot.
- **Color horizontal stripes** : If this option is selected you can choose the horizontal line color.
- **Horizontal stripes color** : Selects the color you wish to case "Coloring horizontal Ribbon" is checked.
- **Horizontal stripes alpha** : Selects transparency horizontal ribbon.
- **Amount of vertical lines** : Amount of vertical lines
- **Vertical line color** : Selects the color of the vertical line.
- **Vertical line thickness** : Selects the vertical line thicker.
- **Vertical line alpha** : Select the transparency of the vertical track.
- **Vertical line dashed** : If this option is selected will draw the vertical line.
- **Color vertical stripes** : If this option is selected the developer can choose the color of the vertical line.
- **Vertical stripes color** : Selects the color you wish to case "Color vertical stripes" is checked.
- **Vertical stripes alpha** : Select the transparency of the vertical stripes.

Anchors

Options to configure anchors on the chart.

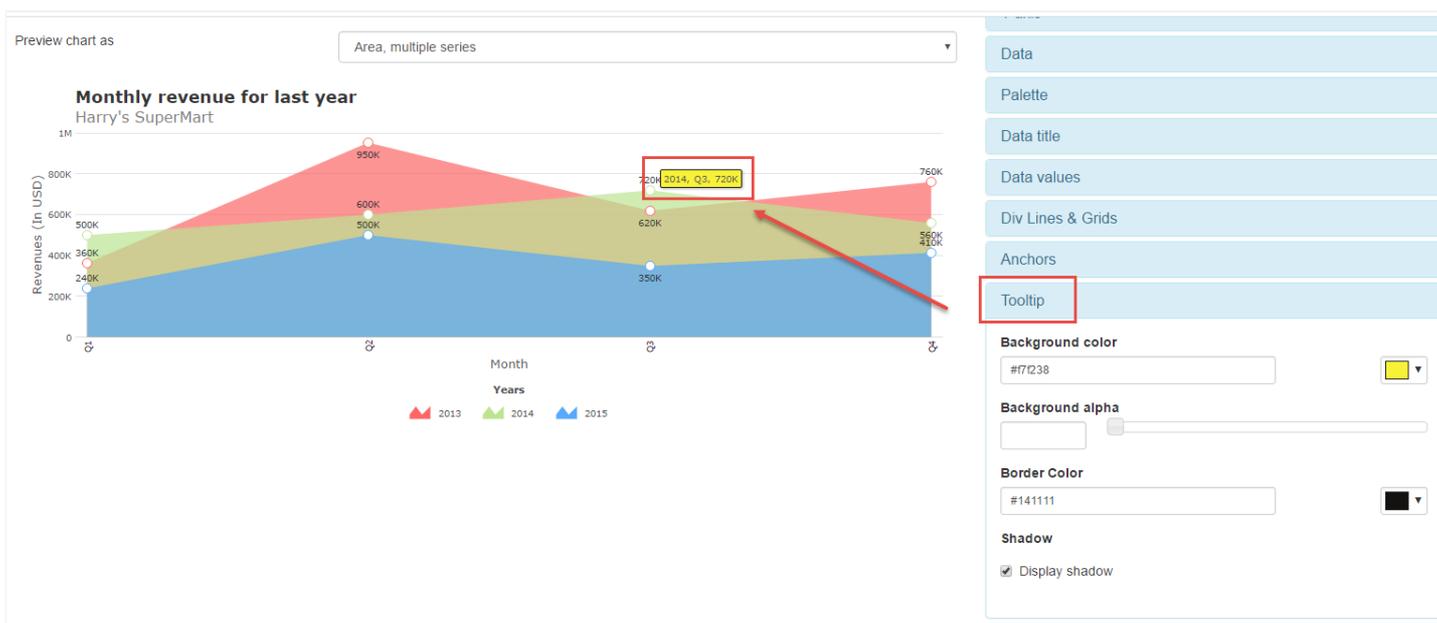

Anchors

- **Show anchors** : Enables the anchors in the chart.
- **Anchor sides** : Select the width of the anchor.
- **Anchor radius** : Selects the size of anchor beam.
- **Background color** : Select the color, and may add a hexadecimal value or select using the color picker.
- **Background alpha** : Selects the transparency of the anchor.
- **Border Color** : Select the anchors border color, and may add a hexadecimal value or select using the color picker.
- **Border width** : Select the border width of the anchor.

Tooltip

Options to configure the tooltips in the chart.

Tooltip

- **Background color** : Select the tooltip color, and may add a hexadecimal value or select using the color picker.
- **Background alpha** : Select the transparency of the background of the tooltip.

- **Border Color** : Select the tooltip border color, and may add a hexadecimal value or select using the color picker..
- **Shadow** : Enable the shadow in the tooltip.

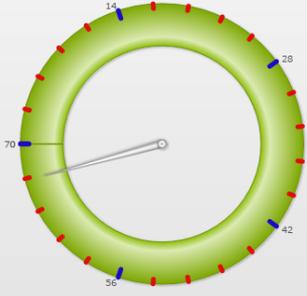

Tick marks

Option to the configure chart marks, this option is only possible for the “Gauge” charts.

- **Minor tick thickness** : Minor tick thickness.
- **Minor tick height** : Select a height for the minor tick.

Legend

Options to configure the chart legend.

Legend

- **Position** : Selects the position of the legend, "beside" or "Below"..
 - **Beside** : Positions the legend beside the chart.
 - **Below** : Positions the legend below the chart.
- **Allow drag** : If this option is selected it will be possible to drag the chart legend to the desired position.
- **Scroll background color** : Selects the color of the scroll bar.
- **Title font** : Select the font, and your formatting such as bold, italic, size and color of the legend.
- **Background color** : Selects the background color of the legend.
- **Background alpha** : Selects the transparency of the legend.
- **Border Color** : Select the legend border color, and may add a hexadecimal value or select using the color picker..
- **Border width** : Selects the Border width of the legend.
- **Border alpha** : Selects the border transparency of the legend.

Limit Settings

In the limit option, the user can choose the maximum limit that will be displayed in the chart.

Limit settings ?		
ATTRIBUTE	VALUE	DESCRIPTION
Field	<input type="text" value="id"/>	Field to perform limit filter
Summarization	<input type="text" value="Sum"/>	In which summarization function the limit will be applied
Limit type	<input type="text" value="Top"/>	Set if the limit will be realized for the first or for the last.
Quantity	<input type="text"/>	Number of records to be applied for the limit

Chart limit Interface

Limit Settings

- **Field** : Field that will realize the filter in the desired limit.
- **Summarization** : In which summarization function will be done in the limit can be “Sum”, “Maximum”, “Minimum”, “Average”, “Variance”, “Standard deviation”, “Count” and “Distinct count”.
- **Limit type** : Defines if the limit will be realized by the firsts or by the last records.
- **Quantity** : Quantity of records that will be applied in the limit.

Generated

application

Email Export

It allows you to send the generated export file by email. For that, you may be using SMTP or integration with **Mandrill** and **SES**.

For more information about Mandrill [click here](#)

For more information about Amazon SES [click here](#)

Sending Options

We must configure how to send the email or select an API already set in Tools> API. [Click Here](#) and see how to configure.

SMTP

SMTP is the standard protocol for sending emails over the Internet, and each provider has its SMTP.

For more information about SMTP settings [click here](#)

Sending settings		
ATTRIBUTE	VALUE	DESCRIPTION
API	- Custom -  	API for sending e-mails.
Gateway	smtp	
SMTP server	smtp.example.com	SMTP server to send email.
SMTP port	465	SMTP server port (example: 25, 465, 587).
SMTP user	root	User to connect to the SMTP
SMTP password	SMTP server connection password.
SMTP protocol		Encryption protocol used by the SMTP server.
From email	default@example.com	Default shipping email.
From name	default	Default shipping name.

- **API:** Allows you to select an API that is already configured in **Tools> API** or set a new one here by selecting **- custom -**. In this case you will see some options according to the selected Gateway.

SMTP Server

SMTP server address for the used provider.

Port SMTP

Define the Port of the mail server. Use the port 465 for security with SSL, 587 for security with TLS, or port 25 for port without security. By default, Scriptcase uses port 25.

User SMTP

SMTP server user.

Enter SMTP

SMTP server user password.

Protocol SMTP

Select the security protocol. If no value is declared, Scriptcase uses the No Security protocol as default.

- **E-mail:** Sets the origin email, which will send the emails.
- **Name:** Name that will be displayed in the sent email.

Mandrill

Mandrill is a transactional email API for MailChimp users, ideal for sending data-driven emails.

Sending settings		
ATTRIBUTE	VALUE	DESCRIPTION
API	- Custom -  	API for sending e-mails.
Gateway	mandrill	
API key	Your API	API connection key.
From email	default@example.com	Default shipping email.
From name	default	Default shipping name.

- **API:** Allows you to select an API that is already configured in **Tools> API** or set a new one here by selecting **- custom -**. In this case you will see some options according to the selected Gateway.
- **API KEY:** Enter the key you obtained when setting up your API.
- **E-mail:** Sets the origin email, which will send the emails.
- **Name:** Name that will be displayed in the sent email.

Amazon SES

Amazon Simple Email Service ([Amazon SES](#)) is an email sending service designed to assist in sending marketing emails, notifications, and transactional messages.

Sending settings		
ATTRIBUTE	VALUE	DESCRIPTION
API	- Custom -  	API for sending e-mails.
Gateway	Amazon SES	
API key	Your Key API	API connection key.
API Secret	Your Secret API	API secret, obtained in association with API KEY.
Region	Region	API Connection Region.
From email	default@example.com	Default shipping email.
From name	default	Default shipping name.

- **API:** Allows you to select an API that is already configured in **Tools> API** or set a new one here by selecting **- custom -**. In this case you will see some options according to the selected Gateway.
- **API KEY:** Enter the key you obtained when setting up your API.

API Secret

Enter the secret access key of your Amazon SES account.

Region

Amazon SES has endpoints in several regions, to reduce network latency, inform the region of the endpoint closest to your application. [See the regions.](#)

- **E-mail:** Sets the origin email, which will send the emails.
- **Name:** Name that will be displayed in the sent email.

Export Settings

In these settings, we define the settings of the email sending interface when exporting, and we can define a default email subject and body.

Export settings		
ATTRIBUTE	VALUE	DESCRIPTION
To	<input type="text" value="[mail]"/>	Enter the default value for the field 'To'.
It has copy	<input type="button" value="Yes"/> ▼	Sets whether to display the field 'copy' within exporting options.
Copy (cc)	<input type="text" value="[mailcopy]"/>	Enter a default value for the field 'Copy'.
It has blind carbon copy (bcc)	<input type="button" value="Yes"/> ▼	Sets whether to display the blind carbon copy field in export option.
Blind carbon copy	<input type="text" value="[mailbcc]"/>	Enter the default value for the field 'blind carbon copy'.
Title	<input type="text" value="{lang_export_email_subject} sales"/>	Default email subject text. You can change the lang variable or add fixed text.
Search of sales		
Body	<input type="text" value="{lang_export_email_body}"/>	Default text for the body of the email. You can change the lang variable or add a fixed text.
Hello, Please find attached with this email the report in %s. Thank you and Have a Nice Day		

To

Enter the default destination email.

Use Copy (CC)

Defines whether or not to display the 'copy' field within the export options.

- **No:** There will be no possibility to send email with copies.
- **Yes:** The field will be displayed within the export options and we can define a default email for copying. The end user can view this email.
- **Hidden:** The field will not be displayed within export options and we can set a default email for copying.

Copy (CC)

Enter the default email for the copy field. This option can also be empty, or you can use a global variable containing an email list.

Using Hidden Copy (BCC)

Sets whether or not to display the 'hidden copy' field within the export options.

- **No:** There will be no possibility to send email with copies.
- **Yes:** The field will be displayed within the export options and we can define a default email for copying. The end user can view this email.
- **Hidden:** The field will not be displayed within export options and we can set a default email for copying.

Copy (BCC)

Enter the default email for the hidden copy field. This option can also be empty, or you can use a global variable containing an

email list.

Subject

Default email subject text. You can change the lang variable or add static text.

Color

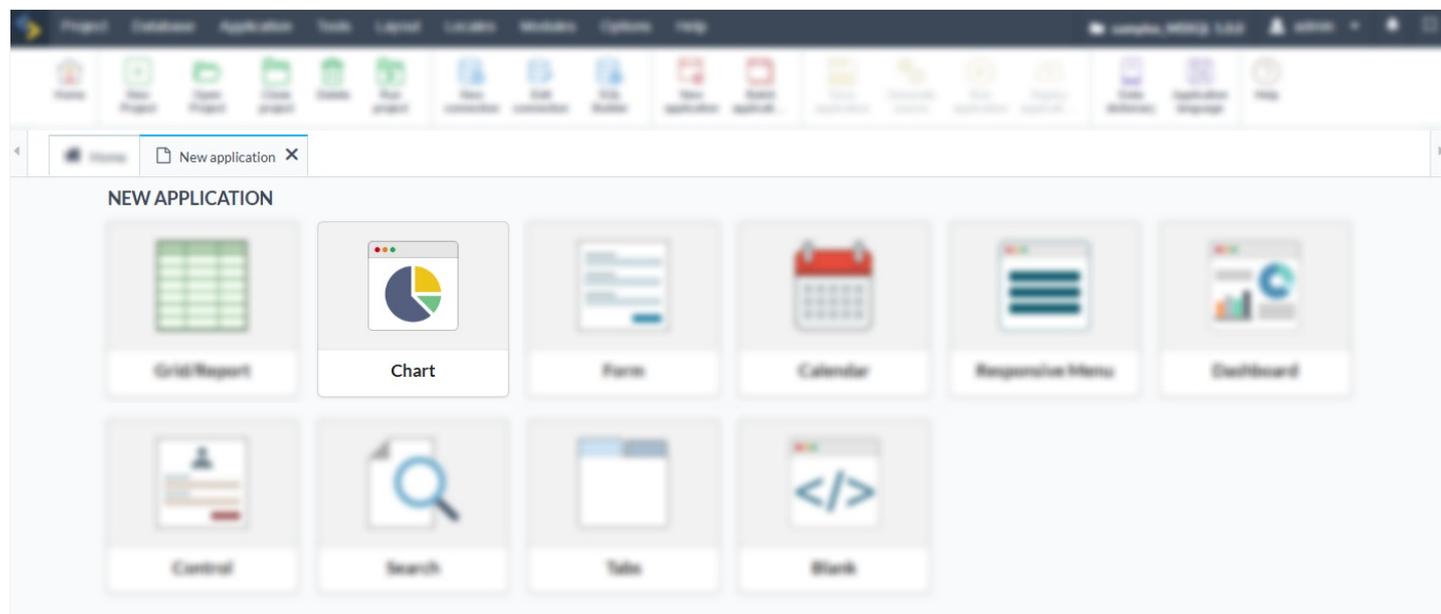

Default body text for the email. You can change the lang variable or add static text.

Creating a Chart Application

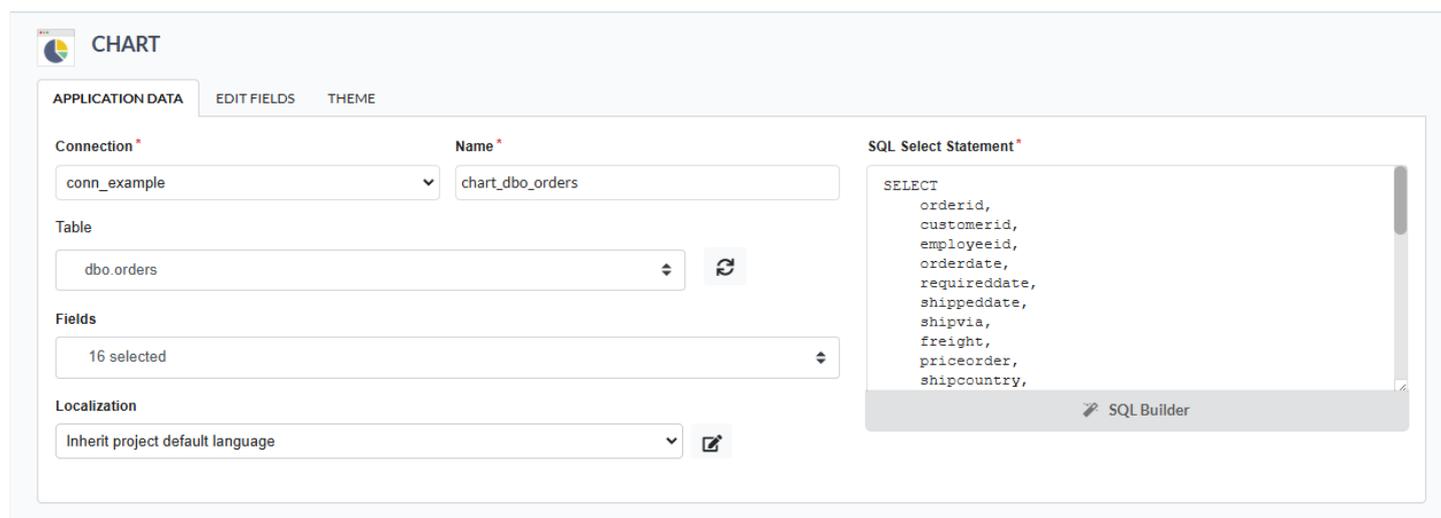

New Application

The process of creating an application is quite simple and intuitive.

You only need to select the type of application you want to generate from the list of applications available in Scriptcase, and it will be generated automatically.

Application Data

Connection

Defines the connection used for the creation of the application. The existing connections in the project will be listed.

Name

The name of the application being created. It cannot contain special characters.

Table

Defines the tables to be used in the application. (Form and Calendar can only use one table).

Fields

Defines the fields that will be part of the applications.

Localization

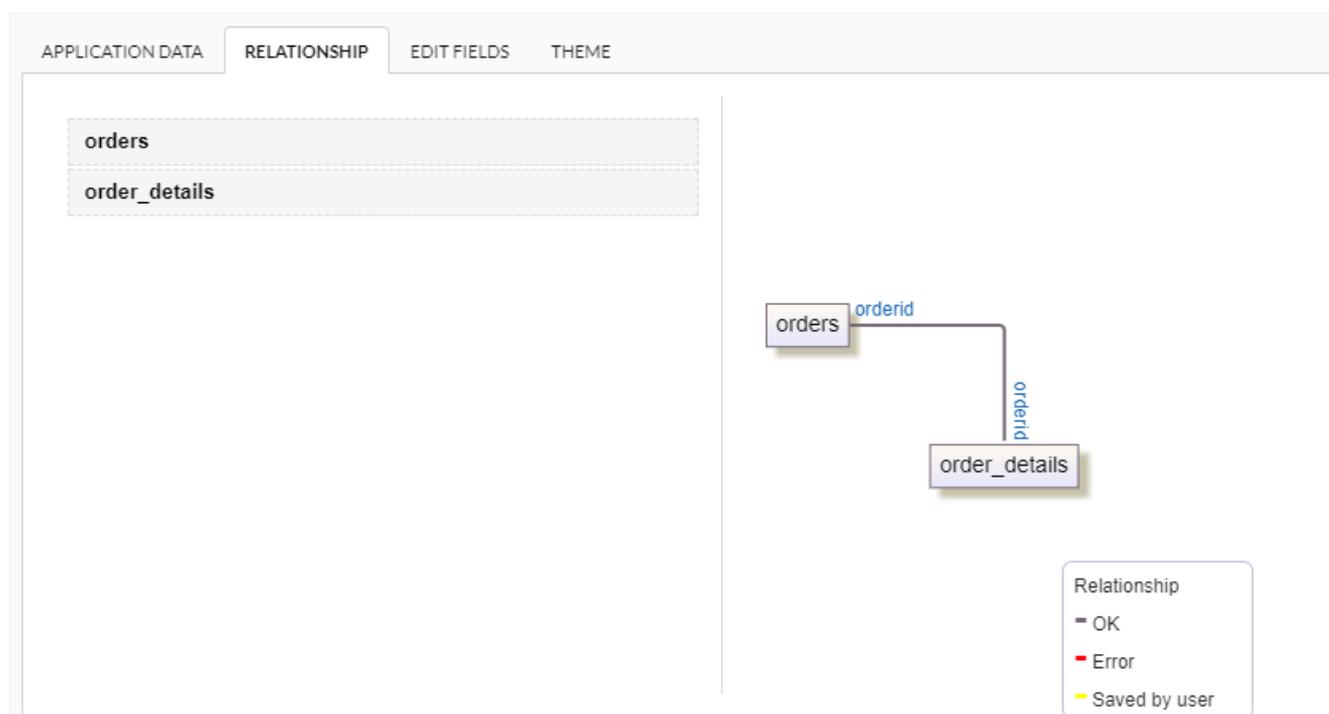

The language of the application to be created. The project's default language is automatically selected.

SQL

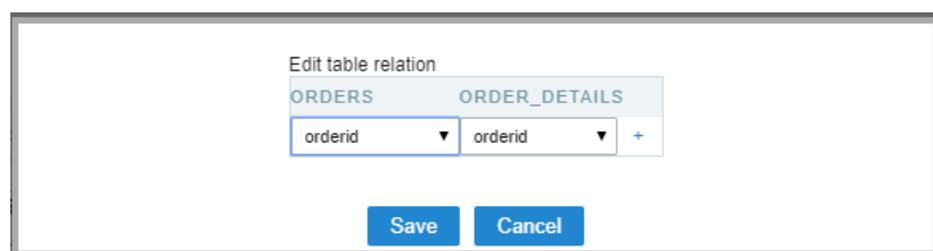

Displays the SELECT command generated after selecting the tables and fields. This field also allows the insertion of a previously created SQL statement, as long as it uses tables that exist in the database selected in the connection.

Relationship

When select two or more tables, the tab "Relationship" will be displayed. In this tab we can see the relationship created between the tables, where we can edit the related fields.

When we click in a link, in the screen above, it will displayed the related field's edition form, as you can see in the image below.

Edit Fields

This screen displays the fields of the selected tables and allows adjustments to be made before creating the application, such as

changing the data type, display name, and other configurations.

Fields	Label	Datatype
orderid	Orderid	Integer
customerid	Customerid	Text
employeed	Employeeid	Integer
orderdate	Orderdate	Date
requireddate	Requireddate	Date
shippeddate	Shippeddate	Date

Fields

Names of the database fields.

Label

Names of the fields in the generated application's interface.

Datatype

Specifies the field's data type.

Theme

On this screen, you can select the theme that the application will use. The default project theme, which can be checked and modified in **Project > Properties**, is automatically selected.

title: Creating a New Grid/Report

Search

Fields

Search fields settings

To define the fields that will be used in the chart search, use drag-and-drop to position the fields within Search Fields.

The order of the fields, within Search Fields, will be the display order in the generated application.

Search fields settings

GRID FIELDS	SEARCH FIELDS
# id	T region_1 <input type="button" value="Edit"/> x
📅 date	# id_1 <input type="button" value="Edit"/> x
T region	\$ sales_1 <input type="button" value="Edit"/> x
T product_category	
T product	
T customer_name	
# qty sold	
\$ cost	
\$ sales	
\$ profit	

Editing Fields

The same field can be added more than once to the Search, these fields will be visible in the generated application since it uses distinct settings, if they are using the same configuration only one of the fields will be displayed.

The display settings of the fields are performed individually, and can be accessed by adding the field in the search and clicking edit.

you will separate the explanation of the display settings from the fields according to the types.

 March

Ok
Cancel

Choose Component

You must define how the field will be used in the Search. Each field type, text, number, and date have different configuration options.

- **Search field label** : Defines the label of the field that will be displayed in the Search.
- **Choose component type**: Defines the format of use of the fields in the Search, for fields date and datetime, you will have the following options: Date Range, Actual Period, Relative Period and Seasonal Period.

Choose Values - Date Range

For datetime fields, you must enable the option **Include Time** so that the hours can be included in the search

Select below the date ranges to allow system users to filter the Summary according to the periods displayed:

Include time

Example: (From Jan 1st 2006 15:50:20 to Jan 1st 2010 20:15:50)

Choose Values - Actual Period

You must define the period that will be used in the search. When running the application, you will have a select with the dates displayed according to the selected period.

Select below the date ranges to allow system users to filter the Summary according to the periods displayed:

Year ▾

All the distinct values in the column will be listed

Default value:

Sets a default value for filter on the initial load of the application.

Choose Values - Relative Period

You must define which periods are available for use in the search.

Select below the date ranges to allow system users to filter the Summary according to the periods displayed:

Select values

Year
Quarter
Month
Week
Day
Time only

Current year
 Last year
 Next year

Default value:

None ▾

Sets a default value for filter on the initial load of the application.

Specify the default filter value to apply. Ensure that the value is present in the column. Enclose the comma containing values inside the double quotes.

Single: Last Year
Multi: Last Year,Current Year

Choosing Values - Seasonal Period

The available values are separated by tabs:

Select below the date ranges to allow system users to filter the Summary according to the periods displayed:

Select values

Quarter
Month
Week
Week Day
Day
Time only

Quarter 1
 Quarter 2
 Quarter 3
 Quarter 4

Default value:

None ▾

Sets a default value for filter on the initial load of the application.

Specify the default filter value to apply. Ensure that the value is present in the column. Enclose the comma containing values inside the double quotes.

Single: October
Multi: May, October

- **Quarter:** Defines the quarters used in the search.
- **Month:** Defines the usage of the months of the year.
- **Week:** Defines the usage of the weeks of the year.
- **Week Day:** Defines the use of the days of the week.
- **Day:** Defines the usage of the days of the month.
- **Only Time:** Defines the use of the day time (Available only in the datetime field)

Slider Range to be incremented

Use the slider component to allow the user to quickly filter numerical data by sliding a graphical thumb between the end points of a track that corresponds to a range of values.

Ok
Cancel

Choose Component

You must define how the field will be used in the Search. Each field type, text, number, and date have different configuration options.

- **Search field label** : Defines the label of the field that will be displayed in the Search.
- **Choose function to apply**: Defines the function that will be used in the search for setting the value. For example, when choosing sum, the range is the range between the lowest and the result of the sum greater.
 - **Actual Values**: This option sets the display of the actual value of the field, saved in the database, without the use of any of the aggregate functions. When using this option, two types of searches, select box and Multi select box usage are added, as well as enabling lookup settings for numeric fields.
- **Choose component type**: Defines the format used for the fields in the search, for numeric fields, you have the Range and selecting **Actual Values** will be displayed **Select Box** and **Multi select box**.

Lookup

For numeric fields, this option is available only when you use the **Actual Values** option and the way the field is used in the search is **Select box** or **Multi select box**.

In this tab, you can create a display lookup in the search field. For more information about creating view lookup, go to **Application > Grid > Fields > Integer**.

Form Orientation

Orientation models for the Form application can be Single record, Multiple records (batch editing), Editable grid (inline editing), and Editable grid view.

Single record

This form orientation allows you to edit only one table record at a time. You will be able to page the form to navigate record by record.

The screenshot shows a settings window titled "INITIAL SETTINGS". On the left, under the "Orientation" section, there is a list of options: "Single record", "Multiple Records", "Editable grid", and "Editable grid view". The "Single record" option is selected. To the right, a preview window shows a form with two columns: "Insert" and "Cancel". The form contains fields for "Name", "Email", "Active" (with a checked "Yes" radio button and an unchecked "No" radio button), "Data" (with a date input field showing "dd/mm/yyyy"), "Maps", and "Types" (with unchecked "Sport" and checked "Auto" radio buttons). Below the preview, a text box explains: "This form orientation allows you to edit only one table record at a time. You will be able to page the form to navigate record by record."

See below a single record form example; you will have different options to organize the layout by adding the fields in different positions using columns, tabs, blocks, and pages. Check the [Form layout](#) options for more details.

Single

record form - application example

Multiple records (Batch editing)

Form orientation with various editable records per page. Update or delete processes will run on selected records via check box. You can set as many records per page as needed to update, delete or add new records.

Initial Settings

Orientation

Choose the Form orientation:

Save Selecteds		Delete Selecteds			
Name	Email	Active	Data	Maps	Types
<input checked="" type="checkbox"/>		<input checked="" type="radio"/> Yes <input type="radio"/> No		Google Maps	<input checked="" type="checkbox"/> Sport <input type="checkbox"/> Auto
<input type="checkbox"/>		<input checked="" type="radio"/> Yes <input type="radio"/> No		Google Maps	<input type="checkbox"/> Sport <input type="checkbox"/> Auto
<input checked="" type="checkbox"/>		<input checked="" type="radio"/> Yes <input type="radio"/> No		Google Maps	<input type="checkbox"/> Sport <input type="checkbox"/> Auto

Form orientation with various editable records per page. Update or delete processes will run on selected records via checkbox. You can set as many records per page as needed to update, to delete or to add new records.

Pagination: Pagination method for the grid records.

Lines Per Page: Number of record lines per page.

Records for insert: Record quantity to be available when inserting.

Fixed label: This option will freeze the column labels on top of the screen during the page scrolling.

- **Pagination** : Paging type for the multiple records form. You can choose if it will be partial or total.

> **Partial pagination** divides the records according to the number of pages defined inside the "lines per page" option. You can also add a button "View" within the application to change dynamically the number of records displayed per page. [See here](#) how to change the amount of records options; **Total pagination** displays all records in just one page.

- **Lines Per Page** : Quantity of rows of records per page. This option is available only when the pagination is “Partial.”
- **Records for insert** : You can set here the number of rows of records per page in the insert mode to add multiple records at a time.
- **Fixed Label**: Establishes the column label at the screen top while scrolling the page.

In the example below, you can see one multiple records form type displaying five records per page for edition.

1	<input checked="" type="checkbox"/>	Jack's New England Clam Chowder	\$ 9.68	10	\$ 96.80
2	<input checked="" type="checkbox"/>	Gustaf's Knockebred	\$ 20.57	6	\$ 123.42
3	<input checked="" type="checkbox"/>	Sir Rodney's Marmalade	\$ 78.65	40	\$ 3,146.00
4	<input type="checkbox"/>	Geitost	\$ 2.42	25	\$ 60.50
5	<input type="checkbox"/>	Guarana Fantastica	\$ 4.84	15	\$ 72.60

View 5 [1 to 5 of 2140]

Multiple records form - application example

Editable grid (inline editing)

Form orientation with various editable records per page. Each record has the update and deletes controls available in its line.

Initial Settings

Orientation

Choose the Form orientation:

Single record

Multiple Records

Editable grid

Editable grid view

New

	Name	Email	Active	Data	Maps	Types
	Abc	None	<input checked="" type="radio"/> Yes <input type="radio"/> No	10/11/2010	Google Maps	<input checked="" type="checkbox"/> Sport <input type="checkbox"/> Auto
			<input checked="" type="radio"/> Yes <input type="radio"/> No		Google Maps	<input type="checkbox"/> Sport <input type="checkbox"/> Auto
			<input checked="" type="radio"/> Yes <input type="radio"/> No		Google Maps	<input type="checkbox"/> Sport <input type="checkbox"/> Auto

Form orientation with various editable records per page. Each record has its own options for update and delete.

Pagination Pagination method for the grid records.

Lines Per Page Number of record lines per page.

Fixed label This option will freeze the column labels on top of the screen during the page scrolling.

- **Pagination** : Paging type for the multiple records form. You can choose if it is going to be partial or total.
- **Lines Per Page** : Quantity of rows of records per page. This option is available only when the pagination is "Partial."
- **Fixed Label**: Establishes the column label at the screen top while scrolling the page.

As you can see in the example below, using the Editable grid, you will have the form with multiple records, and you can edit more than one at the same time. However, differently from the multiple record, you will have to add line by line.

		Victuailles en stock	Leverling	01/30/2019	02/27/2019
		Supremes delices	Peacock	01/31/2019	02/28/2019
		Hanari Carnes	Leverling	02/01/2019	02/15/2019
		Chop-suey Chinese	Buchanan	02/02/2019	03/02/2019
		Richter Supermarkt	Dodsworth	02/03/2019	03/03/2019

Editable grid form - application example

Editable grid view

Form orientation with various editable records per page. All records come with their data displayed in a read-only format. These data are only available for the update by selecting the Edit option in the record itself. You will have the opportunity to edit the record inline or using a modal.

Initial Settings

Orientation
Choose the Form orientation:

- Single record
- Multiple Records
- Editable grid
- Editable grid view**

New

Name	Email	Active	Data	Maps	Types
Abc	None	Yes	10/11/2010	Google Maps	Sport
↑ ×		<input type="radio"/> Yes <input type="radio"/> No		Google Maps	<input type="checkbox"/> Sport <input type="checkbox"/> Auto
↑ ×		<input type="radio"/> Yes <input type="radio"/> No		Google Maps	<input type="checkbox"/> Sport <input type="checkbox"/> Auto

Form orientation with various editable records per page. All records come with its data displayed as read-only. This data will be only available for update when the edit options placed in the record line itself is selected.

Pagination Pagination method for the grid records.
Lines Per Page Number of record lines per page.
Use modal form to edit Use modal form to edit lines
Fixed label This option will freeze the column labels on top of the screen during the page scrolling.

- **Pagination** : Paging type for the multiple records form. You can choose if it is going to be partial or total.
- **Lines Per Page** : Quantity of rows of records per page. This option is available only when the pagination is "Partial."
- **Use modal form to edit** : Use a modal form to edit the records when you click to edit the record.
- **Fixed Label**: Establishes the column label at the screen top while scrolling the page.

The editable grid view form example below shows you you will edit a record. You can't edit multiple records. You will have the grid view and the options to manipulate one by one using the inline edition option or opening a modal.

	Company name	Contact Name	Birhtdate	Credit Limit
	Alfreds Futterkiste	Maria Anders s	07/27/1974	\$ 3,367.41

Form Settings

General settings of the menu form where it is possible to configure some behavior of the application depending on the orientation used.

Settings

Settings	
ATTRIBUTE	VALUE
Friendly URL	<input type="text"/>
Display Line Number	<input type="checkbox"/>
Pagination	Partial <input type="button" value="v"/>
Lines Per Page	<input type="text" value="10"/>
Line break in title	<input type="checkbox"/>
Horizontal Alignment	Center <input type="button" value="v"/>
Vertical Alignment	<input type="button" value="v"/>
Margins	<input type="text"/> Top <input type="text"/> Bottom <input type="text"/> Right <input type="text"/> Left
Table Width Unit	Percent <input type="button" value="v"/>
Table Width	<input type="text" value="30"/>
Table Columns	Automatic <input type="button" value="v"/>
Use modal form NEW	No <input type="button" value="v"/>

Check the details of each attribute available in the configuration block below.

Friendly URL

This attribute defines the application's friendly URL.

Friendly URL	<input type="text" value="order-clients"/>
--------------	--

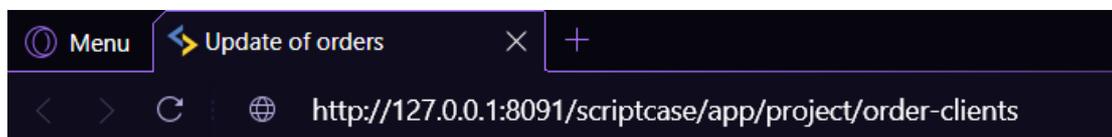

Alphanumeric characters and some special characters are allowed, such as: **hyphen** (-), **underscore** (_), **comma** (,), and **dot** (.).

The use of accents or spaces is not allowed.

Some recommendations for definition are:

- Use keywords for identification.
- Use hyphens to separate words.
- Use only lowercase letters.
- Avoid using dates.

Example of an application using a Friendly URL

The friendly URL can also be defined in the application list on the project's initial screen.

See the example below

APPLICATION	FRIENDLY URL	DESCRIPTION	CREATOR
grid_dbo_vwTarrafa	wwTask		

Display Line Number

This attribute defines whether or not the line counter is displayed in the application. The row counter will be positioned next to the options column.

This feature is only available for forms configured in the formats: **Grid Editable** and **Grid Editable (View)**

Example with display line number enabled

Example with display line number disabled

Pagination

This attribute defines the type of pagination used in the application: **Partial** and **total**

Paging	<div style="border: 2px solid red; padding: 5px;"> <ul style="list-style-type: none"> Total Partial </div>
Display Header	
Active Navigation Buttons	

This attribute is only available for horizontal forms: **Multiple Records**, **Editable Grid** and **Editable Grid (View)**

Partial

Displays a limited amount of records per page, this amount is defined in the **Lines per Page** attribute, which is only available in this type of pagination.

Standard toolbar when using partial pagination.

When using partial pagination all navigation options are available in the application.

Total

Lists all listed records on a single page, removing navigation buttons.

Standard toolbar when using full pagination.

When using full pagination, navigation buttons are automatically hidden from the application toolbar.

Lines Per Page

Defines the maximum total of rows that will be displayed per page.

Lines Per Page	<input type="text" value="5"/>
----------------	--------------------------------

This attribute is only available in horizontal forms (Multiple Records, Editable Grid and Editable Grid (View)) configured to use **partial pagination**.

Application example with five rows per page

In the example below, the application is initially displayed with 5 records per page as defined by the developer.

Orderid	Customerid	Employeeid	Orderdate	Requireddate	Shippeddate	Shipvia	Shipcity
...	885	ALFKI	1	02/15/2022		0	0
...	886	ALFKI	1			0	0
...	10,248	SANTG	4	01/30/2019	02/27/2019	02/03/2019	1 67,657
...	10,249	ANATR	7	01/30/2019	02/27/2019	02/06/2019	1 275,579
...	10,250	HANAR	4	01/31/2019	02/28/2019	02/02/2019	2 779,465

Go to 1 View 5 [1 to 5 of 832]

When using the **Choose Quantity** button on the application's **toolbar** the developer allows the end user to define the number of lines displayed through the **View** button.

Records for Insert

Defines the number of rows available for simultaneous inclusion of records in the multiple records form. The value defined in the **Records for Insert** attribute works regardless of the total number of lines per page of the application.

This attribute is only available for **Multiple Records** forms

Records for insert

Example of Multiple Records forms in insert mode

When clicking on the **New** button, the rows for inclusion of the record will be displayed according to the configuration performed in the attribute.

NEW RECORD OF ACCOUNT 06/28/2022

Accountdescription	
1	<input type="checkbox"/> <input type="text"/>
2	<input type="checkbox"/> <input type="text"/>

Line break in title

This attribute defines whether or not the line break in the field label will be allowed.

This attribute is only available in horizontal forms (Multiple Records, Editable Grid and Editable Grid (View)) configured to use **partial pagination**.

When enabled, does not allow line breaks in the field label. In this way, even if the field occupies a smaller space than the label, as in the Customer Code field in the image below, the line will not be broken.

Example of line break in title enabled

When disabled, allows a line break in the field label. When using this option, the space destined to the label will be defined by the size of the field, in this way, if the label is larger than the space destined to the field, there will be a break in the line.

Example of line break in title disabled

Customer identification	Employeeid
ALFKI	1
ALFKI	1

Horizontal Alignment

Defines the horizontal alignment of the application and can be defined as: **Centered**, **Left** or **Right**.

The attribute's default setting is **Centered**

Centered

Positions the application in the center of the page, respecting the margin definitions defined in the theme or in the **margin** attribute.

Application example with centered alignment

ATUALIZAÇÃO 27/06/2022

field_1

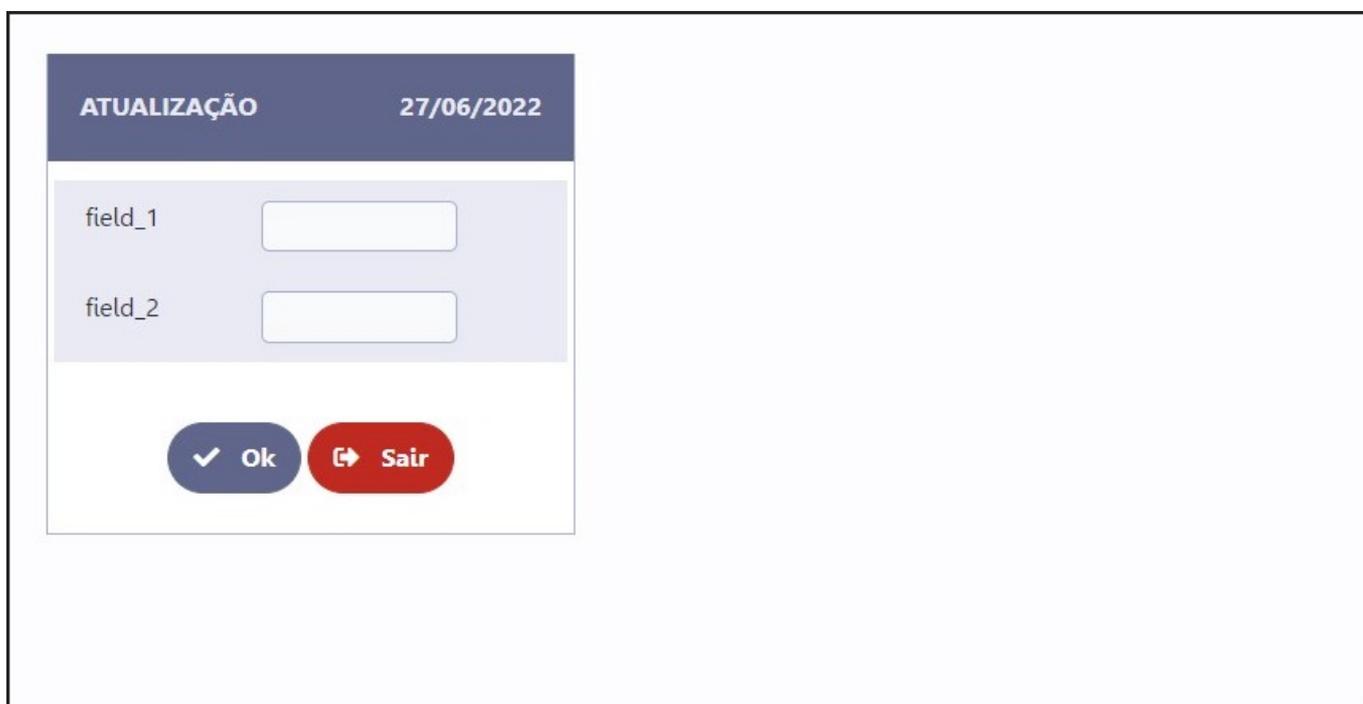

field_2

✓ Ok ↩ Sair

Left

Positions the application in the left corner of the screen, respecting the definitions of the margins defined in the theme or in the **margin** attribute.

Left-aligned application example

ATUALIZAÇÃO 27/06/2022

field_1

field_2

✓ Ok ↩ Sair

Right

Positions the application in the right corner of the screen, respecting the definitions of the margins defined in the theme or in the **margin** attribute.

Right-aligned application example

ATUALIZAÇÃO 27/06/2022

field_1

field_2

✓ Ok ↪ Sair

Vertical Alignment

This attribute defines the vertical alignment of the application and can be configured with the following options: [No Value](#), [Top](#), [Center](#) ou [Bottom](#).

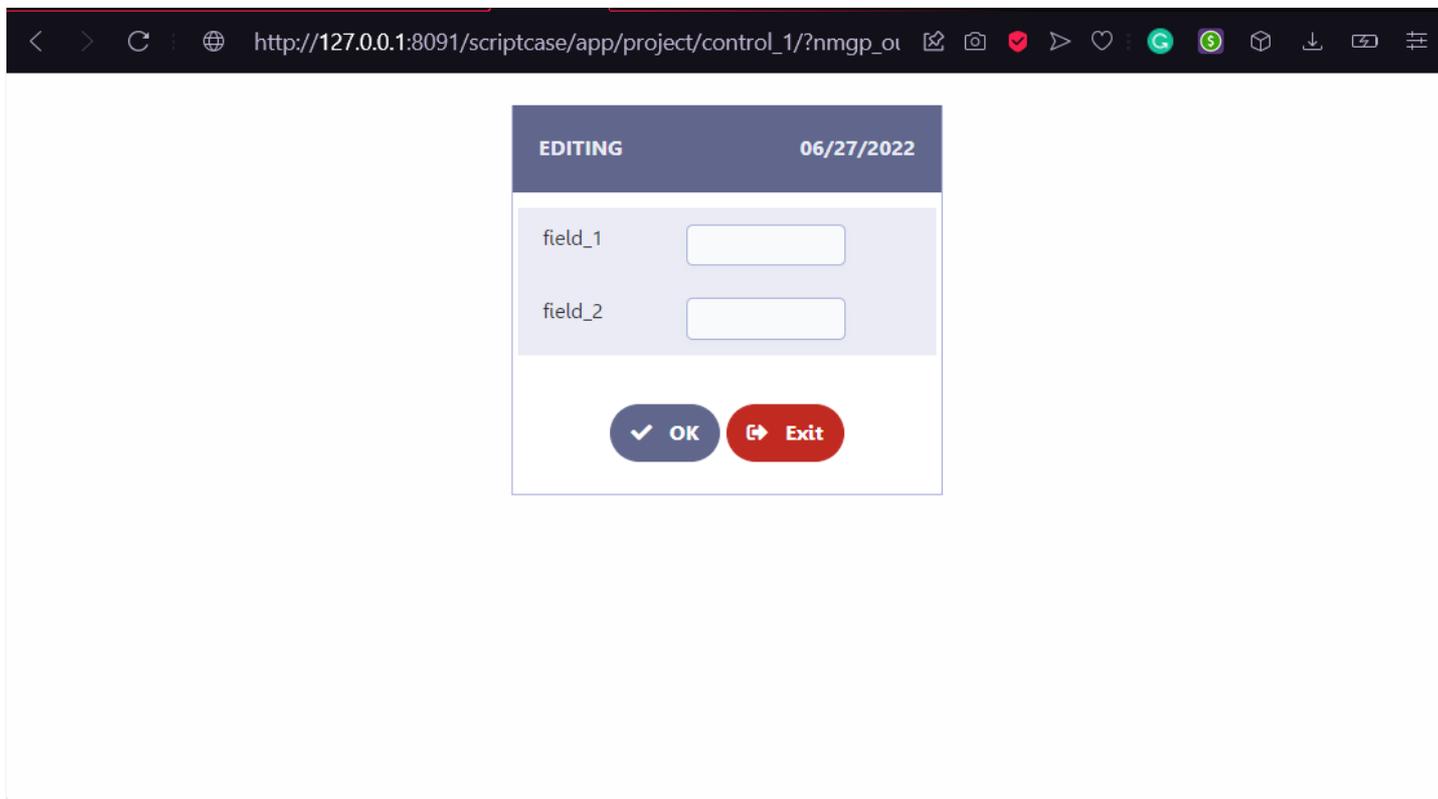

When using **Top**, **Center** or **Bottom** alignments, the **margin** attribute is disregarded.

See below for details on each of the alignment options.

No Value

Standard vertical alignment for new applications. In this configuration, the application is positioned at the top of the screen respecting the margins defined in the **margin** attribute or in the definition of the theme used in the application.

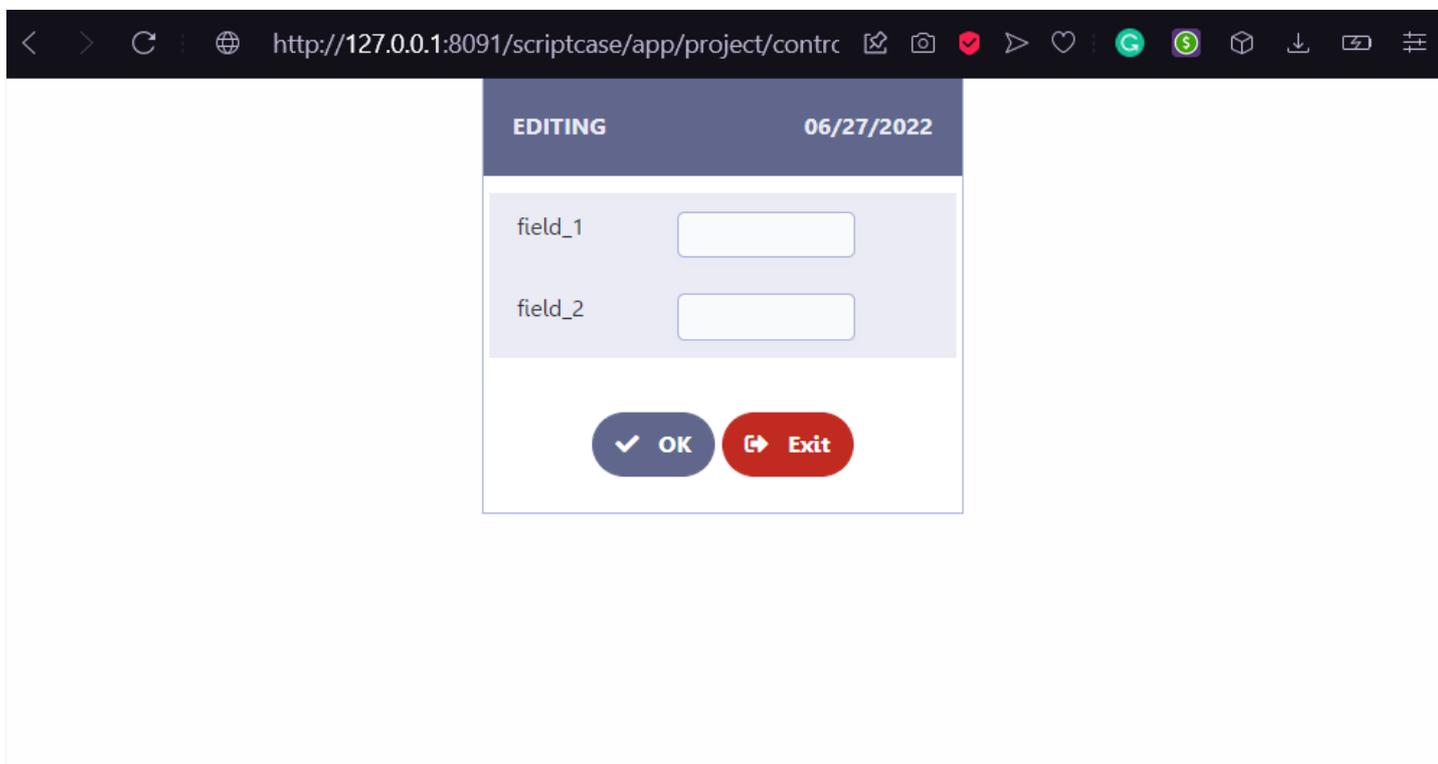

Application example with standard alignment

Top

Places the application at the top of the screen, disregarding the definitions of margins defined in the application theme or in the **margin** attribute.

Application example with alignment on the top

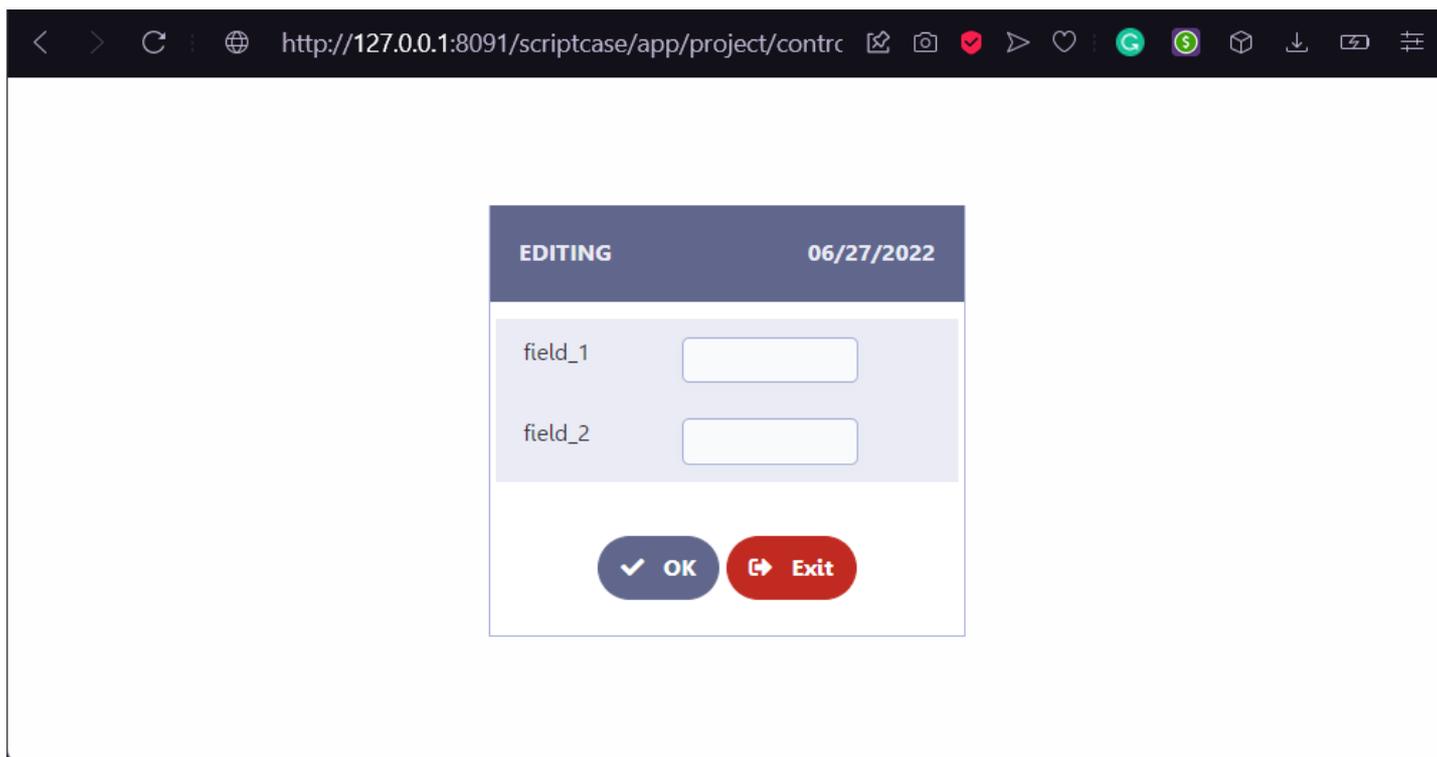

Center

Positions the application in the center of the screen, disregarding the definitions of the margins defined in the application theme

or in the **margin** attribute.

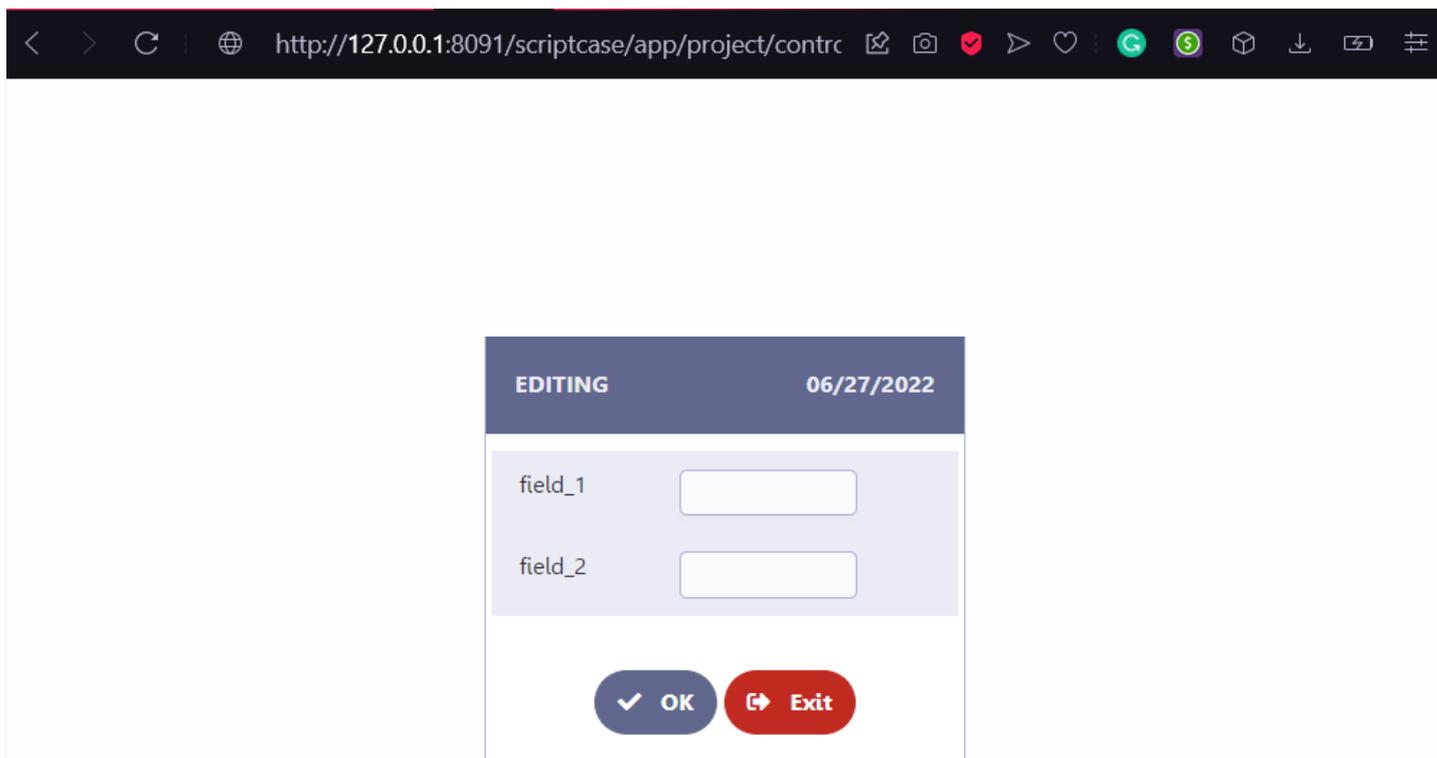

Application example with Center alignment

Bottom

Places the application at the bottom of the screen, disregarding the definitions of margins defined in the application theme or in the **margin** attribute.

Application example with alignment on the bottom

Margins

Allows the developer to set the application's margin values in pixels. If no value is specified, the application will use the default values from the configured theme.

Attention:

When configuring the **Vertical Alignment** attribute, the defined margin values will be ignored.

Example of how to use the attribute

Margins	<input type="text" value="100"/>	Top
	<input type="text"/>	Bottom
	<input type="text"/>	Right
	<input type="text"/>	Left

Table Width Unit

Define a unit of width used in the **Width of Table** attribute, responsible for defining the application extension.

The available options are: **Percent**, **Pixel** and **auto**.

Table Width	<input type="text" value="350"/>
-------------	----------------------------------

Percentage

The application width will be defined using percentage as the width unit. In this way, when inserting a value of 50 in the **Width of Table** attribute, the width of the application will be defined with: `width: 50%;`

In this case the application will have a variable width, defined by the available space.

For example, an application defined with a width of 50%, if opened in an iframe with a width of 800px it will occupy 400px. This same application opened in a space with 200px will occupy 100px.

Pixel

The width of the application will be defined using pixel as the unit of width. In this way, when inserting a value of 50 in the **Table Width** attribute, the width of the application will be defined with: `width: 50px;`

In this case, the application will have a fixed width, occupying the defined value regardless of the available space.

For example, an application defined with a width of 800px, if opened in an iframe with a width of 500 pixels, it will occupy the defined 800px, creating a horizontal scroll within the iframe.

Automatic

When using this option, the **Width of Table** attribute will be disregarded and the size of the application will be calculated by the browser.

Table width

Table Width	<input type="text" value="350"/>
-------------	----------------------------------

Defines the width of the application. In this attribute, only numbers must be used, the width unit that will be used is defined in

the **Unit of Table Width** attribute.

When selecting **automatic** in the Table Width Unit, the value defined in this attribute is disregarded.

Table Columns

This parameter defines the width of the application fields. The available options are: **Automatic** and **Informed**.

The image shows a configuration panel for 'Table Columns'. The dropdown menu is open, displaying 'Automatic' as the selected option and 'Provided' as an alternative option. The 'Layout and Behavior' section is also visible in the background.

This attribute is only available for **single record forms** and will be ignored when using **Inputs with 100% width** option.

Available values in the attribute:

Automatic

The field width is automatically calculated by the browser, which will adjust according to the entered text size.

Informed

In this case, the width of the fields is defined by the value informed in the **Width of labels** attribute, which uses pixel as the width unit.

The image shows a configuration panel for 'Table Columns'. The dropdown menu is set to 'Provided'. Below it, the 'Labels width' input field is set to '600'.

When selecting the informed value, the Width attribute of the labels is mandatory, if no value is informed, the generator will disregard the **Table Columns** attribute.

Labels Width

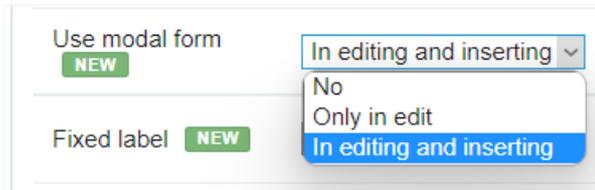

The image shows a configuration panel for 'Labels width'. The input field is set to '600'.

Defines the width of the application's labels, using pixel as the width unit. To set the width, just enter the numbers as in the image above.

This attribute is only available when the **Table Columns** attribute has the value **informed**.

In this case, the **Labels Width** parameter becomes mandatory, if no value is informed, the **Table Columns** attribute will be disregarded.

Use modal form

Only available in editable **Grid (View)** forms, this attribute defines the application's behavior for adding and updating records.

The available options are:

- **No** - Inserting and updating of the record online.
- **Only in edit** - Inline inserting and record update in modal form
- **In editing and inserting** - Adding and updating the record in the modal form

For the **Only in edit** and **In editing and inserting** options, two new attributes will be displayed for defining the width and height of the modal where the form will be opened.

See each of the detailed options below.

No

Default value of the attribute when creating a form, in this configuration the updating or insertion of data will be carried out in line.

Example of in-line registry editing

By clicking the edit icon  the fields will be enabled according to your configuration.

Orderid *	Customer identification	Employeeid	Orderdate mm/dd/yyyy	Freight	Shipname	Priceorder
 885	ALFKI	1	02/15/2022 	0.00		0.00

Example of adding an online record

By clicking the **+ New** button a blank line will be added after the last record listed.

Orderid *	Customer identification	Employeeid	Orderdate mm/dd/yyyy	Freight	Shipname	Priceorder
  885	ALFKI	1	02/15/2022	0.00		0.00
  886	ALFKI	1		0.00		0.00
  10,248	SANTG	4	01/30/2019	15.73	Vins et alcools Chevalier	10,574.00
  10,249	ANATR	7	01/30/2019	14.52	Toms Spezialitten	229.90
  10,250	HANAR	4	01/31/2019	79.86	Hanari Carnes	96.00
 	ALFKI	1				

Only in edit

When selecting the option **Only in edit**, when clicking the edit icon  a modal will open with a form for editing the selected record. In this configuration the record inclusion remains in line.

The size of the modal is defined in the parameters **Modal Width** and **Modal Height**. Both use pixel as a unit of width, just informing numbers.

Record editing example in modal

The screenshot shows a modal window with a light blue background. At the top, there are two buttons: a grey 'Save' button with a floppy disk icon and a red 'Exit' button with a right-pointing arrow icon. Below the buttons, the form fields are arranged as follows:

- Orderid ***: Text input containing '885'.
- Customer identification**: Dropdown menu showing 'ALFKI'.
- Employeeid**: Dropdown menu showing '1'.
- Orderdate**: Text input containing '02/15/2022' with a calendar icon and the format 'mm/dd/yyyy' to its right.
- Freight**: Text input containing '0.00'.
- Shipname**: Empty text input field.
- Priceorder**: Text input containing '0.00'.

At the bottom left of the modal, there is a red asterisk followed by the text '* Required field(s)'. A vertical scrollbar is visible on the right side of the modal.

In editing and inserting

This option defines the use of the modal form for inclusion and editing of records.

The size of the modal is defined in the parameters **Modal Width** and **Modal Height**. Both use pixel as a unit of width, just informing numbers.

Using this setting in the **Use modal form** attribute allows the developer to individually define the fields that will be displayed in the modal form and those displayed when accessing the application. In practice, it is as if there were two applications, one for editing and including records open in the modal and another for displaying and deleting records.

Field configuration must be performed in the Field Positioning menu, [check our documentation](#).

For more details watch the video [Form horizontal \(edição e inclusão com modal\)](#)

Modal Width

The screenshot shows a configuration field with the label 'Modal width' and a text input field containing the value '500'.

Set the width of the modal where the form will open. The attribute uses **pixel** as a unit of measure, so only numbers must be informed to define the width.

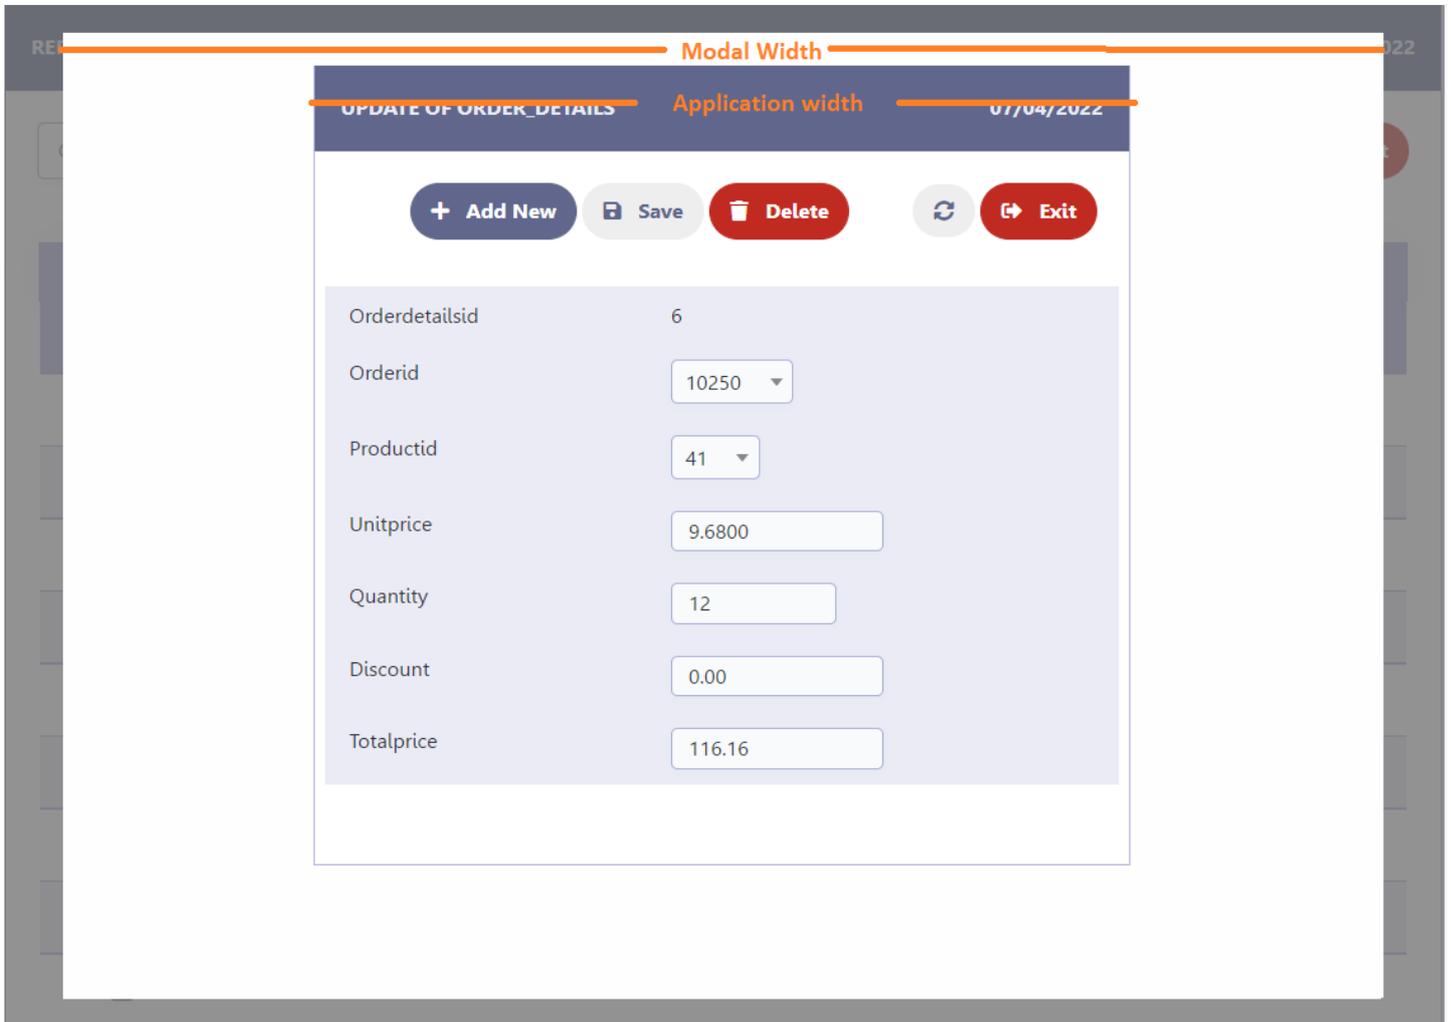

This attribute is only available for **editable grid forms(view)** where the attribute **Use modal form** is set to: **On Editing** or **On**

Editing and Inserting.

The width of the application opened in the modal respects the definition of the **Width of Table** attribute.

Example of the application opened in the modal

This attribute controls the **Modal Width**, which is basically the space available for the form to be displayed. The width of the application that will be opened respects the configuration of the **Width of the Table** of the Editable Grid Form (view).

Modal Height

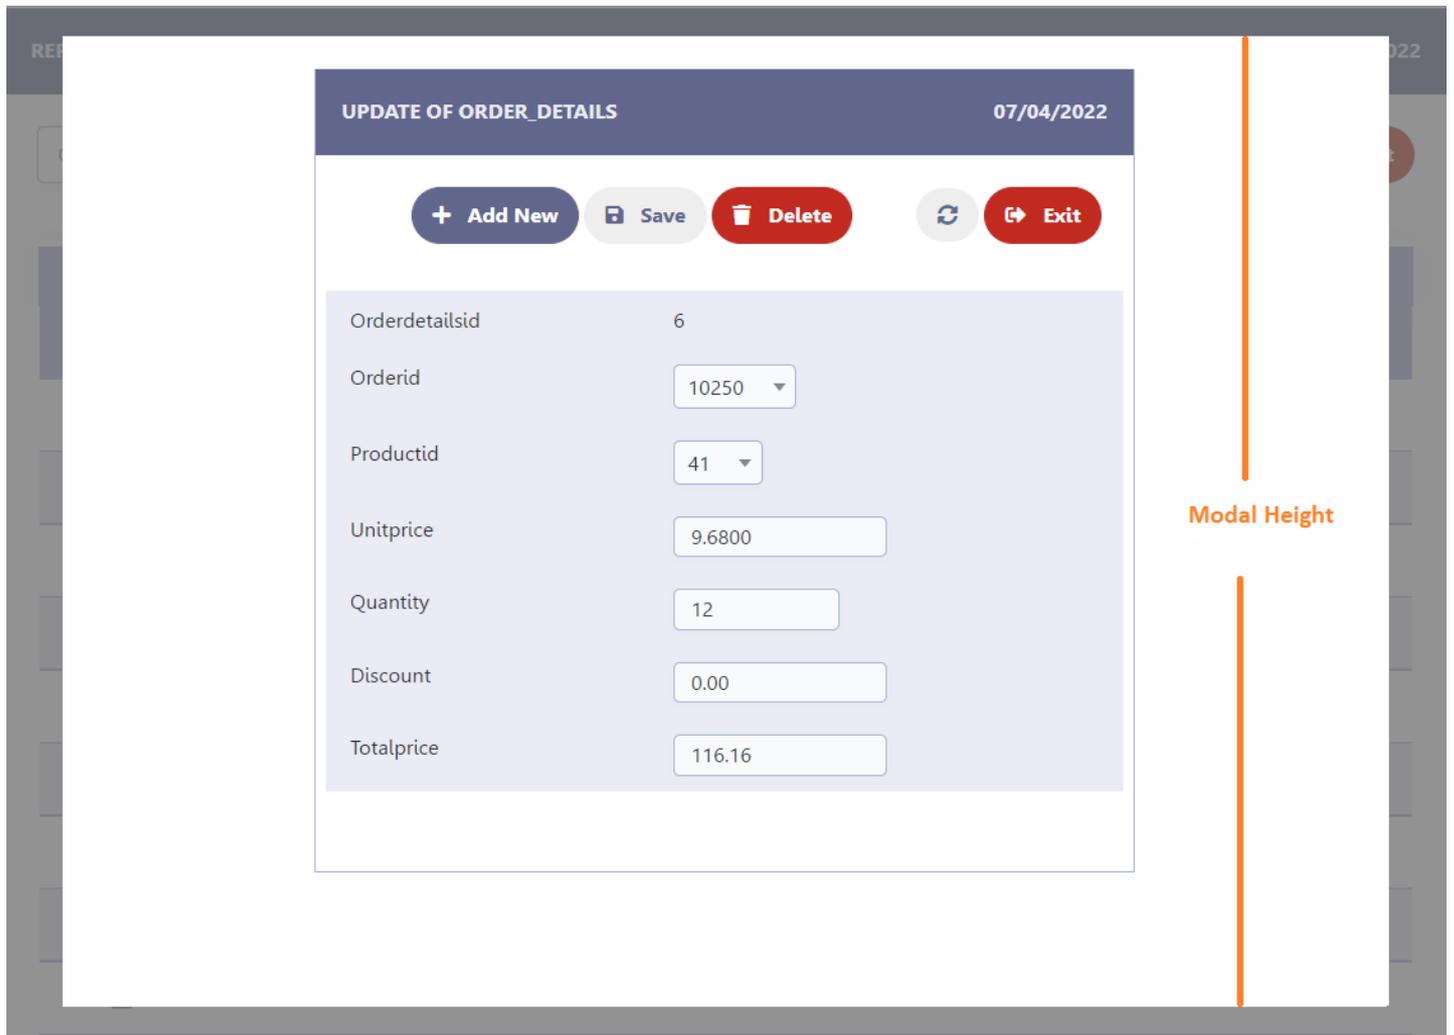

Modal height	<input type="text" value="450"/>
--------------	----------------------------------

Defines the height of the modal where the form will be opened. The attribute uses **pixel** as a unit of measure, so only numbers must be informed to define the height.

This attribute is only available for **editable grid forms(view)** where the attribute **Use modal form** is set to: **On Editing** or **On Editing and Inserting**.

Example of the application open in the modal

This attribute controls the **Modal Height**, which is basically the space available for the form to be displayed. The height of the application that will be opened respects the number of fields selected for the modal form.

Layout and Behavior

Layout and Behavior	
ATTRIBUTE	VALUE
Notify discarded changes	<input checked="" type="checkbox"/>
Automatic tab	<input type="checkbox"/>
Highlight Text on Focus	<input checked="" type="checkbox"/>
Use Enter to	<input type="text" value="v"/>
Field with Initial Focus	<input type="text" value="accountid"/>
Highlight Field with Error	<input checked="" type="checkbox"/>
Display icon only on mouseover	<input checked="" type="checkbox"/>

Check the details of each attribute available in the Layout and Behavior block below.

Notify discarded changes

This attribute defines the behavior of the application regarding changes that have not yet been saved if the user performs some **reload of data** action.

Data reload examples

- Use reload button  .
- Navigate between pages.
- Redirects to another application in the same window.

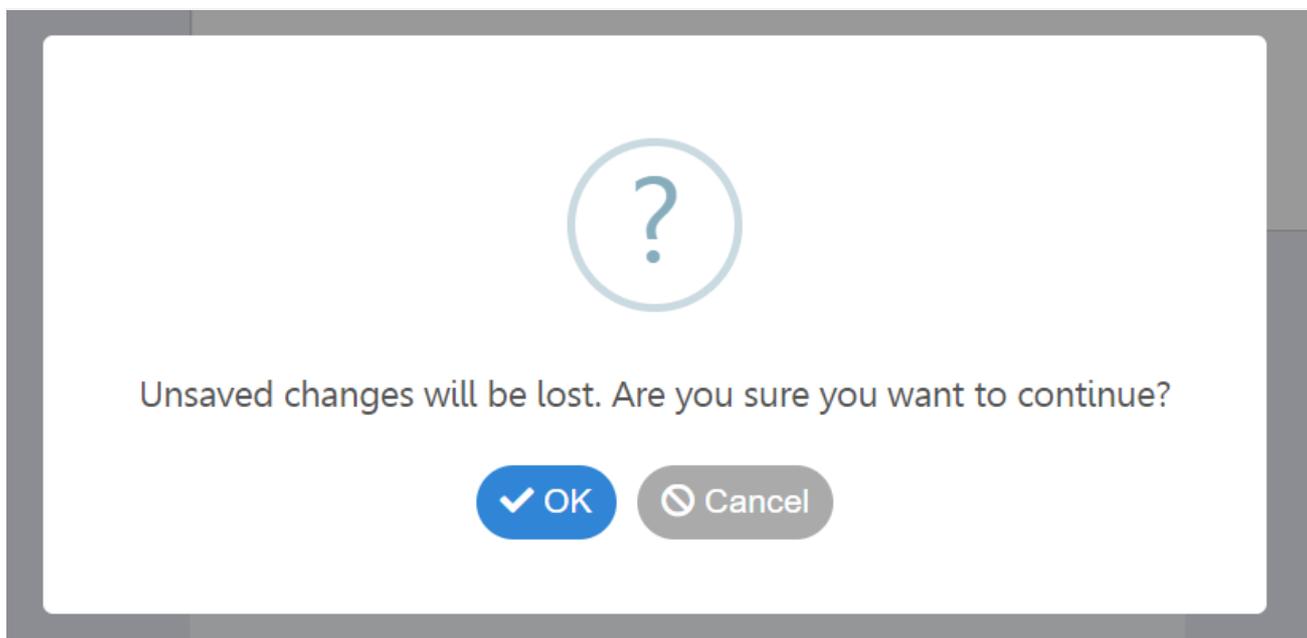

When Disabled, if the user performs any action that causes the data to be reloaded before the changes made are saved, the initiated action will be executed and the unsaved data will be lost.

When enabled, whenever the user performs any action that causes the data to be recharged before it has been saved, an alert will be displayed informing about the possible loss of this data.

In this case, the user can choose to click **OK** which will continue the action started, culminating in the discard of unsaved changes or click **Cancel** which will cause the action started to be interrupted, keeping the unsaved data.

Example of discarded change notification

Some actions may cause the loss of unsaved data, for example: Navigating between records or using the reload button

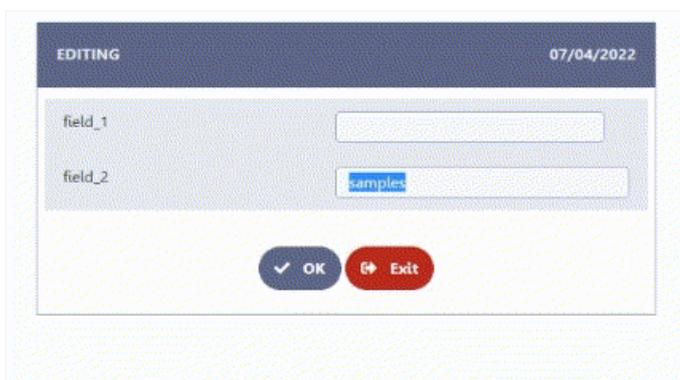

Automatic tab

Shifts focus to the next field when the number of characters in the current field reaches the limit defined in the settings.

Example of auto tab

In the example below, **Field 1** has a limit of 3 characters. When filling in all the characters the focus changes to **Field 2**.

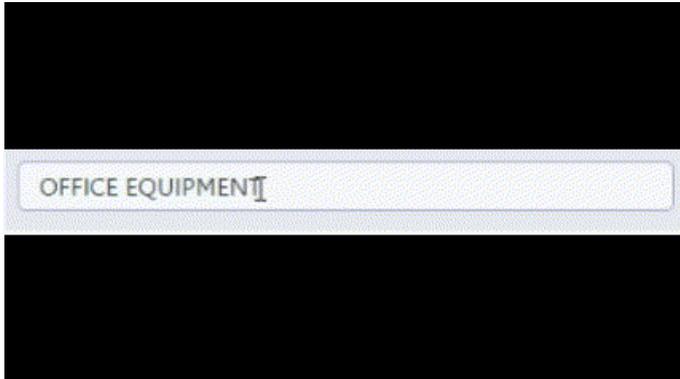

Select Field Content

Defines whether the field content will be selected or not when receiving focus.

When enabled all field contents are selected..

Example of field behavior with attribute enabled

When disabled the field content will not be selected.

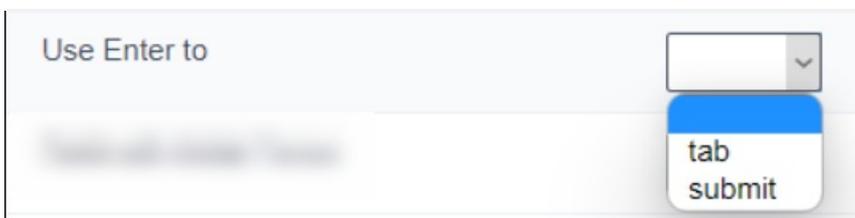

Example of field behavior with attribute disabled

Use the Enter key to

This attribute defines the behavior of the enter key in the application, having as options: **tabular** and **submit**.

The **submit** property is not available for form applications.

Tab

Allows the user to navigate between application fields using the enter key. The tabs follow the field order defined in the **select fields** menu.

Tab example with enter

To submit

Allows the user to submit the application using the enter key.

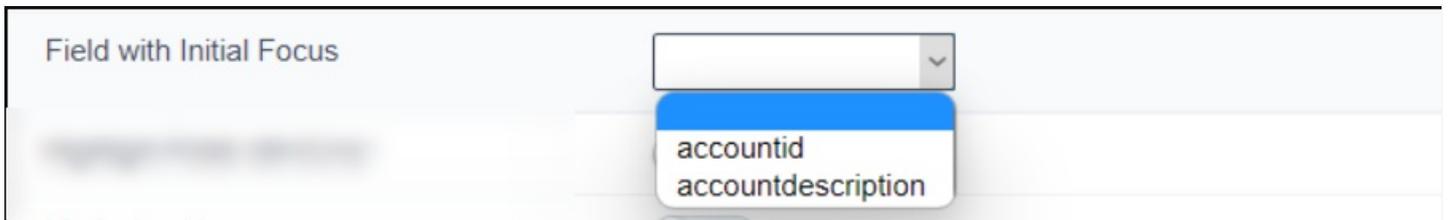

Example submit with enter

This option is not available for form applications.

Field with initial focus

Defines the field that will receive focus when the application is loaded. Enabling the user to start typing without having to use the mouse to focus on the field.

Example of initial focus

Focus field with error

Defines the behavior of the focus in relation to the fields that present an error when submitting the form.

When enabled, when submitting the form, the field with an error will receive focus. If more than one field has an error, the focus will be on the first field with an error, following the order defined in the **Fields Position** menu.

When disabled, when submitting the form, no field will receive autofocus in case of an error.

Check all checkboxes

This attribute controls the display of the **Select** column, allowing application users to check all the checkbox fields of the application or just a specific record.

Select	Application name *	Access	Insert	Delete	Update
<input type="checkbox"/>	app_change_pswd				
<input type="checkbox"/>	app_form_add_users				
<input type="checkbox"/>	app_form_edit_users				
<input type="checkbox"/>	app_form_sec_apps				
<input type="checkbox"/>	app_form_sec_groups				
<input type="checkbox"/>	app_form_sec_groups_apps				
<input type="checkbox"/>	app_grid_sec_apps				

This attribute is only available in **Multiple Record** forms

This column allows two different functions depending on the checked box, check the examples below.

By checking the checkbox below the Select label

In this case, all checkbox fields of the current application page will be checked.

Select	Application name *	Access	Insert	Delete	Update
<input type="checkbox"/>	app_change_pswd	<input type="checkbox"/> Yes	<input type="checkbox"/> Yes	<input type="checkbox"/> Yes	<input type="checkbox"/> Yes
<input type="checkbox"/>	app_form_add_users	<input type="checkbox"/> Yes	<input type="checkbox"/> Yes	<input type="checkbox"/> Yes	<input type="checkbox"/> Yes
<input type="checkbox"/>	app_form_edit_users	<input type="checkbox"/> Yes	<input type="checkbox"/> Yes	<input type="checkbox"/> Yes	<input type="checkbox"/> Yes
<input type="checkbox"/>	app_form_sec_apps	<input type="checkbox"/> Yes	<input type="checkbox"/> Yes	<input type="checkbox"/> Yes	<input type="checkbox"/> Yes
<input type="checkbox"/>	app_form_sec_groups	<input type="checkbox"/> Yes	<input type="checkbox"/> Yes	<input checked="" type="checkbox"/> Yes	<input type="checkbox"/> Yes
<input type="checkbox"/>	app_form_sec_groups_apps	<input type="checkbox"/> Yes	<input type="checkbox"/> Yes	<input type="checkbox"/> Yes	<input type="checkbox"/> Yes

When checking the checkbox in the record line

In this case, all fields of the record configured as checkboxes will be checked.

SELECT	Samples
<input type="checkbox"/>	<input type="checkbox"/> Andrew Fuller <input type="checkbox"/> Anne Dodsworth <input type="checkbox"/> Janet Leverling <input type="checkbox"/> Julian Vieira <input type="checkbox"/> Laura Callahan <input type="checkbox"/> Margaret Peacock <input type="checkbox"/> Michely Suyama <input type="checkbox"/> Nancy Davolio <input type="checkbox"/> Robert King <input type="checkbox"/> Steven Buchanan <input checked="" type="checkbox"/> <input type="checkbox"/>
<input type="checkbox"/>	<input type="checkbox"/> Andrew Fuller <input type="checkbox"/> Anne Dodsworth <input type="checkbox"/> Janet Leverling <input type="checkbox"/> Julian Vieira <input type="checkbox"/> Laura Callahan <input type="checkbox"/> Margaret Peacock <input type="checkbox"/> Michely Suyama <input type="checkbox"/> Nancy Davolio <input type="checkbox"/> Robert King <input type="checkbox"/> Steven Buchanan <input checked="" type="checkbox"/> <input type="checkbox"/>

Display icon only on mouseover

Sets whether the theme sort icons  will always be displayed or whether they will only be displayed on mouseover.

This attribute is only valid in Horizontal forms: **Multiple Records**, **Grid Editable** and **Grid Editable(View)**.

When Enabled, sort icons are displayed on mouseover only.

Sort icons displayed on mouseover

	Orderid	Customerid	Employeeid	Orderid
...	885	ALFKI	1	02/15/2009
...	886	ALFKI	1	02/15/2009
...	10,248	SANTG	4	01/30/2009
...	10,249	ANATR	7	01/30/2009
...	10,250	HANAR	4	01/31/2009

When Disabled, the sort icons will always be displayed in the application.

Sort icons always displayed

Orderid	Customerid	Employeeid	Orderdate
885	ALFKI	1	02/15/2022
886	ALFKI	1

Edit

Fields Configuration.

Fields

It allows accessing the field settings (a pencil icon on the left). You can change the field position by dragging them to the desired position. Drag a field to "fields not displayed" if you don't want it in the app.

Label

It defines the title of the field in the app. For example: if the field name in the database is fld_txt_customer_name, you can display the label "Customer Name".

Data type

It informs the data type of the field.

New

It defines if the field is available when inserting new records.

Update

It defines if the field is available when updating records.

Read-Only

It defines the field as a label. The user can't change its value.

Required

It defines if the field must contain a value.

PK

It defines the Primary Keys fields.

DB value (Insert)

Defines a default value for the field when inserting a new record, like an auto-increment, Date, DateTime, or IP.

DB value (Update)

Defines a default value for the field when updating a record, like an auto-increment, Date, DateTime, or IP.

Page

It shows the pages available in the application. All apps have a page, at least. Each page contains one or more blocks.

Blocks

It shows the blocks available in the application. Blocks contain fields. All apps have a block, at least. A block is displayed if it contains one or more fields.

Page Fields Not Shown

Here we can see the fields that are not in the application.

Observe that you can drag any line to the desired position, blocks, and page. Pages contain Blocks, and Blocks contain fields.

Display Settings

Settings of messages display.

Form Fields Positioning

It allows the definition of the fields that will be part of the form and its display order.

When using the Editable Grid(View) format, it is also possible to define the fields for visualization and data manipulation independently.

Form Fields

Adding and Removing Application Fields

The fields must be configured using the selection buttons, located between the columns.

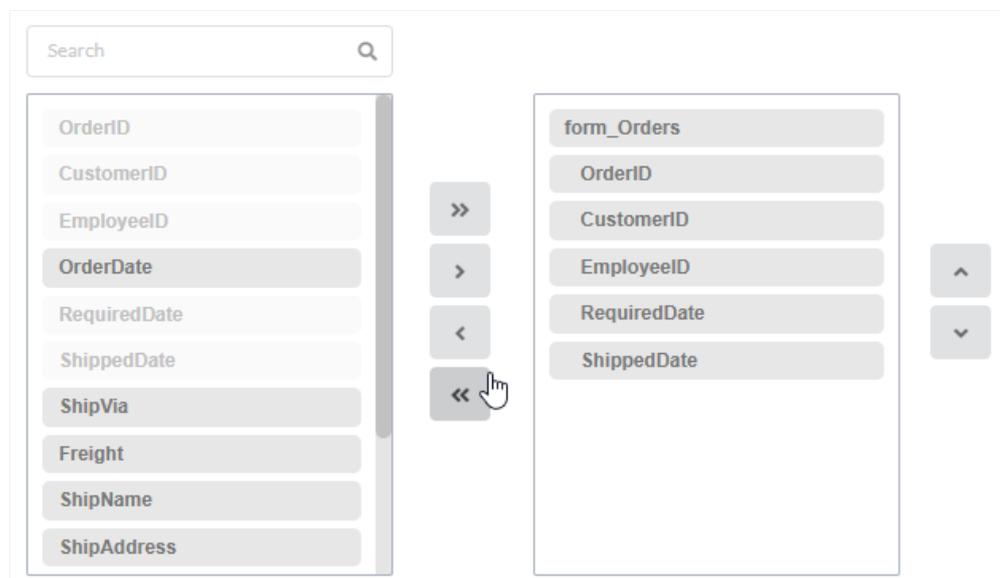

-  - Move all fields to the right.
-  - Moves only selected fields to the right
-  - Moves only the selected fields to the left.
-  - Move all fields to the left.

In the left column, there are the application fields that are not in use in the filter, while the right column shows all the selected fields and the order in which they will be displayed.

To add fields to the filter, select the fields you want in the filter and click the  button.

To select fields in sequence, simply click on a field and drag. Pressing control (Ctrl) allows you to select multiple alternate fields.

Search and positioning

Field display order

The fields will be displayed in the application respecting the order defined in the right column.

The display order must be defined using the sort buttons  and  which will move the selected fields in the column.

Remembering that the fields must be positioned inside a block (**customers**) which must be inside a page (**Pag1**).

Check below the use of the buttons to order the fields

Save and Restore

Below the columns are two buttons:

- **Save** which records the current placement of fields in columns.
- **Restore** which reorganizes the fields returning to the last position saved.

Restoring the positioning of the fields to the last saved definition.

Grid Fields

Grid Fields

Unique key

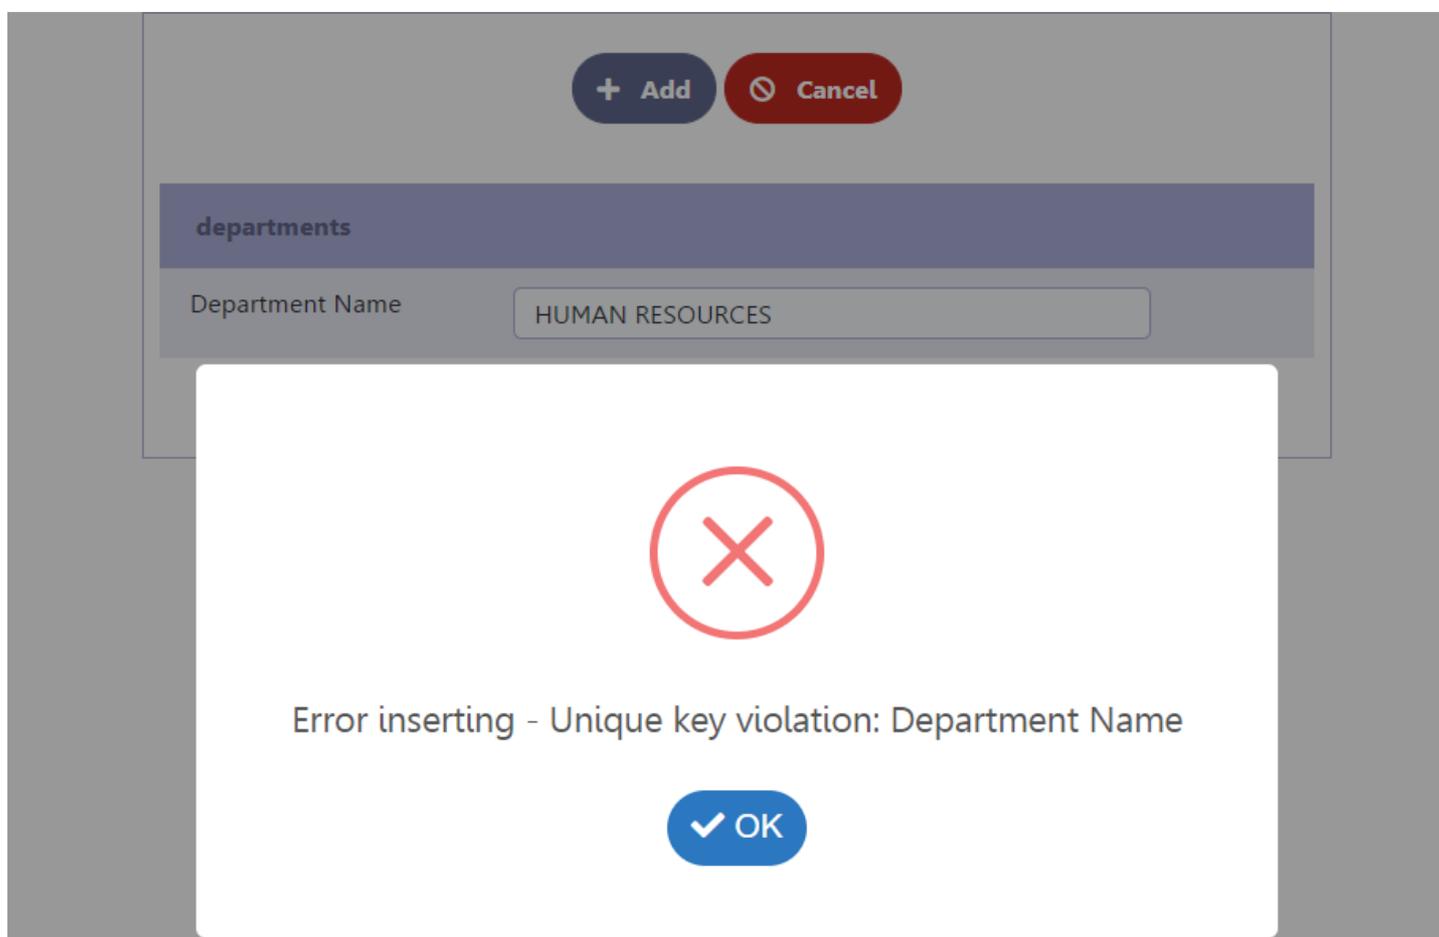

With the unique key option you can inform which fields' data should not have repetitions within the database.

configuration Interface

If you want to combine two or more fields as unique, select the fields by holding the CTRL key of your keyboard and then click on the "Add" button.

The user will receive message if tries to insert a repeated value into the application. The validation and message are created automatically by Scriptcase, you are able to customize it by accessing the [application language](#) option and searching for the lang variable: `{lang_errm_inst_uniq}`. This lang variable contains a pre-set error message content.

Unique key message example

Navigation:

Buttons relative to the navigation of the application.

Next	Move to the next page that can be a single record or a list of records.
Previous	Returns to displays the previous page records or a single record.
First	Move to the First page or record
Last	Move to the Last page or record
Exit	Close the application
Navigation by page	Displays a “page-number” navigation bar. Example: 1 2 3 4 5
Reload	Displays a button to reload the query data

Export:

The options available to export the Records. Scriptcase generates the following export formats for Forms:

PDF	Generates all the data of the application in a PDF format.
Print	Creates an HTML with the records ready for printing.

Update:

The CRUD options available in the Form.

Insert	Inserts the record into the database.
Update	Saves the changes made in a record.
Delete	Deletes the selected record.
Cancel	Cancel the changes made in a record before the insertion.

Others:

Other options available in the Form application.

Jump To	Move to the informed page or record.
Copy	Copy the current record data to another one.
Quick Search	Perform a quick search in the records of the application.
Dynamic Search	It displays the fields of the search to filter the records.
Languages	Displays a Combobox with the languages available in the project properties.
Themes	Displays a Combobox with the languages available in the project properties.
Rows Counter	Displays the number of records retrieved in the application.
HelpCase	Displays a button to open the help page.

Separator:

-----	Displays a line separating the buttons.

Application Hotkeys

Scriptcase allows creating shortcut keys to your applications. You can select a predefined template or create specific actions for an application.

Application Hotkeys ?

ATTRIBUTE	VALUE	DESCRIPTION
Use hotkeys	<input checked="" type="checkbox"/>	Define if the application will use hotkeys
Hotkeys template	<div style="border: 1px solid #ccc; padding: 2px; display: inline-block;">SC_DefaultHotkeys</div> ▼ ↻ ✎	Select the hotkey template from previously created schemas

Clean
+

ACTION	KEYBINDING
No hotkeys configured	

Clean
+

Use hotkeys

Defines if the application uses hotkeys. When you enable this option, the default shortcut keys settings are disabled.

Hotkeys template

Select the [hotkey template](#) previously created.

Action

Selects the triggered action when pressing the selected key.

Keybinding

Selects the keys responsible for executing the chosen action.

Add “+”

Adds a new action on the keys list.

Clear

It clears the selected hotkeys preference.

Options

Options	
ATTRIBUTE	VALUE
Format Row Counter	<input type="text"/>
The number of links displayed	<input type="text" value="5"/>
Help by Block	<input type="checkbox"/>
General Help	<input type="checkbox"/>
Toolbar buttons	<input type="text" value="A DIV below the toolbar."/>

Format Row Counter:

Allows defining the format of the row counter displayed on the application.

Example: (1 to 10 of 200)

The Number of Links Displayed:

Defines the number of links per page, when the navigation option is disabled.

Help by Block:

Indicates if the helps messages from relatives fields are grouped by block. In each field, we can define a help text. With this option activated, it shows up an icon in the block title bar to call the help page.

General Help:

The General Help “consolidates” all the fields help pages in a single page, putting an icon in the toolbar to call the help page.

configuration Interface.

Select primary key fields

It lets you define the Primary key of the Form. ScriptCase already identifies Primary Keys, but you can manually inform or change it by using the buttons beside the fields list. See how the buttons work:

- **On/Off** : Adds or Removes the attribute that defines the primary key for the field. The primary key fields have an asterisk beside their names.
- **All** : Defines all fields as Primary Keys.
- **None** : Defines none fields as Primary Keys.
- **Sorting Button** : These are the arrows on the right side of the Combo box. It allows ordering the fields of the Primary Key, placing it in the desired order. To order them, click on the field and use the arrows to move it.

Where clause

It allows adding a WHERE clause to filter the SQL records.

Order By

It allows adding an ORDER BY clause to determine the order to display the records. By default, it uses the primary key to sort the records.

Connection

It allows defining the database connection of the application. You can change the connection to another one that has the same table.

Table Name

It informs the database table used in the Form.

Variable for Table

It allows to use a variable to change a part of the string containing the table name.

Var
orders

Variable for Table Configuration.

Fill the first input with the name of the variable (replace to). The second input you should fill with the part of the name of the table you want to replace (replace from).

Case sensitive

It defines if the database connection uses case sensitive or not.

Sorting

Field Settings

Sort Fields ?

Select the fields that allow sorting.

On/Off

All

None

*customerid
 *companyname
 *contactname
 *contacttitle
 *birthdate

stateid	Ascendant ▼
city	Ascendant ▼
address	Ascendant ▼
postalcode	Ascendant ▼
phone	Ascendant ▼
fax	Ascendant ▼
cityid	Ascendant ▼
creditlimit	Ascendant ▼
cardtype	Ascendant ▼
cardnumber	Ascendant ▼
notes	Ascendant ▼

Advanced sorting ?

ATTRIBUTE	VALUE	DESCRIPTION
Sorting fields	<input checked="" type="radio"/> Use displayed fields <input type="radio"/> Use columns <input type="radio"/> Define Columns	Default for fields that will be displayed in the advanced sorting
Display icon only on mouseover	<input checked="" type="checkbox"/>	Displays the sorting icon only when the mouse is on the label of the field.

This property defines which fields allow the end-user to sort on the fly, just by clicking on the column (field) he wants to sort by. When sorting the fields, it preserves the GroupBys ordering by default. Also, Scriptcase enables the sorting of the first six application fields, but you can enable it for all fields.

On/Off

All

None

*customerid
 *companyname
 *contactname
 *contacttitle
 *birthdate
 *country
 regionid
 stateid
 city
 address

Sort Fields

It defines the sorting for each field of the application. You can set them as "Ascendant" or "Descendant".

Sort Fields			
customerid	Ascendant ▼	companyname	Ascendant ▼

Advanced Sorting

Define the fields that are available when clicking on the “Sorting” button of the Grid.

▲ ADVANCED SORTING

ATTRIBUTE	VALUE
Sorting fields	<input checked="" type="radio"/> Use displayed fields <input type="radio"/> Use columns <input type="radio"/> Define Columns

Use displayed fields

Defines that all the fields are available when clicking on the “Sorting” button of the application.

Use columns

Defines that all the fields set in the “Columns” option are available when clicking on the “Sorting” button.

Define Columns

Allows selecting the fields freely.

▲ ADVANCED SORTING

ATTRIBUTE	VALUE
Sorting fields	<input type="radio"/> Use displayed fields <input type="radio"/> Use columns <input checked="" type="radio"/> Define Columns
Defined fields for the sorting	<div style="display: flex; align-items: flex-start; gap: 10px;"> <div style="border: 1px solid #ccc; padding: 2px;"> customerid companyname contactname contacttitle birthdate country regionid stateid </div> <div style="display: flex; flex-direction: column; gap: 5px;"> <div style="background-color: #00a0e3; color: white; padding: 5px 15px; border-radius: 3px;">Add >></div> <div style="background-color: #00a0e3; color: white; padding: 5px 15px; border-radius: 3px;">Remove <<</div> </div> <div style="border: 1px solid #ccc; width: 80px; height: 80px; margin-left: 10px;"></div> </div>

Form Group Label

With this option, you can insert one or more titles for the columns in the application, allowing to modify its size, color, font, and position.

The Group Label doesn't work with a dynamic display of fields.

The screenshot displays the 'Group Label' configuration interface. At the top, there is a header 'Group Label' with a question mark icon. Below it, a table structure is shown with a 'Group name' label above the columns. The table has three columns: 'Title_Summary', 'Count_Reg', and 'rule1'. Below the table are two buttons: 'Add Row' and 'Save'. A 'Cell Properties' dialog is open, showing the following settings for the 'Group name' label:

- Title: Group name
- Font: Aa
- Font size: [dropdown]
- Horizontal alignment: Center
- Vertical Alignment: Middle
- Font Color: [color picker]
- Background Color: [color picker]

Buttons for 'Update' and 'Cancel' are at the bottom of the dialog. The text 'Editing Group' is visible on the right side of the dialog.

Label cell properties

Title

It allows you to define a Title for the Group Label.

Font

Set the font family for the group label title.

Font Size

Set the font size for the group label title.

Horizontal Alignment

Define the horizontal alignment of the group label title. Left, Center, or Right.

Vertical Alignment

Define the vertical alignment of the group label title. Middle, Bottom, or Top.

Font Color

Set the font color for the group label title.

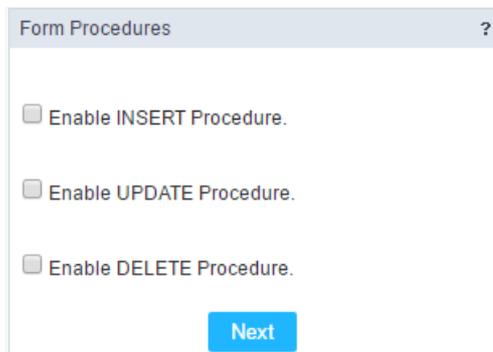

Background Color

Define a background color for the group label title.

Procedures

This interface allows configuring a Form application to execute the Stored Procedures from your database for Insert, Update and Delete records in the form. You don't need to use the three options simultaneously. If a Procedure option is not enabled, it continues to work as default by using the INSERT, UPDATE and DELETE commands.

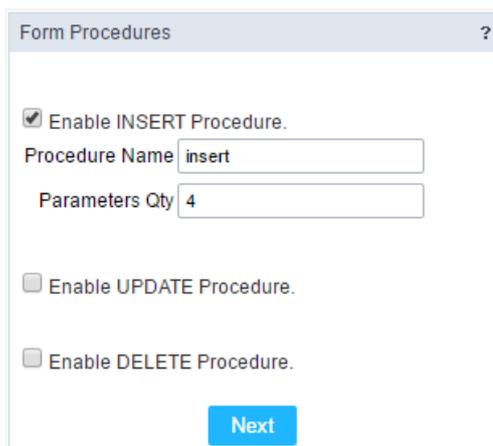

See below, the step-by-step to enable a Stored Procedure for inserting records into the database.

The screenshot shows a window titled "Form Procedures" with a question mark icon. It contains three unchecked checkboxes: "Enable INSERT Procedure.", "Enable UPDATE Procedure.", and "Enable DELETE Procedure.". At the bottom right, there is a blue "Next" button.

Form Stored Procedures Interface.

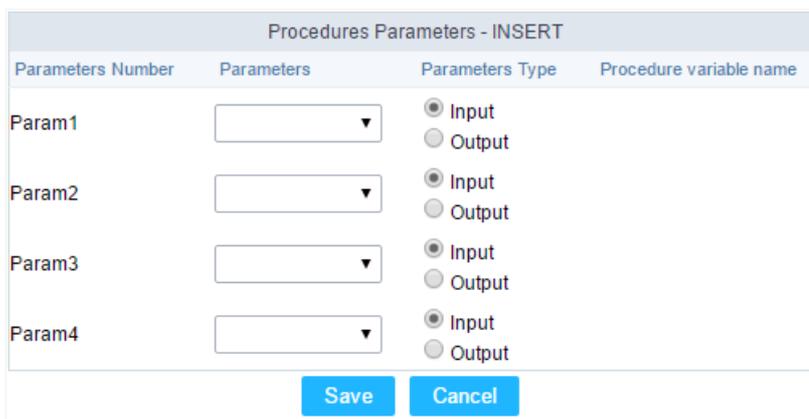

- Let's check the first option: "Enable INSERT Procedure". Then, inform the Name of the Procedure and the number of parameters.

The screenshot shows the "Form Procedures" window with the "Enable INSERT Procedure." checkbox checked. Below it, the "Procedure Name" field contains the text "insert" and the "Parameters Qty" field contains the number "4". The "Enable UPDATE Procedure." and "Enable DELETE Procedure." checkboxes are still unchecked. A blue "Next" button is at the bottom right.

Defining parameters for the Procedure.

- Now associate the fields for each parameter of the Stored Procedure and the type of parameter (Input or Output). Click on the "Save" button to finish.

The screenshot shows a table titled "Procedures Parameters - INSERT". The table has four columns: "Parameters Number", "Parameters", "Parameters Type", and "Procedure variable name". There are four rows, each for a parameter (Param1 to Param4). Each row has a dropdown menu in the "Parameters" column and two radio buttons in the "Parameters Type" column, labeled "Input" and "Output". The "Input" radio button is selected for all parameters. At the bottom of the table, there are two buttons: "Save" and "Cancel".

Parameters Number	Parameters	Parameters Type	Procedure variable name
Param1	<input type="text"/>	<input checked="" type="radio"/> Input <input type="radio"/> Output	
Param2	<input type="text"/>	<input checked="" type="radio"/> Input <input type="radio"/> Output	
Param3	<input type="text"/>	<input checked="" type="radio"/> Input <input type="radio"/> Output	
Param4	<input type="text"/>	<input checked="" type="radio"/> Input <input type="radio"/> Output	

Passing the values to the Stored Procedure Parameters.

JavaScript

To coding with JavaScript in Scriptcase Form application, we must associate a JavaScript event to a form field.

Edit JavaScript Interface.

Select the object

This Combo box displays the fields of the form application, and also the form itself as an object

Select the event

Use it to associate the event with the selected field to apply the JS code. View the events available:

- **onclick:** Acts when clicking on the field.
- **onblur:** Acts when the focus leaves the object.
- **onChange:** Acts when the focus leaves the object, and there are changes in the value.
- **onFocus:** Runs when the focus gets in the object.
- **onMouseOver:** Runs when the mouse pointer hovers the object.
- **onMouseOut:** Runs when the mouse pointer moves out the object.

Events related to the Form

The events below are associated directly with the form object.

- **OnLoad:** This event runs when the page is loaded, also when clicking on the navigating buttons.
- **onSubmit:** This event runs when clicking on the “New”, “Save”, and “Delete” buttons.

Edit JavaScript

*Select the object and event, then click on the Edit button. It opens a page to inform custom JavaScript routines and standar

```
![[Edit JavaScript Interface]][javascript_edicao_code]
```

```
*Edit JavaScript Interface*
```

> The JavaScript language doesn't have the same behavior in all the browsers available. A tip is to test running the applicati

- **OnClick Example**

- When clicking on a field of type radio, you can enable or disable form fields according to the selected value.

```
if(document.F1.gender[0].checked){
  document.F1.maternity.disabled = false;
  document.F1.maternity.style.background='FFFFFF'
}
if(document.F1.gender[1].checked){
  document.F1.maternity.disabled = true;
  document.F1.maternity.style.background='FCEEB3'
}
```

To access the values of a radio field, you need to use the index.

- **OnBlur Example**

- You can define a warning for the field “weekly_work_time” when the focus is getting out it.

```
if (document.F1.tp_point[0].checked && document.F1.weekly_work_time.value > '20')
{
    alert("The work time exceeds the limit allowed");
    document.F1.weekly_work_time.value = "";
    document.F1.weekly_work_time.focus();
}
```

- **OnChange Example**

- By modifying the “Salary” of an employee and leaving the field, we’ll check if his “position” is “gardener”.

```
if (document.F1.salary.value > 2000.00 && document.F1.position.value == 'gardener'){

    alert('When I grow up, I want to be a gardener);
}
```

- **OnFocus Example**

- After informing the purchase value and selecting the payment method in a Select object “Select: pay_method”, the JavaScript code below calculates the value of the purchase.

```
if (document.F1.pay_method[document.F1.pay_method.selectedIndex].text == 'Money')
{
    document.F1.total.value = document.F1.paurchase_value.value;
}
```

- **OnMouseOver Example**

- You can change the style (background color, font and font color) when the mouse hovers the field.

```
document.F1.field_name.style.backgroundColor = "0FFCCA"
```

- **onMouseOut Example**

- Sets the background color when the mouse moves out from the field.

```
document.F1.field_name.style.backgroundColor = "FFFFFF"
```

Dependencies

This feature allows linking the tables that contain relationships, dependencies, like the tables orders and order_details. This way, it's possible to delete a record in the table orders, and it automatically deletes all the details for that order as well. Below let's see a practical example of this feature.

1. Firstly, you must define a new dependency. Then you must select the dependent table. Click on the button New Dependency to start.

► Dependency ?

Table: customers

DEPENDENCY	RELATIONSHIP KEYS	ACTIONS
orders	customers.customerid	orders.customerid ✎ Edit 🗑 Delete 👤 Dependency (1)

Message Type:

[New Dependency](#)

Creating a new Dependency.

1. You must inform the fields amount is related between both tables. In this example, we have only one field.

Add dependency

TABLE	customers
DEPENDENCY	orders ↻
FIELD QUANTITY FOR THIS RELATION	<input type="text" value="1"/>

[Next](#)
[Cancel](#)

Dependency Table configuration.

1. Then select the related key fields: order_details->Orderid - orders->Orderid.

Add dependency

TABLE	customers
DEPENDENCY	account ↻
FIELD QUANTITY FOR THIS RELATION	<input type="text" value="1"/>

[Next](#)
[Cancel](#)

Dependency Key Fields Configurations.

1. Now we need to select behaviour for the application. Then click on the button Generate Scripts to define the Dependency Rule.

► Dependency ?

Table: customers

DEPENDENCY	RELATIONSHIP KEYS		ACTIONS
orders	customers.customerid	orders.customerid	 Edit  Delete  Dependency (1)

Message Type:

To display an error message and rollback in case of 'child rows'. ▼

To display an error message and rollback in case of 'child rows'.

To perform cascade delete in case of 'child rows'.

[New Dependency](#)

Configuring dependency Rules.

Security

Use security

With this option enabled, when accessing the application, an “unauthorized user” message will be displayed, preventing access to the application.

When enabled, application access is only possible through the macro **sc_apl_status** or through **security module**.

[Click here](#) to access the macro documentation sc_apl_status.

In the development environment, the use of the above options for testing purposes may be suppressed, preventing the password being requested or access being blocked at each execution of the applications. To do this, disable the options “Enable security usage” and “Enable password usage” in the menu **Configuration > My Scriptcase**.

Security exit url

Defines which application the user will be redirected to after the “unauthorized user” warning.

Use password

When enabling the option, you will be asked to define a password for accessing the application.

When running the application using the active password, you will be asked for the password before accessing the application.

The password will be requested regardless of the “use security” setting or the use of the security module.

Request password only once

This option defines the behavior of the use password option.

When this option is enabled, the password will be requested only once per session.

When disabling, the password will be requested every time the application will be accessed.

Allow direct calling by URL

Allows an application to be called by typing the URL directly into browsers.

When disabled, when accessing the application by typing the URL directly, the invalid data error will be displayed. With this configuration, the application can only be accessed through a menu application, for example.

Enable CSRF

With this option enabled, the scriptcase prevents a malicious attack on a page where unauthorized commands are transmitted through a user the page trusts.

These attacks are known as a “Cross-Site Request Forgery” attack.

Cookies

HttpOnly

These are cookies that can be set by the server or by javascript but cannot be accessed in any way by javascript.

With the HTTPOnly parameter enabled, it is very difficult to steal a session through XSS because the javascript cannot read the content of these cookies.

A widely exploited attack in XSS is the theft of user session cookies. Theft of cookies is carried out through a javascript command that sends cookies to an external URL where the attacking user has control.

This option is enabled by default in all applications.

Session ID

Enables the session id that will be stored in cookies on the client side. This option embeds the session id directly in the URLs

This option is enabled by default in all applications.

Cookie Secure

With this option enabled, cookies are protected and can only be transmitted via secure communication. Therefore, they cannot be accessed through Javascript.

The HttpOnly option must also be enabled.

Headers

Disable XSS Auditor

XSS is short for Cross-Site Scripting, which is an attack that consists of sending HTML with malicious JavaScript to a website.

It is a security attack that consists of sending HTML with malicious JavaScript to a website. If the website displays this HTML with JavaScript without filtering the malicious JavaScript code, the cookies sent by the website can be stolen and sent to an attacking website, so that it can be used to forge user sessions and access the website's user account without permissions.

Strict-Transport-Security

HSTS forces browsers to use HTTPS in the domain where it is enabled, instead of using HTTP.

When enabled, the default value is "max-age = 31536000".

The HSTS policy is set for one year (31536000 seconds). This period specifies the time the browser will access the server via HTTP

X-Frame-Options

The HTTP X-Frame-Options response header can be used to indicate whether or not the browser should render the page in a `<frame>`, `<iframe>`, `<embed>` " or '". This header provides protection against clickjacking, known as 'click swipe' - this vulnerability can steal relevant information and data from the user.

X-Frame-Options does not allow the rendering of a page in a frame, ensuring that the content of your page is not embedded in other sites

- **SAMEORIGIN:** The SAMEORIGIN directive allows the page to be loaded in a frame from the same source as the page itself. This option must be used so that the application with clickjacking protection can be used in the menu application.
- **DENY:** This directive completely disables page loading in a frame.

If no option is selected, the application can be used on any `<frame>`, `<iframe>`,

or `<object>`, allowing the application to be incorporated into another website.

X-Content-Type-Options

X-Content-Type-Options is used to protect against MIME detection vulnerabilities. With this option enabled, it prevents browsers from interpreting the page content (sniffing) and executing the data as code / tag. These vulnerabilities can occur when uploading a text file with a javascript code and the browser reading the content that is in the file and executing, even though it is just text and not part of the code.

With this enabled, the HTTP X-Content-Type-Options header is defined, by default, as "no detection".

Referrer-Policy

no-referrer.

The Referer header will be omitted completely. No reference information will be sent with requests.

no-referrer-when-downgrade.

This is the default behavior when no policy is specified, or if the value provided is invalid.

origin.

Only send the origin of the document as a reference. For example, a document at `https://example.com/page.html` will send the reference `https://example.com/`.

origin-when-cross-origin.

Sends the origin, path and query string when performing a same-origin request, but only sends the origin of the document in other cases.

same-origin.

The reference will be sent to sources on the same site, but requests between sources will not send reference information.

strict-origin.

Only send the document source as a reference when the security protocol level remains the same (HTTPS → HTTPS), but do not send it to a less secure recipient (HTTPS → HTTP).

strict-origin-when-cross-origin.

Sends the source, path and query string when performing a request from the same source, only sends the source when the security protocol level remains the same during an inter-source request (HTTPS → HTTPS), and sends no header to recipients less secure (HTTPS → HTTP)

unsafe-url.

Sends the source, path and query chain when performing any request, regardless of security.

Feature-Policy

The value of this header is a policy or set of policies that you want the browser to respect for a particular source.

The source whitelist can take on several different values:

- `*:` The feature is allowed in top-level navigation contexts and in nested navigation contexts (iframes).
- `self:` The feature is allowed in top-level navigation contexts and nested navigation contexts from the same source. It is not allowed in documents of cross origin in nested browsing contexts.
- `none:` The feature is not allowed in top-level browsing contexts and is not allowed in nested browsing contexts.
- `<origin (s)>:` specific sources for which to enable the policy (for example `https://example.com`).

Example 1 - Using only one directive Let's say you want to prevent all content from using the geolocation API on your site. You can do this by submitting a restricted 'none' whitelist to the geolocation resource:

Feature-Policy: `geolocation none`

Example 2 - Using more than one directive Functionalities within a policy are separated by semicolons.

Feature-Policy: `unsized-media none; geolocation self https://example.com; camera *;`

Directives

accelerometer

Controls whether the current document is allowed to collect information about the acceleration of the device

via the Accelerometer interface.

ambient-light-sensor

Controls whether the current document is allowed to collect information about the amount of light in the environment around the device through the AmbientLightSensor interface.

autoplay

Controls whether the current document is allowed to play the requested media automatically via the HTMLMediaElement interface. When this policy is disabled and there is no user action, the Promise returned by HTMLMediaElement.play () will reject it with a DOMException. The autoplay attribute on <audio> " and " elements will be ignored.

battery

Controls whether the use of the Battery Status API is allowed. When this policy is disabled, the Promise returned by Navigator.getBattery () will reject it with a NotAllowedError DOMException.

camera

Controls whether the current document is allowed to use inputs from video devices. When this policy is disabled, the Promise returned by getUserMedia () will reject it with a NotAllowedError DOMException.

display-capture

Controls whether or not the current document is allowed to use the getDisplayMedia () method to capture screen content. When this policy is disabled, the Promise returned by getDisplayMedia () will reject it with a NotAllowedError if permission is not obtained to capture the contents of the screen.

document-domain

Control whether the current document is allowed to place document.domain. When this policy is disabled, attempts to place document.domain will fail and cause a SecurityError DOMException to be thrown.

encrypted-media

Controls whether the current document is allowed to use the Encrypted Media Extensions (EME) API. When this policy is disabled, the Promise returned by Navigator.requestMediaKeySystemAccess () will reject it with a DOMException.

execution-while-not-rendered

Controls whether tasks should be performed in frames while they are not rendered (e.g. whether a frame is hidden or display: none).

execution-while-out-of-viewport

Controls whether tasks should be performed in frames while they are outside the visible viewing window.

fullscreen

Controls whether the current document is allowed to use Element.requestFullscreen (). When this policy is disabled, the returned Promise rejects it with a TypeError DOMException.

geolocation

Controls whether the current document is allowed to use the Geolocation interface. When the policy is disabled, calls to getCurrentPosition () and watchPosition () will cause function callbacks to be invoked with a PositionError of PERMISSION_DENIED.

gyroscope

Controls whether the current document is allowed to collect information about the orientation of the device through the Gyroscope interface.

layout-animations

Controls whether the current document is allowed to show layout animations.

legacy-image-formats

Controls whether the current document is allowed to show images in legacy formats.

magnetometer

Controls whether the current document is allowed to collect information about the orientation of the device through the Magnetometer interface.

microphone

Controls whether the current document is allowed to use inputs from audio devices. When this policy is disabled, the Promise returned by `MediaDevices.getUserMedia ()` will reject it with a `NotAllowedError`.

midi

Controls whether the current document is allowed to use the Web MIDI API. When this policy is disabled, the Promise returned by `Navigator.requestMIDIAccess ()` will reject it with a `DOMException`.

navigation-override

Controls the availability of mechanisms that enable the author of the page to take control over the behavior of spatial navigation, or to cancel completely.

oversized-images

Controls whether the current document is allowed to download and display large images.

payment

Controls whether the current document allows the use of the Payment Request API. When this policy is disabled, the `PaymentRequest ()` constructor will throw a `SecurityError DOMException`.

picture-in-picture

Controls whether the current document allows a video to be allowed to play in Picture-in-Picture mode via the corresponding API.

publickey-credentials-get

Controls whether the current document is allowed to use the Web Authentication API to retrieve already stored public key credentials, i.e. via `navigator.credentials.get ({publicKey: ..., ...})`.

sync-xhr

Controls whether the current document is allowed to make synchronous XMLHttpRequest requests.

usb

Controls whether the current document is allowed to use the WebUSB API.

vr

Controls whether the current document is allowed to use the WebVR API. When this policy is disabled, the Promise returned by `Navigator.getVRDisplays ()` will reject it with a `DOMException`. Keep in mind that the WebVR standard is in the process of being replaced by WebXR.

wake-lock

Controls whether the current document is allowed to use the Wake Lock API to indicate that the device should not go into a power saving mode.

screen-wake-lock

Controls whether the current document is allowed to use the Screen Wake Lock API to indicate whether or not the device should darken the screen.

xr-spatial-tracking

Controls whether or not the current document is allowed to use the WebXR Device API to interact with the WebXR session.

Content-Security-Policy

Content-Security-Policy is the name of an HTTP response header that modern browsers use to increase the security of the document (or web page).

The Content-Security-Policy header allows you to restrict resources such as JavaScript, CSS or just about anything the browser loads.

Directives**default-src**

The default-src directive defines the standard policy for fetching features such as JavaScript, Images, CSS, Fonts, AJAX requests, Frames, HTML5 Media. Not all directives go back to default-src. Refer to the Source List Reference for possible values.

DEFAULT-SRC Policy Example `default-src 'self' cdn.example.com;`

script-src

Defines valid JavaScript sources.

SCRIPT-SRC Policy Example `script-src 'self' js.example.com;`

style-src

Defines valid fonts for style sheets or CSS.

EXAMPLE__ STYLE-SRC POLICY `style-src 'self' css.example.com;`

img-src

Defines valid image sources.

Example of IMG-SRC Policy `img-src 'self' img.example.com;`

connect-src

Applies to XMLHttpRequest (AJAX), WebSocket, fetch (), `<a ping>` or EventSource. If not allowed, the browser emulates a 400 HTTP status code. `__Connect-SRC Policy Example__ connect-src 'self';``

font-src

Defines valid fonts for font resources (loaded via @ font-face).

FONT-SRC Policy Example `font-src font.example.com;``

object-src

Defines valid plug-in sources, for example `<object>` or `<applet>`.

Example OBJECT-SRC Policy `object-src 'self';`

media-src

Defines valid audio and video sources, for example `<audio>`, HTML5, `<video>` elements.

Example of MEDIA-SRC Policy `media-src media.example.com;`

frame-src

Defines valid fonts for loading frames. In CSP, Level 2 `frame-src` has been deprecated in favor of the `child-src` directive. CSP Level 3, has not been replaced with `frame-src` and will continue to postpone `child-src` if not present.

Example FRAME-SRC `frame-src 'self';`

sandbox

Enables a sandbox for the requested resource similar to the `iframe` `sandbox` attribute. The sandbox applies a policy of the same origin, avoids pop-ups, plug-ins and blocks the execution of scripts. You can keep the `sandbox` value empty to keep all restrictions in place, or add values: `allow-forms` `allow-same-origin` `allow-scripts` `allow-popups` `allow-modals` `allow-orientation-lock` `allow-pointer-lock` `allow-presentation` `allow-popups-to-escape-sandbox` `allow-top-navigation`

Example of SANDBOX policy `sandbox allow-forms allow-scripts;`

report-uri

Instructs the browser to POST policy crash reports to this URI. You can also use `Content-Security-Policy-Report-Only` as the HTTP header name to instruct the browser to send reports only (does not block anything). This directive was discontinued at CSP Level 3 in favor of the `report-to` directive.

Example REPORT-URI `report-uri / some-report-uri;`

child-src

Defines valid fonts for web workers and nested browsing contexts loaded using elements such as `<frame>` and `<iframe>`.

Example of FILHO-SRC Policy `child-src 'self'`

form-action

Defines valid fonts that can be used as an `<form>` HTML action.

Example action policy example `form-action 'self';`

frame-ancestors

Defines valid fonts for embedding the resource using `<frame>` `<iframe>` `<object>` `<embed>` `<applet>`. Setting this directive to `'none'` should be roughly equivalent to `X-Frame-Options: DENY` `FRAME-ANCESTORS` `EXAMPLE` `POLICY` `frame-ancestors 'none';`

plugin-types

Defines valid MIME types for plug-ins called via `<object>` and `<embed>`. To load one, `<applet>` you must specify `application / x-java-applet`.

PLUG-IN TYPES Policy Example ``plugin-types application / pdf;``**base-uri**

Defines a set of allowed URLs that can be used in the attribute of an HTML basetag.

URI-BASE Policy Example ``` base-uri 'self'; ```

report-to

Defines a report group name defined by an HTTP Response Report-Header. See the reporting API for more information.

Example Report for Policy `report-to groupName;`

worker-src

Restricts URLs that can be loaded as Worker, SharedWorker or ServiceWorker.

WORKER-SRC Policy Example `worker-src 'none';``

manifest-src

Restricts URLs where application manifests can be loaded.

Example of MANIFEST-SRC Policy `manifest-src 'none';``

prefetch-src

Defines valid sources for pre-fetching and pre-rendering of requests, for example, through the linktag with rel = "prefetch" or rel = "prerender":

`__ PREFETCH-SRC Policy Example__ prefetch-src 'none'``

navigate-to

Restricts the URLs to which the document can navigate by any means. For example, when a link is clicked, a form is submitted or window.location is called. If form-action is present, this directive will be ignored for submitting forms. Implementation status

Navigation Policy Example ``navigate-to example.com``

Recaptcha

ReCAPTCHA is an API provided by Google for forms. It adds security, preventing automatic submission of forms through robots.

reCAPTCHA sample:

1. First, we must request an API Key to activate reCAPTCHA into a Scriptcase application by following the steps below:

To get a **Site key** and **Secret Key** go to the link: <https://www.google.com/recaptcha/admin#list>.

See the image:

Label

It is a project identifier to create the reCAPTCHA keys.

Choose the type of reCaptcha

We must choose the option **reCAPTCHA V2**.

Domains

We can insert multiple domains (one per line) to limit the API uses.

1. Then, we need to accept the Terms of Service (“Accept the reCAPTCHA Terms of Service”).
2. When clicking on **Register**, the page refreshes and shows the integration of reCAPTCHA information. There we can get the **Site Key** and **Secret Key**:

1. Now, we can set the Scriptcase application security:

Site Key

Key generated by Google after reCAPTCHA project creation.

Secret Key

Key generated by Google after reCAPTCHA project creation.

Theme

Defines the reCAPTCHA color. There are two options:

- **Light** :
- **Dark** :

Type

The type of reCAPTCHA. There are two options:

- **Audio**:
- **Image**:

Size

The size of reCAPTCHA. There are two options:

- **Normal** :
- **Compact**:

Position

Here we can define the reCAPTCHA component alignment:

- **Left**: Position the reCAPTCHA component at the left.
- **Center**: Position the reCAPTCHA component at the center.
- **Right** : Position the reCAPTCHA component at the right.

Form Log Configuration

This interface allows you to define a Log schema to the app. The Log schema tracks what the end-users are doing in the app. Those are the events it can tracks: Access, Insert, Update, and delete.

To learn how to create a Log schema [see here](#).

LOG	
ATTRIBUTE	VALUE
Schema	log <input type="button" value="⋮"/>
Events	<div style="display: flex; align-items: center; gap: 10px;"><div style="border: 1px solid #ccc; width: 100px; height: 40px; position: relative;"><div style="position: absolute; top: -10px; right: -10px;">▲</div><div style="position: absolute; bottom: -10px; right: -10px;">▼</div></div><div style="text-align: center;"><input type="button" value="Add >>"/> <input type="button" value="Remove <<"/></div><div style="border: 1px solid #ccc; width: 100px; height: 40px; position: relative;"><div style="position: absolute; top: -10px; right: -10px;">▲</div><div style="position: absolute; bottom: -10px; right: -10px;">▼</div></div></div>

Application Log configuration

Schema Select an existing log schema for the application.

Events You can select just specific events to save in the log.

Form - Fields Overview

The applications can have two types of fields.

Table Fields

Columns of the table connected to the application and their data types.

Example:

In a table with the following structure:

```
CREATE TABLE `orders` (
  `orderid` int(11) NOT NULL,
  `customerid` varchar(5) NULL DEFAULT NULL,
  `employeeid` int(11) NULL DEFAULT NULL,
  `orderdate` date NULL DEFAULT NULL,
  `requireddate` date NULL DEFAULT NULL,
  PRIMARY KEY (`orderid`) USING BTREE
);
```

These are the listed fields on left menu **Fields**:

How to synchronize table fields with a form

Anytime you add/delete a field or change its data type, you have to synchronize your form application with the connected table to apply that changes.

For more information, click [here](#).

Virtual Fields

Fields created inside application to assist in the development process.

How to create a virtual field

1. Inside an application, access the left menu **Fields** and click on **New Field** option.
2. Choose how many fields do you want to create:

1. Create the fields and define type, name and label for each one:

- **Type:** Data type of the field.
- **Name:** Internal name of the field. Used to identify the field on events and Scriptcase interface.
- **Label:** Title of the field displayed on the application.

Scriptcase **doesn't insert** virtual fields on the table after its creation.

Types of fields by applications

Application Table Fields Virtual Fields

Grid	<input type="text"/>	<input type="text"/>
Procedure	<input type="text"/>	<input type="text"/>
Chart	<input type="text"/>	<input type="text"/>
Form	<input type="text"/>	<input type="text"/>
Control	<input type="text"/>	<input type="text"/>
Calendar	<input type="text"/>	<input type="text"/>

Application Table Fields Virtual Fields

Search

PDF Report

The applications **Menu**, **Tree Menu**, **Dashboard** and **Blank** were not listed because they haven't manage fields.

Form - Text Field

General Settings

This type of field allows the developer to create quickly inputs to insert and update data, where the final user can inform its data to be allocated in its database.

Type of Data

Defines the type of the field in the application. In this case we should select **Text**.

Label

Defines the title that will be displayed in the field when the application is executed. The terminology used in the interface is fundamental to the system have a good usability, whe should use names and familiar terms to the final user of the application, instead of using terms from the system.

For example, this text field that has the name **customerid**, the client would have a much better understanding of the functionality of the field when we define the label as **Customer Name**.

Not only a fixed text, the **Label** attribute allows the use of langs to define the field's title, making it possible to use your application in a multi language project.

Label below field

Defines the message to be displayed below the field.

Watermark

Informing a text to the **Watermark** it will be displayed in the input a text as an example that can be informed in the field. The result after set will be this:

Initial Value(type)

Allows the initial definition to the field when the form is in insert mode. It is possible to choose between two options:

Defined Value: When this option is selected, the Initial Value attribute will be available, where we should inform the field's initial value. For example, my initial value is **Arlindo**, when a new register is inserted, the field **Seller Name** will be initialized as Arlindo.

System Data: When this option is selected, the initial value will be the actual date of your computer's system.

Amount of Characters

Allows to set the width of the text field's input that varies with the amount of characters informed. Although, if the amount of characters typed are greater than the setting, the text will be pushed to the left, to keep the maximum amount of characters as defined.

Show HTML Content

When this option is active every HTML, CSS and JavaScript content that are in the database will be displayed with the main value.

Validation Image

When this option is active, a image will be displayed next to the informed field if the field is according to the settings defined by the developer.

In the example below, the field was set to receive at least 5 characters, see what happens when informed

only 4 characters:

However if informed 5 or more characters the field will be displayed as:

Password Field

When this option is active, the text field will be converted to the format used in password fields. For example:

View password characters

By enabling this option, a button will be displayed in the password field so that the password is displayed when clicked.

Save Variable

Allows to save a session variable(global variable) with the field's value, to be used in others applications.

For example, in the login form the username can be saved in session and displayed on the header of others applications.

Variable Name

In this attribute we should define the name of the session variable, active in the previous item, that will receive the field's value.

We should inform only the variable's name, - **var_rating**.

The method to use its value is [global variable](#).

Field Mask

Defines the field mask. There are two types of mask described in the table below:

Character Description

- X It is overridden by any characters returned by the database. Filled is required and the value will be completed with leading zeros when there are fewer characters than the size of the mask.
- Z It is overridden by any characters returned by the database. Its filling is optional and when there are fewer characters than the mask size, nothing will be done about the characters that are missing. In addition the leading zeros will be suppressed. When used in conjunction with the X necessarily the use of this character is to the left of the mask.
- 9 It represents any numeric character (from 0-9)
- A It represents an alpha numeric character (A-Z,a-z)
- * It represents any alpha-numeric character (A-Z,a-z,0-9)entered by the user.

For example, it is possible to set the mast to display a telephone number:

It will be show with this format on runtime:

It is also possible to set the field mask like those examples:

Field mask examples:

Telephone number

Field	Mask Input	Typed Value	Formatted Value
Phone Number	+99 99 9999 - 9999	123456789012	+12 34 5678 - 9012
Phone Number	(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
Phone Number	(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
Phone Number	(zz) xxxx - xxxx	12345678	() 1234 - 5678

Field	Mask Input	Typed Value	Formatted Value
Software Key (Letters only)	AAAA-AAAA-AAAA-AAAA	QWERTYUIASDFGHJK	QWER-TYUI-ASDF-GHJK
Software Key (Letters and numbers)	xxxx-xxxx-xxxx-xxxx	Q1W2E3R4T5Y6U7I8	Q1W2-E3R4-T5Y6-U7I8
License Plate	AAA - 9999	QWE1234	QWE - 1234
Scriptcase Serial Key	A999A999A999-**	D111H111G111DG2P	D111H111G111-DG2P
Multiple masks (Phone Number)	9999-9999;(99)9999-9999;	9999 999 9999	+99 99 9999-9999

Validate with mask

When this option is active it is possible to insert the data with the mask set in the **Field Mask** option.

Complete to the left

When this option is used, the value defined will be added on the left of the information inserted in the field if the value is lower than the maximum set in the **Maximum Size** option.

Field size in database

Defines the field's size related to the size set in the database. This value is already set automatically by default when the application is generated.

Hidden Field

When this option is active, the field will be hidden in the application on runtime.

Label Field

When this option is active, the field will be altered to only a label where the info will be displayed, where updates or inserts will not be possible.

Save HTML tags

When this option is active, it allows to HTML tags in the field to be inserted with the data, instead of being interpreted.

Text input in JavaScript

When this option is active, it will be show every JavaScript content inserted in the database with its main value.

This option can only be used using the **Editable grid view**.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disable Field

Allows the developer to disable the field, so the user can not type a value according with the option defined by the developer.

The available options are: **No** - Initial value of the attribute, this option does not disable the field.

Update Mode - This option only disables the field when editing existing registers.

Insert Mode - This option only disables the field when inserting new registers.

Insert / Update Mode - This option disables the field when editing exciting registers or when inserting new registers.

HTML Type

HTML object used to display the field in the form.

SQL Type

Informs the type of the field in the database.

Values Format

Format of Values Interface

Case Settings

Allows converting the letters of the field when it loses focus. The options are: **Uppercase, Lowercase, Capitalize the first word, Capitalize all words.**

Minimum Length

Determines the minimum number of characters a user must enter in the field.

Integer values greater than or equal to 0 must be provided.

Maximum Length

Determines the maximum number of characters a user can enter in the field.

Integer values greater than or equal to 0 must be provided.

Allowed Characters

Allows to select a set of characters that can be typed into the field. The options are:

- **All** : Allows any type of character to be typed into the field
- **Selected** : Defines a set of characters allowed. Using the configuration below, will be allowed to type letters, numbers and other characters (defined in the attribute More). The letters a, b and c (defined in the Less Attribute) are not allowed.

Regular expression

Regular expression used to validate field content.

Regular expression modifier

Modifiers used in the field content validation regular expression.

Error message

Message to be displayed if the regular expression is not valid.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To

include a value to the field it will automatically calculate the next id.

- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).

- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon ? beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - Multiple Lines Text Field

General Settings

Multiple Lines Text field configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Multiple Lines Text , you can inform a Text value to the field in multiple lines.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Watermark** : Create a placeholder for the selected field.
- **Initial Value (type)** : Allows you to define the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : you will inform the Defined Value here.

Initial Value Configuration Interface.

- **Amount of characters** : Define the amount of characters allowed for the field.
- **Validation Image** : Allows to display an image next to the field when it is being validated.
- **Lines** : Allows to define the amount of lines that the field will have at start.
- **Save Variable** : Allows to save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Allows to define the name for the session variable that will receive the field value.
- **Field size in database** : Determines the field size in bytes. it is used to determine the max size of characters that is allowed to type in.
- **Hidden Field** : This option makes the field hidden, but still allows it's value to be processed through JavaScript or PHP.
- **Label Field** : This options make the field behave as a Read Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

- **Save HTML tags** : This option allows to save the HTML content of the field to the database.
- **Text input in JavaScript** : Allows to save JavaScript code informed in the field to the database.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of field in the database.

Values Format

Format of Values Interface

Case Settings

Allows converting the letters of the field when it loses focus. The options are: **Uppercase, Lowercase, Capitalize the first word, Capitalize all words.**

Minimum Length

Determines the minimum number of characters a user must enter in the field.

Integer values : greater than or equal to 0 must be provided.

Maximum Length

Determines the maximum number of characters a user can enter in the field.

Integer values greater than or equal to 0 must be provided.

Allowed Characters

Allows to select a set of characters that can be typed into the field. The options are:

- **All** : Allows any type of character to be typed into the field
- **Selected** : Defines a set of characters allowed. Using the configuration below, will be allowed to type letters, numbers and other characters (defined in the attribute More). The letters a, b and c (defined in the Less Attribute) are not allowed.

Regular expression

Regular expression used to validate field content.

Regular expression modifier

Modifiers used in the field content validation regular expression.

Error message

Message to be displayed if the regular expression is not valid.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the values from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position

(left,right,center and justify).

- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - Integer Field

General Settings

Data type:

It sets the application field type. When the field is set as Number, it is permissible to define formatting rules of integers.

Label:

It sets the title that will be displayed in the field when you run the application. The terminology used in the interface is fundamental for your system has a good usability. In this case, we recommend you to use names and terms familiar to the end user of the application, instead of using terms originated in the system.

Label below field

Defines the message to be displayed below the field.

Watermark

Informing a text for the **watermark** it will be displayed on the input text with an example of what can be reported in the field. The result after that will be configured:

Initial value (type)

Allows setting an initial value for the field when the application is in inclusion. You can choose between two options:

Pre-set value: When you select this option, the Initial Value attribute will be made available in the place where we inform the initial value of the field.

For example, my initial value is **Arlindo** when inserting a new record the **seller_name** field will start with Arlindo.

System date: When you select this option, the initial value will be the current system date of your computer.

If you select the type system date, it will be not necessary to fill in the initial value attribute.

Amount of characters

It allows you to set the width of the input text field according to the amount of characters. However, if the quantity entered is greater than the set for the characters, the text will be pushed to the left, in order to ensure the maximum amount of characters set in the option of **Values formatting**.

Validation Image

When you enable this option, an image will be shown next to the field informing whether the field is in accordance with the settings of *minimum size* and *Maximum size* (as you can see in the images below) defined in the Formatting value option.

In the example below, the field was set to receive at least 5 characters, see what happens with the image when it receives only 4 characters:

However, if the value inserted has 5 or more characters the the image will change according to example bellow:

Use slider:

It displays a slider component in the field. So you can increase or decrease the value sliding the cursor. You can also customize the increment value, if it increments the value 1 by 1, 2, 5, 10... N.

Field Mask Input:

It sets the mask input for the field. There are two types of mask as described in the table below:

Character Description

X	It is overridden by any characters returned by the database. Filled is required and the value will be completed with leading zeros when there are fewer characters than the size of the mask.
Z	It is overridden by any characters returned by the database. Its filling is optional and when there are fewer characters than the mask size, nothing will be done about the characters that are missing. In addition the leading zeros will be suppressed. When used in conjunction with the X necessarily the use of this character is to the left of the mask.
9	It represents any numeric character (from 0-9)
A	It represents an alpha numeric character (A-Z,a-z)
*	It represents any alpha-numeric character (A-Z,a-z,0-9)entered by the user.

Mask Input Examples:

Field	Mask Input	Typed Value	Formatted Value
Phone Number	+99 99 9999 - 9999	123456789012	+12 34 5678 - 9012
Phone Number	(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
Phone Number	(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
Phone Number	(zz) xxxx - xxxx	12345678	() 1234 - 5678
Software Key (Letters only)	AAAA-AAAA-AAAA-AAAA	QWERTYUIASDFGHJK	QWER-TYUI-ASDF-GHJK
Software Key (Letters and numbers)	xxxx-xxxx-xxxx-xxxx	Q1W2E3R4T5Y6U7I8	Q1W2-E3R4-T5Y6-U7I8
License Plate	AAA - 9999	QWE1234	QWE - 1234
Scriptcase Serial Key	A999A999A999- **	D111H111G111DG2P	D111H111G111-DG2P
Multiple masks (Phone Number)	9999-9999;(99)9999-9999;	9999 999 9999	+99 99 9999-9999

Validate with Mask

By enabling this option you will be able to enter data according to the mask that was configured in the option **Field Mask** and Scriptcase will validate it.

Record Variable

Allows you to record a session variable with the value of the field ([global variable] [var_glob]), to be used in other applications.

Example, in the login form the username can be saved in session and displayed in the header of other applications.

Variable Name

In this option you must set the session variable name, enabled in the previous item, which will receive the value of the field.

You need to inform only the variable name, for example: **var_seller**.

The recovery of the value is made as [Global Variable][var_glob]{:target='blank'}.

Field size in Database

This option sets the size of the field relative to the size that is configured in the database. By default this value is already configured automatically when the application is generated.

Hidden Field

This option when enabled will hide the field inside the application at the time of execution.

Label Field

By enabling this option, the field will be changed to only one label where the information will be displayed, so it is not possible to make changes or inserts in the field configured as label.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disable field

Allows you to disable the field, making it impossible for the user to enter a value according to the developer-defined option.

The available options are:

No - initial value of the attribute, this option does not disable the field. **Update mode** - This option disables the field only when editing the records. **Insert mode** - This option disables the field only inserting new records. **Update/Insert mode** - This option disables the field in both editing and inserting new records.

HTML Type

HTML object used to display the field in the application.

Tipo SQL:

Reports the SQL type of the field as it is configured in the database.

Values Format

Use regional settings:

It allows you to apply regional settings to the number fields formatting. When this option is not selected it will be displayed the attributes group, minus sign and negative number format.

Digit grouping:

It allows you to define if the field displays the digit grouping separator.

Maximum Size:

It allows you to define the maximum size that will be used in the field of the application.

Minimum Value:

It allows you to define the minimum value that will be used in the field of the application.

Maximum Value:

It allows you to define the maximum value that will be used in the field of the application.

Grouping:

It allows you to define which character is used to separate thousands. This option is only available when the option to use regional settings is disabled.

Negative sign:

It allows you to define which character will be used for the display of negative numbers. This option is only available when the option to use regional settings is disabled.

Negative number format:

It allows you to define the placement of the negative sign in relation to value. This option is only available when the option to use regional settings is disabled.

Accept:

It allows to define if the field accept only negative values, positive-only or both.

Display Calculator:

This option when enabled will display a calculator to assist the end user to perform calculations.

Use Spin:

This option applies a Spin component to the number field. So the end user can increase or increase the numbers using it. You will also be able to set a minor or major range for the spin.

Smaller increment for the Spin::

Sets the minimum range of the Spin component.

Greater increment for the Spin:

Sets the maximum range of the Spin.

Database Value

It allows you to define how the value to be written to the database.

Preset value:

It allows you to specify a fixed value or associate it to global variables created inside the project and save it automatically to the database field.

Auto increment (automatic):

It allows you to use the increase generated automatically by the database to fill the field. It is used only when the database field is of type AUTO INCREMENT or similar. For the databases that use string, such as Oracle, PostGres and Firebird, you must inform the name of the string.

Auto increment (manual):

The application itself will simulate an auto increment in the field. So the value of the field will be calculated automatically by the application.

Date of inclusion:

The field will be populated automatically with server date during the inclusion.

Date of update:

The field will be populated automatically with server date during the update.

User IP:

The field will get the IP of the machine that is accessing the application.

Calculated by the database:

The field value is assigned by the database itself. The field will not be used in the process of updating. For example: it will be updated via a Trigger.

Null:

The field will be automatically filled with null.

Lookup Settings

The Lookup is a way used to provide the end user a list of values description/name where the items can be selected and used in the application. For example, for a field sex that in the database is represented with M or F values can be presented as male or female dynamically with the lookup. So you will be able to retrieve these values from a database table or manually, if the reference table does not exist.

Example:

Lookup Methods

There are two lookup methods available:

Manual: To use this method it is necessary to inform the selection conditions manually to the Lookup.

Automatic: To use this method it is necessary to use a lookup query from the database to access the reference table.

Editing-automatic lookup:

Select Command:

It sets the SQL command that will retrieve the value to display inside the Grid field. The command must have the following format

```
SELECT field_to_be_displayed FROM table WHERE key_field = {grid_field}
```

The Grid field must be always referenced between curly braces {}, So at run time, the field braces will be replaced by its value in the table.

Multiple Options:

When the Select command informed return multiple values, the option must be selected.

Delimiter:

It sets the tab of values returned by the Select command, this option should be filled when the "Yes" option is checked in the multiple attribute options.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

Use a specific connection:

This option allows you to select another existing connection in the project, other than the current connection, to select the values for the lookup.

Edit Lookup - Manual:

Lookup used to modify the display of the field with predefined values.

Lookup Types

It sets the operating mode of the lookup can be: single value, multiple values (delimiter), multiple values (position) and multiple values (binary).

Single value: it will be displayed only one value for the field. There is a direct replacement of the value stored in the Bank for a label defined in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value of "M" will be replaced by "Male".

Multiple Values (Delimiter):

By using this option it will be displayed multiple values for the selected field. The values must be separated by a delimiter to be informed. A replacement of parts from a string stored in the field, separated by a delimiter for values contained in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value S;M will be replaced by Sports and Movies.

Delimiter: Character used to separate the values within the same string.

Multiple Values (Position)

Allows you to recover information stored in a single string of the selected field. In order for this information to be retrieved must be informed, in addition to the label, the starting position and the number of bytes that each information occupies within the string.

As an example we will use a string to store Sex, Marital status and Hobby respectively. Sex occupies one byte, Status one byte and Hobby two bytes .

For this purpose we define the list as:

Label	Value	Start	Size
Male	M	1	1

Label	Value	Start	Size
Female	F	1	1
Married	M	2	1
Single	S	2	1
Study	ST	3	2
Sportes	SP	3	2
Reading	LE	3	2

Example: the string MMST would be presented in the query as: Male Married Study

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value M will be replaced by Male.

Start: : Starting position in the string where the information is recorded. The first position is always 1.

Size: : Number of bytes that the information occupies in the string.

Multiple values (binary):

It allows you to retrieve several information stored in decimal form of the selected field.

As examples we will use the following list (although not informed in the interface of inclusion of values in the list, each item has a value assigned automatically according to the order):

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

To display the data, a decomposition of the decimal number stored in the bank is performed. For example, numbers 11 and 12 (written in the database) would be decomposed as follows:

$$11 = 1 + 2 + 8 = (\text{Sports} - \text{Culture} - \text{Reading})$$

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

$$12 = 4 + 8 = (\text{Leisure} - \text{Reading})$$

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

Label:

Text that will be displayed in the Grid.

Include Button:

Includes in the list the values populated in the Label and value fields.

Alter Button:

It changes the attributes of the selected item.

Delete Button:

Deletes the selected item.

Clean Button:

It cleans the fields

Save Button:

Allows the user to save the entire list, for later use using the Load Lookup definition option.

Load Lookup definition:

Allows you to load a predefined value list for use as a lookup.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.

- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon ? beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a beside the field.

Pop-up

Display a default icon ? beside the field. To display the message just click in the icon that a Pop-up will be

displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - Decimal Field

General Settings

Decimal field configuration Interface.

Data Type

Define the field type to Decimal. It allows defining the Decimal number format.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Watermark

Create a placeholder to specify a short hint that describes the expected value of an input field

Initial Value (type)

It allows you to define the initial value for the field when in insert mode. The options are:

- **Defined Value:** The field receives the value informed into the input option.

Initial Value Configuration Interface.

- **System Date:** The field receives the current server time.

Amount of characters

Define the number of characters allowed for the field.

Validation Image

Allows displaying an image next to the field when validating it.

Save Variable

It allows saving the value of the field in a session variable to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the session variable that will receive the field value.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Label Field

It sets the field like a Read-Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disabled Field

Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the attributes Grouping, Negative Symbol and negative number format.

Digit grouping

It defines if the field displays the digits separator.

Maximum Size

It defines the max size of the field.

Minimum Value

It defines the min value of the field.

Maximum Value

It defines the max value of the field.

Decimal Precision

It defines the number of decimal places for the field.

Digit Grouping Separator

It defines the character to separate the thousands.

Decimal Separator

It defines the decimal separator.

Negative sign

It defines the character to represent negative numbers.

Negative number format

It defines the position of the Negative sign.

Accept

It determines if the field accepts only negative, positive, or both numbers.

Show a calculator

It displays an icon beside the field to help the user calculating the field value.

Auto-complete with zeros

It automatically informs the decimal places when not specified. If disabled, the user always needs to inform the decimal value.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the values from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected

below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - Currency Field

General Settings

Currency field configuration Interface.

Data Type

Define the field type to Currency. It allows defining the currency number format.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Watermark

Create a placeholder to specify a short hint that describes the expected value of an input field

Initial Value (type)

It allows you to define the initial value for the field when in insert mode. The options are:

- **Defined Value:** The field receives the value informed into the input option.

Initial Value Configuration Interface.

- **System Date:** The field receives the current server time.

Amount of characters

Define the number of characters allowed for the field.

Validation Image

Allows displaying an image next to the field when validating it.

Save Variable

It allows saving the value of the field in a session variable to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the session variable that will receive the field value.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Label Field

It sets the field like a Read-Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disabled Field

Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the attributes Grouping, Negative Symbol and negative number format.

Digit grouping

It defines if the field displays the digits separator.

Currency symbol usage

It defines if the field displays the Currency Symbol of the Regional Settings.

Maximum Size

It defines the max size of the field.

Minimum Value

It defines the min value of the field.

Maximum Value

It defines the max value of the field.

Decimal Precision

It defines the number of decimal places for the field.

Digit Grouping Separator

It defines the character to separate the thousands.

Decimal Separator

It defines the decimal separator.

Negative sign

It defines the character to represent negative numbers.

Negative number format

It defines the position of the Negative sign.

Accept

It determines if the field accepts only negative, positive, or both numbers.

Show a calculator

It displays an icon beside the field to help the user calculating the field value.

Auto-complete with zeros

It automatically informs the decimal places when not specified. If disabled, the user always needs to inform the decimal value.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the values from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The

select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - Date Field

General Settings

Date field configuration Interface.

Data Type

Define the type of field. When setting it to Date, you can inform its format into this field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Watermark

Create a placeholder to specify a short hint that describes the expected value of an input field

Initial Value (type)

It allows you to define the initial value for the field when in insert mode. The options are:

- **Defined Value:** The field receives the value informed into the input option.

Initial Value Configuration Interface.

- **System Date:** The field receives the current server Date.

Amount of characters

Define the number of characters allowed for the field.

Validation Image

Allows displaying an image next to the field when validating it.

Save Variable

It allows saving the value of the field in a session variable to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the session variable that will receive the field value.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Label Field

It sets the field like a Read-Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disabled Field

Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the date separator attribute (Check the Regional Settings).

Date separator

It allows you to inform the separator symbol for the date.

First Day

Defines the first day of the week.

Display

It offers predefined formats for displaying dates.

Internal Format

It allows defining the field format when the SQL type is different from **Date**. You must use the characters **Y**, **M** and **D** that correspond to **Year**, **Month** and **Day**.

Use Combo-box

It allows you to select the date from a combo-box.

Minimum Date

- **Fixed Date**: Inform the minimum date allowed presented in the selected date format.
- **Current Date**: By clicking on the icon next to the text field, ScriptCase offers the following options:
 1. **Actual date**: Set the current date as the minimum allowed date.
 2. **Actual date with increment**: Set the minimum date with the current date more(+) the days, months, or years you want to increment.
 3. **Actual date with decrement**: Set the minimum date with the current date minus(-) the days, months, or years you want to decrement.

Maximum Date

- **Fixed Date**: Inform the maximum date allowed presented in the selected date format.
- **Current Date**: By clicking on the icon next to the text field, ScriptCase offers the following options:
 1. **Actual date**: Set the current date as the maximum allowed date.
 2. **Actual date with increment**: Set the maximum date with the current date more(+) the days, months, or years you want to increment.

3. **Actual date with decrement:** Set the maximum date with the current date minus(-) the days, months, or years you want to decrement.

Display Format

It enables the Date format beside the field when informing the date.

Date display position

Available when activating the **Display Format** flag, defines where the filling mode will be displayed. The options are: **Right**, **B Lower** and **Watermark**.

Display Calendar

It enables a calendar icon beside the field that allows selecting the date from a calendar to fill the input.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the values from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - Time Field

General Settings

Time field configuration Interface.

Data Type

Define the type of field. When setting it to Time, you can inform a time format into this field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Watermark

Create a placeholder to specify a short hint that describes the expected value of an input field

Initial Value (type)

It allows you to define the initial value for the field when in insert mode. The options are:

- **Defined Value:** The field receives the value informed into the input option.

Initial Value Configuration Interface.

- **System Date:** The field receives the current server time.

Amount of characters

Define the number of characters allowed for the field.

Validation Image

Allows displaying an image next to the field when validating it.

Save Variable

It allows saving the value of the field in a session variable to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the session variable that will receive the field value.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Label Field

It sets the field like a Read-Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disabled Field

Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the Time. When not enabled, it displays the Time separator attribute (Check the Regional Settings).

Display

It offers predefined formats for displaying Time.

Minimum time

Minimum value accepted by the field.

- **Fixed Time** : Enter the minimum time that scriptcase will criticize in the time type field in the format as presented.
 - **Current Time** : When clicking on the icon next to the box, scriptcase provides the following options:
 - **Current Time with Increment** : The minimum time will be the current time (+) the days or months or years that you increment.
 - **Current Time with Decrement** : The minimum time will be the current time (-) the days or months or years that you want to decrement.

Maximum time

Maximum value accepted by the field.

- **Fixed Time**: Manually enter the maximum time that scriptcase will input in the time type field in the format as it is presented.
 - **Current Time**: When you click the icon next to the box, scriptcase provides the following options:
 - **Current Time with Increment**: The maximum time will be the current time (+) the days or months or years that you increment.
 - **Current Time with Decrement**: The maximum time will be the current time (-) the days or months or years that you want to decrement.

Display Format

It enables the Time format beside the field when informing the time.

Display position

Available when activating the **Display Format** flag, defines where the filling mode will be displayed. The options are: **Right**, **B Lower** and **Watermark**.

Display full name

Displays the full name instead of the mask. Ex: day month year.

Use Time picker

It uses the JQuery plug-in to choose the time.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - Date and Hour Field

General Settings

Date and Time field configuration Interface.

Data Type

Define the type of field. When setting it to Date and Time, you can inform its format into this field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Watermark

Create a placeholder to specify a short hint that describes the expected value of an input field

Initial Value (type)

It allows you to define the initial value for the field when in insert mode. The options are:

- **Defined Value:** The field receives the value informed into the input option.

Initial Value Configuration Interface.

- **System Date:** The field receives the current server Date and Time.

Amount of characters

Define the number of characters allowed for the field.

Validation Image

Allows displaying an image next to the field when validating it.

Save Variable

It allows saving the value of the field in a session variable to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the session variable that will receive the field value.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Label Field

It sets the field like a Read-Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disabled Field

Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Values Format

Regional Settings

Allows you to apply regional date formatting settings to the field. When not selected, the Date Separator and Time Separator attributes will be displayed.

Display

Allows you to select the display format of the date/time field.

Minimum Date

Minimum value accepted as input for the field.

- **Minimum Date** :
 - **Fixed Date** : Enter the minimum date that scriptcase will criticize in the date type field in the format as presented.
 - **Current Date** : When clicking on the icon next to the box, scriptcase provides the following options:
 - **Simple Current Date** : Will leave the current date as the maximum date, that is, no one born after the current day will enter the form.
 - **Current Date with Increment** : The minimum date will be the current date (+) the days or months or years that you want to increment.
 - **Current Date with Decrement** : The minimum date will be the current date (-) the days or months or years that you want to decrement.

Maximum Date

Maximum value accepted as input for the field.

- **Maximum Date** :
 - **Fixed Date** : Enter the maximum date manually that scriptcase will criticize in the date type field in the format as it is presented.
 - **Current Date** : When clicking the icon next to the box, scriptcase provides the following options:
 - **Simple Current Date** : Will leave the current date as the maximum date, that is, no one born after the current day will enter the form.
 - **Current Date with Increment** : The maximum date will be the current date (+) the days or months or years that you want to increment.
 - **Current Date with Decrement** : The maximum date will be the current date (-) the days or months or years that you want to decrement.
 - **Display Format** : Enables display of the mode

Minimum time

Maximum value accepted by the field.

- **Fixed Time:** Manually enter the maximum time that scriptcase will input in the time type field in the format as it is presented.
 - **Current Time:** When you click the icon next to the box, scriptcase provides the following options:
 - **Current Time with Increment:** The maximum time will be the current time (+) the days or months or years that you increment.
 - **Current Time with Decrement:** The maximum time will be the current time (-) the days or months or years that you want to decrement.

Maximum time

Maximum value accepted by the field.

- **Fixed Time:** Manually enter the maximum time that scriptcase will input in the time type field in the format as it is presented.
 - **Current Time:** When you click the icon next to the box, scriptcase provides the following options:
 - **Current Time with Increment:** The maximum time will be the current time (+) the days or months or years that you increment.
 - **Current Time with Decrement:** The maximum time will be the current time (-) the days or months or years that you want to decrement.

Hour value

Sets the value to be assigned to the time when it is empty and a date is selected in the date picker.

- **Available values are:** Start of day, End of day and Current time.

Apply date limits to the calendar

Apply Minimum and Maximum Date limits when selecting calendar dates, avoiding the selection of dates outside these limits.

Display Format

Display the field format in the data cell.

Date display position

Available when activating the **Display Format** flag, defines where the fill mode will be displayed. The options are: **Right**, **Below** and **Watermark**.

Display full name

Displays the full name instead of the mask. Ex: day month year.

Group Date and Time

Group date and time in the same field.

Display Calendar

Allows you to display a calendar icon next to the field. This allows you to select the month and year, passing the value defined in the calendar to the field.

New Calendar

Show a new calendar with jquery, or the old calendar.

Years Limit

Number of years that will be displayed on the calendar.

View week number

Display week number in application.

Additional months

Display additional months in the calendar.

Available options are: 1, 2 and 3.

Show Combo year and month

Show Combo Year and month in calendar

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Form - HTML Image Field

General Settings

HTML Image field Configuration Interface.

Data Type

Define the type of field. When setting it to HTML Image, it allows to display an image into the field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Image

Set it to display an image. The icon "Select Image" lists all images from Scriptcase and your uploaded images. The "Upload an image" option allows you to send a copy to the Scriptcase server.

Border

Define the width of the Image border in Pixels.

Width

Define the image width size in Pixels.

Height

Define the image height size in Pixels.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.

Form - Card Field

General Settings

Credit Card Number Configuration Interface.

- **Data Type** : Defines the type of field for the application. When it is defined as a Credit Card Number, the field verifies if the value is valid.
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be easier to the user understand if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Watermark** : Creates a placeholder on the field with the text informed.
- **Initial Value (type)** : Set the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Amount of characters** : Defines the amount of characters allowed for the field.
- **Validation Image** : Display an image next to the field when it is being validated.
- **Save Variable** : Saves a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Set the name for the session variable that will receive the field value.
- **Field size in database** : Determines the size in bytes of the fields. It is used to determine the max amount of characters to be typed in.
- **Field Mask** : Defines the display mask for the field. There are three types of masks that can be merged.

Character	Description
9	Represents a numeric character (0-9)
A	Represents an alpha numeric character (A-Z,a-z)
*	Represents any alpha numeric character (A-Z,a-z,0-9) typed by the user.

It is possible to merge two or more masks simultaneously, separated by a semi coma with the smallest mask at start. The replacement occurs when the user is typing when the lowest amount of character exceeds.

Examples of Masks

Field	Mask	Informed Value	Formatted Value
Telephone Number	+99 99 9999 - 9999	123456789012	+12 34 5678 - 9012
Software Key (Only Numbers)	AAAA-AAAA-AAAA-AAAA	QWERTYUIASDFGHJK	QWER-TYUI-ASDF-GHJK
Software Key (Letters an Numbers)	**_--**	Q1W2E3R4T5Y6U7I8	Q1W2-E3R4-T5Y6-U7I8
License Plates	AAA - 9999	QWE1234	QWE - 1234
ScriptCase License	A999A999A999-**	D111H111G111DG2P	D111H111G111-DG2P
Multiple Masks (Telephone)	9999-9999;(99)9999-9999; 9999 999 9999		+99 99 9999-9999

- **Hidden Field** : This option makes the field hidden, but still allows it is value to be processed through JavaScript or PHP.
- **Label Field** : This option make the field behave as a Read Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Display the data type of field in the database.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the values from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the font size, that will be applied to the application field title.
 - **Font Color** : Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.

- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon ? beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - Card Type Field

General Settings

Credit Card field configuration Interface.

Data Type

Define the field type to Credit Card. It sets a combo-box for selecting the credit card type.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Watermark

Create a placeholder to specify a short hint that describes the expected value of an input field

Save Variable

It allows saving the value of the field in a session variable to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the session variable that will receive the field value.

Field size in database

It determines the field size in bytes. It limits the max quantity of the allowed characters.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Label Field

It sets the field like a Read-Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

Disabled Field

Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values Interface.

Credit Card

It allows to define which cards will be listed and their internal value.

Use Title/Deny

It allows informing a new value if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen. It defines the label and value with the Negative Value and the Title.

Negative value

The value of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Title

Label of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Related Field

It allows informing which fields contain the values of Credit Card Number so that it can do the validations correctly.

Reload

It Reloads the form when modifying the value.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookups Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the values from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position

(left,right,center and justify).

- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Form - E-mail Field

General Settings

Email field configuration Interface.

- **Data Type** : Defines the type of field for the application. When set to Email, the field applies validations for an email format.
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name is "Client Name".
- **Watermark** : Create a placeholder for the selected field.
- **Initial Value (type)** : Defines the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Amount of characters** : Defines the amount of characters allowed for the field.
- **Validation Image** : Displays an image next to the field when it is being validated.
- **Save Variable** : Saves a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Defines the name for the session variable that will receive the field value.
- **Hidden Field** : This option makes the field hidden, but still allows its value to be processed through Javascript or PHP.
- **Label Field** : This options make the field behave as a Read Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

- **Display Icon** : Displays the Email icon next to the field.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of field in the database.

Values Format

Format of Values Interface.

Credit Card

It allows to define which cards will be listed and their internal value.

Use Title/Deny

It allows informing a new value if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen. It defines the label and value with the Negative Value and the Title.

Negative value

The value of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Title

Label of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Related Field

It allows informing which fields contain the values of Credit Card Number so that it can do the validations correctly.

Reload

It Reloads the form when modifying the value.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - URL Field

General Settings

URL field configuration Interface.

Data Type

Define the type of field. When setting it to YouTube, it allows displaying an Youtube video on the field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Watermark

Create a placeholder to specify a short hint that describes the expected value of an input field

Initial Value (type)

It allows you to define the initial value for the field when in insert mode. The options are:

- **Defined Value:** The field receives the value informed into the input option.

Initial Value Configuration Interface.

- **System Date:** The field receives the current server time.

Amount of characters

Define the number of characters allowed for the field.

Validation Image

Allows displaying an image next to the field when validating it.

Save Variable

It allows saving the value of the field in a session variable to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the session variable that will receive the field value.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Label Field

It sets the field like a Read-Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

Display Icon

Displays an icon beside the field.

Disabled Field

Defines if the field will be disabled in “Insert Mode”, “Update Mode” or in “Insert and Update Mode”.

Show the URL as a clickable link

It sets the content of the field as a clickable link.

Target handling where the link will open

Target to open the link when clicking on it.

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values Interface.

Credit Card

It allows to define which cards will be listed and their internal value.

Use Title/Deny

It allows informing a new value if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen. It defines the label and value with the Negative Value and the Title.

Negative value

The value of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Title

Label of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Related Field

It allows informing which fields contain the values of Credit Card Number so that it can do the validations correctly.

Reload

It Reloads the form when modifying the value.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only

when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is be accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced buy the curly brackets { }. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - HTML Color Field

General Settings

HTML Color field configuration Interface.

- **Data Type** : Select the type of field for the application. When set to HTML Color, you can select a color to be used in the form.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Initial Value (type)** : Set the initial value to the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Amount of characters** : Defines the amount of characters allowed for the field.
- **Validation Image** : Displays an image next to the field when it is being validated.
- **Save Variable** : Save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Defines the name for the session variable that will receive the field value.
- **Hidden Field** : This option makes the field hidden, but still allows its value to be processed through JavaScript or PHP.
- **Label Field** : This options make the field behave as a Read Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of the field in the database.

Values Format

Format of Values Interface.

Credit Card

It allows to define which cards will be listed and their internal value.

Use Title/Deny

It allows informing a new value if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen. It defines the label and value with the Negative Value and the Title.

Negative value

The value of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Title

Label of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Related Field

It allows informing which fields contain the values of Credit Card Number so that it can do the validations correctly.

Reload

It Reloads the form when modifying the value.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the values from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - HTML Editor Field

General Settings

HTML Editor field configuration Interface.

- **Data Type** : Defines the type of field for the application. When set to HTML Editor, you can inform any type of character and they will be saved in HTML form.
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name is "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Height** : Set the Height in pixels to the HTML Editor field.
- **Hidden Field** : This option makes the field hidden, but still allows its value to be processed through Javascript or PHP.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **SQL Type** : Displays the data type of field in the database.

Toolbar

HTML Editor toolbar settings Interface.

- **Properties**
 - **Position** : Location of the HTML Editor toolbar.
 - **Alignment** : Toolbar button alignment.
 - **Status** : Status Bar Display (Do not Display, Top and Bottom).
 - **Amount** : The Amount of lines of the HTML Editor toolbar.
- **Button Organization** : Positions the toolbar buttons.
- **Preview** : You can visualize the toolbar according to the previous settings.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.

Form - Localization Field

General Settings

Location field Configuration Interface.

Data Type

Define the type of field. When setting it to Location, you can see a Combobox with the Languages that are part of the Project.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Reload

It links the informed text to reload the form when clicking on it.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - Theme Field

General Settings

Theme field configuration Interface.

Data Type

Define the field type to Theme. it shows a combobox with the list of themes set in your project.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Reload

It Reloads the form when modifying the value.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Form - Google Maps Field

General Settings

Google Maps field Configuration Interface.

- **Data Type** : Select the type of field for the application. When it is defined as Google Maps, it will use the Google Maps API to display the map in the Form Applications
- **Label** : Set the title to the field in the application. For example: if the field is defined in the database as cmp_name_client, it will be easier to the user understand if the name is "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Home** : Defines what type of parameters will be used in the API.

Home Configuration Interface.

- **Display Mode** : Indicates the display mode of the map. It can be opened in a Modal or in a new Window.
- **Width** : Defines the width of the map that is going to be displayed.
- **Height** : Defines the height of the map that is going to be displayed.
- **Zoom** : Defines the initial Zoom (available from the Google API) of the Map location.
- **API Key** : API Key for authorization to use Google Maps in the Application. (Required only for the versions 2 or earlier of the Google API.)

The API Key is a unique key, composed by a string(text) alphanumeric, which is the license to use the service. When you subscribe to use the service, the key is tied to the domain and the directory of the server. All the pages that use the API needs to be in the same directory that was used for the subscription. In case you have a web server on your local machine, you just need to possess a key for testing, and to do this you only need to set http://localhost in the domain of the subscription.

To get your API Key access the site by [clicking here](#)

- **Link Type** : Defines how the link will be displayed.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

Form - Image (Database) Field

General Settings

Image (Database) field Configuration Interface.

Data Type

Define the type of field. When setting it to an Image (Database), all the Images files are stored and loaded directly from the Database.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Image Border

Width of the Image border in Pixels.

Image Height

Image height size in Pixels.

Image Width

Image width size in Pixels.

Progress bar

It displays a progress bar when sending the files to the server.

Upload area

It displays a drag and drop area to upload the file.

Upload area icon

Font-awesome icon for viewing in the file upload zone.

Clickable upload area

Hides the upload button and turns the upload area responsible for the upload function.

Maintain Aspect

It maintains the original aspect ratio of the image when resizing it.

Display link only

It allows showing a link to open the image in another window with the original size. (with no re-dimensioning)

Open in Another Window

Allows to open the image in another window.

Extensions and upload size

This setting defines the extensions allowed for uploading and the maximum size of each one.

This setting is important for the security of your project, as it prevents unwanted files from being uploaded.

Note If no value is informed, all extensions will be allowed. The file size will be limited by your PHP configuration.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Disabled Field

Defines if the field will be disabled in “Insert Mode”, “Update Mode” or in “Insert and Update Mode”.

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Multi-upload

This option allows to upload multiple files and store them on a table referencing a record from another table.

To use this option you first need to create a virtual field. _

Multi-Upload Configuration.

Amount of columns

The number of columns to display the files in the Field.

Files sorting

It enables the files sorting after the upload.

Position of the delete

Set the position of the checkbox delete files option.

Position on the upload

Set the position of the checkbox delete files option.

Show status

Display the upload status.

Table

Select the table to stores the file information when uploading.

After selecting the table, you can see a field list of the chosen table to associate the parameters for each field when inserting a new record or updating an existing record.

Multi-Upload fields of the table Configuration.

- **File Name** It gets the name of the loaded file.
- **Upload** It gets the binary value of the file.
- **File Size** Field that will storage the file size in the Database.

- **Auto Increment** Use it only when the field in the database is an auto-increment.
- **Manual Increment** The form is responsible for managing the auto-increment, calculating the value of the field before inserting the record.
- **Foreign Key** It associates the file with a value of a field in the current form.
- **Defined** You can specify a constant value or use a global variable. [global_var]
- **Date of Insertion** It gets the data of the server when inserting the record.
- **Datetime of Insertion** It gets the data and time of the server when inserting the record.
- **User IP** It gets the IP of the computer that is accessing the application.
- **Calculated by the Database** The Database calculates the value of the field.
- **Calculated by the Database if empty** If the value is empty in the application, the Database calculates the value of the field.
- **Null** The field will the null value.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.

- [Upload field with customizable rules \(size and format\)](#)

Form - Image (File Name) Field

General Settings

Data Type

Define the type of field. When setting it to Image (File Name), all the Images files are stored and loaded directly from the Database.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Image Border

The width of the Image border in Pixels.

Image Height

Image height size in Pixels.

Image Width

Image width size in Pixels.

Maintain Aspect

It maintains the original aspect ratio of the image when resizing it.

Progress bar

It displays a progress bar when sending the files to the server.

Upload area

It displays a drag and drop area to upload the file.

Upload area icon

Font-awesome icon for viewing in the file upload zone.

Clickable upload area

Hides the upload button and turns the upload area responsible for the upload function.

Cloud storage API

Profile with the API information (Dropbox, Google Drive or Amazon S3) used to upload the file to the cloud created in Tools > API

Storage API directory

Directory name for upload to the Cloud Storage API. Eg.: files/docs/{id}. The file will be saved in the root folder if this field is empty.

Storage API cache directory

Local directory for caching files sent to the cloud via the storage API

Keep file after uploading via API

It also saves the file in the default folder for images or documents after uploading to a cloud storage API.

Deletion in the storage API

When deleted in the application, the file will also be removed from the folder in the cloud storage API.

Increment file

It inserts a number increment into the file name if there is already another one with the same name in the upload folder.

Subdirectory for local storage

It sets the Sub-folder name of the stored files. It is relative to the directory of Document upload (see the Settings). It is possible to use global variables or local variables to format the name of the sub-folder.

Create Subfolder

It creates the sub-folder if not already created.

Image Caching

Time in minutes to store the image in the cache.

Hide image name

It displays only the image, without the name.

Files Deletion

It Deletes the files from the directory when deleting a record from the database.

Display link only

It allows showing a link to open the image in another window with the original size. (with no re-dimensioning)

Open in Another Window

Allows to open the image in another window.

File Size

It allows defining the field to store the file size in the database.

Extensions and upload size

This setting defines the extensions allowed for uploading and the maximum size of each one.

This setting is important for the security of your project, as it prevents unwanted files from being uploaded.

Note If no value is informed, all extensions will be allowed. The file size will be limited by your PHP configuration.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Disabled Field

Defines if the field will be disabled in “Insert Mode”, “Update Mode” or in “Insert and Update Mode”.

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Multi-upload

This option allows to upload multiple files and store them on a table referencing a record from another table.

To use this option you first need to create a virtual field. _

Multi-Upload Configuration.

Amount of columns

The number of columns to display the files in the Field.

Files sorting

It enables the files sorting after the upload.

Position of the delete

Set the position of the checkbox delete files option.

Position on the upload

Set the position of the checkbox delete files option.

Show status

Display the upload status.

Table

Select the table to stores the file information when uploading.

After selecting the table, you can see a field list of the chosen table to associate the parameters for each field when inserting a new record or updating an existing record.

Multi-Upload fields of the table Configuration.

- **File Name** It gets the name of the loaded file.
- **Upload** It gets the binary value of the file.
- **File Size** Field that will storage the file size in the Database.
- **Auto Increment** Use it only when the field in the database is an auto-increment.
- **Manual Increment** The form is responsible for managing the auto-increment, calculating the value of the field before inserting the record.
- **Foreign Key** It associates the file with a value of a field in the current form.
- **Defined** You can specify a constant value or use a global variable. [global_var]
- **Date of Insertion** It gets the data of the server when inserting the record.
- **Datetime of Insertion** It gets the data and time of the server when inserting the record.

- **User IP** It gets the IP of the computer that is accessing the application.
- **Calculated by the Database** The Database calculates the value of the field.
- **Calculated by the Database if empty** If the value is empty in the application, the Database calculates the value of the field.
- **Null** The field will the null value.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - Document (Database) Field

General Settings

Document (Database) field Configuration Interface.

Data Type

Define the type of field. When setting it to Document (Database), all the document files are stored and loaded directly from the Database.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Icon

It displays an icon beside the field to identify the document type.

Progress bar

It displays a progress bar when sending the files to the server.

Upload area

It displays a drag and drop area to upload the file.

Upload area icon

Font-awesome icon for viewing in the file upload zone.

Clickable upload area

Hides the upload button and turns the upload area responsible for the upload function.

File Name

It allows defining the field to store the file name in the database.

File Size

It allows defining the field to store the file size in the database.

Extensions and upload size

This setting defines the extensions allowed for uploading and the maximum size of each one.

This setting is important for the security of your project, as it prevents unwanted files from being uploaded.

Note If no value is informed, all extensions will be allowed. The file size will be limited by your PHP configuration.

Allow download in read only fields

Allow file download even when field is read-only.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Disabled Field

Defines if the field will be disabled in “Insert Mode”, “Update Mode” or in “Insert and Update Mode”.

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Multi-upload

This option allows to upload multiple files and store them on a table referencing a record from another table.

To use this option you first need to create a virtual field. _

Multi-Upload Configuration.

Amount of columns

The number of columns to display the files in the Field.

Files sorting

It enables the files sorting after the upload.

Position of the delete

Set the position of the checkbox delete files option.

Position on the upload

Set the position of the checkbox delete files option.

Show status

Display the upload status.

Table

Select the table to stores the file information when uploading.

After selecting the table, you can see a field list of the chosen table to associate the parameters for each field when inserting a new record or updating an existing record.

Multi-Upload fields of the table Configuration.

- **File Name** It gets the name of the loaded file.
- **Upload** It gets the binary value of the file.
- **File Size** Field that will storage the file size in the Database.
- **Auto Increment** Use it only when the field in the database is an auto-increment.
- **Manual Increment** The form is responsible for managing the auto-increment, calculating the value of the field before inserting the record.
- **Foreign Key** It associates the file with a value of a field in the current form.
- **Defined** You can specify a constant value or use a global variable. [global_var]

- **Date of Insertion** It gets the data of the server when inserting the record.
- **Datetime of Insertion** It gets the data and time of the server when inserting the record.
- **User IP** It gets the IP of the computer that is accessing the application.
- **Calculated by the Database** The Database calculates the value of the field.
- **Calculated by the Database if empty** If the value is empty in the application, the Database calculates the value of the field.
- **Null** The field will the null value.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.

- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - Document (File Name) Field

General Settings

Document (File Name) field Configuration Interface.

Data Type

Define the type of field. When setting it to Image (File Name), all the Images files are stored and loaded directly from the Database.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Progress bar

It displays a progress bar when sending the files to the server.

Upload area

It displays a drag and drop area to upload the file.

Upload area icon

Font-awesome icon for viewing in the file upload zone.

Clickable upload area

Hides the upload button and turns the upload area responsible for the upload function.

Cloud storage API

Profile with the API information (Dropbox, Google Drive or Amazon S3) used to upload the file to the cloud created in Tools > API

Storage API directory

Directory name for upload to the Cloud Storage API. Eg.: files/docs/{id}. The file will be saved in the root folder if this field is empty.

Storage API cache directory

Local directory for caching files sent to the cloud via the storage API

Keep file after uploading via API

It also saves the file in the default folder for images or documents after uploading to a cloud storage API.

Deletion in the storage API

When deleted in the application, the file will also be removed from the folder in the cloud storage API.

Increment file

It inserts a number increment into the file name if there is already another one with the same name in the upload folder.

Subdirectory for local storage

It sets the Sub-folder name of the stored files. It is relative to the directory of Document upload (see the Settings). It is possible to use global variables or local variables to format the name of the sub-folder.

Create Subfolder

It creates the sub-folder if not already created.

Icon

It displays an icon beside the field to identify the document type.

File Size

It allows defining the field to store the file size in the database.

Extensions and upload size

This setting defines the extensions allowed for uploading and the maximum size of each one.

This setting is important for the security of your project, as it prevents unwanted files from being uploaded.

Note If no value is informed, all extensions will be allowed. The file size will be limited by your PHP configuration.

Allow download in read only fields

When enabled, this option allows file download even when the field is set to read-only.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Disabled Field

Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".

HTML Type

HTML Object to display the field in the form.

Files Deletion

It Deletes the files from the directory when deleting a record from the database.

SQL Type

It informs the data type of field in the database.

Multi-upload

This option allows to upload multiple files and store them on a table referencing a record from another table.

To use this option you first need to create a virtual field. _

Multi-Upload Configuration.

Amount of columns

The number of columns to display the files in the Field.

Files sorting

It enables the files sorting after the upload.

Position of the delete

Set the position of the checkbox delete files option.

Position on the upload

Set the position of the checkbox delete files option.

Show status

Display the upload status.

Table

Select the table to stores the file information when uploading.

After selecting the table, you can see a field list of the chosen table to associate the parameters for each field when inserting a new record or updating an existing record.

Multi-Upload fields of the table Configuration.

- **File Name** It gets the name of the loaded file.
- **Upload** It gets the binary value of the file.
- **File Size** Field that will storage the file size in the Database.
- **Auto Increment** Use it only when the field in the database is an auto-increment.
- **Manual Increment** The form is responsible for managing the auto-increment, calculating the value of the field before inserting the record.
- **Foreign Key** It associates the file with a value of a field in the current form.
- **Defined** You can specify a constant value or use a global variable. [global_var]

Form - Barcode Field

General Settings

Configuration Interface of the Barcode Field.

- **Data Type** : DataType of the field for the application.
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be easier to the user understand if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Disabled Field** : Defines if the field will be disabled in the "Insert Mode" , "Update Mode" or in "Insert and Update Mode".
- **SQL Type** : Database field type.

Values Format

Configuration Interface of the Barcode Field.

- **Type** : Type of Barcode.
- **Text** : Barcode Text for illustration purposes.
- There are **18 types of barcodes**, that are listed below:

Barcode configuration interface.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).

- **Width** : To define a width for the field.
- **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - Select Field

General Settings

Select field configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Select, you can select multiple option from a combo box (Select Field).
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Watermark** : Create a placeholder for the selected field.
- **Initial Value (type)** : Allows you to define the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.
- **Use Select2** : Uses the new component for data selection, allowing searches within the select.
- **Display Select2 search area** : Sets whether to display the search field within Select2.

Initial Value Configuration Interface.

- **Save Variable** : Allows to save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Allows to define the name for the session variable that will receive the field value.
- **Field size in database** : Determines the field size in bytes. It is used to determine the max size of characters that is allowed to type in.
- **Hidden Field** : This option makes the field hidden, but still allows it's value to be processed through Javascript or PHP.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of field in the database.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is be accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

Selecting the lookup type.

- **Lookup Method - Automatic**

Lookup used to list the values that will be displayed on the Checkbox field. These values will be recovered dynamically using the Select command.

Automatic Lookup Interface.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the key_field will be stored in the table field.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimitation.

- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Height** : Defines the height for the select object.
- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.
- **Link** : Allows to create a link to another form allowing to manipulate the list displayed on the select field. After the manipulation, the select object it updated automatically.

- **Lookup Method - Manual**

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table

that contains this information.

Manual Lookup Interface.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).

- **Single Value** :

Setting up Single Value Lookup

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Default** : With this option enabled, the selected item will be inserted to the table when committed.
- **Height** : Defines the height for the select object.

- **Multiple Values (delimiter)**

You can store various values for the select field. The values are separated by the informed delimiter. For example: the combination **Sport, Cinema and Tourism** selected in form will be stored like **E;C;T** in case the delimiter is ; (semi coma).

Setting up Multiple Values (delimiter)

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Height** : Defines the height for the select object.

- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Martial Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man, Single** and **Read**, in the database would be stored the following value **MSRD**.

Setting up Multiple Values (position)

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Negative** : Value to be saved in the table in case there is not any valued selected on the field.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.

- **Size** : Amount of bytes that is going to occupy in the string.
- **Height** : Defines the height for the select object.

- **Multiple Values (binary)**

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

Editing Lookup Configuration Multiple Values (Binary)

- **Label** : Text that will be displayed in the item list of the select field.
- **Height** : Defines the height for the select object.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.

- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

Displaying the original lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Lookup Method - Actual value

This lookup is used to list all the values in the selected field.

This lookup will apply a “distinct” to your SQL query.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

• CSS of the Title

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

• CSS of the Field

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

• CSS of the Input Object

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio,

- Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - Double Select Field

General Settings

Double Select field configuration Interface.

- **Data Type** : Select the type of field for the application. When set to Double Select you can have multiple options selected.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name is "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Initial Value (type)** : Defines the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Save Variable** : Saves a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Set the name for the session variable that will receive the field value.
- **Field size in database** : Determines the size in bytes of the fields. It is used to set the max amount of characters to be typed in.
- **Hidden Field** : This option makes the field hidden, but still allows its value to be processed through Javascript or PHP.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Displays the data type of field in the database.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Date of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or F can be presented like Male or Female or in a dynamic way, getting these values from the database.

Lookup Settings Display for the field.

Automatic Lookup Interface..

- **SQL Select Statement** : Defines the SQL command that will get the values displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the key_field will be stored in the table field.

- **Height** : Set the height(lines) of the field interface.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter than (;).
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Selects another specific connection existing in the project. The select command will be done on the second connection.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top,

- text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - Checkbox Field

General Settings

CheckBox field configuration Interface.

- **Data Type** : Select the type of field for the application. When set to CheckBox, you can have multiple options selected.
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be easier to the user understand if the name is "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Initial Value (type)** : Defines the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Save Variable** : Saves a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Define the name for the session variable that will receive the field value.
- **Field size in database** : Determines the size in bytes of the fields. It is used to determine the max amount of characters to be typed in.
- **Hidden Field** : This option makes the field hidden, but still allows it's value to be processed through JavaScript or PHP. .
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of field in the database.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is be accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or F can be presented like Male or Female or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

• Lookup Methods

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query). *Selecting the lookup type.*

◦ Lookup Method - Automatic

Lookup used to list the values that will be displayed on the CheckBox field. These values will be recovered dynamically using the Select command.

Automatic Lookup Interface.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the key_field will be stored in the table field.

- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Option check all** : Displays two options on the field to check and uncheck all.

- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Selects another specific connection existing in the project. The select command will be done on the second connection.

◦ Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

Manual Lookup Interface.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).

- **Single Value** :

Setting up Single Value Lookup

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Default** : With this option enabled, the selected item will be inserted to the table when committed.
- **Columns** : Set the amount of columns, for the list of items.

- **Multiple Values (delimiter)**

You can store various values for the checkBox field. The values are separated by the informed delimiter. For example: the combination **Sport, Cinema** and **Tourism** selected in form will be stored like **E;C;T** in case the delimiter is ; (semi coma).

Setting up Multiple Values (delimiter)

- **Label** : Text that will be displayed in the item list of the checkBox.
 - **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
 - **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
 - **Columns** : Set amount of columns, for the list of items.
- **Multiple Values (position)**

Stores a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Martial Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in the database would be stored the following value **MSRD**.

Setting up Multiple Values (position)

- **Label** : Text that will be displayed in the item list of the checkBox.
 - **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
 - **Negative** : Value to be saved in the table in case there is not any valued selected on the field.
 - **Start** : Starting position of the string that is going to be stored. The first position is always 1.
 - **Size** : Amount of bytes that is going to occupy in the string.
 - **Columns** : Set the amount of columns, for the list of items.
- **Multiple Values (binary)**

Stores a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

Setting up Multiple Values (Binary)

- **Label** : Text that will be displayed in the item list of the checkBox.
 - **Columns** : Allows you to inform the amount of columns, for the list of items.
 - **Insert Button** : Adds to the list the values informed on the fields Label and Value.
 - **Update Button** : Modifies the attributes of the selected item.
 - **Remove Button** : Remove the selected item from the list.
 - **Clear Button** : Clear the Fields.
 - **Save Button** : Saves all the items of the list, to use on other fields, just click on Load lookup definition.
 - **Load lookup definitions** : Refreshes the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
 - **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
 - **Option check all** : Displays two options on the field to check and uncheck all.
-
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.
-
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - Radio Field

General Settings

Radio field configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Radio, your allowed to select one of the options listed.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Initial Value (type)** : Allows you to define the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Save Variable** : Allows to save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Allows to define the name for the session variable that will receive the field value.
- **Field size in database** : Determines the size in bytes of the fields. It is used to determine the max amount of characters to be typed in.
- **Hidden Field** : This option makes the field hidden, but still allows it's value to be processed through Javascript or PHP. .
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of field in the database.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is be accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example,

the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

• Lookup Methods

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query). *Selecting the lookup type.*

◦ Lookup Method - Automatic

Lookup used to list the values that will be displayed on the Checkbox field. These values will be recovered dynamically using the Select command.

Automatic Lookup Interface.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the key_field will be stored in the table field.

- **Columns** : Allows you to inform the amount of columns, for the list of items.

- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

◦ Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

Manual Lookup Interface.

- **Label** : Text that will be displayed in the item list of the radio.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Default** : With this option enabled, the selected item will be inserted to the table when committed.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the

lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.

- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

 Displaying the original lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Ajax Settings

 Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).

- **Width** : To define a width for the field.
- **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - Text Auto-Complete Field

General Settings

Text auto complete field configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Text auto complete, you can inform a value based on the select statement of the lookup settings and it will manipulate an internal Text for the data.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Watermark** : Create a placeholder for the selected field.
- **Initial Value (type)** : Allows you to define the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You'll inform the Defined Value here.
- **Use Select2**: Uses the new component for data selection, allowing searches within the select.
- **Amount of characters for the Select2** : Sets the number of characters to start the search in Select2.
- **Amount of lines for the Select2** : Sets the maximum number of rows to list the search result in Select2.
- **Width for the Select2** : Sets a width for the area for the Select2.

Initial Value Configuration Interface.

- **Amount of characters** : Define the amount of characters allowed for the field.
- **Save Variable** : Allows to save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Allows to define the name for the session variable that will receive the field value.
- **Complete to the Left** : Allows to define the character that will be used to complete the value to the left that the user typed in to the max size of the field defined in the Field size in database option.
- **Field size in database** : Determines the field size in bytes. it is used to determine the max size of characters that is allowed to type in.
- **Hidden Field** : This option makes the field hidden, but still allows its value to be processed through JavaScript or PHP.
- **Label Field** : This options make the field behave as a Read Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

- **Validate on submit** : Validate the field only when the form is submitted.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of field in the database.

Values Format

Format of Values Interface

Case Settings

Allows converting the letters of the field when it loses focus. The options are: **Uppercase**, **Lowercase**, **Capitalize the first word**, **Capitalize all words**.

Minimum Length

Determines the minimum number of characters a user must enter in the field.

Integer values greater than or equal to 0 must be provided.

Maximum Length

Determines the maximum number of characters a user can enter in the field.

Integer values greater than or equal to 0 must be provided.

Allowed Characters

Allows to select a set of characters that can be typed into the field. The options are:

- **All** : Allows any type of character to be typed into the field
- **Selected** : Defines a set of characters allowed. Using the configuration below, will be allowed to type letters, numbers and other characters (defined in the attribute More). The letters a, b and c (defined in the Less Attribute) are not allowed.

Regular expression

Regular expression used to validate field content.

Regular expression modifier

Modifiers used in the field content validation regular expression.

Error message

Message to be displayed if the regular expression is not valid.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field.

- **Rows** : Allows to define the amount of records displayed in the field.
- **Width** : Defines the width the size of capture box (Capture Text).
- **Search options** : Allows to define the search settings of the field(Start equal to, Any part and End equals to).
- **Capture Text** : When not enabled, you will only view the field to inform the data. See an example below. *lookup Settings configuration Interface.*
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

lookup Settings validation configuration Interface.

- **Show label with the description** : Displays a label with the description.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc

- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed

- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - Number Auto-Complete Field

General Settings

Number auto complete field configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Number auto complete, you can inform a value based on the select statement of the lookup settings and it will manipulate an internal number for the data.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Watermark** : Create a placeholder for the selected field.
- **Initial Value (type)** : Allows you to define the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Amount of characters** : Define the amount of characters allowed for the field.
- **Save Variable** : Allows to save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Allows to define the name for the session variable that will receive the field value.
- **Complete to the Left** : Allows to define the character that will be used to complete the value to the left that the user typed in to the max size of the field defined in the Field size in database option.
- **Field size in database** : Determines the field size in bytes. It is used to determine the max size of characters that is allowed to type in.
- **Hidden Field** : This option makes the field hidden, but still allows its value to be processed through JavaScript or PHP.
- **Label Field** : This options make the field behave as a Read Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

- **Validate on submit** : Validate the field only when the form is submitted.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of field in the database.

Values Format

Format of Values Interface

Case Settings

Allows converting the letters of the field when it loses focus. The options are: **Uppercase**, **Lowercase**, **Capitalize the first word**, **Capitalize all words**.

Minimum Length

Determines the minimum number of characters a user must enter in the field.

Integer values greater than or equal to 0 must be provided.

Maximum Length

Determines the maximum number of characters a user can enter in the field.

Integer values greater than or equal to 0 must be provided.

Allowed Characters

Allows to select a set of characters that can be typed into the field. The options are:

- **All** : Allows any type of character to be typed into the field
- **Selected** : Defines a set of characters allowed. Using the configuration below, will be allowed to type letters, numbers and other characters (defined in the attribute More). The letters a, b and c (defined in the Less Attribute) are not allowed.

Regular expression

Regular expression used to validate field content.

Regular expression modifier

Modifiers used in the field content validation regular expression.

Error message

Message to be displayed if the regular expression is not valid.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field.
- **Rows** : Allows to define the amount of records displayed in the field.
- **Width** : Defines the width the size of capture box (Capture Text).
- **Search options** : Allows to define the search settings of the field(Start equal to, Any part and End equals to).
- **Capture Text** : When not enabled, you will only view the field to inform the data. See an example

below. *lookup Settings configuration Interface.*

- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

lookup Settings validation configuration Interface.

- **Show label with the description** : Displays a label with the description.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.

- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse

leaves the help icon.

- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - Signature Field

General Settings

Configuration Interface of the Signature Field.

The signature field will help you creating more sophisticated forms and making it possible to store signatures in your database. Inside our development environment we have specific settings that will help you to customize your field, those options are:

- **Data Type** : You can define the type of field for the application. When it is defined as a text, it accepts letters, numbers and special characters.
- **Label** : Lets you define a label to the field in the application. For example: if the field is defined in the database as cmp_name_client, it will be easier to the user understand if the name is "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Background color** : Defines a color to the field background by using a valid hexadecimal color value or by choosing a color from the color palette.
- **Pen color**: Set a color to the pen by using a valid hexadecimal color value or by choosing a color from the color palette.
- **Width** : Lets you define a width to the field.
- **Height** : Set a height to the field.
- **Subtitle** : Defines the subtitle that will be displayed beside the field.
- **Initial Value** : Lets you define the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
- **Save Variable** : Save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Set the name for the session variable that will receive the field value.
- **Disabled Field** : Define if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : Displays the HTML Object that will be used to display the field in the form.
- **SQL Type** : Displays the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of ScriptCase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **CSS of the Title**
 - **Font** : Select the font type, that will be applied to the application field title.
 - **Font Size** : Defines the font size, that will be applied to the application field title.
 - **Font Color** : Choose a color to the font by using a valid hexadecimal color value or from the color picker.
 - **Background Color** : You can define the color for the field by using a valid hexadecimal color value or from the color picker.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Set the underline style to the font.
 - **Border style** : Choose a style for the border.
 - **Collapse** : Defines the collapse for the border.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Choose a color for the border, using a color palette to apply to the title.
 - **Horizontal Alignment** : Position the label of the field in the wanted position (left,right,center and justify).
 - **Vertical Alignment** : Position the label of the field in the wanted position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : Defines a width for the title of the field.
 - **Height** : Set a height for the title of the field.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed

Form - Rating Field

General Settings

This field allows the developer to create a field for rating using stars (or any other image), where the final user can select a rate option.

Attribute descriptions

Data Type

Define the field type to **Rating**.

Label

The Label option lets you define the title of a field. Example: If the database field name is "**Stars**", You can display a different name for the user, like "**Stars**".

Besides use a fixed text, the **Label** attribute allows the use of **Langs** to define the field title, allowing the [internationalization of your application](#).

Label below field

Defines the message to be displayed below the field.

Subtitle

Define the subtitle of the field, below the ratings. **Example:** "Thank you for your feedback!".

As in the **Label**, the **subtitle** attribute also allows the use of **Langs** for the [internationalization of your application](#).

Amount of icons

It defines how many icons it will display in the field. The value set in this attribute must be according to the evaluation rules.

Initial Value (type)

Allow the definition of an initial value for the field when the form application is in insert mode. The only option available in this field is **Defined**. Selecting this option the attribute **Initial Value** will be showed for set the value.

Example: The initial value is 3 when inserting a new record, the rate field will initiate with 3 stars already selected.

The value defined in this attribute will overlap any value defined previously.

Save variable

It allows saving the value of the field in a session variable([Global variable](#)) to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the **session variable** that will receive the field value.

We must inform only the variable name, - **var_rating**.

We can get the value as a [global variable](#).

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of ScriptCase, there are the same attributes available in Interface.

Display Settings configuration Interface.

• CSS of the Title

- **Font** : Select the font type, that will be applied to the application field title.
- **Font Size** : Defines the font size, that will be applied to the application field title.
- **Font Color** : Choose a color to the font by using a valid hexadecimal color value or from the color picker.
- **Background Color** : You can define the color for the field by using a valid hexadecimal color value or from the color picker.
- **Bold** : Applies the bold style to the font.
- **Underline** : Set the underline style to the font.
- **Border style** : Choose a style for the border.
- **Collapse** : Defines the collapse for the border.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Choose a color for the border, using a color palette to apply to the title.
- **Horizontal Alignment** : Position the label of the field in the wanted position (left,right,center and justify).
- **Vertical Alignment** : Position the label of the field in the wanted position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : Defines a width for the title of the field.
- **Height** : Set a height for the title of the field.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon ? beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a beside the field.

Pop-up

Display a default icon ? beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard ? icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field’s help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field’s help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - Rating Smile Field

General settings

This field type allows the final user evaluate with an emoji that goes from **Very Bad** to **Excellent**.

Data type

Defines the data type of the field in the application. In this case we should select **Rating Smile**.

Label

Defines the title that will be shown in the field when the application is running. The used terms in the interface are essential to the system has good usability, we should use comum name and terms for the final user, instead of the default values of the system.

For example, for the rating smile field, the client would have a better understanding of the field function when the label is **Product evaluation**.

Besides a fixed text, the **Label** allow to use of lang to define the field title, this way is possible to use the [application internationalization](#).

Label below field

Allows you to define a message that will be displayed under the field, which can serve as a help or caption for example.

Subtitle

Define a subtitle that will be shown beside the field. Ex.: Thank you for the feedback!

Below is one example of an application subtitle:

Values and hints

Allow to the developer to define the values to each emoji taht will be saved at the data base and allow to define a hint (**It is show passing the mouse above the emoji**)

Display format

Allows the developer to define the format that the emojis will be shown.

In case the first option is defined, the emojis will be shown like this:

In case the second option is defined, the emojis will be shown like this:

Icon size

Allows defining the icon size in pixels.

Rating padding

Allows for defining the padding value between the emojis.

Icon colors

Allows the icon colors to be defined in each emoji.

Initial value (type)

Allows defining a default value to the field when the application will be in insert mode. Is possible to choose between two options:

Default value: Selecting this option, the default value will be available, where we should input the field's default value. For example, my default value is **Allan**, inserting a new register, the field **Seller Name** will start with Allan.

Save variable

It allows saving a session variable ([global variable](#)) with the field value, to be used in other applications.

For example, in the login form the username can be saved in session and displayed in the header of other applications.

Variable name

In this one we should define the variable's name in session, available at the last item, which will receive the field value.

We should inform only the variable's name, **var_seller**.

The recovery of the value is done in the form of a [global variable](#).

Disable field

Allow to Disable field, impossible to change the defined value.

Available options are:

No - Default value, this option don't disable the field.

Update mode - This option disable the field only at update. **Insert mode** -This option disable the field only at insert. **Insert/Update mode** -This option disable the field in both insert and update.

HTML type

HTML object used to show the form field.

SQL type

Infomrs the field type at the data base.

Display Sttings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).

- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon ? beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Form - Rating Thumbs Field

General settings

This field type allows the final user to save data with the icons like or dislike.

Data type

Defines the data type of the field in the application. In this case we should select **Rating Thumbs**.

Label

Defines the title that will be shown in the field when the application is running. The used terms in the interface are essential to the system has good usability, we should use comum name and terms for the final user, instead of the default values of the system.

For example, for the rating thumbs field, the client would have a better understanding of the field function when the label is **Product evaluation**.

Besides a fixed text, the **Label** allow to use of lang to define the field title, this way is possible to use the [application internationalization](#).

Label below field

Allows you to define a message that will be displayed under the field, which can serve as a help or caption for example.

Subtitle

Define a subtitle that will be shown beside the field. Ex.: Welcome to help us with your feedback!

Below is one example of an application subtitle:

Values and hints

Allow to the developer to define the values to each icon taht will be saved at the database and allow to define a hint (**It is shown passing the mouse above the icon**)

Display format

Allows the developer to define the format that the emojis will be shown.

In case the first option is defined, the emojis will be shown like this:

In case the second option is defined, the emojis will be shown like this:

Icon size

Allows defining the icon size in pixels.

Rating padding

Allows for defining the padding value between the emojis.

Icon colors

Allows the icon colors to be defined in each emoji.

Initial value (type)

Allows defining a default value to the field when the application will be in insert mode. Is possible to choose between two options:

Default value: Selecting this option, the default value will be available, where we should input the field's default value. For example, my default value is **Allan**, inserting a new register, the field **Seller Name** will start with Allan.

Save variable

It allows saving a session variable ([global variable](#)) with the field value, to be used in other applications.

For example, in the login form the username can be saved in session and displayed in the header of other applications.

Variable name

In this one we should define the variable's name in session, available at the last item, which will receive the field value.

We should inform only the variable's name, **var_seller**.

The recovery of the value is done in the form of a [global variable](#).

Disable field

Allow to Disable field, impossible to change the defined value.

Available options are:

No - Default value, this option don't disable the field.

Update mode - This option disable the field only at update. **Insert mode** -This option disable the field only at insert. **Insert/Update mode** -This option disable the field in both insert and update.

HTML type

HTML object used to show the form field.

SQL type

Infomrs the field type at the data base.

Display Sttings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).

- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Form Application using Pages

feature.

Pages Settings

The form application already comes with a default page, identified as "Pag1", but it is possible to rename it. Use the pages when you have an application that contains many fields. A form with more than 20 fields in a vertical way is challenging to use. So you could arrange the fields into the blocks and the blocks into the pages.

PAGES SETTINGS

Title Font Defines a font to be used in step titles. If not informed, it will use the same font defined in the application theme.

Title Font Size Defines the font size for step titles. If not informed, the same font size defined in the application theme will be applied.

Title color for the completed steps Defines the font color for the title of steps already completed. If not informed, the same color defined in the application theme will be applied.

Title color for the current step Sets the font color for the title of the current step. If not informed, the same color defined in the application theme will be applied.

Title color for the next step Defines the font color for the next step title. If not informed, the same color defined in the application theme will be applied.

The color after next step Defines the font color for the title of steps after the next step. If not informed, the same color defined in the application theme will be applied.

Description Font Defines the font for the step description. If not informed, the same font defined in the application theme will be applied.

Font size for description Defines the font size for step descriptions. If not informed, the same font size defined in the application theme will be applied.

Description color for the completed step Defines the font color for the description of steps already completed. If not informed, the same color defined in the application theme will be applied.

Description color for the current step Defines the font color for the current step description. If not informed, the same font color defined in the application theme will be applied.

Description color for the next step Defines the font color for the next step description. If not informed, the same font color defined in the application theme will be applied.

Description color after the next step Defines the font color for the step description after the next step. If not informed, the same font color defined in the application theme will be applied.

Layout

This module lets you editing display options for the application. You can apply visualization themes, organize blocks, define values, and the display format of the Header and Footer.

Blocks

Blocks are “containers” where you can position the application fieldSlides of Forms, Controls, or Grids.

Scriptcase creates applications with one block by default. You can add more blocks as you wish, to organize it in the best way.

See below, the Columns Organization, and where you can define the position of the next block: beside or below the current one.

Block		Title	Label		Fields		Organization			
Op	Name	Label	Display	Display	Position	Columns	Position	Next	Width	Collapse
Pag1										
	form_orders	form_orders	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Pag2										
	Block 2	Block 2	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Blocks not shown										

Application Block configuration

On the left side of each block, there are two icons, the first one to edit the information of the block and the second one to delete the block.

Organizing the position of the Blocks

See below how to modify the display order of the Blocks in one Page.

Click and drag the block that you desire to modify to its new position.

Block		Title	Label		Fields		Organization			
Op	Name	Label	Display	Display	Position	Columns	Position	Next	Width	Collapse
Pag1										
	form_orders	form_orders	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Pag2										
	Block 2	Block 2	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Blocks not shown										

Application Block Display configuration

- See how to remove a block from the display

Click on the block desired and drag it to the item “Blocks not Shown”. This way, you can also drag the block to another page if desired. See the images below.

Block		Title		Label		Fields			Organization			
Op	Name	Label	Display	Display	Position	Columns	Position	Next	Width	Collapse

Application Block Display configuration

Block

- **Name:** The name that identifier the Block.
- **Label:** Title of the block to display in the application.

Title

- **Display:** It controls the display of the block title.

Label

- **Display:** It controls the display of the field labels of the block.
- **Position:** Options to display label :
 1. **Above:** Display the label above the field.
 2. **Beside:** Display the label beside the field.
 3. **Below:** Display the label below the field.

Fields

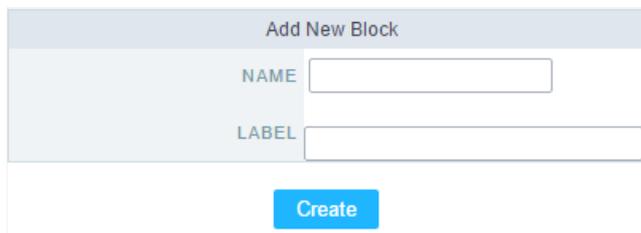

- **Columns:** Amount of columns side by side in the block.
- **Position:** The way to display the fields in the block:
 1. **Below:** Display the fields one below the other respecting the number of columns.
 2. **Beside:** Display the fields one beside the other respecting the number of columns.
 3. **Line:** Display the fields one beside the other with no tabulation.

Organization

- **Next:** The way to display the blocks in the page:
 1. **Below:** Set to show the following block below the current one.
 2. **Beside:** Set to show the following block beside the current one.
 3. **Tab:** Set to show the following block in a different tab then the current one.
- **Width:** Set the block width in pixels or percentages. Use the symbol “%” to indicates the value in percentage.
- **Collapse:** Enables the option to close the block.

Create a New Block

To include new blocks in an Application, click on the button **Create New Block**. Then, enter the name and label of the block in the following interface and finish by click on Create.

The screenshot shows a form titled "Add New Block". It contains two input fields: "NAME" and "LABEL". Below the fields is a blue "Create" button.

Creating application blocks configuration

Name

Name of the Block.

Label

Title of the block to display in the application.

Edit Blocks

To edit a block, click on the icon  that is on the left side of the block. Then you can see the following interface to define the parameters of the blocks. Click on Save to finish.

Application Block editing interface

Name

Name of the block. ##### Title

Block title for display. ##### Display Title

This option, when active, allows displaying the block title. ##### Title Font

Set the font family of the block title. ##### Font Size

Set the font size of the block title. ##### Font Color

Set the font color of the block title. ##### Background Color

Set the Background Color of the block title. ##### Background image

Set a Background image for the block title. ##### Title Height

Height in pixels of the block title line. ##### Horizontal Alignment

Horizontal Alignment of the block title (Left, Center, and Right). ##### Vertical Alignment

Vertical Alignment of the block title (Top, Middle, and Bottom). ##### Display Label

Display the labels of the fields in the block. ##### Columns

Amount of field columns in a block. ##### Columns Width

Set the field column width of the block. ##### Label Color

Color of the field labels. ##### Fields Organization

The way to display the fields in the block. ##### Label Position

Set the position of the field labels of the block.

The options are:

- **Beside** - This option positions the label on the right side of the field.

User

- **Above** - This option places the label above the field.

- **Below** - This option places the label below the field.

Next Block

Set the position of the following block relating to the current one. ##### Border Color
The border Color for the block. ##### Border Width
The border Width for the block. ##### Block Width
The width for the block. ##### Block Height
The Height for the block. ##### Cell Spacing
The Cell Spacing in the block. ##### Collapse
It enables the option to close the block.

Settings

ScriptCase creates an app by using default values defined per project, but you can change those values for a specific application on this interface.

▲ LAYOUT SETTINGS

Header Template	Flat	Template name used for the application header.
Footer Template	Default	Template name used for the application footer.

Application Layout

Header Template

Allows choosing the look of the application Header.

Footer Template

Allows choosing the look of the application Footer.

Button

Allows choosing the button theme for the application.

Themes

Choose one of the selected themes in the project properties. It defines the look of the application, like colors, fonts, and others.

Header

Here we can define if we want to display the header or not, the application title, and fill the header variables. The header looks according to the selected template in the Layout settings interface.

▲ HEADER	
ATTRIBUTE	VALUE
Display Header	<input checked="" type="checkbox"/>
Insertion Title	<input type="text" value="{lang_othr_frmi_tit} - orders"/>
Update Title	<input type="text" value="{lang_othr_frmu_tit} - orders"/>
Header Variables	
SC_HEADER	<input type="text" value="Title"/>
SC_VALUE	<input type="text" value="Date"/> ?

Application Header Configuration

Display Header

This option determines if we want to display the header or not.

Title

Allows informing the title of the application.

Header Variables

We must fill the variable fields with one of the types available in the Combobox. Depending on the type, you need to associate content with it. Those are the types:

- **Field:** When you choose the option "**Field**", it opens a Combobox to choose a field to associate the field value with the header. This option will be enabled in the applications that you can crate a fields
- **Title:** It displays the value of "**Application Title**" in the header.
- **Date:** It displays the system's date in "yyyy/mm/dd" format in the header. There are several display formats available, and you can change it by using the text field beside it. To access existing formats, click on the hint to see an explanation.
- **Image:** It displays a field to inform the name of an existing image in the server. You can select an image by clicking on the

icon “**Choose Image**”, and you still can upload new images by using the button “**Upload**”. .

- **Value:** It displays the content of the text input. You can inform static texts and “**Global Variables**”. e.g. “Employee Name: [v_name]”.

Depending on the Application, you may have more than one title option.

Footer

FOOTER	
ATTRIBUTE	VALUE
Display Footer	<input type="checkbox"/>

Form Events Overview

Most Scriptcase applications, with the exception of Tabs and Dashboard applications, have events that can be used to create business rules, validations and changes to the application's CSS, among other things.

When events are executed?

Each event is executed at a certain moment in the application and has an execution order, for this reason, they have different functions within the creation of a business rule and validations.

They can be triggered automatically, as in the case of the **onApplicationInit** and **onScriptInit** events, where they are executed when the application starts. Also, they can be triggered through user interaction, as with the **onNavigate** and **onValidate** events, which are executed when browsing the application or submitting a form, respectively.

For information about the timing of events execution or other information, access the documentation of the desired event.

how they work?

By default, the events already have handle for opening `<?php` and closing `?>` of PHP tags, so they are ready to receive PHP code and macros from Scriptcase.

However, it is possible to use other languages in the event, such as **JQuery**, **JavaScript**, **CSS** and **HTML**. For this, it is necessary to close the PHP tag `?>` of the event, so that the code can be added.

Remembering that it is necessary to reopen the event's PHP tag `<?php`, otherwise the application will not run correctly.

When closing the PHP tag in a Scriptcase event, the executed language is HTML.

Example of using other languages:

onApplicationInit - Form

First non-formal event executed, being triggered before the assembly of SQL and HTML.

It works as a preparation for an application, since it is possible among other things, various manipulatives, performs validations and changes a connection with a macro **sc_change_connection**, for example.

See below an example of how you use it.

No example below, or **form_orders** will be altered according to the user accessing the system.

If variable [usr_login] is equal to **admin**, or user will have access to or form with the possibility of inserting and excluding a registration.

If a variable has some other value, or user still has access to the form, therefore, only with a possibility of altering a registry.

Code example

```
if ([usr_login] == 'admin') {  
    sc_apl_conf ("form_orders", "insert", "in");  
    sc_apl_conf ("form_orders", "remove", "activated");  
} else {  
    sc_apl_conf ("form_orders", "insert", "off");  
    sc_apl_conf ("form_orders", "remove", "off");  
}
```

onNavigate - Form

In the form, this event is always executed when performing a navigation, through the **navigation buttons**, **navigation by page** or the option **go to**.

onScriptInit - Form

These formulas are executed before the application starts. At this moment, the application locals variables are not available.

onLoadRecord - Form

This event is executed before the form is loaded. In this moment all the applications variables are available.

onLoad - Form

This event is executed before the form is loaded. In this moment all the applications variables are available.

onRefresh - Form

This event occurs when the form application is reloaded, is possible to reload the form based on fields (select, radio, checkbox) or using the toolbar's Refresh button

onValidate - Form

This event is executed when the form is submitted to the server, using the buttons: "add", "change" or "delete"

In this event, it is allowed to perform validations before the form data is sent to the database.

In the example below, using the form_orders application, we will validate the freight field, where if the value assigned to the freight field is greater than 30, an error message will be triggered to the user and the form submission will be cancelled.

Code example:

```
if({freight} > 30){  
  sc_error_message("Shipping value is too high");  
}
```

onValidateFailure - FailureForm

This event occurs when submitting the application in OnValidate, has errors generated by macros `sc_error_exit`, `sc_error_message`, or error detected by scriptcase (errors related to Database).

onValidateSuccess - Form

This event occurs after submitting the form and executing the onValidate event, so if the validation is successful and contains no errors, generated by the `sc_error_exit` or `sc_error_message` macros, the `onValidateSuccess` event is executed.

onBeforeInsert - Form

This event occurs after form validation (onValidate and onValidateSuccess), when clicking the Insert button, and before executing the SQL command to add the record to the database.

Example: We check the user privileges table before inserting the record, if he does not have privilege, we should send an error message.

```
sc_lookup(priv_ins," select priv_ins from tb_privileges where login = [var_login] ");
if({priv_ins [0][0]} != 'YES'){
  sc_error_message(" you do not have privileges to perform this operation ");
}
```

onAfterInsert - Form

This event occurs after clicking the Insert button on the form. The form will execute the onValidate, onValidateSuccess and onBeforeInsert events, and right after executing the SQL command to insert the database record, it will execute the onAfterInsert event.

Example: After the inclusion of a record in the database, we want to store the inserting operation in a log table.

```
sc_exec_sql(" insert into log values ([glo_user],'target table','insert',{key_field}) "); //insert the user id that was stored in a session variable [glo_user] and the newly added registry key {key_field}.
```

onBeforeInsertAll - Form

This event occurs after clicking the Insert button of the **multiple record form**. The form will execute the onValidate and onValidateSuccess events, then it will execute the **onBeforeInsertAll** event before starting the execution of the SQL commands to insert the records into the database.

Note: This event is triggered only once, regardless of the number of lines inserted in one click on the Insert button.

Example: We check the user privileges table before inserting the record, if he does not have privilege, we should send an error message.

```
sc_lookup(priv_ins," select priv_ins from tb_privileges where login = [var_login] ");  
if({priv_ins [0][0]} != 'YES'){  
    sc_error_message(" you do not have privileges to perform this operation ");  
}
```

onAfterInsertAll - Form

This event occurs after clicking on the Insert button of the **multiple record form**. The Form will execute the `onValidate`, `onValidateSuccess` and `onBeforeInsertAll` events, and then it will execute the **onAfterInsertAll** event after execute all the SQL commands to insert the records into the database.

For example, after entering the items of an invoice, (`tb_itens_nf`), in a multiple-record form, include in the "parent" table (`invoice_file`) the total value of the products.

```
sc_lookup (tot, "select sum (item_value) from tb_itens_nf where num_nf = {num_nf}");
```

```
{tmp_tot} = {tot [0] [0]};
```

```
sc_exec_sql ("update tb_itens_nf set total_itens = {tmp_tot} where num_nf = {num_nf}");
```

onBeforeUpdate

This event occurs after form validation (onValidate and onValidateSuccess), when clicking the Save button, and before executing the SQL command to Update the record in the database.

Example: We are checking the user privileges table before updating the record, if it does not have such privilege, we send an error message.

```
sc_lookup(priv_upd ," select priv_upd from tb_privileges where login = [var_login] ");
```

```
if( {priv_upd [0][0]} != 'YES'){
```

```
    sc_error_message("You do not have privileges to perform this operation");
```

```
}
```

onAfterUpdate - Form

This event occurs after clicking the form's Save button. The form will then execute the onValidate, onValidateSuccess and onBeforeUpdate events, and right after executing the SQL command to insert the database record, it will execute the onAfterUpdate event.

Example: After updating a record in the database, we want to store the update operation in a log table.

```
sc_exec_sql(" insert into log values ([glo_user],'target table','update',{key_field}) "); //insert the user id that was stored in a session variable [glo_user] and the newly added registry key {key_field}.
```

onBeforeUpdateAll - Form

This event occurs after clicking the Save button on the **multi-record form**. The form will then execute the events `onValidate` and `onValidateSuccess`, and then execute the event **onBeforeUpdateAll** before starting the execution of SQL commands to update records in the database.

Note: This event is triggered only once, regardless of the amount of rows updated in one click on the Save button.

As examples we can see in the example below, we consult a user privileges table before updating the record, if it does not have such privilege, we send an error message.

```
sc_lookup(priv_upd ," select priv_upd from tb_privileges where login = [var_login] ");  
if({priv_upd [0][0]} != 'YES'){  
sc_error_message(" you do not have privileges to perform this operation ");  
}
```

onAfterUpdateAll - Form

This event occurs after clicking on the Save button of **the multiple record form**. The Form will execute the onValidate, onValidateSuccess and onBeforeUpdateAll events, and then it will execute the **onAfterUpdateAll** event after execute all the SQL commands to update the records into the database.

Example: We can update the total value of an invoice (tb_invoice) after update its items (tb_invoice_items) in a multiple records form.

```
sc_lookup (tot, "select sum(value_item) from tb_invoice_items where num_nf = {num_nf}");
```

```
{tmp_tot} = {tot [0] [0]};
```

```
sc_exec_sql ("UPDATE tb_invoice SET total_items = {tmp_tot} WHERE num_nf = {num_nf}");
```

onBeforeDelete - Form

This event occurs after form validation (onValidate and onValidateSuccess), when clicking the Delete button, and before executing the SQL command to delete the record in the database.

As examples we can see in the example below, we consult a user privileges table before deleting the record, if it does not have such privilege, we send an error message.

```
sc_lookup(priv_del," select priv_del from tb_privileges where login = [var_login] ");
if({priv_del[0][0]} != 'YES'){
    sc_error_messagem(" you do not have privileges to perform this operation ");
}
```

onAfterDelete - Form

This event occurs after clicking the form's Delete button. The form will then execute the events onValidate, onValidateSuccess and onBeforeDelete, and then, right after executing the SQL command to delete the record in the database, it will execute the event onAfterDelete.

Example: After deleting the record we can easily create logs, according to the code below:

```
sc_exec_sql(" insert into tb_log values([glo_user],'exclusion','customer_table',{code}); //we are storing the literals 'exclusion' and 'customer_table', the session variable [glo_user] and the field variable {code} containing the deleted content of the code field.
```

onBeforeDeleteAll - Form

This event occurs after clicking the Delete button on the **multi-record form**. The form will execute the onValidate and onValidateSuccess events, then it will execute the **onBeforeDeleteAll** event before starting the execution of the SQL commands to delete records in the database.

Note: This event is triggered only once, regardless of the amount of lines removed in one click on the Delete button.

As examples we can see in the example below, we consult a user privileges table before deleting the record, if it does not have such privilege, we send an error message.

```
sc_lookup(priv_del," select priv_del from tb_privileges where login = [var_login] ");  
if({priv_del[0][0]} != 'YES'){  
sc_error_message(" you do not have privileges to perform this operation ");  
}
```

onAfterDeleteAll - Form

This event occurs after clicking no button Exclude form multiple records. Or the form will execute the onValidate, onValidateSuccess and onBeforeDelete events, and the logo will execute all the SQL commands to exclude the records not the data bank, it will execute or the **onAfterDeleteAll** event.

Note: This event occurs only once regardless of the quantity of records excluded at a time.

Ex. In an order item form (multiple records), we want to delete the order if all screen items are deleted. Just in the event OnAfterDeleteAll use a block similar to the one shown below:

```
sc_exec_sql ("DELETE FROM orders WHERE order_id = {order}");
```

Code Editor

Scriptcase has Events to allow the developers to customize the application code. By using the events, the developers can program custom actions at a specific execution time (e.g. After a record is inserted, when it is loaded, upon submitting a Form, ...) and for a specific application type. In the events area you can use global and local variables, JavaScript, CSS, HTML, PHP codes and also Scriptcase macros.

Scriptcase code editor is used within events and has a series of shortcuts to help in the applications development.

At the top section of the editor, there are some options that allows us to change the editor theme or expand it, for example. These options can also be activated using the hotkeys.

- - Increases the area occupied by your code editor.
- - Expand the sides of the code editor.
- - Activates the search in the code editor.
- - Enables replace in the code editor.
- - Defines the code editor theme.

The hotkeys are available in all browsers compatible with Scriptcase.

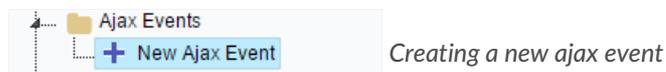

[Click Here](#) to view the Scriptcase hotkeys documentation.

Form Ajax Events

OnClick

The ajax event OnClick is executed when the field that it's based on is clicked.

- Creating a new ajax event

Field Allows you to use an existing field from the current application as a parameter for the link.

Variable Allows you to use a global variable from the current application as a parameter for the link.

Fixed Allows you to inform a fixed value as a parameter for the link.

Empty No value will be passed as a parameter for the link.

- Link Properties (Grid)

Link properties

Link Operation Mode display mode for the application called

Exit URL for the target application Output URL of the application. When not defined, output link (Back button) will be the Grid itself.

Hint of the link Message to be displayed when the mouse is over the field with the link

Form properties

Enable insert button on target application Enables the buttons New and Include within the Form

Enable update button on target application Enables the Update button within the form

Enable delete button on target application Enables the Delete button within the Form

Enable navigation button on target application Enables the navigation buttons (first, previous, next, and last) on the Form.

Enable button to edit a grid record Enables the button for the records edit

Save Help

Configuring the properties for the link button when the destined application is a Grid.

Link Operation Mode How the link will open (Open in the same Window, Open in another Window, Modal).

Exit URL for the target application URL or an application that be redirect to when exiting the Grid application.

Initial Mode Allows you to define the initial mode of the grid application (Search or Grid).

Number of Lines Allows you to define the amount of lines displayed in the Grid.

Number of Columns Allows you to define the amount of columns displayed in the Grid.

Paging Enable the paging in the Grid.

Display Header Enable the Grid Header.

Active Navigation Buttons Enable the navigation button (First, Back, Next and Last) in the Grid.

- Link Properties (Form)

Link properties	
Link Operation Mode	Open in the same Window ▾ display mode for the application called

Master/detail form

This option allows you to create forms to update, on a single screen, tables with 1:N relationship.

New detail

In the application menu, you can create a new connection by clicking on the “New detail” option from Master/detail folder.

Creating a new detail.

Include name

Interface to set the **Name** and **Label** of the link. It will be displayed in the master application as a field. The name cannot contain spaces in lower special characters.

By checking the option Create a new block to place this field, the application will position itself in the new block automatically.

 A screenshot of a configuration window titled 'Include Master/Detail Form'. It contains two input fields: 'Name' with the value 'samples' and 'Label' with the value '{lang_master_detail}'. Below these fields is a checked checkbox labeled 'Create a new block to place this field.'. At the bottom of the window are two buttons: 'Create' (in blue) and 'Help' (in grey).

Interface to set link name

and label.

Application list

Only the form types: Editable Grid or Editable Grid View can be used as an application detail. You must create the form detail application before you create the Master/Detail link, because you will need to select the application during the link creation.

Interface to configure the

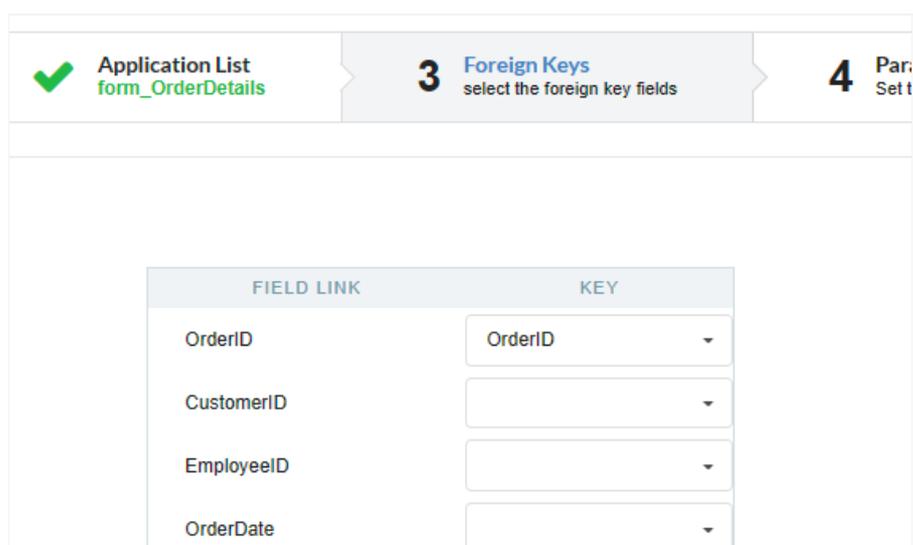

detail application.

Foreign Keys

This step is enabled when you create the master/detail between form type applications. Here will be set the foreign key that links the two tables in the database.

In the left column the all fields of the master application are listed and in the select field, on the right, the list of all fields of the selected application to the Detail.

The developer must bind the fields that are foreign key in the master table. The other fields must remain blank.

Interface to configure the detail application.

Parameters definition

In this step, the global variables defined in the detailed application for parameter passing will be listed.

For masters/details created with grid applications, defining a parameter is essential to display data in the detail related to the master being displayed.

Without this parameter, all the data from the grid used in the detail will be displayed.

[Click here](#) to access the documentation related to creating parameters in the grid.

The screenshot shows a configuration interface with a progress bar at the top. The progress bar has four steps: 1. Application List (grid_OrderDetails), 2. Foreign Keys (select the foreign key fields), and 3. Parameters Definition (Set the application input parameters). The third step is currently active. Below the progress bar, there is a section titled 'Select values to pass as parameters' with a refresh icon. This section contains a table with three columns: 'Parameters', 'Type', and 'Value'. The 'Parameters' column has the value 'var_orderid'. The 'Type' column has a dropdown menu open, showing three options: 'Fields', 'Fixed value', and 'No value'. The 'Value' column has a dropdown menu with the value 'OrderID'. The word 'Interface' is written vertically on the right side of the screenshot.

Parameters ?	Type ?	Value
var_orderid	Fields	OrderID

to configure the link parameters.

In the **Types of Parameters** we have three options, they are:

Fields

This option the connection will use the destination application field to make the record call according to the query application field.

Fixed value

This option allows the user to define a fixed value that will be used for the next application call.

The use of variables is not allowed.

No value

This option allows you to create the connection without the need to send any parameters to the next application.

General Settings

After the link creation, you can change some settings by clicking on the link and selecting the properties option.

General Settings: samples	
ATTRIBUTE	VALUE
Label	<input type="text" value="{lang_master_detail}"/>
	Sample master/detail
Label below field	<input type="text"/>
Link	<h3>Link data</h3> <p>Linked to: grid_OrderDetails</p> <p>Parameters var_orderid = {OrderID}</p> <div style="border: 1px solid #ccc; padding: 5px;"> <p>Grid Property</p> <p>Initial Mode <input type="text" value=""/></p> <p>Grid view mode <input type="text" value="View only"/></p> <p>Number of Lines <input type="text" value=""/></p> <p>Number of Columns <input type="text" value=""/></p> <p>Display Header <input type="text" value=""/></p> <p>Active Navigation Buttons <input type="text" value=""/></p> </div> <div style="border: 1px solid #ccc; padding: 5px;"> <p>Iframe properties</p> <p>Iframe width <input type="text" value=""/></p> <p>Iframe height <input type="text" value=""/></p> <p>Remove application margin <input type="radio"/> Yes <input checked="" type="radio"/> No</p> <p>Remove application border <input type="radio"/> Yes <input checked="" type="radio"/> No</p> </div> <div style="border: 1px solid #ccc; padding: 5px;"> <p>Detail properties</p> <p>Paging <input type="text" value=""/></p> </div> <p style="text-align: center;"> <input type="button" value="Edit link"/> <input type="button" value="Save"/> </p>

Label

Define the name shown in the application. This attribute accept text or language variable.

Label below field

Define the text that will be shown below the detail. This Attribute to accept text or language variable.

Grid Property

- **Initial Mode** - Defines whether the detail application will be initiated by the **search** module or the **grid** module.
- View only -
- **Number of Lines** - Defines the number of lines that the application will show at the beginning.
- **Number of Columns** - Defines the number of columns that the application will show at the beginning.
- **Display Header** - Defines whether the application header will be displayed.
- **Active Navigation Buttons** - Defines whether the application Navigation Buttons will be displayed.

This configuration block is only displayed in master detail between a grid and a form.

Form properties

Within this option you can select the buttons that are going to be displayed in the detail form.

- Enable insert button on target application
- Enable update button on target application

- Enable delete button on target application
- Enable navigation button on target application
- Maintain the WHERE clause in the target application

This configuration block is only displayed in master detail between two forms

Iframe properties

This option allows you to configure the iframe height and width (in pixels) where the detail form is going to be displayed.

- **Iframe width** - Sets the width of the iframe
- **Iframe height** - Sets the height of the iframe
- **Remove application margin** - Remove the application margin inside the iframe
- **Remove application border** - Remove application borders inside the iframe

Detail properties

- **Form Type** - The option "Form Type" only works to change applications already configured with horizontal orientation, used within the detail. E.g. Multiple Rows or Editable Grid. **This attribute is only displayed in links between two forms.**
- **Paging** : Allows you to select your form detail paging. The options are:
 - **Partial** : This option will set page layout as partial, with a limited records per page, according to the quantity informed within the option below "Lines per page"
 - **Total** : This option will set the page to display all records in one page.
- **Lines per page** : Here you can set the amount of records that are displayed in the detail form, you will need to set that just if paging is partial. **This attribute is only displayed in links between two forms.**
- **When deleting** : This option allows you to choose how the form detail dependencies will be treated in a deletion. **This attribute is only displayed in links between two forms.** The options are:
 - **Warn when there are dependencies** : Displays an error message if there is dependency on the detail form record that is being deleted from the master form.
- **Delete dependencies without warning** : Deletes all existing dependencies in the detail form without warning the user.

Many-to-many Relationship

Allows you to configure automatic update link tables in N:N relationships

Identification

This link will be handled as a field within the form application. We have to set the field name, data type, label and define if we will use a specific connection for this link. If decide to you use a specific connection there will be a combo box with for you to select according to the connections available in the project.

Field	<input type="text"/>	Field Name.
Data Type	<input type="text" value="Text"/>	Field data type.
Label	<input type="text"/>	Application field title.
Connection	<input type="checkbox"/> Choose connection	Check if you would like to use a different connection than the one of the application.

Creating field

to update link table.

Grid Information

In this step you need to inform the data source, this connection will be available for the user to select (lookup). It allows you to choose if the select command is manually informed or if it will be based on a table.

Process that helps you to build your SQL Select Statement. You can fill the SQL Statement manually or choose the table.

Manually

Choose Table

Informing the select command.

If you check the option "Choose table" there will be 3 combo boxes for you to select according to the connections tables available in the project: table, key field and description.

Process that helps you to build your SQL Select Statement. You can fill the SQL Statement manually or choose the table.

Manually

Choose Table

account

Key

Description

Informing the select command based in

a table..

- **Key** : Value that will be stored in the table.
- **Description** : Value that will be displayed in the update field.

SQL Select Statement

Select command informed by user or created based on a table, it is responsible for displaying the selection field contents.

SQL Select Statement from the foreign table that contains the data that will be used to update the relationship table. The SQL Statement must return 2 fields: the first is the key and the second is the description.

SQL Select Statement

```
select group_id, description from sec_groups order by description
```

Select command.

Lookup display

This option sets the display for the update field

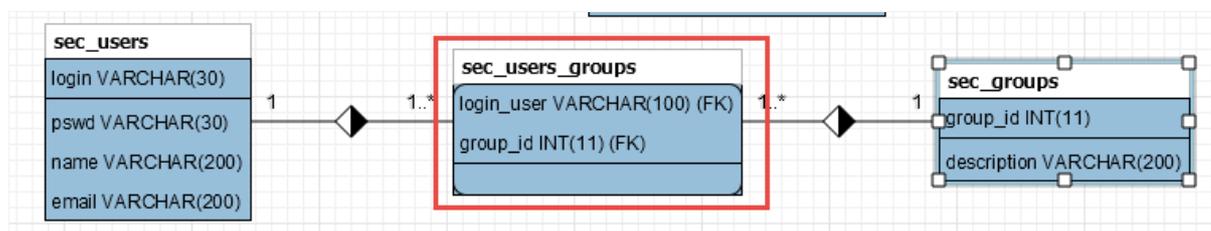

Display key and description <input type="radio"/> Yes <input checked="" type="radio"/> No	For each record, display its key and description.
Display Title <input type="radio"/> Yes <input checked="" type="radio"/> No	Display attribute title.
Separator <input type="text"/>	Delimiter between key and description.
Object <input type="text" value="Double Select"/>	Lookup Object type.
Height <input type="text" value="7"/>	Object Height

Field object

type.

- **Display key and description** : If you want to display the code and the description informed in the select command.
- **Display Title** : Displays attribute title (see attribute).
- **Separator** : When the option Display key and description is checked as yes you must define a separator between the code and the description.
- **Object** : Object field type that will be displayed in the update form. The types are: Select, Radio, Check box and Double Select.
- **Check and Uncheck All** : Option to Check and Uncheck all records (available only for when Check box object is selected).
- **Columns** : This option sets the number of columns (available only when the objects Check box or Radio is selected)
- **Height** : This option sets the object height (available only when the objects Select or Double Select is selected).

Link Table

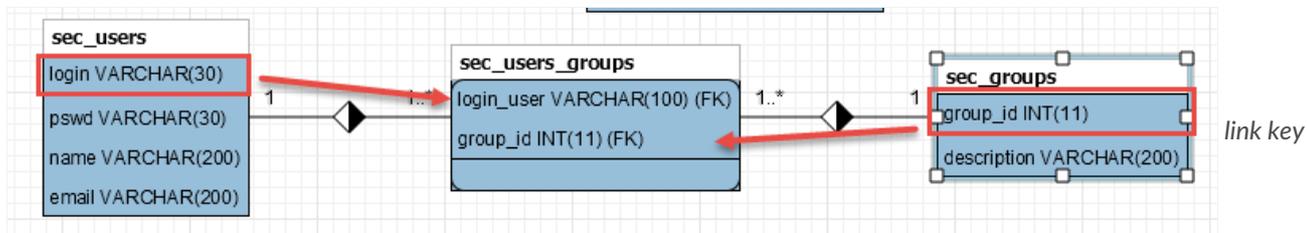

Link table.

This option sets the relationship table that will be updated.

Table Name

Update table selection.

Relationship Keys

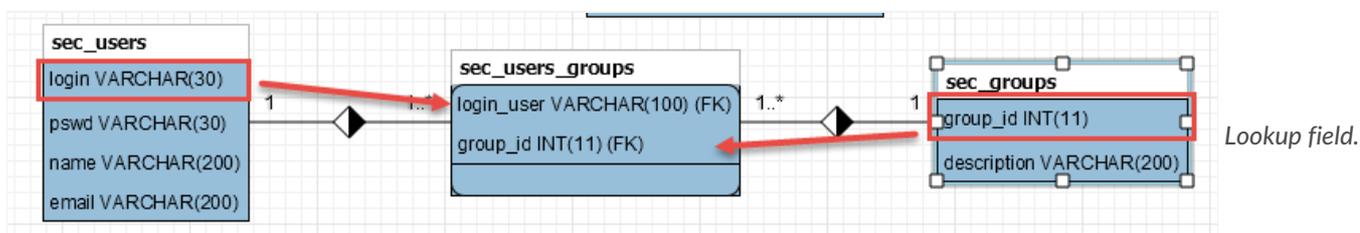

This option sets the application fields that are related with the link table fields.

Field	Key
login_user	customerid
group_id	regionid

Setting

values for the fields in the update table.

Lookup Field

This option sets the field from the lookup table that is related to the link table.

Lookup field
group_id

Defining the foreign key relationship table..

Link Attributes

This option sets the values that are recorded in the fields of the link table that are not foreign key.

Field	Attributes
login_user	customerid

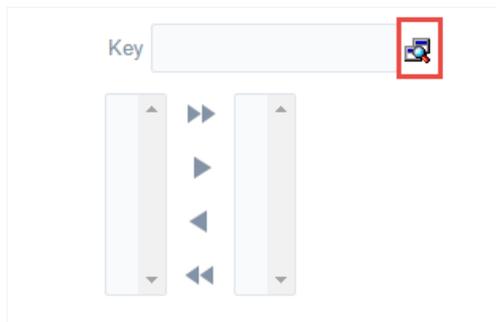

Setting

the assignment field.

- **Attributes** : It is written a value without the need for user data entry, it is an application field itself.
- **Data entry** : It is written a value reported by the user, it is necessary to create a field and relate it by the select.

Search

Available only for Double Select object

Search in the double select field.

This option sets a filter for the link field.

![Search settings for the link field.][relacao_n_n_info_filtro_config] Search settings for the link field.

- **Limit of Records** : Maximum number of records returned by the search.
- **Initial State** : this option sets whether the form field load come Filled or empty.
- **Search Fields** : This option sets whether the search will be displayed the code and/or Description.

General Display Settings

This option allows you to configure all general display settings from from field title and object.

Field CSS	Title CSS	INPUT Object CSS
		Font <input type="text"/> Font Size <input type="text"/> Font Color <input type="text"/> Background <input type="text"/> Bold <input type="radio"/> Yes <input checked="" type="radio"/> No Underline <input type="radio"/> Yes <input checked="" type="radio"/> No Border Size <input type="text"/> Border Color <input type="text"/> Horizontal Alignment <input type="text"/> Vertical Alignment <input type="text"/> Width <input type="text"/>

Display settings.

Help Configuration

This feature allows it to be documented instructions for use of the application generated, that is, help end users to better understand the business rules of the system and the best way to operate it.

Help Description <input type="text"/>
Help Type <input type="text"/>

Help Configuration

- **Attributes**
- **Help Description** : This option allows the inclusion of a text that will be displayed when the user to position the mouse over the field.
 - **Help Type**:
 - **Pop-up** : When choosing the type pop-up, help icon is displayed next to the field; that when clicked, will display what was reported in the attribute Describes Help.
 - **Hint** : When you pass the mouse cursor over the field, will help described in the field Describe Help.

- **Text** : Next to the field will appear a text containing the help that was described in the field Describe Help.

Form Search Overview

The chart application offers the following types of filters for the user:

Advanced Filter

The Advanced Filter is another powerful filtering tool in Scriptcase. It offers more detailed options to refine query results. With the Advanced Filter, you can select columns, comparison operators, and values to create custom filter conditions. Additionally, you can combine multiple conditions using logical operators like "AND" and "OR." The Advanced Filter is ideal when you need more precision in your queries, allowing you to define complex criteria to find the desired data.

Filter Builder

Allows the end user to create filters during the use of the application, combining different conditions and logical operators (AND/OR) to create more robust filters and generate more detailed reports.

Below is an example of how the filter builder works.

The user can add several fields or nested conditions to combine the use of logical operators.

Dynamic Filter

Allows the end user to build filters during the use of the application by adding the fields that should compose the filter according to their needs, within the same logical operator.

Below is an example of how the dynamic filter works.

The user must select the logical operator that will be used for all filter fields: All conditions (AND) or any condition (OR).

Form Search Settings

With this interface, you can define general options of the Search Form.

Search configuration Interface.

Search Criteria

Allows to select the logical operator **AND** or **OR** to define the criteria of the search;

Display Condition

Gets the condition of the search available for the user to choose one. He can select “AND” or “OR” in a Combobox.

Use auto-complete in the fields

Automatically turns the field into an autocomplete according to the existing values in the database. If the user chooses **Yes**, the autocomplete will enable automatically in all inputs that contain a relationship. If the user decides **No**, so no autocompletes will be displayed. Otherwise, the option selected is **Defined in the field** it'll keep the settings for each field individually.

Form Dynamic Search Settings

On this screen, the general behavior of the dynamic filter in the application will be defined.

Filter type

Defines the type of filter that will be used in the application.

Filter Builder

Allows the end user to create filters during the use of the application, combining different conditions and logical operators (AND/OR) to create more robust filters and generate more qualified reports.

Below is an example of how the filter builder works.

The user can add multiple fields or nested conditions to combine the use of logical operators.

Dynamic filter

Allows the end user to build filters during the use of the application by adding the fields that should compose the filter according to their needs, within the same logical operator.

Below is an example of how the dynamic filter works.

The user must select the logical operator that will be used for all filter fields: All conditions (AND) or any condition (OR).

Use the ENTER key for

This attribute defines the behavior of the ENTER key when the filter screen is being displayed.

Form Filter Build Settings

Enable/Disable

This attribute defines whether the user can disable fields or nestings in the filter builder, keeping them disabled until the application is reloaded.

Example of the disable button

Display filter condition

Defines whether the filter condition will be displayed while the user builds their filter.

When enabled, the condition is assembled as the user adds the filter's conditions and logical operators. When disabled, this condition will not be displayed.

Modal Filter

Defines the location where the filter builder will open in the application.

When enabled, the filter will open in a modal. If disabled, the filter will be displayed in a div below the application's toolbar. See below for examples of both behaviors.

Opening in a modal

Div below the toolbar

Select Fields for Filter Build in Form

On this screen, the fields that will be available for use in the dynamic filter must be defined.

In the **left column**, all application fields and the **Search** field are displayed, which helps in locating the fields. In the **right column** are the fields selected to be displayed in the filter.

Adding and Removing Application Fields

The fields must be configured using the selection buttons, located between the columns.

- - Move all fields to the right.
- - Moves only selected fields to the right
- - Moves only the selected fields to the left.
- - Move all fields to the left.

In the left column, there are the application fields that are not in use in the filter, while the right column shows all the selected fields and the order in which they will be displayed.

To add fields to the filter, select the fields you want in the filter and click the button.

To select fields in sequence, simply click on a field and drag. Pressing control (Ctrl) allows you to select multiple alternate fields.

Search and positioning

Field display order

The fields will be displayed in the application respecting the order defined in the right column.

The display order must be defined using the sort buttons and which will move the selected fields in the column.

Remembering that the fields must be positioned inside a block (**customers**) which must be inside a page (**Pag1**).

Check below the use of the buttons to order the fields

Save and Restore

Below the columns are two buttons:

- **Save** which records the current placement of fields in columns.
- **Restore** which reorganizes the fields returning to the last position saved.

Restoring the positioning of the fields to the last saved definition.

Select Fields

On this screen, the fields that will be available for use in the dynamic filter must be defined.

In the **left column**, all application fields and the **Search** field are displayed, which helps in locating the fields. In the **right column** are the fields selected to be displayed in the filter.

Adding and Removing Application Fields

The fields must be configured using the selection buttons, located between the columns.

- - Move all fields to the right.
- - Moves only selected fields to the right
- - Moves only the selected fields to the left.
- - Move all fields to the left.

In the left column, there are the application fields that are not in use in the filter, while the right column shows all the selected fields and the order in which they will be displayed.

To add fields to the filter, select the fields you want in the filter and click the button.

To select fields in sequence, simply click on a field and drag. Pressing control (Ctrl) allows you to select multiple alternate fields.

Search and positioning

Field display order

The fields will be displayed in the application respecting the order defined in the right column.

The display order must be defined using the sort buttons and which will move the selected fields in the column.

Remembering that the fields must be positioned inside a block (**customers**) which must be inside a page (**Pag1**).

Check below the use of the buttons to order the fields

Save and Restore

Below the columns are two buttons:

- **Save** which records the current placement of fields in columns.
- **Restore** which reorganizes the fields returning to the last position saved.

Restoring the positioning of the fields to the last saved definition.

Quicksearch

Quicksearch is an option that allows to search data in various fields of the application by using the text box in the toolbar.

Quick Search Settings

In the quick search settings you can find the following options:

Quicksearch layout

Simplified: Standard quicksearch view. This option displays the input where we must inform the terms to be searched for.

Extended: In this layout, in addition to the simplified layout options described above, it is possible to select the columns where a search will be carried out and the criteria to be selected.

The criteria must be selected in the option **Research Criteria**, they are:

Contains, Equal beginning, Exactly equal, Does not contain, Different, Greater than, Greater than equal, Less than and Less equal

Highlight results

Highlights the result of the research performed.

Button within the search area

Defines the placement of the search button, whether it will be in the text area or outside it.

Option Enable -

Option Disabled -

Display combobox in the simplified layout

When active, display combobox with the fields selected in the **Quicksearch extended fields** option

Watermark

Watermark that will be displayed in quicksearch. A lang or a fixed text can be used.

By default, we use the lang: {lang_othr_qk_watermark}

Quicksearch width

Width in pixels of the Quicksearch input.

Settings for Individual Search by field

This configuration defines the fields that are available in the quicksearch combobox, when activating the Extended Layout option, in the general settings

Fields for individual search

Use fields displayed in the application: When selecting this option, only the fields displayed in the application will be available in the combobox.

Define fields manually: Allows the developer to select the fields that will be available in the quicksearch combobox.

Search settings in the 'All Fields' option

This option defines the fields that will be used in quicksearch, regardless of their configuration. That is, all fields selected in this option will always be available in the search.

Search in All Fields

All Fields added to the fields of the Individual Search : In addition to the fields selected in this option, the fields selected in the **Quicksearch extended fields** option will be available in the quicksearch search.

Only those selected for All Fields: Only the fields selected in this option will be available in the search through quicksearch

Search Criteria

Defines quicksearch search criteria.

When checking the options, the combobox with the criteria will be displayed

These are the options available as a quicksearch search criterion.

- **Contains**
- **Equal beginning**
- **Exactly equal**
- **Does not contain**
- **Different**
- **Greater than**
- **Greater than equal**
- **Less than**
- **Less equal**

Form Search Fields Overview

The applications can have two types of fields.

Table Fields

Columns of the table connected to the application and their data types.

Example:

In a table with the following structure:

```
CREATE TABLE `orders` (
  `orderid` int(11) NOT NULL,
  `customerid` varchar(5) NULL DEFAULT NULL,
  `employeeid` int(11) NULL DEFAULT NULL,
  `orderdate` date NULL DEFAULT NULL,
  `requireddate` date NULL DEFAULT NULL,
  PRIMARY KEY (`orderid`) USING BTREE
);
```

These are the listed fields on left menu **Fields**:

How to synchronize table fields with a form

Anytime you add/delete a field or change its data type, you have to synchronize your form application with the connected table to apply that changes.

For more information, click [here](#).

Virtual Fields

Fields created inside application to assist in the development process.

How to create a virtual field

1. Inside an application, access the left menu **Fields** and click on **New Field** option.
2. Choose how many fields do you want to create:

1. Create the fields and define type, name and label for each one:

- **Type:** Data type of the field.
- **Name:** Internal name of the field. Used to identify the field on events and Scriptcase interface.
- **Label:** Title of the field displayed on the application.

Scriptcase **doesn't insert** virtual fields on the table after its creation.

Types of fields by applications

Application Table Fields Virtual Fields

Grid	<input type="text"/>	<input type="text"/>
Procedure	<input type="text"/>	<input type="text"/>
Chart	<input type="text"/>	<input type="text"/>
Form	<input type="text"/>	<input type="text"/>
Control	<input type="text"/>	<input type="text"/>
Calendar	<input type="text"/>	<input type="text"/>

Application Table Fields Virtual FieldsSearch PDF Report

The applications **Menu**, **Tree Menu**, **Dashboard** and **Blank** were not listed because they haven't manage fields.

Text

General Settings

This type of field allows the developer to create quickly inputs to insert and update data, where the final user can inform its data to be allocated in its database.

Type of Data

Defines the type of the field in the application. In this case we should select **Text**.

Label

Defines the title that will be displayed in the field when the application is executed. The terminology used in the interface is fundamental to the system have a good usability, whe should use names and familiar terms to the final user of the application, instead of using terms from the system.

For example, this text field that has the name **customerid**, the client would have a much better understanding of the functionality of the field when we define the label as **Customer Name**.

Not only a fixed text, the **Label** attribute allows the use of langs to define the field's title, making it possible to use your application in a multi language project.

Label below field

Defines the message to be displayed below the field.

Watermark

Informing a text to the **Watermark** it will be displayed in the input a text as an example that can be informed in the field. The result after set will be this:

Initial Value(type)

Allows the initial definition to the field when the form is in insert mode. It is possible to choose between two options:

Defined Value: When this option is selected, the Initial Value attribute will be available, where we should inform the field's initial value. For example, my initial value is **Arlindo**, when a new register is inserted, the field **Seller Name** will be initialized as Arlindo.

System Data: When this option is selected, the initial value will be the actual date of your computer's system.

Amount of Characters

Allows to set the width of the text field's input that varies with the amount of characters informed. Although, if the amount of characters typed are greater than the setting, the text will be pushed to the left, to keep the maximum amount of characters as defined.

Show HTML Content

When this option is active every HTML, CSS and JavaScript content that are in the database will be displayed with the main value.

Validation Image

When this option is active, a image will be displayed next to the informed field if the field is according to the settings defined by the developer.

In the example below, the field was set to receive at least 5 characters, see what happens when informed

only 4 characters:

However if informed 5 or more characters the field will be displayed as:

Password Field

When this option is active, the text field will be converted to the format used in password fields. For example:

View password characters

By enabling this option, a button will be displayed in the password field so that the password is displayed when clicked.

Save Variable

Allows to save a session variable(global variable) with the field's value, to be used in others applications.

For example, in the login form the username can be saved in session and displayed on the header of others applications.

Variable Name

In this attribute we should define the name of the session variable, active in the previous item, that will receive the field's value.

We should inform only the variable's name, - **var_rating**.

The method to use its value is [global variable](#).

Field Mask

Defines the field mask. There are two types of mask described in the table below:

Character Description

- X It is overridden by any characters returned by the database. Filled is required and the value will be completed with leading zeros when there are fewer characters than the size of the mask.
- Z It is overridden by any characters returned by the database. Its filling is optional and when there are fewer characters than the mask size, nothing will be done about the characters that are missing. In addition the leading zeros will be suppressed. When used in conjunction with the X necessarily the use of this character is to the left of the mask.
- 9 It represents any numeric character (from 0-9)
- A It represents an alpha numeric character (A-Z,a-z)
- * It represents any alpha-numeric character (A-Z,a-z,0-9)entered by the user.

For example, it is possible to set the mast to display a telephone number:

It will be show with this format on runtime:

It is also possible to set the field mask like those examples:

Field mask examples:

Telephone number

Field	Mask Input	Typed Value	Formatted Value
Phone Number	+99 99 9999 - 9999	123456789012	+12 34 5678 - 9012
Phone Number	(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
Phone Number	(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
Phone Number	(zz) xxxx - xxxx	12345678	() 1234 - 5678

Field	Mask Input	Typed Value	Formatted Value
Software Key (Letters only)	AAAA-AAAA-AAAA-AAAA	QWERTYUIASDFGHJK	QWER-TYUI-ASDF-GHJK
Software Key (Letters and numbers)	xxxx-xxxx-xxxx-xxxx	Q1W2E3R4T5Y6U7I8	Q1W2-E3R4-T5Y6-U7I8
License Plate	AAA - 9999	QWE1234	QWE - 1234
Scriptcase Serial Key	A999A999A999-**	D111H111G111DG2P	D111H111G111-DG2P
Multiple masks (Phone Number)	9999-9999;(99)9999-9999;	9999 999 9999	+99 99 9999-9999

Validate with mask

When this option is active it is possible to insert the data with the mask set in the **Field Mask** option.

Complete to the left

When this option is used, the value defined will be added on the left of the information inserted in the field if the value is lower than the maximum set in the **Maximum Size** option.

Field size in database

Defines the field's size related to the size set in the database. This value is already set automatically by default when the application is generated.

Hidden Field

When this option is active, the field will be hidden in the application on runtime.

Label Field

When this option is active, the field will be altered to only a label where the info will be displayed, where updates or inserts will not be possible.

Save HTML tags

When this option is active, it allows to HTML tags in the field to be inserted with the data, instead of being interpreted.

Text input in JavaScript

When this option is active, it will be show every JavaScript content inserted in the database with its main value.

This option can only be used using the **Editable grid view**.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disable Field

Allows the developer to disable the field, so the user can not type a value according with the option defined by the developer.

The available options are: **No** - Initial value of the attribute, this option does not disable the field.

Update Mode - This option only disables the field when editing existing registers.

Insert Mode - This option only disables the field when inserting new registers.

Insert / Update Mode - This option disables the field when editing exciting registers or when inserting new registers.

HTML Type

HTML object used to display the field in the form.

SQL Type

Informs the type of the field in the database.

Field Behavior

Use autocomplete:

Field automatically turns into autocomplete according to existing values in the database.

Use Select2

Uses the new component for data selection, allowing searches within the select comboBox.

Width for the Select2

Sets a width for the area in the Select2.

Amount of characters

Sets the amount of characters to start the search.

Amount of rows

Sets the maximum number of rows to list the search result.

Width:

Defines a width in pixels for a result box.

Search options:

Defines the validation that will be made to fetch the search result.

Start equals to: Will return the records with the same start value as in the database.

Any part: Will return the records when exist the character in any part of the record.

End equals to: Will return the records with the same final value as in the database.

Position between values:

Defines the position that objects will be displayed.

Text Between Values

Text that will appear when using a filter condition between two values.

OnChange Submit:

Submit search on this field changing.

Show Condition:

To show or not the search condition. It only works if the search has at least one condition.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Integer

Data type:

It sets the application field type. When the field is set as Number, it is permissible to define formatting rules of integers.

Label:

It sets the title that will be displayed in the field when you run the application. The terminology used in the interface is fundamental for your system has a good usability. In this case, we recommend you to use names and terms familiar to the end user of the application, instead of using terms originated in the system.

Label below field

Defines the message to be displayed below the field.

Watermark

Informing a text for the **watermark** it will be displayed on the input text with an example of what can be reported in the field. The result after that will be configured:

Initial value (type)

Allows setting an initial value for the field when the application is in inclusion. You can choose between two options:

Pre-set value: When you select this option, the Initial Value attribute will be made available in the place where we inform the initial value of the field.

For example, my initial value is **Arlindo** when inserting a new record the **seller_name** field will start with Arlindo.

System date: When you select this option, the initial value will be the current system date of your computer.

If you select the type system date, it will be not necessary to fill in the initial value attribute.

Amount of characters

It allows you to set the width of the input text field according to the amount of characters. However, if the quantity entered is greater than the set for the characters, the text will be pushed to the left, in order to ensure the maximum amount of characters set in the option of **Values formatting**.

Validation Image

When you enable this option, an image will be shown next to the field informing whether the field is in accordance with the settings of *minimum size* and *Maximum size* (as you can see in the images below) defined in the Formatting value option.

In the example below, the field was set to receive at least 5 characters, see what happens with the image when it receives only 4 characters:

However, if the value inserted has 5 or more characters the the image will change according to example bellow:

Use slider:

It displays a slider component in the field. So you can increase or decrease the value sliding the cursor. You can also customize the increment value, if it increments the value 1 by 1, 2, 5, 10... N.

Field Mask Input:

It sets the mask input for the field. There are two types of mask as described in the table below:

Character Description

X	It is overridden by any characters returned by the database. Filled is required and the value will be completed with leading zeros when there are fewer characters than the size of the mask.
Z	It is overridden by any characters returned by the database. Its filling is optional and when there are fewer characters than the mask size, nothing will be done about the characters that are missing. In addition the leading zeros will be suppressed. When used in conjunction with the X necessarily the use of this character is to the left of the mask.
9	It represents any numeric character (from 0-9)
A	It represents an alpha numeric character (A-Z,a-z)
*	It represents any alpha-numeric character (A-Z,a-z,0-9)entered by the user.

Mask Input Examples:

Field	Mask Input	Typed Value	Formatted Value
Phone Number	+99 99 9999 - 9999	123456789012	+12 34 5678 - 9012
Phone Number	(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
Phone Number	(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
Phone Number	(zz) xxxx - xxxx	12345678	() 1234 - 5678
Software Key (Letters only)	AAAA-AAAA-AAAA-AAAA	QWERTYUIASDFGHJK	QWER-TYUI-ASDF-GHJK
Software Key (Letters and numbers)	xxxx-xxxx-xxxx-xxxx	Q1W2E3R4T5Y6U7I8	Q1W2-E3R4-T5Y6-U7I8
License Plate	AAA - 9999	QWE1234	QWE - 1234
Scriptcase Serial Key	A999A999A999-**	D111H111G111DG2P	D111H111G111-DG2P
Multiple masks (Phone Number)	9999-9999;(99)9999-9999;	9999 999 9999	+99 99 9999-9999

Validate with Mask

By enabling this option you will be able to enter data according to the mask that was configured in the option **Field Mask** and Scriptcase will validate it.

Record Variable

Allows you to record a session variable with the value of the field ([global variable] [var_glob]), to be used in other applications.

Example, in the login form the username can be saved in session and displayed in the header of other applications.

Variable Name

In this option you must set the session variable name, enabled in the previous item, which will receive the value of the field.

You need to inform only the variable name, for example: **var_seller**.

The recovery of the value is made as [Global Variable][var_glob]{:target='blank'}.

Field size in Database

This option sets the size of the field relative to the size that is configured in the database. By default this value is already configured automatically when the application is generated.

Hidden Field

This option when enabled will hide the field inside the application at the time of execution.

Label Field

By enabling this option, the field will be changed to only one label where the information will be displayed, so it is not possible to make changes or inserts in the field configured as label.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disable field

Allows you to disable the field, making it impossible for the user to enter a value according to the developer-defined option.

The available options are:

No - initial value of the attribute, this option does not disable the field. **Update mode** - This option disables the field only when editing the records. **Insert mode** - This option disables the field only inserting new records. **Update/Insert mode** - This option disables the field in both editing and inserting new records.

HTML Type

HTML object used to display the field in the application.

Tipo SQL:

Reports the SQL type of the field as it is configured in the database.

Use regional settings:

It allows you to apply regional settings to the number fields formatting. When this option is not selected it will be displayed the attributes group, minus sign and negative number format.

Digit grouping:

It allows you to define if the field displays the digit grouping separator.

Maximum Size:

It allows you to define the maximum size that will be used in the field of the application.

Minimum Value:

It allows you to define the minimum value that will be used in the field of the application.

Maximum Value:

It allows you to define the maximum value that will be used in the field of the application.

Grouping:

It allows you to define which character is used to separate thousands. This option is only available when the option to use regional settings is disabled.

Negative sign:

It allows you to define which character will be used for the display of negative numbers. This option is only available when the option to use regional settings is disabled.

Negative number format:

It allows you to define the placement of the negative sign in relation to value. This option is only available when the option to use regional settings is disabled.

Accept:

It allows to define if the field accept only negative values, positive-only or both.

Display Calculator:

This option when enabled will display a calculator to assist the end user to perform calculations.

Use Spin:

This option applies a Spin component to the number field. So the end user can increase or increase the numbers using it. You will also be able to set a minor or major range for the spin.

Smaller increment for the Spin::

Sets the minimum range of the Spin component.

Greater increment for the Spin:

Sets the maximum range of the Spin.

Lookup Settings

The Lookup is a way used to provide the end user a list of values description/name where the items can be selected and used in the application. For example, for a field sex that in the database is represented with M or F values can be presented as male or female dynamically with the lookup. So you will be able to retrieve these values from a database table or manually, if the reference table does not exist.

Example:

Lookup Methods

There are two lookup methods available:

Manual: To use this method it is necessary to inform the selection conditions manually to the Lookup.

Automatic: To use this method it is necessary to use a lookup query from the database to access the reference table.

Editing-automatic lookup:

Select Command:

It sets the SQL command that will retrieve the value to display inside the Grid field. The command must have the following format

```
SELECT field_to_be_diplayed FROM table WHERE key_field = {grid_field}
```

The Grid field must be always referenced between curly braces {}, So at run time, the field braces will be replaced by its value in the table.

Multiple Options:

When the Select command informed return multiple values, the option must be selected.

Delimiter:

It sets the tab of values returned by the Select command, this option should be filled when the “Yes” option is checked in the multiple attribute options.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

Use a specific connection:

This option allows you to select another existing connection in the project, other than the current connection, to select the values for the lookup.

Edit Lookup - Manual:

Lookup used to modify the display of the field with predefined values.

Lookup Types

It sets the operating mode of the lookup can be: single value, multiple values (delimiter), multiple values (position) and multiple values (binary).

Single value: it will be displayed only one value for the field. There is a direct replacement of the value stored in the Bank for a label defined in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value of “M” will be replaced by “Male”.

Multiple Values (Delimiter):

By using this option it will be displayed multiple values for the selected field. The values must be separated by a delimiter to be informed. A replacement of parts from a string stored in the field, separated by a delimiter for values contained in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value S;M will be replaced by Sports and Movies.

Delimiter: Character used to separate the values within the same string.

Multiple Values (Position)

Allows you to recover information stored in a single string of the selected field. In order for this information to be retrieved must be informed, in addition to the label, the starting position and the number of bytes that each information occupies within the string.

As an example we will use a string to store Sex, Marital status and Hobby respectively. Sex occupies one byte, Status one byte and Hobby two bytes .

For this purpose we define the list as:

Label	Value	Start	Size
Male	M	1	1
Female	F	1	1
Married	M	2	1
Single	S	2	1
Study	ST	3	2
Sportes	SP	3	2
Reading	LE	3	2

Example: the string MMST would be presented in the query as: Male Married Study

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value M will be replaced by Male.

Start: : Starting position in the string where the information is recorded. The first position is always 1.

Size : Number of bytes that the information occupies in the string.

Multiple values (binary):

It allows you to retrieve several information stored in decimal form of the selected field.

As examples we will use the following list (although not informed in the interface of inclusion of values in the list, each item has a value assigned automatically according to the order):

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

To display the data, a decomposition of the decimal number stored in the bank is performed. For example, numbers 11 and 12 (written in the database) would be decomposed as follows:

$$11 = 1 + 2 + 8 = (\text{Sports} - \text{Culture} - \text{Reading})$$

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

$$12 = 4 + 8 = (\text{Leisure} - \text{Reading})$$

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading

Assigned value Description in Lookup

16 Music

Label:

Text that will be displayed in the Grid.

Include Button:

Includes in the list the values populated in the Label and value fields.

Alter Button:

It changes the attributes of the selected item.

Delete Button:

Deletes the selected item.

Clean Button:

It cleans the fields

Save Button:

Allows the user to save the entire list, for later use using the Load Lookup definition option.

Load Lookup definition:

Allows you to load a predefined value list for use as a lookup.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Decimal

General Settings

Decimal field Configuration Interface.

Data Type

Define the field type to Decimal. It allows defining the Decimal number format.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Accumulated

It defines the field to accumulate values of another field. This option is only available for virtual fields.

Accumulator field

It is available when the option "Accumulated" is enabled. This configuration defines which field will accumulate the values. The field should be Integer, Currency, or Decimal.

Grid Mask

It defines a mask for the field value. There is two types of masks:

Character	Description
X	It sets the placeholder to any character for replacing. If the entered number of characters is less than the mask size, It completes the field value with zeros (Filling full-size field entry is required).
Z	It sets the placeholder to any character for replacing, but it suppresses zeros at field left (Complete field filling is optional). Use it on the left when combined with the X mask.

Mask Examples

Mask	Field Value	Formatted Value
(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
(zz) xxxx - xxxx	1234567890	(12) 3456 - 7890
(zz) xxxx - xxxx	12345678	() 1234 - 5678
(zz) xxxx - xxxx	0012345678	() 1234 - 5678

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Field Behavior

Use autocomplete:

Field automatically turns into autocomplete according to existing values in the database.

Use Select2

Uses the new component for data selection, allowing searches within the select comboBox.

Width for the Select2

Sets a width for the area in the Select2.

Amount of characters

Sets the amount of characters to start the search.

Amount of rows

Sets the maximum number of rows to list the search result.

Width:

Defines a width in pixels for a result box.

Search options:

Defines the validation that will be made to fetch the search result.

Start equals to: Will return the records with the same start value as in the database.

Any part: Will return the records when exist the character in any part of the record.

End equals to: Will return the records with the same final value as in the database.

Position between values:

Defines the position that objects will be displayed.

Text Between Values

Text that will appear when using a filter condition between two values.

OnChange Submit:

Submit search on this field changing.

Show Condition:

To show or not the search condition. It only works if the search has at least one condition.

Values format

Decimal Field Format of Values with Regional Settings.

- **Regional Settings** : Allows to apply the Regional Settings to format the number of the field. When not enabled, the attributes Digit Grouping Separator, Decimal Separator, Negative sign and Negative number format.
- **Decimal Precision** : Defines the amount of decimal places for the field.
- **Digit grouping** : Defines if the field will display the digits separator.
- **Decimal Separator** : Defines the decimal separator.
- **Accept** : Determines if the field, will accept only negative, positive or both numbers.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.

- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Currency

General Settings

Currency field Configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Currency, you can currency values to the field.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Currency Field Behavior Interface of the Search Configuration.

- **Use auto-complete** : The field behaves as an auto-complete according to the values existing in the database.
- **Amount of characters** : Sets the amount of characters to start the search.
- **Amount of rows** : Sets the maximum number of rows to list the search result.
- **Width** : Sets the width in pixels for the result box.
- **Search options** : Defines the validation that will be made to fetch the search result.
- **Position between values** : This option sets the position that objects will be displayed.
- **Text between values** : Text that will appear between values.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Values format

Currency Field Format of Values with Regional Settings.

- **Regional Settings** : Allows to apply the Regional Settings to format the number of the field. When not enabled, the attributes Digit Grouping Separator, Decimal Separator.
- **Decimal Precision** : Defines the amount of decimal places for the field.
- **Digit grouping** : Defines if the field will display the digits separator.
- **Decimal Separator** : Defines the decimal separator.
- **Accept** : Determines if the field, will accept only negative, positive or both numbers.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).

- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.

Date

General Settings

- **Data Type** : Define the type of field for the application. When set to Date, you can inform a date.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Watermark**: Displays a watermark in the field input.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the datatype of field in the database.

Values format

- **Regional Settings** : Allows to apply the Regional Settings to format the dates of the field. When not enabled, it will be displayed the date separator attribute.
- **Date separator** : Allows you to inform the separator symbol for the date.
- **Display** : Select the format of the day for display.
- **Internal Format** : Allows to define the format the field when the SQL type is different from **Date**. You need to use the characters **A**, **M** and **D** that correspond to **Year**, **Month** and **Day**.
- **Use Combo-box** : Allows you to select the date using a combo-box.
 - **Year as Combo** : Allows to use the year combo to select the date.
 - **Initial Year** : First year displayed in the combo.
 - **Actual Year +** : Display the current plus the amount of years informed.
- **Month in full textual** : Displays the Month format in Full.
- **Display Calendar** : Enables the a calendar icon beside the field, this allows to select the date from a calendar with the format already setup.
 - **New Calendar** : Defines if the JQuery calendar (New Calendar) is going to be displayed or the old format.
 - **Years Limit** : Amount of years displayed in the calendar.
 - **View week number** : Displays the number of the week in the application.
 - **Additional months** : Displays the additional months of the calendar.
 - **Show Combo year and month** : Displays the year and month of the calendar in the combo box.

Field Behavior

- **Position between values** : This option sets the position that objects will be displayed.
- **Text between values** : Text that will appear between values.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Special Conditions

- **All Period** : Searches for all periods of dates.
- **Today** : Searches in today's date.
- **Yesterday** : Searches in yesterday's date.
- **Last 7 days** : Searches the last 7 days. Ex: ((01/01/2017 01/07/2017)).
- **This month** : Searches the dates from the first day of the current month.
- **Last month** : Searches the dates from the first day of lasts month.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of

Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Values format

Datetime Field Format of Values with Regional Settings.

- **Regional Settings** : Allows to apply the Regional Settings to format the dates of the field. When not enabled, it will be displayed the date separator and time separator attributes.
- **Date separator** : Allows you to inform the separator symbol for the date.
- **Time separator** : Allows you to inform the separator symbol for the time.
- **Display** : Select the format of the day/time for display.
- **Internal Format** : Allows to define the format the field when the SQL type is different from **DATETIME**. You need to use the characters **A, M, D, HH, II, and SS** that correspond to **Year, Month, Day, Hour, Minutes** and **Seconds**.
- **Use Combo-box** : Allows you to select the date using a combo-box.
 - **Year as Combo** : Allows to use the year combo to select the date.
 - **Initial Year** : First year displayed in the combo.
 - **Actual Year +** : Display the current plus the amount of years informed.
- **Month in full textual** : Displays the Month format in Full.
- **Display Calendar** : Enables the a calendar icon beside the field, this allows to select the date from a calendar with the format already setup.
 - **New Calendar** : Defines if the JQuery calendar (New Calendar) is going to be displayed or the old format.
 - **Years Limit** : Amount of years displayed in the calendar.
 - **View week number** : Displays the number of the week in the application.
 - **Additional months** : Displays the additional months of the calendar.
 - **Show Combo year and month** : Displays the year and month of the calendar in the combo box.

Field Behavior

Date Field Behavior Interface of the Search Configuration.

- **Position between values** : This option sets the position that objects will be displayed.
- **Text between values** : Text that will appear between values.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Special Conditions

Datetime Field Special Conditions.

- **All Period** : Searches for all periods of dates.
- **Today** : Searches in todays date.
- **Yesterday** : Searches in yesterdays date.
- **Last 7 days** : Searches the last 7 days. Ex: ((01/01/2017 01/07/2017)).
- **This month** : Searches the dates from the first day of the current month.
- **Last month** : Searches the dates from the first day of lasts month.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**

- **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Select

General Settings

Select field Configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Select, you can select multiple option from a combo box (Select Field).
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Select Field Behavior Interface of the Search Configuration.

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Search Lookup

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

• Lookup Methods

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

Selecting the lookup type.

◦ Lookup Method - Automatic

Lookup used to list the values that will be displayed on the Checkbox field. These values will be recovered dynamically using the Select command.

Automatic Lookup Interface.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the `key_field` will be stored in the table field.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimitation.

- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Height** : Defines the height for the select object.
- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to

a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.
- **Link** : Allows to create a link to another form allowing to manipulate the list displayed on the select field. After the manipulation, the select object it updated automatically.

◦ **Lookup Method - Manual**

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

Manual Lookup Interface.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

Setting up Single Value Lookup

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Default** : With this option enabled, the selected item will be inserted to the table when committed.
- **Height** : Defines the height for the select object.

- **Multiple Values (delimiter)**

You can store various values for the select field. The values are separated by the informed delimiter. For example: the combination **Sport, Cinema** and **Tourism** selected in form will be stored like **E;C;T** in case the delimiter is ; (semi coma).

Setting up Multiple Values (delimiter)

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Height** : Defines the height for the select object.

- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of

bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in the database would be stored the following value **MSRD**.

Setting up Multiple Values (position)

- **Label** : Text that will be displayed in the item list of the select field.
 - **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
 - **Negative** : Value to be saved in the table in case there is not any valued selected on the field.
 - **Start** : Starting position of the string that is going to be stored. The first position is always 1.
 - **Size** : Amount of bytes that is going to occupy in the string.
 - **Height** : Defines the height for the select object.
- **Multiple Values (binary)**

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute	Value	Lookup	Description
1		Sports	
2		Culture	
4		Pleasure	
8		Reading	
16		Music	

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute	Value	Lookup	Description
1		Sports	
2		Culture	
4		Pleasure	
8		Reading	
16		Music	

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute	Value	Lookup	Description
-----------	-------	--------	-------------

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

Editing Lookup Configuration Multiple Values (Binary)

- **Label** : Text that will be displayed in the item list of the select field.
- **Height** : Defines the height for the select object.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

Displaying the original lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Lookup Method - Actual value

This lookup is used to list all the values in the selected field.

This lookup will apply a “distinct” to your SQL query.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.

- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Double Select

General Settings

Double Select field Configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Double Select, your allowed to have multiple options selected.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Double Select Field Behavior Interface of the Search Configuration.

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Search Lookup

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or F can be presented like Male or Female or in a dynamic way, getting these values from the database.

Lookup Settings Display for the field.
Automatic Lookup Interface..

- **SQL Select Statement** : Defines the SQL command that will get the values displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the `key_field` will be stored in the table field.
- **Height** : Set the height(lines) of the field interface.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter than (;).
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Selects another specific connection existing in the project. The select command will be done on the second connection.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**

- **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Check box

General Settings

Check box field Configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Check box, your allowed to have multiple options selected.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Check box Field Behavior Interface of the Search Configuration.

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Search Lookup

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or F can be presented like Male or Female or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

• Lookup Methods

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query). *Selecting the lookup type.*

◦ Lookup Method - Automatic

Lookup used to list the values that will be displayed on the CheckBox field. These values will be recovered dynamically using the Select command.

Automatic Lookup Interface.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the `key_field` will be stored in the table field.

- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Option check all** : Displays two options on the field to check and uncheck all.

- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Selects another specific connection existing in the project. The select command will be done on the second connection.

◦ **Lookup Method - Manual**

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

Manual Lookup Interface.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).

- **Single Value** :

Setting up Single Value Lookup

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Default** : With this option enabled, the selected item will be inserted to the table when committed.
- **Columns** : Set the amount of columns, for the list of items.

- **Multiple Values (delimiter)**

You can store various values for the checkBox field. The values are separated by the informed delimiter. For example: the combination **Sport, Cinema** and **Tourism** selected in form will be stored like **E;C;T** in case the delimiter is ; (semi coma).

Setting up Multiple Values (delimiter)

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Columns** : Set amount of columns, for the list of items.

- **Multiple Values (position)**

Stores a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Martial Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man, Single** and **Read**, in the database would be stored the

following value **MSRD**.

Setting up Multiple Values (position)

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Negative** : Value to be saved in the table in case there is not any valued selected on the field.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.
- **Columns** : Set the amount of columns, for the list of items.

▪ **Multiple Values (binary)**

Stores a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

Setting up Multiple Values (Binary)

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Columns** : Allows you to inform the amount of columns, for the list of items.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Saves all the items of the list, to use on other fields, just click on Load lookup definition.

- **Load lookup definitions** : Refreshes the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Option check all** : Displays two options on the field to check and uncheck all.

- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

• CSS of the Title

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

• CSS of the Field

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

• CSS of the Input Object

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio,

- Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Radio

General Settings

Radio field Configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Radio, your allowed to select one of the options listed.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Radio Field Behavior Interface of the Search Configuration.

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Search Lookup

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

• Lookup Methods

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query). *Selecting the lookup type.*

◦ Lookup Method - Automatic

Lookup used to list the values that will be displayed on the Checkbox field. These values will be recovered dynamically using the Select command.

Automatic Lookup Interface.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the `key_field` will be stored in the table field.

- **Columns** : Allows you to inform the amount of columns, for the list of items.

- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.

- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

◦ **Lookup Method - Manual**

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

Manual Lookup Interface.

- **Label** : Text that will be displayed in the item list of the radio.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Default** : With this option enabled, the selected item will be inserted to the table when committed.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

Displaying the original lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

-
- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
 - **Help Type**
 - **Pop-up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

 Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Text Auto-Complete

General Settings

Text Auto-Complete field Configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Text auto complete, you can inform a value based on the select statement of the lookup settings and it will manipulate an internal Text for the data.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Text Auto-Complete Field Behavior

Interface of the Search Configuration.

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **Case Settings** : Allows to convert the letters of the field when losing the focus. The options are:
 - **Upper Case** : All in Upper Case.
 - **Lower Case** : All in Lower Case.
 - **Capitalize first word** : Capitalizes the first letter of the word.
 - **Capitalize all words** : Capitalizes the first letter of all the words.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Search Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field.
- **Rows** : Allows to define the amount of records displayed in the field.
- **Width** : Defines the width the size of capture box (Capture Text).
- **Search options** : Allows to define the search settings of the field(Start equal to, Any part and End equals to).
- **Capture Text** : When not enabled, you will only view the field to inform the data. See an example below. *lookup Settings configuration Interface.*
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

lookup Settings validation configuration Interface.

- **Show label with the description** : Displays a label with the description.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

-
- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
 - **Help Type**
 - **Pop-up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

 Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Number Auto-Complete

General Settings

Number Auto-Complete Field Behavior Interface of the Search Configuration.

- **Data Type** : Define the type of field for the application. When set to Number auto complete, you can inform a value based on the select statement of the lookup settings and it will manipulate an internal number for the data.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Number Auto-Complete Field Behavior Interface of the Search Configuration.

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **Position between values** : This option sets the position that objects will be displayed.
- **Text between values** : Text that will appear between values.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Values format

Number Auto-Complete Field Format of Values with Regional Settings.

- **Regional Settings** : Allows to apply the Regional Settings to format the number of the field. When not enabled, the attributes Digit Grouping Separator, Decimal Separator, Negative sign and Negative number format.
- **Decimal Precision** : Defines the amount of decimal places for the field.
- **Digit grouping** : Defines if the field will display the digits separator.
- **Decimal Separator** : Defines the decimal separator.
- **Accept** : Determines if the field, will accept only negative, positive or both numbers.

Search Lookup

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field.
- **Rows** : Allows to define the amount of records displayed in the field.
- **Width** : Defines the width the size of capture box (Capture Text).
- **Search options** : Allows to define the search settings of the field(Start equal to, Any part and End equals to).
- **Capture Text** : When not enabled, you will only view the field to inform the data. See an example below. *lookup Settings configuration Interface.*
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

lookup Settings validation configuration Interface.

- **Show label with the description** : Displays a label with the description.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps

the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

- [Highlight option](#)

Date Comparison

Special field that allows you to change the functioning of a date type field in the summary filter, enabling the comparison of metrics over time. To use this type of field, it is necessary to have a date type field created, and later change its type to Date Comparison.

It is only available in the advanced filter and its operation is exclusive to the query summary module.

Example of the field in the summary filter

Example of the Generated summary

When using the comparison, the summary will be assembled showing the values for the periods informed.

General Configuration

In this block are the general settings of the field, and where it will be 'transformed' into a comparative data field, simply access the settings of a data field and change the *Data* type to **Date comparison**

Data type of the field.

This attribute defines the type of field in the application. This definition implies the configuration options that will be displayed to the developer as well as the behavior of the field when running the application.

During the application creation process, Scriptcase maps the fields of the table(s) used and defines the data type of the fields according to their SQL type.

For example

Fields of type varchar in the table will be defined as text in the **Data Type** attribute.

It is possible to change the field's data type, however it is important to take into account the **SQLType**, displayed in the General Configuration block, to define the field's data type.

Search Label

Defines the title of the column displayed in the executed application and can be defined using: Lang, Text or Global variable.

Lang

The use of lang in the attribute definition is recommended for creating multilingual systems. The langs must be previously defined using the option [Traduzir aplicações](#) or through [Dicionário de Dados](#).

Fixed text

In this case, the column title will not be changed due to user interaction, such as changing the application language, for example.

It is a good option for systems created with just one language.

Global variable

The use of global variables allows you to change the column title according to your system business rule.

We also provide the macro [sc_label](#) which allows you to change the column title regardless of how the label attribute was defined.

Example of a column title

Use same label used on the Grid

This option, when activated, allows you to use the title of the field defined in the grid, in this case the value defined in the **Label filter** attribute will be disregarded.

Value Formatting

Regional Settings

Allows you to apply regional date formatting settings to the field, according to the application language. When disabling the use of *regional settings*, some settings will be displayed such as: **Date separator**, **First Day** and **Display**.

Check below for more details about each configuration option.

It is possible to change regional settings in general, allowing the use of the option and the same configuration in all your projects, according to the language used. For this configuration, access the Menu *Locales* > [Configurações Regionais](#)

Date separator

Defines the character that will be used to visually separate the parts of the date (day, month and year). The characters normally used are: slashes ("/"), hyphens ("-") and periods (.).

Alguns exemplos

- **slashes (/):** 25/10/2023
- **hyphens (-):** 25-10-2023
- **periods (.):** 25.10.2023

This option will be displayed if the **Use regional settings** attribute is disabled.

First day

Defines the first day of the week to be displayed in the calendar in the date field, for selecting dates.

First day change example

In this example, the *First day* was defined as Monday, changing the order in which the days of the week are displayed in the field calendar.

This option will be displayed if the **Use regional settings** attribute is disabled.

Display

Defines the date display format by selecting one of the listed formats.

The options are:

- dd-mm-aaaa
- mm-dd-aaaa
- aaaa-mm-dd

This option will be displayed if the **Use regional settings** attribute is disabled.

View week number

Defines whether the number of weeks will be displayed in the date field calendar.

Example of a calendar with number of weeks

Special Conditions

Defines the special conditions that will be displayed in the date field calendar, see the example below.

Example of special conditions in the date field calendar

If no interval is enabled, the calendar in the date field will not have any special conditions.

Example of the date field without special conditions

Select Values

In this attribute, the special conditions that will be listed as an option in the application must be defined. The predefined intervals are grouped according to the period they refer to. For example, the condition *Last week* is in the tab **Week**.

In each of the tabs it is also possible to create personalized intervals using the button [Add new range](#).

In the tab , all selected ranges will be listed, so that the display order can be changed according to the user's needs.

Sorting tab

In this tab, all selected conditions will be listed, allowing the intervals to be reordered according to the system's needs. You can also remove conditions one by one or using the button **Remove all**.

Add New Range

Clicking on *add new range* will open a screen with some options for adding new ranges. To add an interval, we must select the type (next or last) and enter the period (value).

For example, adding a range in the year tab, defined *Last* in the attribute as **Type** and reporting *2* in the attribute **Value** a range will be created: **Last two years**

This button is available on the **Year, Quarter, Month, Week** and **Day** tabs.

Type

Defines whether the created interval will refer to a future period (next) or a previous period (last).

- **Next** - Defines that the created interval will refer to a future date, for example, **Next year**.
- **Last** - Defines that the range will refer to a previous date, for example, **Last Year**.

Value

Sets the amount of time for the interval.

This field only accepts positive integer values greater than zero.

Title

Defines the text that will be displayed in the application. When creating a new range, a lang is automatically

generated, it is also possible to use a fixed text.

Include Current

This option changes how the created interval works, adding the current period to the interval.

For example, adding an interval to the year tab, defining *Next* in the **Type** attribute and entering 2 in the **Valor** attribute and checking the **Include current** option will create an interval: **Next 2 years from current**.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse

leaves the help icon.

- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Application Settings (Form)

Settings

With this interface, you can set the common attributes of the app.

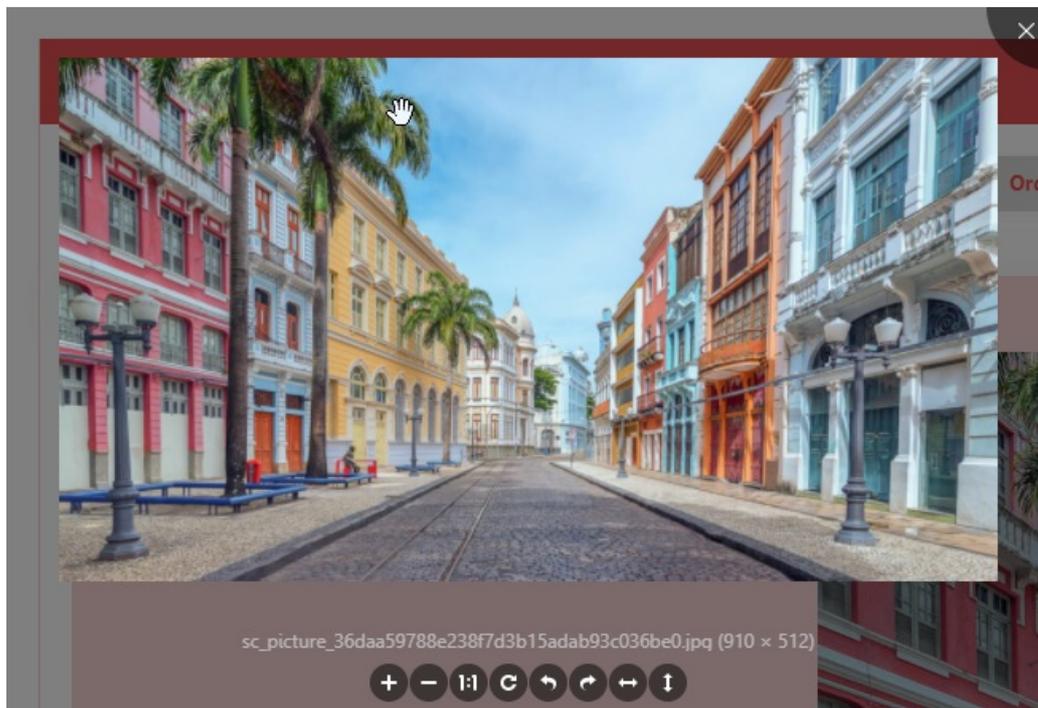

SETTINGS	
ATTRIBUTE	VALUE
Application Code	grid_customers (9.00.0000)
Description	<input type="text"/>
Documents Path	<input type="text" value="C:/Program Files/NetMake/v9/www"/>
Image Directory	<input type="text" value="/scriptcase/file/img"/>
Application images	<input type="button" value="Add"/> <input type="button" value="Delete"/>
Language	<input type="text" value="English (United States)"/>
Share Location Variable	<input checked="" type="checkbox"/>
Charset	<input type="text"/>
Share Theme Variable	<input checked="" type="checkbox"/>
Folder	<input type="text" value="root"/>
Edit by Project	<input checked="" type="checkbox"/>
Timeout	<input type="text" value="0"/>
HelpCase Link	Application <input type="text"/> Search <input type="text"/> Summary <input type="text"/>

Application Settings Interface

• Attributes

- **Application Code** : It is the name that defines an application. An app can be renamed at the [List of Application](#).
- **Description** : This field contains a brief description of the application objectives.
- **Documents Path** : The absolute path to store uploaded documents in the application.
- **Image Directory** : The filesystem directory to store the application images.
- **Application images** : Import images into the application to allows using them in the application.
- **Language** : Set the default language of the application. Display all the application hints and messages in the selected language.
- **Share Location Variable** : Define if the app shares the regional settings with other applications through a session variable.
- **Charset** : Define a specific charset to use in the application.
- **Share Theme Variable** : Define if the app shares the Theme settings with other applications through a session variable.
- **Folder** : Define the project folder that contains the app.

- **Edit by Project** : Define if other project developers can edit the application.
- **Timeout** : Set the session runtime timeout in seconds. If the value is Zero, it assumes the default timeout of the PHP.
- **HelpCase Link** : It allows to associate a [HelpCase](#) file with the application.
- **Image Viewer**: Activates the image viewer features in the running application. By clicking on the image the user can drag, rotate, invert, and enlarge the selected image.

Notification Settings

Notification settings	
ATTRIBUTE	VALUE
Use SweetAlert	<input type="checkbox"/>
Error Position on the field	Down ▼
Show the Error Title in the Application	<input checked="" type="checkbox"/>
Show the Error Title in the Field	<input type="checkbox"/>
Error Title	{lang_errm_errt}
Script Error	<input type="checkbox"/>
SQL Error	<input checked="" type="checkbox"/>
Debug Mode	<input type="checkbox"/>
Ajax Error Output	<input checked="" type="checkbox"/>

- **Use SweetAlert**: Use the SweetAlert to display messages from the application. When this option is active, it will replace the browser's "confirm" and "alert".
- **SweetAlert position using Toast** : The position to display error messages on the application.
- **Error Position on the field** : The position to display error messages when criticizing the field.
- **Show the Error Title in the Application** : Define to display the title line of the error message or not.
- **Show the Error Title in the Field** : Define to display the title line of the error message in the field or not.

- **Script Error** : Allows displaying the line code where there is an error..
- **SQL Error** : Allows displaying the SQL statement if it got an error.
- **Debug Mode** : Runs the application in Debug mode, showing all SQL statements the application is executing.
- **Ajax Error Output** : Enables the Ajax alert for debugging errors.

Navigation

This interface allows defining the navigating behavior of the application

NAVIGATION	
ATTRIBUTE	VALUE
Exit URL	<input type="text"/> 
Close on Exit	<input type="checkbox"/>
Redirect URL	<input type="text"/> 
Redirect Variable	<input type="text"/>

Navigation Interface.

Exit URL

URL to where the user goes when he clicks on the “exit” button.

Close on Exit

Close the browser window when the user clicks on the “exit” button.

Redirect URL

Redirect to another URL in case there aren't any global variables available.

Redirect Variable

Creates a variable with the application name and sends it to the redirected application.

Messages

On this screen, you can redefine the default application messages to the end-user by customizing the validation messages for Insert, Update, and Delete. You can also define messages for SQL errors and the confirmation outputs.

Messages

Messages		
ATTRIBUTE	VALUE	DESCRIPTION
No Records Message	<input type="text"/>	When the application has no records,it will display this customized text.
Primary key violation	<input type="text"/>	Message to display when the primary key constraint is violated
Unique key violation	<input type="text"/>	Message to display when the unique constraint is violated

No Records Message

The message displayed when the application has no records.

Primary key violation

The message displayed when there is a violation in the database's primary key constraint.

Unique key violation

The message displayed when there is a violation in the database's unique constraint.

Insertion Messages

▲ Insertion messages		
ATTRIBUTE	VALUE	DESCRIPTION
Message After Insert		Message to display after inserting a record.
Message to Confirm Insert		Message to display to confirm inserting of a record.

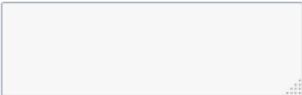

Message After Insert

The message displayed when inserting a new record.

Message to Confirm Insert

The message displayed if the end-user wants to confirm the inserting of a new record.

Update Messages

▲ Update messages		
ATTRIBUTE	VALUE	DESCRIPTION
Message After Update		Message to display after updating a record.
Message to Confirm Update		Message to display on the update confirmation

Message After Update

The message displayed when updating a record.

Message to Confirm Update

The message displayed if the end-user wants to confirm the changes of a record.

Messages of delete

Messages of Delete.		
ATTRIBUTE	VALUE	DESCRIPTION
Message After Delete		Message to display after delete a record.
Message to confirm Delete		Message to display on the delete confirmation

Message After Delete

The message displayed when deleting a record.

Message to confirm Delete

Displays a customized message asking to confirm the record deletion.

If you make no changes, the application will use the default values for the messages. Those values can be configured in [Locales - > Application Language](#).

Global Variables

This screen shows all global variables used in the application

The global variable is an external parameter required for running the application. The application can include global variables in the WHERE clause, field definitions and names, event programming, and so on.

You can define global variables by using square brackets ([variable]). You can pass the parameters to the application through one of the methods: Session, Post, and Get

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(") instead of the brackets([]) because of the conflict with the of Global Variables syntax{:target="_blank"} Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

Global variables Interface.

Example:

```
Select CustomerID, CustomerName from Customers WHERE CustomerID = '[v_customerid]'
```

We do not recommend using session variables (global variables) with the same name as the table fields.

In this case, the variable **v_customerid** is displaying in the global variables configuration.

VARIABLE SETTINGS	
ATTRIBUTE	VALUE
global	<div style="border: 1px solid black; padding: 5px;"> <p>Scope</p> <p><input type="checkbox"/> SESSION</p> <p><input checked="" type="checkbox"/> POST</p> <p><input checked="" type="checkbox"/> GET</p> </div> <div style="border: 1px solid black; padding: 5px; margin-top: 5px;"> <p>Settings</p> <p><input type="checkbox"/> Optional</p> </div> <div style="border: 1px solid black; padding: 5px; margin-top: 5px;"> <p>Type</p> <p><input type="radio"/> Out</p> <p><input checked="" type="radio"/> In</p> </div>

Global variables configuration Interface.

Attribute

It shows the variable's name in the application.

Value

Defines the behavior of the variables, divided into three blocks, they are:

Scope

Defines how the application receives the variable. A variable defined as the POST method in the app does not receive value if it comes with the GET method. Those are the methods available:

- **Session:** Defines that the variable must be created as a PHP session variable by another application.
- **GET:** Defines that the variable must be passed by the URL, that is, visible by the browser.
- **POST:** Defines that the variable must be passed through the POST method of an HTML form.

Settings

- **Optional:** Check it to don't validate the variable at runtime.

Type (In / Out)

Defines whether the variable comes from another application (In), or it is starting in the current app (Out).

Description

Indicates where the application is using the variable.

Synchronize table

This process performs a comparison between the definitions of application fields and fields of the connected database table. If there is any change within the connected table, such as adding a new field, exclusion, or a change in the data type, the changes will appear visible as in the image below:

Application Fields	Table Fields
customerid	customerid
companyname	companyname
contactname	contactname
contacttitle	contacttitle
birthdate	birthdate
country	country
regionid	regionid
stateid	stateid
city	city
address	address
postalcode	postalcode
phone	phone
fax	fax
cityid	cityid
creditlimit	creditlimit
cardtype	cardtype
cardnumber	cardnumber
	Files
notes	

Confirm Help

■ Fields that will be created
■ Fields that will be updated
■ Fields that will be removed

Table synchronization interface.

After accessing the function from the link "Synchronize table" you will see a comparison table between the application fields (left table) and the database table fields (right table), above image, the fields highlighted in "red" will be deleted of the application, the fields highlighted in "Green" will be inserted in the form, and the fields highlighted in "orange" will be updated, so data type will be updated.

To rename a field in the database table, the table synchronization effect, by comparison, will be the same as deleting a field that existed in the application and the inclusion of a new field.

Below you can see a video showing the process:

Form Links Overview

This feature allows the developer to create links between applications of the same project, expanding the integration of applications. All link options are grouped under the Application Links menu.

Application Links

In the first access to the menu, we can see the list of existing connections in the application.

If the application does not have a configured link, the application list screen will be displayed with the message: **This application does not have any link. Click here to create one now.**

ID

Link identification ID.

Type

The type of link created, some links such as Edit Link allow only one link per application. In this case, the developer will be able to check the connection types that already exist in the application

Target Application

This info show the target application name.

Actions

This column has edit options for the links.

Properties

It allows accessing the binding properties where it is possible to configure the binding behavior.

Link

Displays the links screen, where it is possible to configure the link that was made with the application informed in the target application column. In this option it is possible to change the parameter passed in the connection as well as the target application.

Delete

Permanently deletes the connection in the applications.

Through the option [Restore Applications](#), it is possible to get a previous version of the application, making it possible to recover the link deleted.

Links Type

The Form application has the following links options

- [Application Link][ligacao_edicao] - Allows you to link a form with any project application.
- [Capture Link](#): It allows the creation of links from the filter fields of the Grid application, in order to enable the recovery of the value to fill in the field, with another Grid application of the project.
- [Field Link](#): Allows you to create a link through the application fields to any application in the project.
- [Button Link](#): It allows creating a link through the buttons created by the developer in the query application, to any application in the project.

Form Applications Link Types x Target Application available to link

Check the links types of the Form application and the target applications available for each link types.

Only **Capture link** have some restrictions in the target application use, allowing only to use of Grid application.

	Application Link	Capture Link	Button Link
Grid	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Chart	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Form	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Application link

Este tipo de enlace permite crear un enlace desde un Formulario hacia cualquier tipo de aplicación.

En las opciones de tipos de enlace, seleccionaremos la Ligación de Aplicación. Al elegir esta opción, será posible acceder a otra aplicación desde el formulario.

![Interfaz de creación de enlace de aplicación.][ligacao_criando_aplicacao]

Application List

All project applications available for the link will be listed. In this step, the developer must select the destination application that will be used in the connection.

![Tela com a lista de aplicações disponíveis para ligação de edição][img_lista_apps]

Finding Applications

To assist in locating the application, you can use the **grouping buttons** or the **Search** field.

Search field

The search is performed by application name.

Grouping Buttons

In this grouping there are three visualization options:

All

Lists all applications in the project alphabetically **a-z**.

Example of applications without clustering

By folder

Lists applications grouped by their folder, according to the organization of applications in the [Explorer Project](#).

Example of applications grouped by Folder

- **Item 1** - List of folders created in [Explorer Project](#). Select the folder and all applications in the folder will be displayed on the **item 2**.
- **Item 2** - List of applications in the folder selected in the __Item 1__.

By type

Lists applications grouped by their respective type.

Example of applications grouped by type

Item 1 - Types of existing applications in Scriptcase. Select the type of application you want to list, the applications corresponding to the selected type will be listed in **item 2**. **Item 2** - List of applications referring to the type selected in **item 1**.

When selecting the destination application, click on **Next** ».

Parameter Definition

In this step, the developer must inform the values that will be passed to the parameters of the destination application.

These parameters can be:

- [Global Variables](#) - Which can be defined in the events or in the target application's SQL.
- Primary Key - For connections created with applications of the types: [Form](#) and [Calendar](#).

For the **Edit Link** to function correctly, it is necessary for the primary key field of the form to receive a value, which can be defined by a global variable, a field from the grid, or by using the Fixed Value option.

Parameters

Lists all parameters defined in the target application.

Type

Defines the source type of the value that will be sent to the parameter defined in the destination application.

The options are:

- **Fields** - It uses the value of a field from the source application as a parameter.
- **Variable** - It uses the value of a global variable, defined in the source application, as a parameter. **This option will only be listed if a global variable is defined in an event in the source application.**
- **Fixed value** - It uses a fixed value, defined in the value column, as a parameter. **In this option only alphanumeric values are allowed.**
- **No value** - Using this option no value is passed. When using this option as a parameter for a primary key, the target application will be displayed in include mode.

Value

Defines the value that will be sent as a parameter. The options in this column change according to the selected **Type**.

- When selecting **Campo** - The value column will list all the fields of the source application, which will send the value.
- When selecting **Variable** - All global variables defined in the source application will be listed.
- When selecting **Fixed value** - A field will be displayed for the value to be informed. The use of variables is not allowed in this option and we must use only alphanumeric values.
- When selecting **No Value** - In this case, no value will be sent to the parameter.

Refresh Button

This button enables ajax reloading of the list of parameters, in this way it is possible to change or add a parameter in the destination application without the need to restart the creation of the connection in progress.

Properties

The **Properties** screen allows you to configure the redirection behavior between applications in Scriptcase.

Link Properties

In this screen, we will configure the link properties.

Redirect after insert:

This setting provides three options that will apply after an insertion.

Yes: Selecting this option, the application will go to the linked application as soon as a new record is inserted.

No: Selecting this option, the application will not go to the linked application as soon as a new record is inserted.

Exit Application: Selecting this option, the application will go to the exit application or to the application that initially called the form, after the record insertion.

Redirect after update:

This setting provides three options that will apply after an update.

Yes: Selecting this option, the application will go to the linked application as soon as a record is edited.

No: Selecting this option, the application will not go to the linked application as soon as a record is edited.

Exit Application: Selecting this option, the application will go to the exit application or to the application that initially called the form, after updating the record.

Form Properties

These properties are only available in links where the destination application is a form, this configuration block defines whether or not to display the **Update** (*Insert, Update and Delete*) and **Navigation** (*first, *previous, *next and last*) of the target form, according to the toolbar settings of the called application.

It is important to point out that the attributes in the Form Properties block do not override the toolbar settings of the called form, they only determine whether the buttons configured there will be displayed or not in the link.

This attribute is not available if the **Link Operation Mode** attribute is set to *Open in an iframe*. In this configuration, the form's buttons will be displayed on the toolbar of the link's source application. [Click here](#) for more details on the query toolbar.

Enable Insert Button

Sets whether or not to display the **Insert** button on the target form. For this, it is necessary that the button *include* is selected to be displayed in the settings of the [toolbar](#) of the application.

Enable Update Button

Sets whether or not to display the **Refresh** button on the target form. For this, it is necessary that the button *change* is selected to be displayed in the settings of the [toolbar](#) of the application.

Enable Delete Button

Sets whether or not to display the **Delete** button on the target form. For this, it is necessary that the button *Delete* is selected to be displayed in the settings of the [toolbar](#) of the application.

Enable Navigation Buttons

Determines whether or not to display the **Navigation Buttons** (*First, Back, Page Navigation, Next, Last*) configured in [toolbar](#) of the target form.

Keep the WHERE clause in the target application

This attribute is only available when enabling navigation buttons.

This attribute makes it possible for the **WHERE** clause of the source application (Query) to be maintained in the destination application. This means that the filters performed in the query will be inherited by the target form, enabling better quality in the records displayed for editing.

Form Field Link Settings

Creating a field link

Allows to create a link, represented through a link, from a grid's column to any project's existing application. All the links are displayed in a dropdown if there are more than one link to the same field.

In the types of link option, we will choose the **Field link**.

Applications list

After we select this option, will be displayed the applications list to what you want to create the link.

This screen can be viewed from the following ways:

All:

In which is possible to see all the project's applications. **Example:**

By folder:

In which is possible to see the applications according to the folders in which each of them are.

By type:

In which is possible to see the applications grouped by its respective types.

Definition of Parameters

In this setting we are going to define the type of parameter that will be passed to the next application.

We have two options at **Type of Parameters**, they are:

Fixed value:

This option allows the user to define a fixed value that will be used to the call of the next application.

No value:

This option allows to create the link without the need to send any parameter to the next application.

It is also possible to see a refresh button at its right side.

This button should be used when a new parameter is added to the target application, so the new parameter can be loaded in the current application to make the link.

Link properties

In this screen we will set the application display mode that will be called in the link.

There are five display options, they are:

Open in the same window:

When we use this option the target application will be displayed in the same window of the application, and the target application will have a back button so we can return to the previous application.

Open in another window:

When we use this option the target application will be displayed in other browser window, and the target application will have a exit button so we can close this window.

Modal:

When we use this option the target application will be displayed in the same window of our application, however it will be displayed in a small window above the current application.

Open in the same window

When we use this option the target application will be displayed in the same window of the application, and the target application will have a back button so we can return to the previous application.

When we select this option, we can set the following options:

![Same window][mesma_janela]

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Open in another window

When we use this option the target application will be displayed in another browser window.

When we select this option, we can set the following options:

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Close the form after an update:

Choosing the option **Yes**, the window will be closed after doing the update of a register.

Close the form after an insert:

Choosing the option **Yes**, the window will be closed after doing the insert of a register.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Open the application in a tab inside the menu:

Choosing the option **Yes**, the application will be open in a **menu tab**, when executed from a menu application, instead of opened in another browser window.

Open in an iframe

When we use this option the target application will be displayed in the same window of our application, and the target application will have a back button so we can return to the previous application.

When we select this option, we can set the following options:

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Iframe properties

In this settings, we can define some iframe details that will display the target application.

Iframe position in relation to the main application:

In this option, we will define in which position in relation to the main application the iframe will be displayed, there are four options:

Below: The iframe will be displayed below the main application.

Above: The iframe will be displayed above the main application.

Right: The iframe will be displayed on the right of the main application.

Left: The iframe will be displayed on the left the main application.

Iframe height:

Allows to set the iframe height.

Iframe width:

Allows to set the iframe width.

Modal

When we use this option the target application will be displayed in the same window of the application, however she will be displayed in a small window above the current application.

When we select this option, we can set the following options:

Height:

Allows to set the Modal height.

Width:

Allows to set the Modal width.

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Close the form after an update:

Choosing the option **Yes**, the window will be closed after doing the update of a register.

Close the form after an insert:

Choosing the option **Yes**, the window will be closed after doing the insert of a register.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Grid's Properties

In those settings we can define how our target grid will be displayed. We initially have six options, that are:

![Form proprieties][propriedades_consulta]

Initial module:

We can define how our application will be executed in those two options:

Grid: The application will be executed as a grid.

Search: The application will be executed as a search.

Quantity of rows:

In this option we can define the quantity of rows that will be displayed in the target application.

Quantity of Columns:

In this option we can define the quantity of columns that will be displayed in the target application.

Pagination:

In this option we can define if the target application's pagination will be total or partial, in case partial is the selected option the quantity of rows will be the informed previously.

Enable header:

In this option we can define if the target application's header will be displayed.

Enable Navigation buttons:

In this option we can define if the buttons **first, previous, next and last** will be available in the target application.

Form Capture link Settings

Creating a Capture Link

The capture link is used to return a value from a **Grid** to a **Form** field.

In the types of links options, we will choose the **Capture Link**. After selection this option, we should also choose which field we want to return the value of.

Applications list

After we select this option, will be displayed the applications list to what you want to create the link.

This screen can be viewed from the following ways:

All:

In which is possible to see all the project's applications. **Example:**

By folder:

In which is possible to see the applications according to the folders in which each of them are.

By type:

In which is possible to see the applications grouped by its respective types.

Definition of Parameters

In this setting we are going to define the type of parameter that will be passed to the next application.

We have two options at **Type of Parameters**, they are:

Fixed value:

This option allows the user to define a fixed value that will be used to the call of the next application.

No value:

This option allows to create the link without the need to send any parameter to the next application.

It is also possible to see a refresh button at its right side.

This button should be used when a new parameter is added to the target application, so the new parameter can be loaded in the current application to make the link.

Application with no parameters

However, when the target application does not have any defined parameters, the following screen is displayed:

Clicking in the button, you will be taken to the target application to create a parameter, so you can use the update button in the **parameters definitions** to refresh them.

Link properties

In this screen we will set the application display mode that will be called in the link.

In this type of link there is only one display option:

Modal:

When we use this option the target application will be displayed in the same window of our application, however it will be displayed in a small window above the current application.

Modal

When we use this option the target application will be displayed in the same window of the application, however she will be displayed in a small window above the current application.

When we select this option, we can set the following options:

Modal:

In this option we are going to define if the target application will be opened in a Modal.

Yes: This option will make the target application be opened in a modal. **No:** This option will make the target application be opened in a new window.

If **Yes** is selected in the previous option, the Modal **Height** and **Width** will be available.

![Modal with yes][modal2]

Height:

Allows to set the Modal height.

Width:

Allows to set the Modal width.

If **No** is selected in the previous option, only those options will be available.

Allows to modify manually in the update:

When we select the option **Yes**, the button **New** is created in the grid to insert new registers.

Allows to modify manually in the insert:

Indicates which shortcut key to the button add new register.

Allows to modify automatically in the update:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Allows to modify automatically in the insert:

Choosing the option **Yes**, the window will be closed after doing the insert of a register.

Form Button link Settings

Creating a Button Link

Allows the developer to create a link where the call to the other application will be done through a button.

In the type of links options, we will choose the **Button Link**. Choosing this option it will be possible to create a link to any other application.

List of applications

After selecting this option, The list of applications to what you want to create a link will be displayed.

This screen can be viewed in the following ways:

All:

In which is possible to see all the project's applications. **Example:**

By folder:

In which is possible to see the applications according to the folders in which each of them are.

By type:

In which is possible to see the applications grouped by its respective types.

Definition of Parameters

In this setting we are going to define the type of parameter that will be passed to the next application.

We have two options at **Type of Parameters**, they are:

Fixed value:

This option allows the user to define a fixed value that will be used to the call of the next application.

No value:

This option allows to create the link without the need to send any parameter to the next application.

It is also possible to see a refresh button at its right side.

This button should be used when a new parameter is added to the target application, so the new parameter can be loaded in the current application to make the link.

Link properties

In this screen we will set the application display mode that will be called in the link.

There are five display options, they are:

Open in the same window:

When we use this option the target application will be displayed in the same window of the application, and the target application will have a back button so we can return to the previous application.

Open in another window:

When we use this option the target application will be displayed in other browser window, and the target application will have a exit button so we can close this window.

Modal:

When we use this option the target application will be displayed in the same window of our application, however it will be displayed in a small window above the current application.

Open in the same window

When we use this option the target application will be displayed in the same window of the application, and the target application will have a back button so we can return to the previous application.

When we select this option, we can set the following options:

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Open in another window

When we use this option the target application will be displayed in another browser window.

When we select this option, we can set the following options:

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Close the form after an update:

Choosing the option **Yes**, the window will be closed after doing the update of a register.

Close the form after an insert:

Choosing the option **Yes**, the window will be closed after doing the insert of a register.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Open the application in a tab inside the menu:

Choosing the option **Yes**, the application will be open in a **menu tab**, when executed from a menu application, instead of opened in another browser window.

Choosing the option **Yes**, there are also some other settings to be displayed:

Title to the tab:

This option allows the developer to set a title to the tab that will be opened when used in a Menu application.

Hint to the tab:

This option allows the developer to set a message to be displayed when the mouse cursor is over the tab Menu.

Active tab icon:

This option allows the developer to set an icon to be displayed in the tab when used in a menu application.

Modal

When we use this option the target application will be displayed in the same window of the application, however she will be displayed in a small window above the current application.

When we select this option, we can set the following options:

Height:

Allows to set the Modal's height.

Width:

Allows to set the Modal's width.

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Close the form after an update:

Choosing the option **Yes**, the window will be closed after doing the update of a register.

Close the form after an insert:

Choosing the option **Yes**, the window will be closed after doing the insert of a register.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Form Programming

ScriptCase has incorporated the concept of Object Oriented programming, using attributes, resources, methods and libraries. It is possible to create your own business rules in applications, and by using these concepts you can reap huge rewards in terms of better organization and improved development.

Attributes

The attributes are variables that has the global scope declared in the application. An attribute that can be referenced in all the methods and the application's events.

The screenshot shows a web interface titled 'ATTRIBUTES SETTINGS'. It features a table with two columns: 'ATTRIBUTE' and 'VALUE'. Below the table, there is a section labeled 'Attributes'. This section contains an input field labeled 'Attribute Name', four blue buttons labeled 'Include', 'Update', 'Delete', and 'Clean', and a vertical scrollbar on the right side.

Attributes configuration Interface.

Attribute Name : This field allows to inform the attributes name, after typing the name just click on **include**. In case you want to **update** click on the attributes name (located on the buttons' right side), do the necessary modifications and click on update. In case it is necessary to **delete** an attribute, it is necessary to do same process as the update, but when selecting the attribute, it is necessary to click on the delete button. The **clear** button, as the name suggests, it clears the list of all the attributes listed on the right.

Internal libraries

To use the internal libraries just select the correspondent (Project Libraries for example). This process allows the methods existing in the library, to be visible in all the application's Events and Methods.

See how to manage the libraries by [clicking here](#).

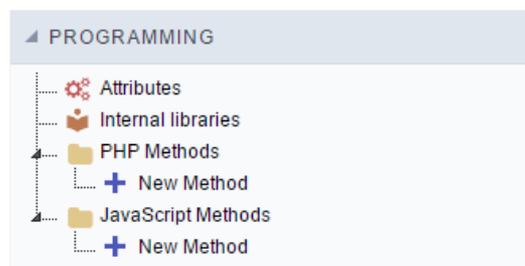

The screenshot shows a web interface titled 'INTERNAL LIBRARIES - SCRIPTCASE'. It displays a list of internal libraries for different sessions. The first session, 'INTERNAL LIBRARIES - SCRIPTCASE', has a checkbox and the filename 'sc_ssn.php'. The other sessions, 'INTERNAL LIBRARIES - PUBLIC', 'INTERNAL LIBRARIES - PROJECT: PROJECT1', and 'INTERNAL LIBRARIES - USER: ADMIN', all show 'No library found for this session.'

Internal Libraries management Interface

PHP Methods

Methods are function or procedures declared by the developer, that helps when applying the routines. Using methods in the applications allows to reuse your code throughout the application, optimizing the development experience.

Creating a new method

- Give the method a name and click Create. As in the image below.

PHP methods are incorporated into the same class, so it is not possible to use two functions with the same name even when used in different methods.

- Methods can receive parameters.

- Add the amount of variables:

- Defining the variables:

Name	Type	Value Standard
	For Value	
	For Value	
	For References	

- **Name** : Type in the variable's name.
- **Type** : Selecting the type of variables: For Value or For Reference.

- **Value Standard** : The parameter's value used to initialize when calling the method.

References allows to create a second name for a variable that you can use to read and modify the variable's original information.

- Editing a parameter:

- : Checking all the parameters in the parameter list.
- : Uncheck all the parameters in the parameter list.
- : Edit the selected parameter of the list.
- : Deletes the selected variable of the list.

JavaScript Methods

Methods are function or procedures declared by the developer, that helps when applying the routines. Using methods in the applications allows to reuse of the your code throughout the application, optimizing the development experience.

Creating a new method

JavaScript method creation Interface

- Define a name for the method and click on Create. Like the image below.

Include Method.

- Methods can receive parameters.

function new_method

```
1 echo "Hello World!!!";
```

Definition of the parameters of the method:

new_method

- No defined parameter.

Add 1 Parameter(s) Cancel

Save

- Add the amount of variables:

JavaScript method parameter definition

- Defining the variables:

Name	Type	Value Standard
	For Value	

Defining the variables

Save Back Cancel

- **Name** : Type in the variable's name.
- **Type** : Selecting the type of variables: For Value or For Reference.
- **Value Standard** : The parameter's value used to initialize when calling the method.
References allows to create a second name for a variable that you can use to read and modify the original variable's information.

- Editing a parameter:

Definition of the parameters of the method:

new_method

Parameters

\$test = test

✓

Add 1 Parameter(s) Cancel

Save

- : Checking all the parameters in the parameter list.
- : Uncheck all the parameters in the parameter list.
- : Edit the selected parameter of the list.
- : Deletes the selected variable of the list.

Creating a Form Application

New Application

The process of creating an application is quite simple and intuitive.

You only need to select the type of application you want to generate from the list of applications available in Scriptcase, and it will be generated automatically.

Application Data

When selecting the application, the following screen will appear.

On this tab, you must select the connection to be used in the application. Once the connection is selected, the tables will be loaded and displayed in the **Table** field.

You can select more than one table when creating applications.

After selecting the tables and fields to be part of the application, the application name will be generated using the type + table name.

Example: form_orders

However, you can change the application name to any other name you prefer.

FORM

APPLICATION DATA EDIT FIELDS THEME

Type*

Single row Multiple rows Editable grid Editable grid (view)

Connection* Name*

conn_example form_dbo_customers

Table

dbo.customers

Localization

Inherit project default language

Create application as a multi step form

Number of steps 4 ?

Connection

Defines the connection used for the creation of the application. The existing connections in the project will be listed.

Name

The name of the application being created. It cannot contain special characters.

Table

Defines the tables to be used in the application. (Form and Calendar can only use one table).

Localization

The language of the application to be created. The project's default language is automatically selected.

Create application as a multi step form

When this option is selected, the form will be configured in a step format, dividing the filling process into multiple pages.

This functionality is available only for single-record forms. After creation, it is possible to revert to the traditional format by adjusting the page settings.

Number of steps

Defines the initial number of steps the multi-step form will have, creating the blocks and pages that compose the form automatically. The fields will be distributed across the created pages and can be rearranged later by adjusting the field positioning.

Edit Fields

This screen displays the fields of the selected tables and allows adjustments to be made before creating the application, such as changing the data type, display name, and other configurations.

FORMULARIO						
DATOS DE LA APLICACIÓN		EDITAR LOS CAMPOS	TEMA			
Campos	Etiqueta	Tipo de datos	Nuevo	Actualizar	De sólo lectura	Requerido
OrderID	Order ID	Numero	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

ShipVia	Ship Via	Numero	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Fields

Names of the database fields.

Label

Names of the fields in the generated application's interface.

Datatype

Specifies the field's data type.

New

Defines the fields available for insertion.

Update

Defines the fields available for the Update.

Read-Only

Defines whether the field will be read-only.

Required

Defines whether the field will be mandatory.

Theme

On this screen, you can select the theme that the application will use. The default project theme, which can be checked and modified in **Project > Properties**, is automatically selected.

Tab Settings

TAB SETTINGS	
ATTRIBUTE	VALUE
Title	<input type="text" value="tabs"/>
Friendly URL	<input type="text"/>
Organization	<input type="text" value="iframe"/>
Type	<input type="text" value="Folder on the Top"/>
Table Width	<input type="text" value="80"/>
Measure Unit	<input type="text" value="Percent"/>
Tab Alignment	<input type="text" value="Left"/>
Application alignment	<input type="text" value="Center"/>
Margins	<input type="text"/> Up <input type="text"/> Down <input type="text"/> Right <input type="text"/> Left
Exit	<input type="text" value="Button on the bottom of the page"/>
Exit Icon	<input type="text"/> 

Tab settings interface.

Within the Tab settings you can configure the following attributes:

- **Title** : Application title that will be displayed in the toolbar.
- **Friendly URL** : This field allows you to customize the URL that will be called by the application, the allowed characters are the same available on regular URLs: a-z, A-Z, 0-9, -_. This option can also be changed within Scriptcase Home interface, on the "Friendly URL" column from the applications grid.
- **Organization** : Allows the applications to run inside folders via iframe or embedded on the tabs application.
- **Type** : This option sets how the folders will be organized, it can be:
 - **Folder on the Top** : Displays the folders above the application.
 - **Folder on the Bottom** : Displays the folders below the application, next to the footer.
 - **Folder on the Left** : This option allows the folders to be aligned in the left, like a vertical menu.
 - **Folder on the Right** : This option allows the folders to be aligned in the right, like a vertical menu.
 - **Menu on the Top** : This option is similar to "Folder on the Top", but its visual schema has the menu style.
 - **Menu on the Bottom** : This option is similar to "Folder on the Bottom", but its visual schema has the menu style. .
 - **Menu on the Left** : This option is similar to "Folder on the Left", but its visual schema has the menu style.
 - **Menu on the Right** : This option is similar to "Folder on the Right", but its visual schema has the menu style.
 - **Side by Side** : Display all applications in folders, one next to the other.
- **Table Width** : Main table size.
- **Measure Unit** : The unit used by table size. It can be: Pixel or percentage..
- **Tab Alignment** : This option sets the tab alignment position. It can be: center, left or right.
- **Application alignment** : This option sets the application alignment position, It can be: center, left, or right.
- **Exit** : This option allows you to define how the exit will be presented in the application, the options:
 - Button on the bottom of the page;
 - Folder;
 - Button in the toolbar

- In view.
- **Exit Icon** : This option allow you to select an icon for the “Exit” option in the tab. Use the image manage to select or import a customized image.

Security

Use security

With this option enabled, when accessing the application, an “unauthorized user” message will be displayed, preventing access to the application.

When enabled, application access is only possible through the macro **sc_apl_status** or through **security module**.

[Click here](#) to access the macro documentation sc_apl_status.

In the development environment, the use of the above options for testing purposes may be suppressed, preventing the password being requested or access being blocked at each execution of the applications. To do this, disable the options “Enable security usage” and “Enable password usage” in the menu **Configuration > My Scriptcase**.

Security exit url

Defines which application the user will be redirected to after the “unauthorized user” warning.

Use password

When enabling the option, you will be asked to define a password for accessing the application.

When running the application using the active password, you will be asked for the password before accessing the application.

The password will be requested regardless of the “use security” setting or the use of the security module.

Request password only once

This option defines the behavior of the use password option.

When this option is enabled, the password will be requested only once per session.

When disabling, the password will be requested every time the application will be accessed.

Allow direct calling by URL

Allows an application to be called by typing the URL directly into browsers.

When disabled, when accessing the application by typing the URL directly, the invalid data error will be displayed. With this configuration, the application can only be accessed through a menu application, for example.

Cookies

HttpOnly

These are cookies that can be set by the server or by javascript but cannot be accessed in any way by javascript.

With the HTTPOnly parameter enabled, it is very difficult to steal a session through XSS because the javascript cannot read the content of these cookies.

A widely exploited attack in XSS is the theft of user session cookies. Theft of cookies is carried out through a javascript command that sends cookies to an external URL where the attacking user has control.

This option is enabled by default in all applications.

Session ID

Enables the session id that will be stored in cookies on the client side. This option embeds the session id directly in the URLs

This option is enabled by default in all applications.

Cookie Secure

With this option enabled, cookies are protected and can only be transmitted via secure communication. Therefore, they cannot be accessed through Javascript.

The HttpOnly option must also be enabled.

Headers

Desabilitar o Auditor XSS

XSS is short for Cross-Site Scripting, which is an attack that consists of sending HTML with malicious JavaScript to a website.

It is a security attack that consists of sending HTML with malicious JavaScript to a website. If the website displays this HTML with JavaScript without filtering the malicious JavaScript code, the cookies sent by the website can be stolen and sent to an attacking website, so that it can be used to forge user sessions and access the website's user account without permissions.

Strict-Transport-Security

HSTS forces browsers to use HTTPS in the domain where it is enabled, instead of using HTTP.

When enabled, the default value is "max-age = 31536000".

The HSTS policy is set for one year (31536000 seconds). This period specifies the time the browser will access the server via HTTP

X-Frame-Options

The HTTP X-Frame-Options response header can be used to indicate whether or not the browser should render the page in a `<frame>`, `<iframe>`, `<embed>` " or '". This header provides protection against clickjacking, known as 'click swipe' - this vulnerability can steal relevant information and data from the user.

X-Frame-Options does not allow the rendering of a page in a frame, ensuring that the content of your page is not embedded in other sites

- **SAMEORIGIN:** The SAMEORIGIN directive allows the page to be loaded in a frame from the same source as the page itself. This option must be used so that the application with clickjacking protection can be used in the menu application.
- **DENY:** This directive completely disables page loading in a frame.

If no option is selected, the application can be used on any `<frame>`, `<iframe>`,

or `<object>`, allowing the application to be incorporated into another website.

X-Content-Type-Options

X-Content-Type-Options is used to protect against MIME detection vulnerabilities. With this option enabled, it prevents browsers from interpreting the page content (sniffing) and executing the data as code / tag. These vulnerabilities can occur when uploading a text file with a javascript code and the browser reading the content that is in the file and executing, even though it is just text and not part of the code.

With this enabled, the HTTP X-Content-Type-Options header is defined, by default, as "no detection".

Referrer-Policy

no-referrer.

The Referer header will be omitted completely. No reference information will be sent with requests.

no-referrer-when-downgrade.

This is the default behavior when no policy is specified, or if the value provided is invalid.

origin.

Only send the origin of the document as a reference. For example, a document at `https://example.com/page.html` will send the reference `https://example.com/`.

origin-when-cross-origin.

Sends the origin, path and query string when performing a same-origin request, but only sends the origin of the document in other cases.

same-origin.

The reference will be sent to sources on the same site, but requests between sources will not send reference information.

strict-origin.

Only send the document source as a reference when the security protocol level remains the same (HTTPS → HTTPS), but do not send it to a less secure recipient (HTTPS → HTTP).

strict-origin-when-cross-origin.

Sends the source, path and query string when performing a request from the same source, only sends the source when the security protocol level remains the same during an inter-source request (HTTPS → HTTPS), and sends no header to recipients less secure (HTTPS → HTTP)

unsafe-url.

Sends the source, path and query chain when performing any request, regardless of security.

Feature-Policy

The value of this header is a policy or set of policies that you want the browser to respect for a particular source.

The source whitelist can take on several different values:

- ``*:`` The feature is allowed in top-level navigation contexts and in nested navigation contexts (iframes).
- ``self:`` The feature is allowed in top-level navigation contexts and nested navigation contexts from the same source. It is not allowed in documents of cross origin in nested browsing contexts.
- ``none:`` The feature is not allowed in top-level browsing contexts and is not allowed in nested browsing contexts.
- ``<origin (s)>:`` specific sources for which to enable the policy (for example `https://example.com`).

Example 1 - Using only one directive Let's say you want to prevent all content from using the geolocation API on your site. You can do this by submitting a restricted 'none' whitelist to the geolocation resource:

Feature-Policy: ``geolocation 'none'``

Example 2 - Using more than one directive Functionalities within a policy are separated by semicolons.

Feature-Policy: `unsized-media 'none'; geolocation 'self' https://example.com; camera *;``

Directives

accelerometer

Controls whether the current document is allowed to collect information about the acceleration of the device

via the Accelerometer interface.

ambient-light-sensor

Controls whether the current document is allowed to collect information about the amount of light in the environment around the device through the AmbientLightSensor interface.

autoplay

Controls whether the current document is allowed to play the requested media automatically via the HTMLMediaElement interface. When this policy is disabled and there is no user action, the Promise returned by HTMLMediaElement.play () will reject it with a DOMException. The autoplay attribute on <audio> " and " elements will be ignored.

battery

Controls whether the use of the Battery Status API is allowed. When this policy is disabled, the Promise returned by Navigator.getBattery () will reject it with a NotAllowedError DOMException.

camera

Controls whether the current document is allowed to use inputs from video devices. When this policy is disabled, the Promise returned by getUserMedia () will reject it with a NotAllowedError DOMException.

display-capture

Controls whether or not the current document is allowed to use the getDisplayMedia () method to capture screen content. When this policy is disabled, the Promise returned by getDisplayMedia () will reject it with a NotAllowedError if permission is not obtained to capture the contents of the screen.

document-domain

Control whether the current document is allowed to place document.domain. When this policy is disabled, attempts to place document.domain will fail and cause a SecurityError DOMException to be thrown.

encrypted-media

Controls whether the current document is allowed to use the Encrypted Media Extensions (EME) API. When this policy is disabled, the Promise returned by Navigator.requestMediaKeySystemAccess () will reject it with a DOMException.

execution-while-not-rendered

Controls whether tasks should be performed in frames while they are not rendered (e.g. whether a frame is hidden or display: none).

execution-while-out-of-viewport

Controls whether tasks should be performed in frames while they are outside the visible viewing window.

fullscreen

Controls whether the current document is allowed to use Element.requestFullscreen (). When this policy is disabled, the returned Promise rejects it with a TypeError DOMException.

geolocation

Controls whether the current document is allowed to use the Geolocation interface. When the policy is disabled, calls to getCurrentPosition () and watchPosition () will cause function callbacks to be invoked with a PositionError of PERMISSION_DENIED.

gyroscope

Controls whether the current document is allowed to collect information about the orientation of the device through the Gyroscope interface.

layout-animations

Controls whether the current document is allowed to show layout animations.

legacy-image-formats

Controls whether the current document is allowed to show images in legacy formats.

magnetometer

Controls whether the current document is allowed to collect information about the orientation of the device through the Magnetometer interface.

microphone

Controls whether the current document is allowed to use inputs from audio devices. When this policy is disabled, the Promise returned by `MediaDevices.getUserMedia ()` will reject it with a `NotAllowedError`.

midi

Controls whether the current document is allowed to use the Web MIDI API. When this policy is disabled, the Promise returned by `Navigator.requestMIDIAccess ()` will reject it with a `DOMException`.

navigation-override

Controls the availability of mechanisms that enable the author of the page to take control over the behavior of spatial navigation, or to cancel completely.

oversized-images

Controls whether the current document is allowed to download and display large images.

payment

Controls whether the current document allows the use of the Payment Request API. When this policy is disabled, the `PaymentRequest ()` constructor will throw a `SecurityError DOMException`.

picture-in-picture

Controls whether the current document allows a video to be allowed to play in Picture-in-Picture mode via the corresponding API.

publickey-credentials-get

Controls whether the current document is allowed to use the Web Authentication API to retrieve already stored public key credentials, i.e. via `navigator.credentials.get ({publicKey: ..., ...})`.

sync-xhr

Controls whether the current document is allowed to make synchronous XMLHttpRequest requests.

usb

Controls whether the current document is allowed to use the WebUSB API.

vr

Controls whether the current document is allowed to use the WebVR API. When this policy is disabled, the Promise returned by `Navigator.getVRDisplays ()` will reject it with a `DOMException`. Keep in mind that the WebVR standard is in the process of being replaced by WebXR.

wake-lock

Controls whether the current document is allowed to use the Wake Lock API to indicate that the device should not go into a power saving mode.

screen-wake-lock

Controls whether the current document is allowed to use the Screen Wake Lock API to indicate whether or not the device should darken the screen.

xr-spatial-tracking

Controls whether or not the current document is allowed to use the WebXR Device API to interact with the WebXR session.

Content-Security-Policy

Content-Security-Policy is the name of an HTTP response header that modern browsers use to increase the security of the document (or web page).

The Content-Security-Policy header allows you to restrict resources such as JavaScript, CSS or just about anything the browser loads.

Directives**default-src**

The default-src directive defines the standard policy for fetching features such as JavaScript, Images, CSS, Fonts, AJAX requests, Frames, HTML5 Media. Not all directives go back to default-src. Refer to the Source List Reference for possible values.

DEFAULT-SRC Policy Example `default-src 'self' cdn.example.com;`

script-src

Defines valid JavaScript sources.

SCRIPT-SRC Policy Example `script-src 'self' js.example.com;`

style-src

Defines valid fonts for style sheets or CSS.

EXAMPLE__ STYLE-SRC POLICY `style-src 'self' css.example.com;`

img-src

Defines valid image sources.

Example of IMG-SRC Policy `img-src 'self' img.example.com;`

connect-src

Applies to XMLHttpRequest (AJAX), WebSocket, fetch (), `<a ping>` or EventSource. If not allowed, the browser emulates a 400 HTTP status code. `__Connect-SRC Policy Example__ connect-src 'self';``

font-src

Defines valid fonts for font resources (loaded via @ font-face).

FONT-SRC Policy Example `font-src font.example.com;``

object-src

Defines valid plug-in sources, for example `<object>` or `<applet>`.

Example OBJECT-SRC Policy `object-src 'self';`

media-src

Defines valid audio and video sources, for example `<audio>`, HTML5, `<video>` elements.

Example of MEDIA-SRC Policy `media-src media.example.com;`

frame-src

Defines valid fonts for loading frames. In CSP, Level 2 `frame-src` has been deprecated in favor of the `child-src` directive. CSP Level 3, has not been replaced with `frame-src` and will continue to postpone `child-src` if not present.

Example FRAME-SRC `frame-src 'self';`

sandbox

Enables a sandbox for the requested resource similar to the `iframe` `sandbox` attribute. The sandbox applies a policy of the same origin, avoids pop-ups, plug-ins and blocks the execution of scripts. You can keep the `sandbox` value empty to keep all restrictions in place, or add values: `allow-forms` `allow-same-origin` `allow-scripts` `allow-popups`, `allow-modals`, `allow-orientation-lock`, `allow-pointer-lock`, `allow-presentation`, `allow-popups-to-escape-sandbox`, `allow-top-navigation`

Example of SANDBOX policy `sandbox allow-forms allow-scripts;`

report-uri

Instructs the browser to POST policy crash reports to this URI. You can also use `Content-Security-Policy-Report-Only` as the HTTP header name to instruct the browser to send reports only (does not block anything). This directive was discontinued at CSP Level 3 in favor of the `report-to` directive.

Example REPORT-URI `report-uri / some-report-uri;`

child-src

Defines valid fonts for web workers and nested browsing contexts loaded using elements such as `<frame>` and `<iframe>`.

Example of CHILD-SRC Policy `child-src 'self'`

form-action

Defines valid fonts that can be used as an `<form>` HTML action.

Example action policy example `form-action 'self';`

frame-ancestors

Defines valid fonts for embedding the resource using `<frame>` `<iframe>` `<object>` `<embed>` `<applet>`. Setting this directive to `'none'` should be roughly equivalent to `X-Frame-Options: DENY` `FRAME-ANCESTORS` `EXAMPLE` `POLICY` `frame-ancestors 'none';`

plugin-types

Defines valid MIME types for plug-ins called via `<object>` and `<embed>`. To load one, `<applet>` you must specify `application / x-java-applet`.

PLUG-IN TYPES Policy Example ``plugin-types application / pdf;``**base-uri**

Defines a set of allowed URLs that can be used in the attribute of an HTML basetag.

URI-BASE Policy Example ``` base-uri 'self'; ```

report-to

Defines a report group name defined by an HTTP Response Report-Header. See the reporting API for more information.

Example Report for Policy `report-to groupName;`

worker-src

Restricts URLs that can be loaded as Worker, SharedWorker or ServiceWorker.

WORKER-SRC Policy Example `worker-src 'none';``

manifest-src

Restricts URLs where application manifests can be loaded.

Example of MANIFEST-SRC Policy `manifest-src 'none';``

prefetch-src

Defines valid sources for pre-fetching and pre-rendering of requests, for example, through the linktag with rel = "prefetch" or rel = "prerender":

`__ PREFETCH-SRC Policy Example__ prefetch-src 'none'``

navigate-to

Restricts the URLs to which the document can navigate by any means. For example, when a link is clicked, a form is submitted or window.location is called. If form-action is present, this directive will be ignored for submitting forms. Implementation status

Navigation Policy Example ``navigate-to example.com``

Tab Application Layout Setting

This module lets you editing display options for the application. You can apply visualization themes, organize blocks, define values, and the display format of the Header and Footer.

Layout Settings

ScriptCase creates an app by using default values defined per project, but you can change those values for a specific application on this interface.

▲ LAYOUT SETTINGS

Header Template	<input type="text" value="Flat"/>	Template name used for the application header.
Footer Template	<input type="text" value="Default"/>	Template name used for the application footer.
Button	<input type="text"/>	Use different buttons than what was defined in the color scheme.
Themes	<input type="text" value="Sc9_Rhino"/>	Use different themes from the one defined for the color scheme

Application Layout

Settings

Header Template

Allows choosing the look of the application Header.

Footer Template

Allows choosing the look of the application Footer.

Button

Allows choosing the button theme for the application.

Themes

Choose one of the selected themes in the project properties. It defines the look of the application, like colors, fonts, and others.

Header

Here we can define if we want to display the header or not, the application title, and fill the header variables. The header looks according to the selected template in the Layout settings interface.

▲ HEADER	
ATTRIBUTE	VALUE
Display Header	<input checked="" type="checkbox"/>
Insertion Title	<input type="text" value="{lang_othr_frmi_tit} - orders"/>
Update Title	<input type="text" value="{lang_othr_frmu_tit} - orders"/>
Header Variables	
SC_HEADER	<input type="text" value="Title"/>
SC_VALUE	<input type="text" value="Date"/> ?

Application Header Configuration

Display Header

This option determines if we want to display the header or not.

Title

Allows informing the title of the application.

Header Variables

We must fill the variable fields with one of the types available in the Combobox. Depending on the type, you need to associate content with it. Those are the types:

- **Field:** When you choose the option “**Field**”, it opens a Combobox to choose a field to associate the field value with the header. This option will be enabled in the applications that you can create a fields
- **Title:** It displays the value of “**Application Title**” in the header.
- **Date:** It displays the system’s date in “yyyy/mm/dd” format in the header. There are several display formats available, and you can change it by using the text field beside it. To access existing formats, click on the hint to see an explanation.
- **Image:** It displays a field to inform the name of an existing image in the server. You can select an image by clicking on the icon “**Choose Image**”, and you still can upload new images by using the button “**Upload**”. 
- **Value:** It displays the content of the text input. You can inform static texts and “**Global Variables**”. e.g. “Employee Name: [v_name]”.

Depending on the Application, you may have more than one title option.

Application Settings (Tabs Application)

General data

SETTINGS	
ATTRIBUTE	VALUE
Application Code	tabs (9.00.0000)
Connection	Not defined () ▾
Default Profile	<input type="text"/>
Language	English (United States) ▾
Edit by Project	<input checked="" type="checkbox"/>
Share Location Variable	<input checked="" type="checkbox"/>
Charset	<input type="text"/>
Share Theme Variable	<input checked="" type="checkbox"/>
Exit URL	<input type="text"/> 🔗
Folder	root ▾
Description	<input type="text"/>
HelpCase Link	<input type="text"/>

Settings interface.

In this folder you can set the application configuration attributes, such as:

- **Application Code** : Code for internal use of ScriptCase. Should start by a letter.
- **Connection** : Connection name of the used by ScriptCase to access the tables. The user can select it.
- **Default Profile** : Default profile to be loaded into the production environment.
- **Language** : Data formatting based on the regional settings.
- **Charset** : Share location with other applications based on the values in the session.
- **Share Theme Variable** : Shares themes with other applications based on the values in the session.
- **Exit URL** :URL to which the user will be redirected to exit the application.
- **Folder** : Folder where the application will be stored in the work group. The user can select it.
- **Description** : Application description.
- **HelpCase Link** : Using this option you can associate HelpCase files to your application.

Global variables

This screen shows all global variables used in the application

The global variable is an external parameter required for running the application. The application can include global variables in the WHERE clause, field definitions and names, event programming, and so on.

You can define global variables by using square brackets ([variable]). You can pass the parameters to the application through one of the methods: Session, Post, and Get

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(") instead

of the brackets([]) because of the conflict with the of Global Variables syntax{:target="_blank"} Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

Global variables Interface.

Example:

```
Select CustomerID, CustomerName from Customers WHERE CustomerID = '[v_customerid]'
```

We do not recommend using session variables (global variables) with the same name as the table fields.

In this case, the variable **v_customerid** is displaying in the global variables configuration.

 A screenshot of the 'VARIABLE SETTINGS' configuration interface. It features a table with two columns: 'ATTRIBUTE' and 'VALUE'. The 'ATTRIBUTE' column contains the word 'global'. The 'VALUE' column contains three sections: 'Scope' with radio buttons for 'SESSION' (unchecked), 'POST' (checked), and 'GET' (checked); 'Settings' with a radio button for 'Optional' (unchecked); and 'Type' with radio buttons for 'Out' (unchecked) and 'In' (checked).

Global variables configuration Interface.

Attribute

It shows the variable's name in the application.

Value

Defines the behavior of the variables, divided into three blocks, they are:

Scope

Defines how the application receives the variable. A variable defined as the POST method in the app does not receive value if it comes with the GET method. Those are the methods available:

- **Session:** Defines that the variable must be created as a PHP session variable by another application.
- **GET:** Defines that the variable must be passed by the URL, that is, visible by the browser.
- **POST:** Defines that the variable must be passed through the POST method of an HTML form.

Settings

- **Optional:** Check it to don't validate the variable at runtime.

Type (In / Out)

Defines whether the variable comes from another application (In), or it is starting in the current app (Out).

Description

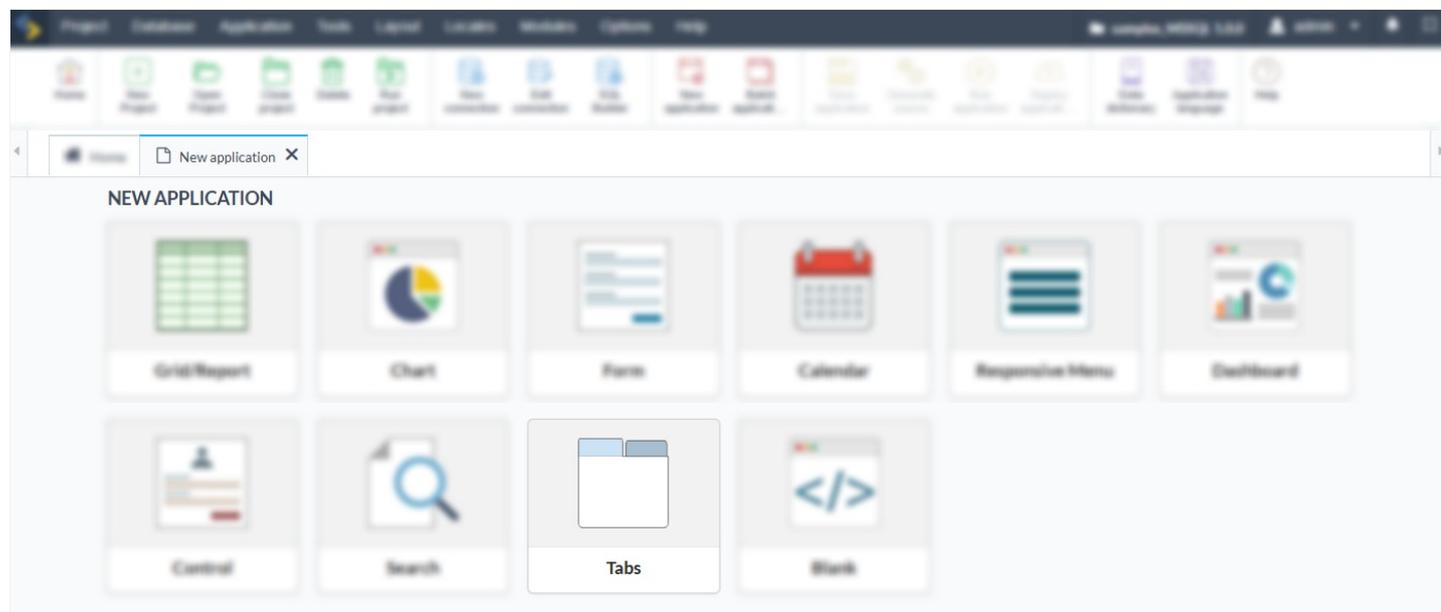

Indicates where the application is using the variable.

Creating a Tabs Application

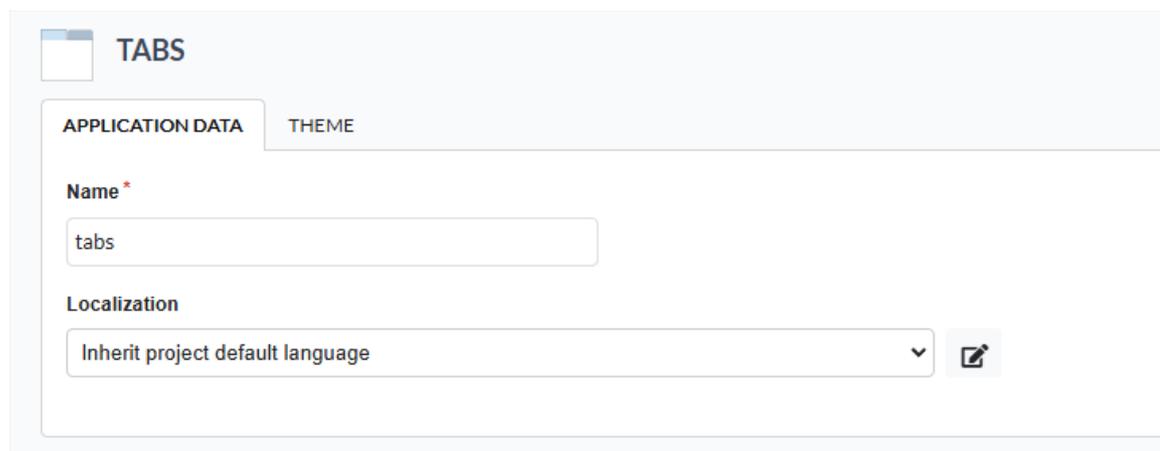

New Application

The process of creating an application is quite simple and intuitive.

You only need to select the type of application you want to generate from the list of applications available in Scriptcase, and it will be generated automatically.

Application Data

A screenshot of the 'TABS' application configuration screen. The interface is light blue and features a tabbed interface at the top with 'TABS' and 'THEME'. The 'APPLICATION DATA' tab is selected. It contains two main sections: 'Name' with a text input field containing 'tabs', and 'Localization' with a dropdown menu set to 'Inherit project default language' and a small edit icon to its right.

Name

The name of the application being created. It cannot contain special characters.

Localization

The language of the application to be created. The project's default language is automatically selected.

Theme

On this screen, you can select the theme that the application will use. The default project theme, which can be checked and

modified in **Project > Properties**, is automatically selected.

Dashboard Settings

General Overview

The Dashboard application is focused on creating components where you can visualize several applications at the same time.

With the dashboard application, it is possible to create, for example, a screen to visualize several graphs, and also, with the addition of the Index Widget create comparisons, show sum of values, among other functionalities.

On the home screen, you can also configure where the Widgets will be displayed, they can be easily dragged and mounted according to the user's need.

At the homepage you can see the Widgets and some options.

Add Link Widget

This is the option to create a [link widget](#)

Add Index Widget

This is the option for creating an [index widget](#)

And within these, there are the options for:

Pencil

Used to edit Widget settings.

Trash

Used to Delete a Widget.

Besides that when the mouse is over the Widget, we can see a button  to change the size of it.

Add Link Widget

This option allows any application that exists in the project to be added to a Widget.

Link
Toolbar
Properties

Enter here the link which will open within the widget. It can be a Scriptcase application's name or an external URL. When you select an application, if it has links to other applications, you will be able also to set where these application links will opened.

Link

Link

To create the link enter the Widget and the application, it is necessary only to click on the field "Connection", then it will be shown a list with all the applications existing in the project.

Link
Toolbar
Properties

Enter here the link which will open within the widget. It can be a Scriptcase application's name or an external URL. When you select an application, if it has links to other applications, you will be able also to set where these application links will opened.

Link

Calendar

form_order_details

PDF Report

pdfreport_orders

Toolbar

In the toolbar settings, it is possible to configure the buttons that will appear in the toolbar of the application that is configured in **connection**.

The toolbar options will be displayed according to the application being connected, that is, according to the toolbar of each application.

Link
Toolbar
Properties

Configure here the buttons that will be displayed in the application linked inside this widget. Note that if the button is not being originally used by the application, the flag here whether checked or not will not work.

<input checked="" type="checkbox"/> Column chart	<input checked="" type="checkbox"/> Sorting	<input checked="" type="checkbox"/> Dynamic search
<input checked="" type="checkbox"/> Line chart	<input checked="" type="checkbox"/> Customize	<input checked="" type="checkbox"/> Advanced search
<input checked="" type="checkbox"/> Area chart	<input checked="" type="checkbox"/> Chart types	
<input checked="" type="checkbox"/> Pie chart	<input checked="" type="checkbox"/> Summary	
<input checked="" type="checkbox"/> Stacked chart	<input checked="" type="checkbox"/> PDF	
<input checked="" type="checkbox"/> Combination Chart	<input checked="" type="checkbox"/> Print	

Add Index Widget

This option allows you to add to an Index Widget based on a database table.

Index

To create an Index Widget you need to make a few settings.

Index
Formatting
Filter
Layout
Properties

Configure the properties for retrieving the index value.

Title	Icon	Alignment
<input type="text" value="Title1"/>	<input type="text" value=""/>	<input type="text" value="Center"/>
Connection	Table Name	
<input type="text" value="conn_mysql"/>	<input type="text" value="orders"/>	
Metric field	Metric function	Display as
<input type="text" value="priceorder"/>	<input type="text" value="Sum"/>	<input type="text" value="Percentage difference"/>
Period field	Period function	Display values of
<input type="text" value="orderdate"/>	<input type="text" value="Full date"/>	<input type="text" value="Both periods"/>

Title

In this option we can define a title for the Widget for a better visualization of what we want to display.

Icon

In this option we can define an icon to be shown in the Widget.

Alignment

In this option we can define the horizontal position that the data in the Widget will be shown, we have three options:

Left: The left side of the Widget will be shown.

Centralized: Will be shown in the center of the Widget.

Right: This will be shown to the right of the Widget.

Connection

In this option it is allowed to choose which connection will be used in the Index Widget, each Widget can be configured with different connections.

Table Name

In this option it is allowed to choose which table will be used in the Index Widget.

After choosing the table, will be shown some more options, they are:

Metric Field

In this option it is allowed to select a table field to perform a metric, as in **chart application**. However it is possible to make some comparisons according to the period defined in the next option.

Period field

In this option it is allowed to select a field from the table so that the data chosen in the previous option can be compared.

Formatting

In this option you can configure the formatting of the metric and period that will be shown in the execution of the filter.

Set the metric and the index period formats.

Formatting of the metric

Metric format as

Decimal precision

Format the value in scales
 Yes No
 K: thousands
 M: million
 B: billion

Regional Settings
 Yes No

Complete with Zeros
 Yes No

Formatting of the period

Regional Settings
 Yes No

Metric Formatting

Metric Formatting as

Allows you to define the type of data that the metric will be shown, there are three options:

Internal: The index metric will be shown as a value of integer type. **Decimal:** The index metric will be shown as a value of type Decimal. **Currency:** The metric of the index will be shown as a value of type Modal.

Use regional settings

Lets you define whether the metric will follow the settings that were defined in the [Regional Settings](#).

Decimals

Allows you to set how many decimal places will be in the metric index, however this will only be available when the metric format is **Decimal** or **Currency**.

Complete with zeros

Allows you to set whether the value will be completed with zeros when set to **Decimal** or **Currency**.

Format the value in scales

Lets you set whether the number in the index will appear in a scale or the whole number. If **Yes** is chosen, the number instead of **10.000** will appear with **10 k** value.

Period Formatting

The options are shown according to the setting in **Feed Function** which is set to **Index**, so the setting can vary between:

Use regional settings

Allows you to set whether the period will follow the settings that were set in the [regional settings](#).

Display the name of the month

Lets you to set whether to display the name of the month.

Prefix for semester, four-month, quarter, two-month, week.

Lets you inform a [lang](#) or a title that the developer wants to appear.

Display name of the day

Lets you set whether to show the name of the day.

Filter

Allows you to perform the filter configuration that will be displayed when the Index Widget is running.

Index
Formatting
Filter
Layout
Properties

Configure the default filters of the index metric and dimension.

Metric filter
SUM(priceorder)

Filter condition

Filter for the period
YYYYMMDD2(orderdate)

Date range Relative period

Filter condition

Metric filter

Filter conditions

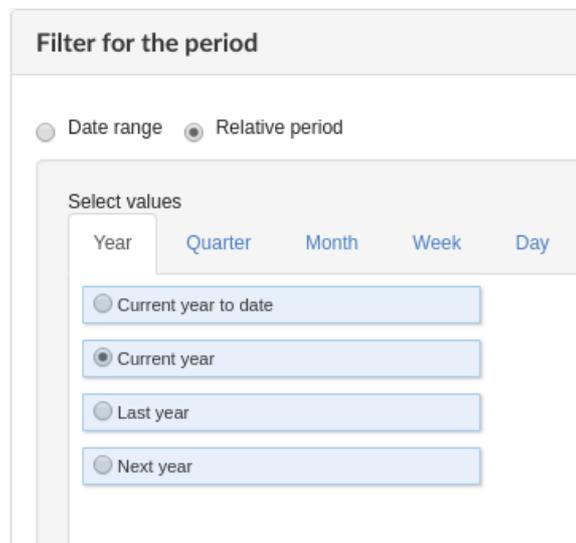

In this option we can define the condition of the filter so that the information regarding that metric is shown, and it is not possible to change that at run time.

Period Filter

Date Ranges

In this option we can define the condition of the filter so that the information regarding that period is shown, and it is not possible to change at run time.

Relative period

Filter for the period

Date range
 Relative period

Select values

Year
 Quarter
 Month
 Week
 Day

Current year to date

Current year

Last year

Next year

We must define which periods are available for use in the filter.

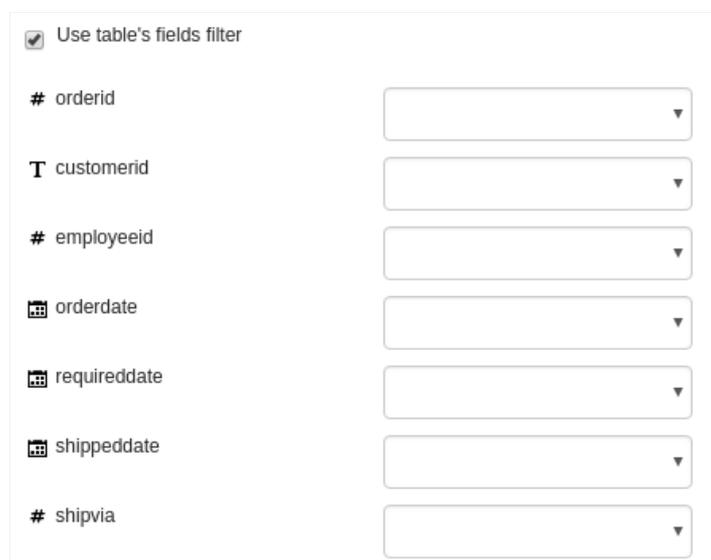

Another option referring only to the relative period is the possibility of creating conditions with relative periods customized directly within the filter interface.

The available values are separated by tabs:

Year: Sets the year used in the filter. **Quarter:** Defines the quarters used in the filter. **Month:** Sets the usage of the months of the year. **Week:** Sets the use of the weeks of the year. **Day:** Sets the use of the days of the month.

Use field table filter

Allows you to create filters from table fields.

Use table's fields filter

orderid

T customerid

calendar orderdate

calendar requireddate

calendar shippeddate

shipvia

Layout

In this option you can configure the layout of the map that will appear in the Widget.

Index
Formatting
Filter
Layout
Properties

Set up specifically for this widget some visual characteristics of its presentation. These values will overwrite those set in the application theme.

Index background	<input style="width: 100%;" type="color"/>
Title font	<input style="width: 100%;" type="text"/> ▼
Positive index font	<input style="width: 100%;" type="text"/> ▼
Negative index font	<input style="width: 100%;" type="text"/> ▼
Neutral index font	<input style="width: 100%;" type="text"/> ▼
Dimension font	<input style="width: 100%;" type="text"/> ▼
Positive metric font	<input style="width: 100%;" type="text"/> ▼
	<input style="width: 100%;" type="text"/> ▼
Neutral metric font	<input style="width: 100%;" type="text"/> ▼

Index background

It allows you to set a background color for the widget content.

Title Source

Allows you to configure the font to be displayed in the index title, in this option there are four more options:

Arial, Helvetica, sans-serif; 12px; bold; #000000 ▼

Arial, Helvetica, sans-serif ▼

12

#000000

■

bold

Family/source type Font size Color of the font The font style

Source of positive index

Allows you to configure the font that will be displayed in the index when positive, in this option there are four more options:

Arial, Helvetica, sans-serif; 12px; bold; #000000 ▼

Arial, Helvetica, sans-serif ▼

12

#000000

■

bold

Family/source type Font size Color of the font The font style

Negative index source

Allows you to configure the font that will be displayed in the index when negative, in this option there are four more options:

Family/source type Font size Color of the font The font style

Source of the neutral index

Allows you to configure the font to be displayed in the index when neutral, in this option there are four more options:

Family/source type Font size Color of the font The font style

Source of the dimension index

Allows you to configure the font size, in this option there are four more options:

Family/source type Font size Color of the font The font style

Source of positive metrics

Allows you to configure the font that will be displayed in the metric when positive, in this option there are four more options:

Family/source type Font size Color of the font The font style

Negative metric source

Allows you to configure the font that will be displayed in the metric when negative, in this option there are four more options:

Family/source type Font size Color of the font The font style

Neutric metric source

Allows you to configure the font that will be displayed in the metric when neutral, in this option there are four more options:

Family/source type Font size Color of the font The font style

Properties

Allows you to configure some features that will be available at execution time, they are

Link Toolbar **Properties**

Set the widget's execution properties.

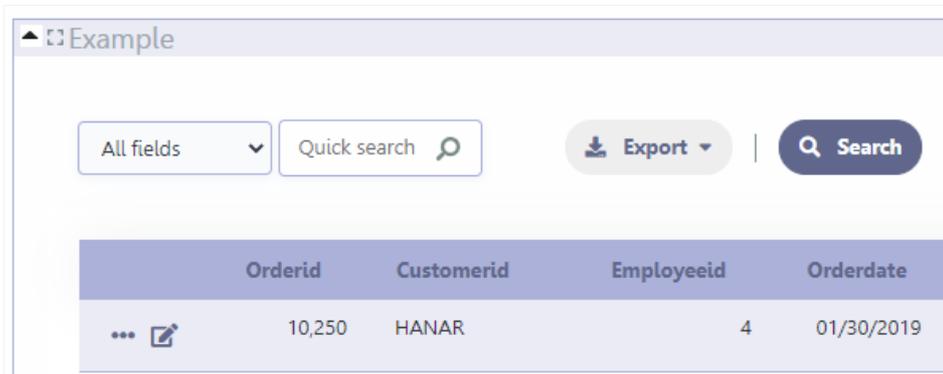

- Compact mode
- Move
- Remove application margin
- Display widget header
- Maximize
- Remove border
- Removable
- Collapsible

Reload Time

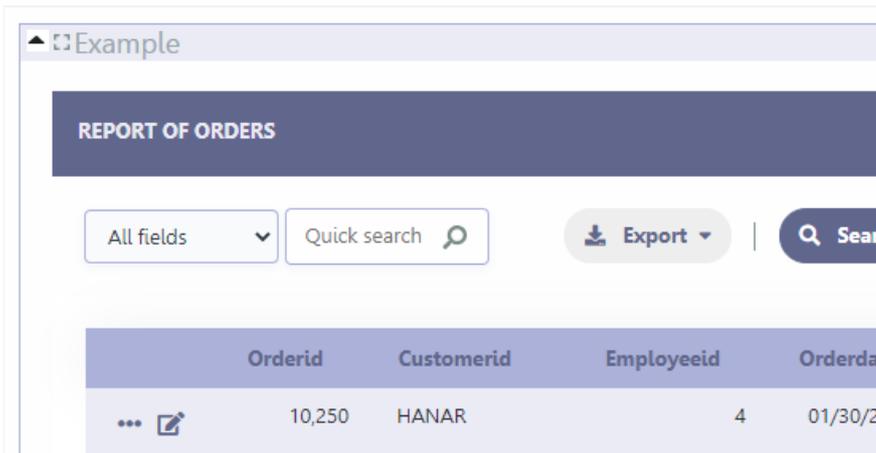

Compact Mode

Removes header and footer of applications added within the Widget:

Example with compact mode enabled

Example with compact mode disabled

Show widget header

Allows you to enable or disable the running widget header. The title and **Remove**, **Mover**, **Maximizar** and **Expand__** options will be displayed, according to the individual configuration of the options.

The **Remove**, **Mover**, **Maximizar** and **Expand** options are only available if the header is being displayed.

Remove

Enables or disables the button to delete the widget at run time.

The widget will be displayed again when reloading the page.

Mover

Enables or disables the option that allows widgets to be moved at run time.

Maximize

Enables or disables the option to maximize the widget. 

Expand

Enables or disables the button to expand the widget. 

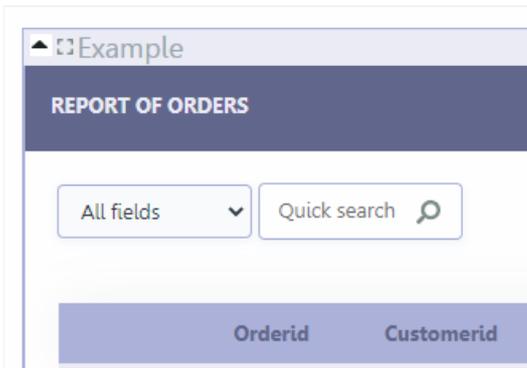

Reload time

Allows you to define a time in seconds for the Widget to be reloaded, thus reloading the information.

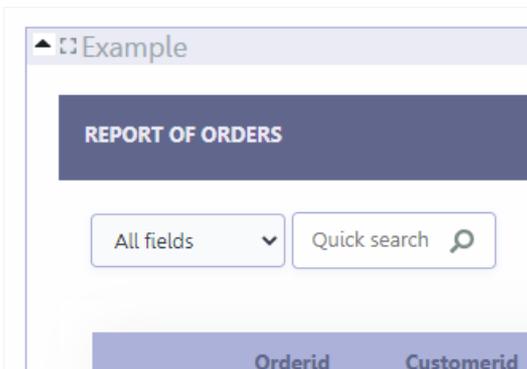

Remove application margin

This option removes application margins within the Widget.

Example of the application with the option remove margin enabled

Example of the application with the option remove margin disabled

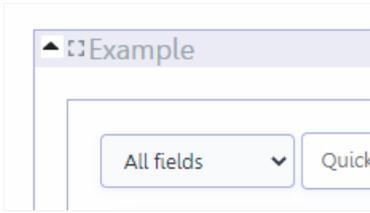

Remove border

This option removes the edges of the applications used within the Widget

Example of the application with the remove border option activated

Example of the application with the remove border option disabled

Related Links [↗](#)

Security

Use security

With this option enabled, when accessing the application, an “unauthorized user” message will be displayed, preventing access to the application.

When enabled, application access is only possible through the macro **sc_apl_status** or through **security module**.

[Click here](#) to access the macro documentation sc_apl_status.

In the development environment, the use of the above options for testing purposes may be suppressed, preventing the password being requested or access being blocked at each execution of the applications. To do this, disable the options “Enable security usage” and “Enable password usage” in the menu **Configuration > My Scriptcase**.

Security exit url

Defines which application the user will be redirected to after the “unauthorized user” warning.

Use password

When enabling the option, you will be asked to define a password for accessing the application.

When running the application using the active password, you will be asked for the password before accessing the application.

The password will be requested regardless of the “use security” setting or the use of the security module.

Request password only once

This option defines the behavior of the use password option.

When this option is enabled, the password will be requested only once per session.

When disabling, the password will be requested every time the application will be accessed.

Allow direct calling by URL

Allows an application to be called by typing the URL directly into browsers.

When disabled, when accessing the application by typing the URL directly, the invalid data error will be displayed. With this configuration, the application can only be accessed through a menu application, for example.

Cookies

HttpOnly

These are cookies that can be set by the server or by javascript but cannot be accessed in any way by javascript.

With the HTTPOnly parameter enabled, it is very difficult to steal a session through XSS because the javascript cannot read the content of these cookies.

A widely exploited attack in XSS is the theft of user session cookies. Theft of cookies is carried out through a javascript command that sends cookies to an external URL where the attacking user has control.

This option is enabled by default in all applications.

Session ID

Enables the session id that will be stored in cookies on the client side. This option embeds the session id directly in the URLs

This option is enabled by default in all applications.

Cookie Secure

With this option enabled, cookies are protected and can only be transmitted via secure communication. Therefore, they cannot be accessed through Javascript.

The HttpOnly option must also be enabled.

Headers

Desabilitar o Auditor XSS

XSS is short for Cross-Site Scripting, which is an attack that consists of sending HTML with malicious JavaScript to a website.

It is a security attack that consists of sending HTML with malicious JavaScript to a website. If the website displays this HTML with JavaScript without filtering the malicious JavaScript code, the cookies sent by the website can be stolen and sent to an attacking website, so that it can be used to forge user sessions and access the website's user account without permissions.

Strict-Transport-Security

HSTS forces browsers to use HTTPS in the domain where it is enabled, instead of using HTTP.

When enabled, the default value is "max-age = 31536000".

The HSTS policy is set for one year (31536000 seconds). This period specifies the time the browser will access the server via HTTP

X-Frame-Options

The HTTP X-Frame-Options response header can be used to indicate whether or not the browser should render the page in a `<frame>`, `<iframe>`, `<embed>` " or '". This header provides protection against clickjacking, known as 'click swipe' - this vulnerability can steal relevant information and data from the user.

X-Frame-Options does not allow the rendering of a page in a frame, ensuring that the content of your page is not embedded in other sites

- **SAMEORIGIN:** The SAMEORIGIN directive allows the page to be loaded in a frame from the same source as the page itself. This option must be used so that the application with clickjacking protection can be used in the menu application.
- **DENY:** This directive completely disables page loading in a frame.

If no option is selected, the application can be used on any `<frame>`, `<iframe>`,

or `<object>`, allowing the application to be incorporated into another website.

X-Content-Type-Options

X-Content-Type-Options is used to protect against MIME detection vulnerabilities. With this option enabled, it prevents browsers from interpreting the page content (sniffing) and executing the data as code / tag. These vulnerabilities can occur when uploading a text file with a javascript code and the browser reading the content that is in the file and executing, even though it is just text and not part of the code.

With this enabled, the HTTP X-Content-Type-Options header is defined, by default, as "no detection".

Referrer-Policy

no-referrer.

The Referer header will be omitted completely. No reference information will be sent with requests.

no-referrer-when-downgrade.

This is the default behavior when no policy is specified, or if the value provided is invalid.

origin.

Only send the origin of the document as a reference. For example, a document at `https://example.com/page.html` will send the reference `https://example.com/`.

origin-when-cross-origin.

Sends the origin, path and query string when performing a same-origin request, but only sends the origin of the document in other cases.

same-origin.

The reference will be sent to sources on the same site, but requests between sources will not send reference information.

strict-origin.

Only send the document source as a reference when the security protocol level remains the same (HTTPS → HTTPS), but do not send it to a less secure recipient (HTTPS → HTTP).

strict-origin-when-cross-origin.

Sends the source, path and query string when performing a request from the same source, only sends the source when the security protocol level remains the same during an inter-source request (HTTPS → HTTPS), and sends no header to recipients less secure (HTTPS → HTTP)

unsafe-url.

Sends the source, path and query chain when performing any request, regardless of security.

Feature-Policy

The value of this header is a policy or set of policies that you want the browser to respect for a particular source.

The source whitelist can take on several different values:

- `*:` The feature is allowed in top-level navigation contexts and in nested navigation contexts (iframes).
- `self:` The feature is allowed in top-level navigation contexts and nested navigation contexts from the same source. It is not allowed in documents of cross origin in nested browsing contexts.
- `none:` The feature is not allowed in top-level browsing contexts and is not allowed in nested browsing contexts.
- `<origin (s)>:` specific sources for which to enable the policy (for example `https://example.com`).

Example 1 - Using only one directive Let's say you want to prevent all content from using the geolocation API on your site. You can do this by submitting a restricted 'none' whitelist to the geolocation resource:

Feature-Policy: `geolocation none`

Example 2 - Using more than one directive Functionalities within a policy are separated by semicolons.

Feature-Policy: `unsized-media none; geolocation self https://example.com; camera *;`

Directives

accelerometer

Controls whether the current document is allowed to collect information about the acceleration of the device

via the Accelerometer interface.

ambient-light-sensor

Controls whether the current document is allowed to collect information about the amount of light in the environment around the device through the AmbientLightSensor interface.

autoplay

Controls whether the current document is allowed to play the requested media automatically via the HTMLMediaElement interface. When this policy is disabled and there is no user action, the Promise returned by HTMLMediaElement.play () will reject it with a DOMException. The autoplay attribute on <audio> " and " elements will be ignored.

battery

Controls whether the use of the Battery Status API is allowed. When this policy is disabled, the Promise returned by Navigator.getBattery () will reject it with a NotAllowedError DOMException.

camera

Controls whether the current document is allowed to use inputs from video devices. When this policy is disabled, the Promise returned by getUserMedia () will reject it with a NotAllowedError DOMException.

display-capture

Controls whether or not the current document is allowed to use the getDisplayMedia () method to capture screen content. When this policy is disabled, the Promise returned by getDisplayMedia () will reject it with a NotAllowedError if permission is not obtained to capture the contents of the screen.

document-domain

Control whether the current document is allowed to place document.domain. When this policy is disabled, attempts to place document.domain will fail and cause a SecurityError DOMException to be thrown.

encrypted-media

Controls whether the current document is allowed to use the Encrypted Media Extensions (EME) API. When this policy is disabled, the Promise returned by Navigator.requestMediaKeySystemAccess () will reject it with a DOMException.

execution-while-not-rendered

Controls whether tasks should be performed in frames while they are not rendered (e.g. whether a frame is hidden or display: none).

execution-while-out-of-viewport

Controls whether tasks should be performed in frames while they are outside the visible viewing window.

fullscreen

Controls whether the current document is allowed to use Element.requestFullscreen (). When this policy is disabled, the returned Promise rejects it with a TypeError DOMException.

geolocation

Controls whether the current document is allowed to use the Geolocation interface. When the policy is disabled, calls to getCurrentPosition () and watchPosition () will cause function callbacks to be invoked with a PositionError of PERMISSION_DENIED.

gyroscope

Controls whether the current document is allowed to collect information about the orientation of the device through the Gyroscope interface.

layout-animations

Controls whether the current document is allowed to show layout animations.

legacy-image-formats

Controls whether the current document is allowed to show images in legacy formats.

magnetometer

Controls whether the current document is allowed to collect information about the orientation of the device through the Magnetometer interface.

microphone

Controls whether the current document is allowed to use inputs from audio devices. When this policy is disabled, the Promise returned by `MediaDevices.getUserMedia ()` will reject it with a `NotAllowedError`.

midi

Controls whether the current document is allowed to use the Web MIDI API. When this policy is disabled, the Promise returned by `Navigator.requestMIDIAccess ()` will reject it with a `DOMException`.

navigation-override

Controls the availability of mechanisms that enable the author of the page to take control over the behavior of spatial navigation, or to cancel completely.

oversized-images

Controls whether the current document is allowed to download and display large images.

payment

Controls whether the current document allows the use of the Payment Request API. When this policy is disabled, the `PaymentRequest ()` constructor will throw a `SecurityError DOMException`.

picture-in-picture

Controls whether the current document allows a video to be allowed to play in Picture-in-Picture mode via the corresponding API.

publickey-credentials-get

Controls whether the current document is allowed to use the Web Authentication API to retrieve already stored public key credentials, i.e. via `navigator.credentials.get ({publicKey: ..., ...})`.

sync-xhr

Controls whether the current document is allowed to make synchronous XMLHttpRequest requests.

usb

Controls whether the current document is allowed to use the WebUSB API.

vr

Controls whether the current document is allowed to use the WebVR API. When this policy is disabled, the Promise returned by `Navigator.getVRDisplays ()` will reject it with a `DOMException`. Keep in mind that the WebVR standard is in the process of being replaced by WebXR.

wake-lock

Controls whether the current document is allowed to use the Wake Lock API to indicate that the device should not go into a power saving mode.

screen-wake-lock

Controls whether the current document is allowed to use the Screen Wake Lock API to indicate whether or not the device should darken the screen.

xr-spatial-tracking

Controls whether or not the current document is allowed to use the WebXR Device API to interact with the WebXR session.

Content-Security-Policy

Content-Security-Policy is the name of an HTTP response header that modern browsers use to increase the security of the document (or web page).

The Content-Security-Policy header allows you to restrict resources such as JavaScript, CSS or just about anything the browser loads.

Directives**default-src**

The default-src directive defines the standard policy for fetching features such as JavaScript, Images, CSS, Fonts, AJAX requests, Frames, HTML5 Media. Not all directives go back to default-src. Refer to the Source List Reference for possible values.

DEFAULT-SRC Policy Example `default-src 'self' cdn.example.com;`

script-src

Defines valid JavaScript sources.

SCRIPT-SRC Policy Example `script-src 'self' js.example.com;`

style-src

Defines valid fonts for style sheets or CSS.

EXAMPLE__ STYLE-SRC POLICY `style-src 'self' css.example.com;`

img-src

Defines valid image sources.

Example of IMG-SRC Policy `img-src 'self' img.example.com;`

connect-src

Applies to XMLHttpRequest (AJAX), WebSocket, fetch (), `<a ping>` or EventSource. If not allowed, the browser emulates a 400 HTTP status code. **__Connect-SRC Policy Example__** `connect-src 'self';``

font-src

Defines valid fonts for font resources (loaded via @ font-face).

FONT-SRC Policy Example `font-src font.example.com;``

object-src

Defines valid plug-in sources, for example `<object>` or `<applet>`.

Example OBJECT-SRC Policy `object-src 'self';`

media-src

Defines valid audio and video sources, for example `<audio>`, HTML5, `<video>` elements.

Example of MEDIA-SRC Policy `media-src media.example.com;`

frame-src

Defines valid fonts for loading frames. In CSP, Level 2 `frame-src` has been deprecated in favor of the `child-src` directive. CSP Level 3, has not been replaced with `frame-src` and will continue to postpone `child-src` if not present.

Example FRAME-SRC `frame-src 'self';`

sandbox

Enables a sandbox for the requested resource similar to the `iframe` `sandbox` attribute. The sandbox applies a policy of the same origin, avoids pop-ups, plug-ins and blocks the execution of scripts. You can keep the `sandbox` value empty to keep all restrictions in place, or add values: `allow-forms` `allow-same-origin` `allow-scripts` `allow-popups` `allow-modals` `allow-orientation-lock` `allow-pointer-lock` `allow-presentation` `allow-popups-to-escape-sandbox` `allow-top-navigation`

Example of SANDBOX policy `sandbox allow-forms allow-scripts;`

report-uri

Instructs the browser to POST policy crash reports to this URI. You can also use `Content-Security-Policy-Report-Only` as the HTTP header name to instruct the browser to send reports only (does not block anything). This directive was discontinued at CSP Level 3 in favor of the `report-to` directive.

Example REPORT-URI `report-uri / some-report-uri;`

child-src

Defines valid fonts for web workers and nested browsing contexts loaded using elements such as `<frame>` and `<iframe>`.

Example of FILHO-SRC Policy `child-src 'self'`

form-action

Defines valid fonts that can be used as an `<form>` HTML action.

Example action policy example `form-action 'self';`

frame-ancestors

Defines valid fonts for embedding the resource using `<frame>` `<iframe>` `<object>` `<embed>` `<applet>`. Setting this directive to `'none'` should be roughly equivalent to `X-Frame-Options: DENY` `FRAME-ANCESTORS` `EXAMPLE` `POLICY` `frame-ancestors 'none';`

plugin-types

Defines valid MIME types for plug-ins called via `<object>` and `<embed>`. To load one, `<applet>` you must specify `application / x-java-applet`.

PLUG-IN TYPES Policy Example ``plugin-types application / pdf;``

base-uri

Defines a set of allowed URLs that can be used in the attribute of an HTML basetag.

URI-BASE Policy Example ``` base-uri 'self'; ```

report-to

Defines a report group name defined by an HTTP Response Report-Header. See the reporting API for more information.

Example Report for Policy `report-to groupName;`

worker-src

Restricts URLs that can be loaded as Worker, SharedWorker or ServiceWorker.

WORKER-SRC Policy Example `worker-src 'none';``

manifest-src

Restricts URLs where application manifests can be loaded.

Example of MANIFEST-SRC Policy `manifest-src 'none';``

prefetch-src

Defines valid sources for pre-fetching and pre-rendering of requests, for example, through the linktag with `rel = "prefetch"` or `rel = "prerender"`:

`__ PREFETCH-SRC Policy Example__ prefetch-src 'none'``

navigate-to

Restricts the URLs to which the document can navigate by any means. For example, when a link is clicked, a form is submitted or `window.location` is called. If `form-action` is present, this directive will be ignored for submitting forms. Implementation status

Navigation Policy Example ``navigate-to example.com``

Dashboard Log Configuration

This interface allows you to define a Log schema to the app. The Log scheme tracks what the end-users are doing in the app. Those are the events it can tracks: Access, Insert, Update, and delete.

To learn how to create a Log schema [see here](#).

LOG	
ATTRIBUTE	VALUE
Schema	log <input type="button" value="⋮"/>
Events	<div style="display: flex; align-items: center; gap: 10px;"><div style="border: 1px solid #ccc; width: 100px; height: 40px; position: relative;"><div style="position: absolute; top: -10px; right: -10px;">▲</div><div style="position: absolute; bottom: -10px; right: -10px;">▼</div></div><div style="text-align: center;"><input type="button" value="Add >>"/> <input type="button" value="Remove <<"/></div><div style="border: 1px solid #ccc; width: 100px; height: 40px; position: relative;"><div style="position: absolute; top: -10px; right: -10px;">▲</div><div style="position: absolute; bottom: -10px; right: -10px;">▼</div></div></div>

Application Log configuration

Schema Select an existing log schema for the application.

Events You can select just specific events to save in the log.

Dashboard Layout Setting

This module lets you editing display options for the application. You can apply visualization themes, organize blocks, define values, and the display format of the Header and Footer.

Layout Settings

ScriptCase creates an app by using default values defined per project, but you can change those values for a specific application on this interface.

▲ LAYOUT SETTINGS

Header Template	<input type="text" value="Flat"/>	Template name used for the application header.
Footer Template	<input type="text" value="Default"/>	Template name used for the application footer.
Button	<input type="text"/>	Use different buttons than what was defined in the color scheme.
Themes	<input type="text" value="Sc9_Rhino"/>	Use different themes from the one defined for the color scheme

Application Layout

Settings

Header Template

Allows choosing the look of the application Header.

Footer Template

Allows choosing the look of the application Footer.

Button

Allows choosing the button theme for the application.

Themes

Choose one of the selected themes in the project properties. It defines the look of the application, like colors, fonts, and others.

Header

Here we can define if we want to display the header or not, the application title, and fill the header variables. The header looks according to the selected template in the Layout settings interface.

▲ HEADER	
ATTRIBUTE	VALUE
Display Header	<input checked="" type="checkbox"/>
Insertion Title	<input type="text" value="{lang_othr_frmi_tit} - orders"/>
Update Title	<input type="text" value="{lang_othr_frmu_tit} - orders"/>
Header Variables	
SC_HEADER	<input type="text" value="Title"/>
SC_VALUE	<input type="text" value="Date"/> ?

Application Header Configuration

Display Header

This option determines if we want to display the header or not.

Title

Allows informing the title of the application.

Header Variables

We must fill the variable fields with one of the types available in the Combobox. Depending on the type, you need to associate content with it. Those are the types:

- **Field:** When you choose the option “**Field**”, it opens a Combobox to choose a field to associate the field value with the header. This option will be enabled in the applications that you can create a fields
- **Title:** It displays the value of “**Application Title**” in the header.
- **Date:** It displays the system’s date in “yyyy/mm/dd” format in the header. There are several display formats available, and you can change it by using the text field beside it. To access existing formats, click on the hint to see an explanation.
- **Image:** It displays a field to inform the name of an existing image in the server. You can select an image by clicking on the icon “**Choose Image**”, and you still can upload new images by using the button “**Upload**”. 
- **Value:** It displays the content of the text input. You can inform static texts and “**Global Variables**”. e.g. “Employee Name: [v_name]”.

Depending on the Application, you may have more than one title option.

Footer

FOOTER	
ATTRIBUTE	VALUE
Display Footer	<input type="checkbox"/>
Footer Variables	
NM_FOOTER_DATA	<input type="text"/>
NM_FOOTER_LOGO	<input type="text"/>
NM_FOOTER_TITLE	<input type="text"/>

Application Footer Settings

This page may change depending on the footer template chosen in the Layout Settings.

Display Footer

This option determines if we want to display the footer or not.

Footer Variables

We must fill the variable fields with one of the types available in the Combobox. Depending on the type, you need to associate content with it. Those are the types:

- **Field:** When you choose the option "**Field**", it opens a Combobox to choose a field to associate the field value with the header. This option will be enabled in the applications that you can create a fields
- **Date:** It displays the system's date in "yyyy/mm/dd" format in the header. There are several display formats available, and you can change it by using the text field beside it. To access existing formats, click on the hint to see an explanation.
- **Image:** It displays a field to inform the name of an existing image in the server. You can select an image by clicking on the icon "**Choose Image**", and you still can upload new images by using the button "**Upload**". 
- **Value:** It displays the content of the text input. You can inform static texts and "**Global Variables**". e.g. "Employee Name: [v_name]".

Application Settings (Dashboard)

General data

▲ SETTINGS

Settings interface.

In this folder you can set the application configuration attributes, such as:

- **Application Code** : Code for internal use of ScriptCase. Should start by a letter.
- **Connection** : Connection name of the used by ScriptCase to access the tables. The user can select it.
- **Default Profile** : Default profile to be loaded into the production environment.
- **Language** : Data formatting based on the regional settings.
- **Charset** : Share location with other applications based on the values in the session.
- **Share Theme Variable** : Shares themes with other applications based on the values in the session.
- **Exit URL** :URL to which the user will be redirected to exit the application.
- **Folder** : Folder where the application will be stored in the work group. The user can select it.
- **Description** : Application description.
- **HelpCase Link** : Using this option you can associate HelpCase files to your application.

Global variables

This screen shows all global variables used in the application

The global variable is an external parameter required for running the application. The application can include global variables in the WHERE clause, field definitions and names, event programming, and so on.

You can define global variables by using square brackets ([variable]). You can pass the parameters to the application through one of the methods: Session, Post, and Get

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(") instead of the brackets([]) because of the conflict with the of Global Variables syntax{:target="_blank"} Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

Global variables Interface.

Example:

```
Select CustomerID, CustomerName from Customers WHERE CustomerID = '[v_customerid]'
```

We do not recommend using session variables (global variables) with the same name as the table fields.

In this case, the variable **v_customerid** is displaying in the global variables configuration.

 A screenshot of a configuration window titled 'VARIABLE SETTINGS'. It features a table with two columns: 'ATTRIBUTE' and 'VALUE'. The 'ATTRIBUTE' column contains the text 'global'. The 'VALUE' column contains three stacked form sections: 'Scope' with three checkboxes (SESSION, POST, GET), 'Settings' with one checkbox (Optional), and 'Type' with two radio buttons (Out, In).

Global variables configuration Interface.

Attribute

It shows the variable's name in the application.

Value

Defines the behavior of the variables, divided into three blocks, they are:

Scope

Defines how the application receives the variable. A variable defined as the POST method in the app does not receive value if it comes with the GET method. Those are the methods available:

- **Session:** Defines that the variable must be created as a PHP session variable by another application.
- **GET:** Defines that the variable must be passed by the URL, that is, visible by the browser.
- **POST:** Defines that the variable must be passed through the POST method of an HTML form.

Settings

- **Optional:** Check it to don't validate the variable at runtime.

Type (In / Out)

Defines whether the variable comes from another application (In), or it is starting in the current app (Out).

Description

Indicates where the application is using the variable.

Creating a Dashboard Application

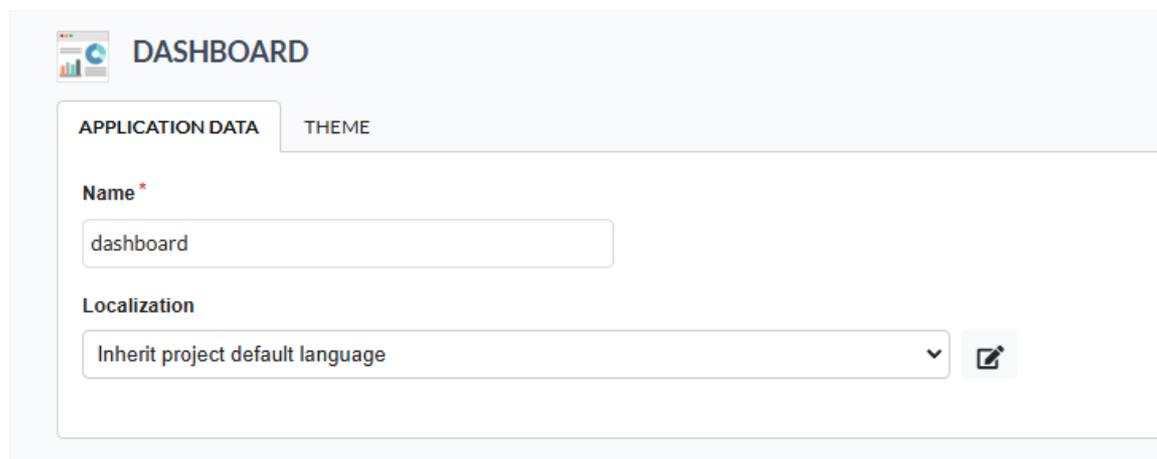

New Application

The process of creating an application is quite simple and intuitive.

You only need to select the type of application you want to generate from the list of applications available in Scriptcase, and it will be generated automatically.

Application Data

A screenshot of the 'DASHBOARD' application configuration form. The form has two tabs: 'APPLICATION DATA' (selected) and 'THEME'. Under the 'APPLICATION DATA' tab, there are two fields: 'Name' with a text input containing 'dashboard' and 'Localization' with a dropdown menu showing 'Inherit project default language'. There is a small icon of a document with a pencil next to the dropdown.

Name

The name of the application being created. It cannot contain special characters.

Localization

The language of the application to be created. The project's default language is automatically selected.

Theme

On this screen, you can select the theme that the application will use. The default project theme, which can be checked and modified in **Project > Properties**, is automatically selected.

Control Settings

This interface is useful for editing the main display settings of the app.

Settings	
ATTRIBUTE	VALUE
Friendly URL	<input type="text" value="Form"/>
Line break in title	<input checked="" type="checkbox"/>
Horizontal Alignment	<input type="text" value="Center"/>
Vertical Alignment	<input type="text" value="Center"/>
Margins	<input type="text" value="10"/> Top <input type="text" value="10"/> Down <input type="text" value="10"/> Right <input type="text" value="10"/> Left
Inputs 100% width	<input checked="" type="checkbox"/>
Table Width Unit	<input type="text" value="Percent"/>
Table Width	<input type="text" value="20"/>
Table Columns	<input type="text" value="Automatic"/>

Form Settings Interface.

Friendly URL

Allows to define a URL for the application different from the application name. You can use the following chars (a-z, A-Z, 0-9, - _). You still can change it on the initial screen of the home project, through the "Friendly URL" column in the apps list.

Line break in title

Use it if you want to break the line on the field titles.

Horizontal Alignment

Allows you to set the alignment of the application on the page.

Vertical Alignment

Allows you to define the initial vertical alignment of the application (Above, Centered and Below).

Margins

Allows to define the margins of the application (Right, Left, Up and Down) in pixels.

Table Width

The width of the form table. Scriptcase uses Plain HTML to generate applications by using tables lines and cells.

Table Width Unit

Measurement unit for the table width defined in the previous option, being: percentage, pixel, or automatic.

Table Columns

This parameter defines the column (fields) width of the table (application).

Labels width

When the previous option is set to “Provided” you must inform the width of the labels here.

Layout and Behavior

This interface allows setting the behavior of the app.

Layout and Behavior	
ATTRIBUTE	VALUE
Notify discarded changes	<input checked="" type="checkbox"/>
Automatic tab	<input type="checkbox"/>
Highlight Text on Focus	<input checked="" type="checkbox"/>
Use Enter to	<input type="text" value=""/>
Field with Initial Focus	<input type="text" value="accountid"/>
Highlight Field with Error	<input checked="" type="checkbox"/>
Display icon only on mouseover	<input checked="" type="checkbox"/>

Layout and Behavior configuration Interface.

Notify discarded changes

Notifies the user when any changes made will be lost when reloading the data.

Automatic tab

Changes the focus to the next field when the amount of characters reaches its defined limit.

Highlight Text on Focus

Highlights the field when selected.

Use Enter to

Allows to use the “Enter” key to pass the focus to the next field.

Field with Initial Focus

Determines the field starts with focus when accessing the application. This option doesn’t work with fields that contain a watermark.

Highlight Field with Error

Focus the field with the error when submitting the form.

Use a template from the HTML Editor

Allows to use the TinyMCE editor. You can edit and create your HTML Templates.

Edit

Fields Configuration.

Fields

It allows accessing the field settings (a pencil icon on the left). You can change the field position by dragging them to the desired position. Drag a field to "fields not displayed" if you don't want it in the app.

Label

It defines the title of the field in the app. For example: if the field name in the database is fld_txt_customer_name, you can display the label "Customer Name".

Data type

It informs the data type of the field.

New

It defines if the field is available when inserting new records.

Update

It defines if the field is available when updating records.

Read-Only

It defines the field as a label. The user can't change its value.

Required

It defines if the field must contain a value.

PK

It defines the Primary Keys fields.

DB value (Insert)

Defines a default value for the field when inserting a new record, like an auto-increment, Date, DateTime, or IP.

DB value (Update)

Defines a default value for the field when updating a record, like an auto-increment, Date, DateTime, or IP.

Page

It shows the pages available in the application. All apps have a page, at least. Each page contains one or more blocks.

Blocks

It shows the blocks available in the application. Blocks contain fields. All apps have a block, at least. A block is displayed if it contains one or more fields.

Page Fields Not Shown

Here we can see the fields that are not in the application.

Observe that you can drag any line to the desired position, blocks, and page. Pages contain Blocks, and Blocks contain fields.

Display Settings

Settings of messages display.

DISPLAY	
ATTRIBUTE	VALUE
Markers positioning	Right
Display message	<input checked="" type="checkbox"/>

Display Interface.

Attributes #### Markers positioning Set the position of the markers that Indicates required fields.

Display message

Set it if you want to display the message of the required field.

Related Videos 

Control Fields positioning

In this configuration screen we have a list of all the fields available in the application, whether they are fields mapped from the table or virtual fields (Created only in the Scriptcase interface).

It is also possible to allow the end user to manipulate the application's fields in the way they prefer, for that we must add the **columns button** in the application's toolbar.

In the **left column**, we have a list with all the fields available for use and in the **right column** we have a list of the fields that were selected to be displayed in the running application.

Adding and Removing Application Fields

The fields must be configured using the selection buttons, located between the columns.

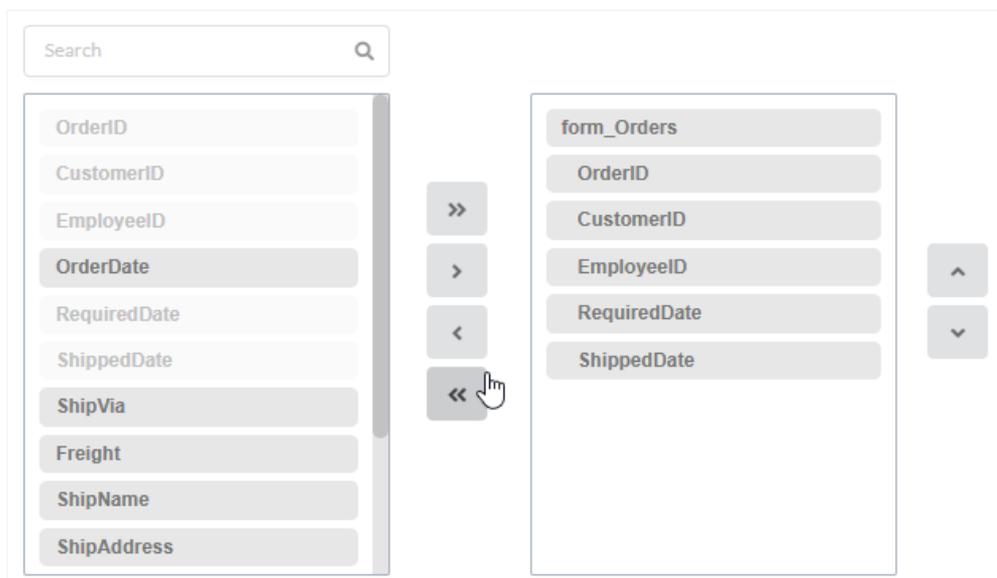

- **»** - Move all fields to the right.
- **>** - Moves only selected fields to the right
- **<** - Moves only the selected fields to the left.
- **«** - Move all fields to the left.

In the left column, there are the application fields that are not in use in the filter, while the right column shows all the selected fields and the order in which they will be displayed.

To add fields to the filter, select the fields you want in the filter and click the **>** button.

To select fields in sequence, simply click on a field and drag. Pressing control (Ctrl) allows you to select multiple alternate fields.

Search and positioning

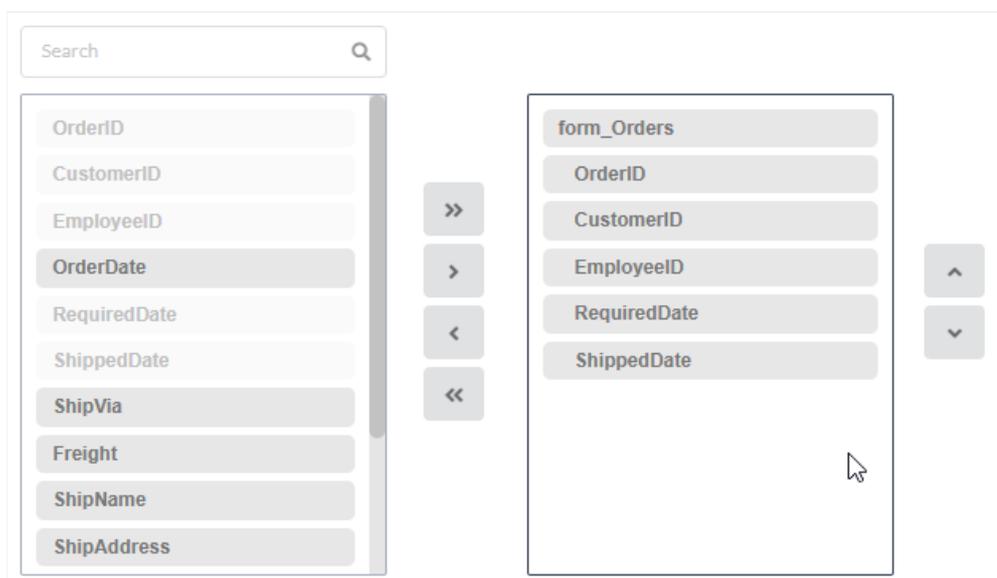

Field display order

The fields will be displayed in the application respecting the order defined in the right column.

The display order must be defined using the sort buttons  and  which will move the selected fields in the column.

Remembering that the fields must be positioned inside a block (**customers**) which must be inside a page (**Pag1**).

Check below the use of the buttons to order the fields

Save and Restore

Below the columns are two buttons:

- **Save** which records the current placement of fields in columns.
- **Restore** which reorganizes the fields returning to the last position saved.

Restoring the positioning of the fields to the last saved definition.

Search

OrderID		form_Orders

Navigation:

Buttons relative to the navigation of the application.

Next	Move to the next page that can be a single record or a list of records.
Previous	Returns to displays the previous page records or a single record.
First	Move to the First page or record
Last	Move to the Last page or record
Exit	Close the application
Navigation by page	Displays a “page-number” navigation bar. Example: 1 2 3 4 5
Reload	Displays a button to reload the query data

Export:

The options available to export the Records. Scriptcase generates the following export formats for Forms:

PDF	Generates all the data of the application in a PDF format.
Print	Creates an HTML with the records ready for printing.

Update:

The CRUD options available in the Form.

Insert	Inserts the record into the database.
Update	Saves the changes made in a record.
Delete	Deletes the selected record.
Cancel	Cancel the changes made in a record before the insertion.

Others:

Other options available in the Form application.

Jump To	Move to the informed page or record.
Copy	Copy the current record data to another one.
Quick Search	Perform a quick search in the records of the application.
Dynamic Search	It displays the fields of the search to filter the records.
Languages	Displays a Combobox with the languages available in the project properties.
Themes	Displays a Combobox with the languages available in the project properties.
Rows Counter	Displays the number of records retrieved in the application.
HelpCase	Displays a button to open the help page.

Separator:

-----	Displays a line separating the buttons.
-------	---

Dropdown List Theme

Allows defining the Dropdown theme selecting between **Application theme** and **Button theme**.

Name

Allows defining a name for the button group.

Label

It is the displayed name for the button group in the application.

Hint\Title

Displays a hint to the end-user when the mouse is on the group of buttons.

Button Type

Allows displaying the button group as a Button, Image, or Link.

Image

Allows selecting an image for the button.

Display

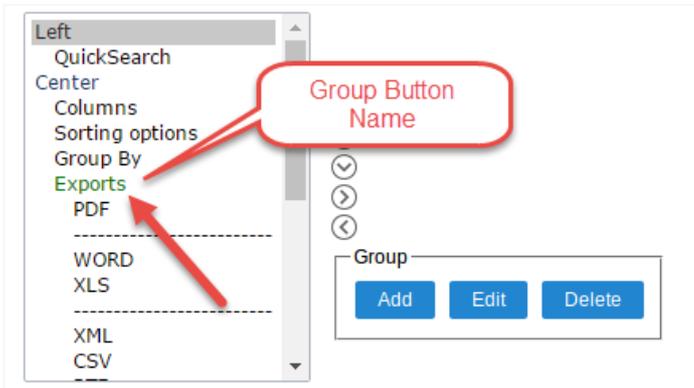

Defines if the button displays only Text, only image, or both.

Display Position

Defines the position of the Text or Image (Text to the right, Image to the right).

After creating a button group, you need to move the grouped buttons below of the Button Group and then move them to the

right. Like the image below:

Buttons Settings

Button	Label	Hint	Shortcut key
Ok			
Exit			

Button:

It displays the buttons available in the application.

Label:

Allows defining the buttons name that to display for the users.

Hint:

Allows defining the buttons hint that to display for the users.

Shortcut Key:

Allows defining the shortcut key for each button.

Application Hotkeys

Scriptcase allows creating shortcut keys to your applications. You can select a predefined template or create specific actions for an application.

Application Hotkeys ?

ATTRIBUTE	VALUE	DESCRIPTION
Use hotkeys	<input checked="" type="checkbox"/>	Define if the application will use hotkeys
Hotkeys template	<div style="border: 1px solid #ccc; padding: 2px; display: inline-block;">SC_DefaultHotkeys</div> ▼ ↻ ✎	Select the hotkey template from previously created schemas

Clean
+

ACTION	KEYBINDING
No hotkeys configured	

Clean
+

Use hotkeys

Defines if the application uses hotkeys. When you enable this option, the default shortcut keys settings are disabled.

Hotkeys template

Select the [hotkey template](#) previously created.

Action

Selects the triggered action when pressing the selected key.

Keybinding

Selects the keys responsible for executing the chosen action.

Add “+”

Adds a new action on the keys list.

Clear

It clears the selected hotkeys preference.

Options

Options	
ATTRIBUTE	VALUE
Format Row Counter	<input style="width: 150px;" type="text" value="{lang_othr_smry_info}"/>
The number of links displayed	<input style="width: 50px;" type="text" value="5"/>
Jump to	<input style="width: 50px;" type="text" value="Page"/>
Records per page	<input style="width: 150px;" type="text" value="10,20,50"/>
Help by Block	<input type="checkbox"/>
General Help	<input type="checkbox"/>
Toolbar buttons	<input style="width: 150px;" type="text" value="A DIV below the toolbar."/>

Rows Counter:

Allows to display the Rows Counter or not.

Example: (1 to 10 of 200)

The Number of Links Displayed:

Defines the number of links per page, when the navigation option is disabled.

Jump To:

Move to the informed record page.

Records by page:

Allows defining the number of records to be exhibited for each page. To show all records use the option "all".

Example: 10,20,30, all

Help by Block:

Indicates if the helps messages from relatives fields are grouped by block. In each field, we can define a help text. With this option activated, it shows up an icon in the block title bar to call the help page.

General Help:

The General Help "consolidates" all the fields help pages in a single page, putting an icon in the toolbar to call the help page.

Toolbar Buttons:

The type of view for the Toolbar buttons (A DIV below the toolbar, Modal).

Control SQL Settings

This interface allows configuring the related database settings, such as the Primary Key, Filters, Sorts.

SQL SETTINGS		
ATTRIBUTE	VALUE	DESCRIPTION
Select primary key fields.		
	<div style="display: flex; align-items: center; gap: 10px;"> <div style="border: 1px solid #ccc; padding: 5px;">On/Off</div> <div style="border: 1px solid #ccc; padding: 5px;">All</div> <div style="border: 1px solid #ccc; padding: 5px;">None</div> </div>	<div style="border: 1px solid #ccc; padding: 5px;"> <ul style="list-style-type: none"> *orderid customerid employeeid orderdate requireddate shippeddate shipvia freight priceorder shipcountry </div>
Where clause	<input type="text"/>	SQL
Order By	<input type="text"/>	
Connection	<input type="text" value="conn_mysql"/>	
Table Name	<input type="text" value="orders"/>	
Variable for Table	<input type="text"/>	
Case Sensitive	<input checked="" type="checkbox"/>	

configuration Interface.

Select primary key fields

It lets you define the Primary key of the Form. ScriptCase already identifies Primary Keys, but you can manually inform or change it by using the buttons beside the fields list. See how the buttons work:

- **On/Off** : Adds or Removes the attribute that defines the primary key for the field. The primary key fields have an asterisk beside their names.
- **All** : Defines all fields as Primary Keys.
- **None** : Defines none fields as Primary Keys.
- **Sorting Button** : These are the arrows on the right side of the Combo box. It allows ordering the fields of the Primary Key, placing it in the desired order. To order them, click on the field and use the arrows to move it.

Where clause

It allows adding a WHERE clause to filter the SQL records.

Order By

It allows adding an ORDER BY clause to determine the order to display the records. By default, it uses the primary key to sort the records.

Connection

It allows defining the database connection of the application. You can change the connection to another one that has the same table.

Table Name

It informs the database table used in the Form.

Variable for Table

It allows to use a variable to change a part of the string containing the table name.

Var
orders

Variable for Table Configuration.

Fill the first input with the name of the variable (replace to). The second input you should fill with the part of the name of the table you want to replace (replace from).

Case sensitive

It defines if the database connection uses case sensitive or not.

JavaScript

To coding with JavaScript in Scriptcase Form application, we must associate a JavaScript event to a form field.

Edit JavaScript Interface.

Select the object

This Combo box displays the fields of the form application, and also the form itself as an object

Select the event

Use it to associate the event with the selected field to apply the JS code. View the events available:

- **onclick:** Acts when clicking on the field.
- **onblur:** Acts when the focus leaves the object.
- **onChange:** Acts when the focus leaves the object, and there are changes in the value.
- **onFocus:** Runs when the focus gets in the object.
- **onMouseOver:** Runs when the mouse pointer hovers the object.
- **onMouseOut:** Runs when the mouse pointer moves out the object.

Events related to the Form

The events below are associated directly with the form object.

- **OnLoad:** This event runs when the page is loaded, also when clicking on the navigating buttons.
- **onSubmit:** This event runs when clicking on the “New”, “Save”, and “Delete” buttons.

Edit JavaScript

*Select the object and event, then click on the Edit button. It opens a page to inform custom JavaScript routines and standar

```
![[Edit JavaScript Interface]][javascript_edicao_code]
```

```
*Edit JavaScript Interface*
```

> The JavaScript language doesn't have the same behavior in all the browsers available. A tip is to test running the applicati

- **OnClick Example**

- When clicking on a field of type radio, you can enable or disable form fields according to the selected value.

```
if(document.F1.gender[0].checked){
  document.F1.maternity.disabled = false;
  document.F1.maternity.style.background='FFFFFF'
}
if(document.F1.gender[1].checked){
  document.F1.maternity.disabled = true;
  document.F1.maternity.style.background='FCEEB3'
}
```

To access the values of a radio field, you need to use the index.

- **OnBlur Example**

- You can define a warning for the field “weekly_work_time” when the focus is getting out it.

```
if (document.F1.tp_point[0].checked && document.F1.weekly_work_time.value > '20')
{
    alert("The work time exceeds the limit allowed");
    document.F1.weekly_work_time.value = "";
    document.F1.weekly_work_time.focus();
}
```

- **OnChange Example**

- By modifying the “Salary” of an employee and leaving the field, we’ll check if his “position” is “gardener”.

```
if (document.F1.salary.value > 2000.00 && document.F1.position.value == 'gardener'){

    alert('When I grow up, I want to be a gardener);
}
```

- **OnFocus Example**

- After informing the purchase value and selecting the payment method in a Select object “Select: pay_method”, the JavaScript code below calculates the value of the purchase.

```
if (document.F1.pay_method[document.F1.pay_method.selectedIndex].text == 'Money')
{
    document.F1.total.value = document.F1.paurchase_value.value;
}
```

- **OnMouseOver Example**

- You can change the style (background color, font and font color) when the mouse hovers the field.

```
document.F1.field_name.style.backgroundColor = "0FFCCA"
```

- **onMouseOut Example**

- Sets the background color when the mouse moves out from the field.

```
document.F1.field_name.style.backgroundColor = "FFFFFF"
```

Security

Use security

With this option enabled, when accessing the application, an “unauthorized user” message will be displayed, preventing access to the application.

When enabled, application access is only possible through the macro **sc_apl_status** or through **security module**.

[Click here](#) to access the macro documentation sc_apl_status.

In the development environment, the use of the above options for testing purposes may be suppressed, preventing the password being requested or access being blocked at each execution of the applications. To do this, disable the options “Enable security usage” and “Enable password usage” in the menu **Configuration > My Scriptcase**.

Security exit url

Defines which application the user will be redirected to after the “unauthorized user” warning.

Use password

When enabling the option, you will be asked to define a password for accessing the application.

When running the application using the active password, you will be asked for the password before accessing the application.

The password will be requested regardless of the “use security” setting or the use of the security module.

Request password only once

This option defines the behavior of the use password option.

When this option is enabled, the password will be requested only once per session.

When disabling, the password will be requested every time the application will be accessed.

Allow direct calling by URL

Allows an application to be called by typing the URL directly into browsers.

When disabled, when accessing the application by typing the URL directly, the invalid data error will be displayed. With this configuration, the application can only be accessed through a menu application, for example.

Enable CSRF

With this option enabled, the scriptcase prevents a malicious attack on a page where unauthorized commands are transmitted through a user the page trusts.

These attacks are known as a “Cross-Site Request Forgery” attack.

Cookies

HttpOnly

These are cookies that can be set by the server or by javascript but cannot be accessed in any way by javascript.

With the HTTPOnly parameter enabled, it is very difficult to steal a session through XSS because the javascript cannot read the content of these cookies.

A widely exploited attack in XSS is the theft of user session cookies. Theft of cookies is carried out through a javascript command that sends cookies to an external URL where the attacking user has control.

This option is enabled by default in all applications.

Session ID

Enables the session id that will be stored in cookies on the client side. This option embeds the session id directly in the URLs

This option is enabled by default in all applications.

Cookie Secure

With this option enabled, cookies are protected and can only be transmitted via secure communication. Therefore, they cannot be accessed through Javascript.

The HttpOnly option must also be enabled.

- [Form overview](#)

Headers

Disable XSS Auditor

XSS is short for Cross-Site Scripting, which is an attack that consists of sending HTML with malicious JavaScript to a website.

It is a security attack that consists of sending HTML with malicious JavaScript to a website. If the website displays this HTML with JavaScript without filtering the malicious JavaScript code, the cookies sent by the website can be stolen and sent to an attacking website, so that it can be used to forge user sessions and access the website's user account without permissions.

Strict-Transport-Security

HSTS forces browsers to use HTTPS in the domain where it is enabled, instead of using HTTP.

When enabled, the default value is "max-age = 31536000".

The HSTS policy is set for one year (31536000 seconds). This period specifies the time the browser will access the server via HTTP

X-Frame-Options

The HTTP X-Frame-Options response header can be used to indicate whether or not the browser should render the page in a `<frame>`, `<iframe>`, `<embed>` " or '". This header provides protection against clickjacking, known as 'click swipe' - this vulnerability can steal relevant information and data from the user.

X-Frame-Options does not allow the rendering of a page in a frame, ensuring that the content of your page is not embedded in other sites

- **SAMEORIGIN:** The SAMEORIGIN directive allows the page to be loaded in a frame from the same source as the page itself. This option must be used so that the application with clickjacking protection can be used in the menu application.
- **DENY:** This directive completely disables page loading in a frame.

If no option is selected, the application can be used on any `<frame>`, `<iframe>`,

or `<object>`, allowing the application to be incorporated into another website.

X-Content-Type-Options

X-Content-Type-Options is used to protect against MIME detection vulnerabilities. With this option enabled, it prevents browsers from interpreting the page content (sniffing) and executing the data as code / tag. These vulnerabilities can occur when uploading a text file with a javascript code and the browser reading the content that is in the file and executing, even though it is just text and not part of the code.

With this enabled, the HTTP X-Content-Type-Options header is defined, by default, as "no detection".

Referrer-Policy

no-referrer.

The Referer header will be omitted completely. No reference information will be sent with requests.

no-referrer-when-downgrade.

This is the default behavior when no policy is specified, or if the value provided is invalid.

origin.

Only send the origin of the document as a reference. For example, a document at `https://example.com/page.html` will send the reference `https://example.com/`.

origin-when-cross-origin.

Sends the origin, path and query string when performing a same-origin request, but only sends the origin of the document in other cases.

same-origin.

The reference will be sent to sources on the same site, but requests between sources will not send reference information.

strict-origin.

Only send the document source as a reference when the security protocol level remains the same (HTTPS → HTTPS), but do not send it to a less secure recipient (HTTPS → HTTP).

strict-origin-when-cross-origin.

Sends the source, path and query string when performing a request from the same source, only sends the source when the security protocol level remains the same during an inter-source request (HTTPS → HTTPS), and sends no header to recipients less secure (HTTPS → HTTP)

unsafe-url.

Sends the source, path and query chain when performing any request, regardless of security.

Feature-Policy

The value of this header is a policy or set of policies that you want the browser to respect for a particular source.

The source whitelist can take on several different values:

- ``*:`` The feature is allowed in top-level navigation contexts and in nested navigation contexts (iframes).
- ``self:`` The feature is allowed in top-level navigation contexts and nested navigation contexts from the same source. It is not allowed in documents of cross origin in nested browsing contexts.
- ``none:`` The feature is not allowed in top-level browsing contexts and is not allowed in nested browsing contexts.
- ``<origin (s)>:`` specific sources for which to enable the policy (for example `https://example.com`).

Example 1 - Using only one directive Let's say you want to prevent all content from using the geolocation API on your site. You can do this by submitting a restricted 'none' whitelist to the geolocation resource:

Feature-Policy: ``geolocation 'none'``

Example 2 - Using more than one directive Functionalities within a policy are separated by semicolons.

Feature-Policy: `unsized-media 'none'; geolocation 'self' https://example.com; camera *;``

Directives

accelerometer

Controls whether the current document is allowed to collect information about the acceleration of the device

via the Accelerometer interface.

ambient-light-sensor

Controls whether the current document is allowed to collect information about the amount of light in the environment around the device through the AmbientLightSensor interface.

autoplay

Controls whether the current document is allowed to play the requested media automatically via the HTMLMediaElement interface. When this policy is disabled and there is no user action, the Promise returned by HTMLMediaElement.play () will reject it with a DOMException. The autoplay attribute on <audio> " and " elements will be ignored.

battery

Controls whether the use of the Battery Status API is allowed. When this policy is disabled, the Promise returned by Navigator.getBattery () will reject it with a NotAllowedError DOMException.

camera

Controls whether the current document is allowed to use inputs from video devices. When this policy is disabled, the Promise returned by getUserMedia () will reject it with a NotAllowedError DOMException.

display-capture

Controls whether or not the current document is allowed to use the getDisplayMedia () method to capture screen content. When this policy is disabled, the Promise returned by getDisplayMedia () will reject it with a NotAllowedError if permission is not obtained to capture the contents of the screen.

document-domain

Control whether the current document is allowed to place document.domain. When this policy is disabled, attempts to place document.domain will fail and cause a SecurityError DOMException to be thrown.

encrypted-media

Controls whether the current document is allowed to use the Encrypted Media Extensions (EME) API. When this policy is disabled, the Promise returned by Navigator.requestMediaKeySystemAccess () will reject it with a DOMException.

execution-while-not-rendered

Controls whether tasks should be performed in frames while they are not rendered (e.g. whether a frame is hidden or display: none).

execution-while-out-of-viewport

Controls whether tasks should be performed in frames while they are outside the visible viewing window.

fullscreen

Controls whether the current document is allowed to use Element.requestFullscreen (). When this policy is disabled, the returned Promise rejects it with a TypeError DOMException.

geolocation

Controls whether the current document is allowed to use the Geolocation interface. When the policy is disabled, calls to getCurrentPosition () and watchPosition () will cause function callbacks to be invoked with a PositionError of PERMISSION_DENIED.

gyroscope

Controls whether the current document is allowed to collect information about the orientation of the device through the Gyroscope interface.

layout-animations

Controls whether the current document is allowed to show layout animations.

legacy-image-formats

Controls whether the current document is allowed to show images in legacy formats.

magnetometer

Controls whether the current document is allowed to collect information about the orientation of the device through the Magnetometer interface.

microphone

Controls whether the current document is allowed to use inputs from audio devices. When this policy is disabled, the Promise returned by `MediaDevices.getUserMedia ()` will reject it with a `NotAllowedError`.

midi

Controls whether the current document is allowed to use the Web MIDI API. When this policy is disabled, the Promise returned by `Navigator.requestMIDIAccess ()` will reject it with a `DOMException`.

navigation-override

Controls the availability of mechanisms that enable the author of the page to take control over the behavior of spatial navigation, or to cancel completely.

oversized-images

Controls whether the current document is allowed to download and display large images.

payment

Controls whether the current document allows the use of the Payment Request API. When this policy is disabled, the `PaymentRequest ()` constructor will throw a `SecurityError DOMException`.

picture-in-picture

Controls whether the current document allows a video to be allowed to play in Picture-in-Picture mode via the corresponding API.

publickey-credentials-get

Controls whether the current document is allowed to use the Web Authentication API to retrieve already stored public key credentials, i.e. via `navigator.credentials.get ({publicKey: ..., ...})`.

sync-xhr

Controls whether the current document is allowed to make synchronous XMLHttpRequest requests.

usb

Controls whether the current document is allowed to use the WebUSB API.

vr

Controls whether the current document is allowed to use the WebVR API. When this policy is disabled, the Promise returned by `Navigator.getVRDisplays ()` will reject it with a `DOMException`. Keep in mind that the WebVR standard is in the process of being replaced by WebXR.

wake-lock

Controls whether the current document is allowed to use the Wake Lock API to indicate that the device should not go into a power saving mode.

screen-wake-lock

Controls whether the current document is allowed to use the Screen Wake Lock API to indicate whether or not the device should darken the screen.

xr-spatial-tracking

Controls whether or not the current document is allowed to use the WebXR Device API to interact with the WebXR session.

Content-Security-Policy

Content-Security-Policy is the name of an HTTP response header that modern browsers use to increase the security of the document (or web page).

The Content-Security-Policy header allows you to restrict resources such as JavaScript, CSS or just about anything the browser loads.

Directives**default-src**

The default-src directive defines the standard policy for fetching features such as JavaScript, Images, CSS, Fonts, AJAX requests, Frames, HTML5 Media. Not all directives go back to default-src. Refer to the Source List Reference for possible values.

DEFAULT-SRC Policy Example `default-src 'self' cdn.example.com;`

script-src

Defines valid JavaScript sources.

SCRIPT-SRC Policy Example `script-src 'self' js.example.com;`

style-src

Defines valid fonts for style sheets or CSS.

EXAMPLE__ STYLE-SRC POLICY `style-src 'self' css.example.com;`

img-src

Defines valid image sources.

Example of IMG-SRC Policy `img-src 'self' img.example.com;`

connect-src

Applies to XMLHttpRequest (AJAX), WebSocket, fetch (), `<a ping>` or EventSource. If not allowed, the browser emulates a 400 HTTP status code. **__Connect-SRC Policy Example__** `connect-src 'self';``

font-src

Defines valid fonts for font resources (loaded via @ font-face).

FONT-SRC Policy Example `font-src font.example.com;``

object-src

Defines valid plug-in sources, for example `<object>` or `<applet>`.

Example OBJECT-SRC Policy `object-src 'self';`

media-src

Defines valid audio and video sources, for example `<audio>`, HTML5, `<video>` elements.

Example of MEDIA-SRC Policy `media-src media.example.com;`

frame-src

Defines valid fonts for loading frames. In CSP, Level 2 `frame-src` has been deprecated in favor of the `child-src` directive. CSP Level 3, has not been replaced with `frame-src` and will continue to postpone `child-src` if not present.

Example FRAME-SRC `frame-src 'self';`

sandbox

Enables a sandbox for the requested resource similar to the `iframe` `sandbox` attribute. The sandbox applies a policy of the same origin, avoids pop-ups, plug-ins and blocks the execution of scripts. You can keep the `sandbox` value empty to keep all restrictions in place, or add values: `allow-forms allow-same-origin allow-scripts allow-popups allow-modals allow-orientation-lock allow-pointer-lock allow-presentation allow-popups-to-escape-sandbox allow-top-navigation`

Example of SANDBOX policy `sandbox allow-forms allow-scripts;`

report-uri

Instructs the browser to POST policy crash reports to this URI. You can also use `Content-Security-Policy-Report-Only` as the HTTP header name to instruct the browser to send reports only (does not block anything). This directive was discontinued at CSP Level 3 in favor of the `report-to` directive.

Example REPORT-URI `report-uri / some-report-uri;`

child-src

Defines valid fonts for web workers and nested browsing contexts loaded using elements such as `<frame>` and `<iframe>`.

Example of CHILD-SRC Policy `child-src 'self'`

form-action

Defines valid fonts that can be used as an `<form>` HTML action.

Example action policy example `form-action 'self';`

frame-ancestors

Defines valid fonts for embedding the resource using `<frame>`, `<iframe>`, `<object>`, `<embed>`, `<applet>`. Setting this directive to `'none'` should be roughly equivalent to `X-Frame-Options: DENY FRAME-ANCESTORS`. **EXAMPLE POLICY** `frame-ancestors 'none';`

plugin-types

Defines valid MIME types for plug-ins called via `<object>` and `<embed>`. To load one, `<applet>` you must specify `application / x-java-applet`.

PLUG-IN TYPES Policy Example ``plugin-types application / pdf;``

base-uri

Defines a set of allowed URLs that can be used in the attribute of an HTML basetag.

URI-BASE Policy Example ``` base-uri 'self'; ```

report-to

Defines a report group name defined by an HTTP Response Report-Header. See the reporting API for more information.

Example Report for Policy `report-to groupName;`

worker-src

Restricts URLs that can be loaded as Worker, SharedWorker or ServiceWorker.

WORKER-SRC Policy Example `worker-src 'none';``

manifest-src

Restricts URLs where application manifests can be loaded.

Example of MANIFEST-SRC Policy `manifest-src 'none';``

prefetch-src

Defines valid sources for pre-fetching and pre-rendering of requests, for example, through the linktag with rel = "prefetch" or rel = "prerender":

`__ PREFETCH-SRC Policy Example__ prefetch-src 'none'``

navigate-to

Restricts the URLs to which the document can navigate by any means. For example, when a link is clicked, a form is submitted or window.location is called. If form-action is present, this directive will be ignored for submitting forms. Implementation status

Navigation Policy Example ``navigate-to example.com``

Captcha

Captcha

Use Captcha

Defines if the application uses Captcha.

Number of Characters

Amount of characters in the Captcha image.

Character List

List of characters used in the Captcha.

Label

The message displayed for the Captcha.

Error message

Captcha error message.

Height

Height of the Captha image. (in pixels)

Width

Width of the Captha image. (in pixels)

Font Size

Font Size of the Captha image. (in pixels)

Reload

Display the refresh button in the Captcha.

Select one layout

It offers layouts for display the Captcha.

Recaptcha

ReCAPTCHA is an API provided by Google for forms. It adds security, preventing automatic submission of forms through robots.

reCAPTCHA sample:

1. First, we must request an API Key to activate reCAPTCHA into a Scriptcase application by following the steps below:

To get a **Site key** and **Secret Key** go to the link: <https://www.google.com/recaptcha/admin#list>.

See the image:

Label

It is a project identifier to create the reCAPTCHA keys.

Choose the type of reCaptcha

We must choose the option **reCAPTCHA V2**.

Domains

We can insert multiple domains (one per line) to limit the API uses.

1. Then, we need to accept the Terms of Service (“Accept the reCAPTCHA Terms of Service”).
2. When clicking on **Register**, the page refreshes and shows the integration of reCAPTCHA information. There we can get the **Site Key** and **Secret Key**:

1. Now, we can set the Scriptcase application security:

Site Key

Key generated by Google after reCAPTCHA project creation.

Secret Key

Key generated by Google after reCAPTCHA project creation.

Theme

Defines the reCAPTCHA color. There are two options:

- **Light** :
- **Dark** :

Type

The type of reCAPTCHA. There are two options:

- **Audio**:
- **Image**:

Size

The size of reCAPTCHA. There are two options:

- **Normal** :
- **Compact**:

Position

Here we can define the reCAPTCHA component alignment:

- **Left**: Position the reCAPTCHA component at the left.
- **Center**: Position the reCAPTCHA component at the center.
- **Right** : Position the reCAPTCHA component at the right.

Control Log Configuration

This interface allows you to define a Log schema to the app. The Log schema tracks what the end-users are doing in the app. Those are the events it can tracks: Access, Insert, Update, and delete.

To learn how to create a Log schema [see here](#).

LOG	
ATTRIBUTE	VALUE
Schema	log <input type="button" value="⋮"/>
Events	<div style="display: flex; align-items: center; gap: 10px;"><div style="border: 1px solid #ccc; width: 100px; height: 40px; position: relative;"><div style="position: absolute; top: -10px; right: -10px;">▲</div><div style="position: absolute; bottom: -10px; right: -10px;">▼</div></div><div style="text-align: center;"><input type="button" value="Add >>"/> <input type="button" value="Remove <<"/></div><div style="border: 1px solid #ccc; width: 100px; height: 40px; position: relative;"><div style="position: absolute; top: -10px; right: -10px;">▲</div><div style="position: absolute; bottom: -10px; right: -10px;">▼</div></div></div>

Application Log configuration

Schema Select an existing log schema for the application.

Events You can select just specific events to save in the log.

Authentications

Scriptcase can link its applications using OAuth methods. These methods allow you to integrate a Scriptcase project with the following data sources:

Facebook

▲ FACEBOOK	
ATTRIBUTE	VALUE
App ID	<input type="text"/>
Secret	<input type="text"/>
Method return	<input type="text" value="▼"/> +

Facebook fields authentication interface.

When you create a button Facebook authentication, you must fill in the fields:

- **App ID** : Facebook application ID. This ID will be provided by [Facebook Developer's page](#).
- **Secret** : Secret key provided by Facebook, so the application can be executed.
- **Method return** : Method that will be performed when Facebook service returns the requested data. You will have to create that method according to our validation rules, using the option "Programming > PHP Methods"

For building applications, visit: [Facebook app development](#)

Twitter

▲ TWITTER	
ATTRIBUTE	VALUE
Key	<input type="text"/>
Secret	<input type="text"/>
Method return	<input type="text" value="▼"/> +

Twitter fields authentication interface.

When you create a button "Twitter Authentication", you must fill in the fields:

- **Key** : Twitter application ID. This ID will be provided by [Twitter Developer's page](#).
- **Secret** : Secret key provided by Twitter, so the application can be executed.
- **Method return** : Method that will be performed when Twitter service returns the requested data. You will have to create that method according to our validation rules, using the option "Programming > PHP Methods"

For building applications, visit: [Twitter app development](#)

Google

▲ GOOGLE	
ATTRIBUTE	VALUE
Application Name	<input type="text"/>
Client ID	<input type="text"/>
Secret	<input type="text"/>
Method return	<input type="text"/> ▼ +

Google fields authentication interface.

- **Application name** : Name of the application created on Google+.
- **Client ID** : Google+ application ID. This ID will be provided by [Google Developer's page](#).
- **Secret** : Secret key provided by Google+, so the application can be executed.
- **Method return** : Method that will be performed when Google+ service returns the requested data. You will have to create that method according to our validation rules, using the option "Programming > PHP Methods"

For building applications, visit: [Google+ app development](#)

PayPal

▲ PAYPAL	
ATTRIBUTE	VALUE
Paypal URL	<input type="text" value="https://www.sandbox.paypal.com/cgi-bin/webscr"/>
Id	<input type="text"/>
Order number	<input type="text"/>
Customized field	<input type="text"/>
Variable with the description	<input type="text"/>
Variable with the Total amount.	<input type="text"/>
Variable with the currency type	<input type="text"/>
Paypal Method	<input type="text"/> ▼ +
Method Cancel	<input type="text"/> ▼ +
Method IPN	<input type="text"/> ▼ +

PayPal fields authentication interface.

To create the integration with PayPal, you must fill in these fields:

- **PayPal URL** : This URL can be to the PayPal SandBox or to the real PayPal API. The SandBox is used to perform tests with the application before applying the integration in a real environment.
- **Id** : PayPal ID to receive the sales money. Usually the registered email as business.
- **Order number** : Order Number to be stored in PayPal. Also used to treat the receipt of the IPN in order to identify and process the order as paid.
- **Customized field** : Custom field to be stored in PayPal. Also used to treat the receipt of the IPN in order to identify and process the order as paid, if you want to do some additional checking.
- **Variable with the description** : Using this field you can place the Global variable that will contain the description to be sent to PayPal.
- **Variable with the Total amount.** : Method to be ran when PayPal service return the data requested.

- **Variable with the currency type** : Use to specify the payment currency. If the currency variable is not included, the currency defaults to USD.
- **PayPal Method** : Method that will be called after the User complete the PayPal transaction. You will have to create that method according to our validation rules, using the option “Programming > PHP Methods”
- **Method Cancel** : Method to be executed if the user cancels the PayPal transaction. You will have to create that method according to our validation rules, using the option “Programming > PHP Methods”
- **Method IPN** : Method that will be called by web service from PayPal to confirm the payment of a transaction. This method is called by web service and it has no HTML output to the end-user. You will have to create that method according to our validation rules, using the option “Programming > PHP Methods”

For PayPal configuration, please visit: [Configuring PayPal credentials](#)

Control - Fields Overview

The applications can have two types of fields.

Table Fields

Columns of the table connected to the application and their data types.

Example:

In a table with the following structure:

```
CREATE TABLE `orders` (
  `orderid` int(11) NOT NULL,
  `customerid` varchar(5) NULL DEFAULT NULL,
  `employeeid` int(11) NULL DEFAULT NULL,
  `orderdate` date NULL DEFAULT NULL,
  `requireddate` date NULL DEFAULT NULL,
  PRIMARY KEY (`orderid`) USING BTREE
);
```

These are the listed fields on left menu **Fields**:

Virtual Fields

Fields created inside application to assist in the development process.

How to create a virtual field

1. Inside an application, access the left menu **Fields** and click on **New Field** option.
2. Choose how many fields do you want to create:

1. Create the fields and define type, name and label for each one:

- **Type**: Data type of the field.
- **Name**: Internal name of the field. Used to identify the field on events and Scriptcase interface.
- **Label**: Title of the field displayed on the application.

Scriptcase **doesn't insert** virtual fields on the table after its creation.

Types of fields by applications

Application Table Fields Virtual Fields

Grid	<input type="text"/>	<input type="text"/>
Procedure	<input type="text"/>	<input type="text"/>
Chart	<input type="text"/>	<input type="text"/>
Form	<input type="text"/>	<input type="text"/>
Control	<input type="text"/>	<input type="text"/>
Calendar	<input type="text"/>	<input type="text"/>
Search	<input type="text"/>	<input type="text"/>
PDF Report	<input type="text"/>	<input type="text"/>

The applications **Menu**, **Tree Menu**, **Dashboard** and **Blank** were not listed because they haven't manage fields.

Control - Text Field

General Settings

This type of field allows the developer to create quickly inputs to insert and update data, where the final user can inform its data to be allocated in its database.

Type of Data

Defines the type of the field in the application. In this case we should select **Text**.

Label

Defines the title that will be displayed in the field when the application is executed. The terminology used in the interface is fundamental to the system have a good usability, who should use names and familiar terms to the final user of the application, instead of using terms from the system.

For example, this text field that has the name **customerid**, the client would have a much better understanding of the functionality of the field when we define the label as **Customer Name**.

Not only a fixed text, the **Label** attribute allows the use of langs to define the field's title, making it possible to use your application in a multi language project.

Label below field

Defines the message to be displayed below the field.

Watermark

Informing a text to the **Watermark** it will be displayed in the input a text as an example that can be informed in the field. The result after set will be this:

Initial Value(type)

Allows the initial definition to the field when the form is in insert mode. It is possible to choose between two options:

Defined Value: When this option is selected, the Initial Value attribute will be available, where we should inform the field's initial value. For example, my initial value is **Arlindo**, when a new register is inserted, the field **Seller Name** will be initialized as Arlindo.

System Data: When this option is selected, the initial value will be the actual date of your computer's system.

Amount of Characters

Allows to set the width of the text field's input that varies with the amount of characters informed. Although, if the amount of characters typed are greater than the setting, the text will be pushed to the left, to keep the maximum amount of characters as defined.

Show HTML Content

When this option is active every HTML, CSS and JavaScript content that are in the database will be displayed with the main value.

Validation Image

When this option is active, a image will be displayed next to the informed field if the field is according to the settings defined by the developer.

In the example below, the field was set to receive at least 5 characters, see what happens when informed

only 4 characters:

However if informed 5 or more characters the field will be displayed as:

Password Field

When this option is active, the text field will be converted to the format used in password fields. For example:

View password characters

By enabling this option, a button will be displayed in the password field so that the password is displayed when clicked.

Save Variable

Allows to save a session variable(global variable) with the field's value, to be used in others applications.

For example, in the login form the username can be saved in session and displayed on the header of others applications.

Variable Name

In this attribute we should define the name of the session variable, active in the previous item, that will receive the field's value.

We should inform only the variable's name, - **var_rating**.

The method to use its value is [global variable](#).

Field Mask

Defines the field mask. There are two types of mask described in the table below:

Character Description

- X It is overridden by any characters returned by the database. Filled is required and the value will be completed with leading zeros when there are fewer characters than the size of the mask.
- Z It is overridden by any characters returned by the database. Its filling is optional and when there are fewer characters than the mask size, nothing will be done about the characters that are missing. In addition the leading zeros will be suppressed. When used in conjunction with the X necessarily the use of this character is to the left of the mask.
- 9 It represents any numeric character (from 0-9)
- A It represents an alpha numeric character (A-Z,a-z)
- * It represents any alpha-numeric character (A-Z,a-z,0-9)entered by the user.

For example, it is possible to set the mast to display a telephone number:

It will be show with this format on runtime:

It is also possible to set the field mask like those examples:

Field mask examples:

Telephone number

Field	Mask Input	Typed Value	Formatted Value
Phone Number	+99 99 9999 - 9999	123456789012	+12 34 5678 - 9012
Phone Number	(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
Phone Number	(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
Phone Number	(zz) xxxx - xxxx	12345678	() 1234 - 5678

Field	Mask Input	Typed Value	Formatted Value
Software Key (Letters only)	AAAA-AAAA-AAAA-AAAA	QWERTYUIASDFGHJK	QWER-TYUI-ASDF-GHJK
Software Key (Letters and numbers)	xxxx-xxxx-xxxx-xxxx	Q1W2E3R4T5Y6U7I8	Q1W2-E3R4-T5Y6-U7I8
License Plate	AAA - 9999	QWE1234	QWE - 1234
Scriptcase Serial Key	A999A999A999-**	D111H111G111DG2P	D111H111G111-DG2P
Multiple masks (Phone Number)	9999-9999;(99)9999-9999;	9999 999 9999	+99 99 9999-9999

Validate with mask

When this option is active it is possible to insert the data with the mask set in the **Field Mask** option.

Field size in database

Defines the field's size related to the size set in the database. This value is already set automatically by default when the application is generated.

Hidden Field

When this option is active, the field will be hidden in the application on runtime.

Label Field

When this option is active, the field will be altered to only a label where the info will be displayed, where updates or inserts will not be possible.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disable Field

Allows the developer to disable the field, so the user can not type a value according with the option defined by the developer.

The available options are: **No** - Initial value of the attribute, this option does not disable the field.

Update Mode - This option only disables the field when editing existing registers.

Insert Mode - This option only disables the field when inserting new registers.

Insert / Update Mode - This option disables the field when editing exciting registers or when inserting new registers.

HTML Type

HTML object used to display the field in the form.

SQL Type

Informs the type of the field in the database.

Values Format

Format of Values Interface

Case Settings

Allows converting the letters of the field when it loses focus. The options are: **Uppercase**, **Lowercase**, **Capitalize the first word**, **Capitalize all words**.

Minimum Length

Determines the minimum number of characters a user must enter in the field.

Integer values greater than or equal to 0 must be provided.

Maximum Length

Determines the maximum number of characters a user can enter in the field.

Integer values greater than or equal to 0 must be provided.

Allowed Characters

Allows to select a set of characters that can be typed into the field. The options are:

- **All** : Allows any type of character to be typed into the field
- **Selected** : Defines a set of characters allowed. Using the configuration below, will be allowed to type letters, numbers and other characters (defined in the attribute More). The letters a, b and c (defined in the Less Attribute) are not allowed.

Regular expression

Regular expression used to validate field content.

Regular expression modifier

Modifiers used in the field content validation regular expression.

Error message

Message to be displayed if the regular expression is not valid.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Control - Multiple Lines Text Field

General Settings

Multiple Lines Text field configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Multiple Lines Text , you can inform a Text value to the field in multiple lines.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Watermark** : Create a placeholder for the selected field.
- **Initial Value (type)** : Allows you to define the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Amount of characters** : Define the amount of characters allowed for the field.
- **Validation Image** : Allows to display an image next to the field when it is being validated.
- **Lines** : Allows to define the amount of lines that the field will have at start.
- **Save Variable** : Allows to save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Allows to define the name for the session variable that will receive the field value.
- **Field size in database** : Determines the field size in bytes. It is used to determine the max size of characters that is allowed to type in.
- **Hidden Field** : This option makes the field hidden, but still allows it's value to be processed through JavaScript or PHP.
- **Label Field** : This options make the field behave as a Read Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of field in the database.

Values Format

Format of Values Interface

Case Settings

Allows converting the letters of the field when it loses focus. The options are: **Uppercase**, **Lowercase**, **Capitalize the first word**, **Capitalize all words**.

Minimum Length

Determines the minimum number of characters a user must enter in the field.

Integer values greater than or equal to 0 must be provided.

Maximum Length

Determines the maximum number of characters a user can enter in the field.

Integer values greater than or equal to 0 must be provided.

Allowed Characters

Allows to select a set of characters that can be typed into the field. The options are:

- **All** : Allows any type of character to be typed into the field
- **Selected** : Defines a set of characters allowed. Using the configuration below, will be allowed to type letters, numbers and other characters (defined in the attribute More). The letters a, b and c (defined in the Less Attribute) are not allowed.

Regular expression

Regular expression used to validate field content.

Regular expression modifier

Modifiers used in the field content validation regular expression.

Error message

Message to be displayed if the regular expression is not valid.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.

- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Control - Integer Field

General Settings

Data type:

It sets the application field type. When the field is set as Number, it is permissible to define formatting rules of integers.

Label:

It sets the title that will be displayed in the field when you run the application. The terminology used in the interface is fundamental for your system has a good usability. In this case, we recommend you to use names and terms familiar to the end user of the application, instead of using terms originated in the system.

Label below field

Defines the message to be displayed below the field.

Watermark

Informing a text for the **watermark** it will be displayed on the input text with an example of what can be reported in the field. The result after that will be configured:

Initial value (type)

Allows setting an initial value for the field when the application is in inclusion. You can choose between two options:

Pre-set value: When you select this option, the Initial Value attribute will be made available in the place where we inform the initial value of the field.

For example, my initial value is **Arlindo** when inserting a new record the **seller_name** field will start with Arlindo.

System date: When you select this option, the initial value will be the current system date of your computer.

If you select the type system date, it will be not necessary to fill in the initial value attribute.

Amount of characters

It allows you to set the width of the input text field according to the amount of characters. However, if the quantity entered is greater than the set for the characters, the text will be pushed to the left, in order to ensure the maximum amount of characters set in the option of **Values formatting**.

Validation Image

When you enable this option, an image will be shown next to the field informing whether the field is in accordance with the settings of *minimum size* and *Maximum size* (as you can see in the images below) defined in the Formatting value option.

In the example below, the field was set to receive at least 5 characters, see what happens with the image when it receives only 4 characters:

However, if the value inserted has 5 or more characters the the image will change according to example bellow:

Use slider:

It displays a slider component in the field. So you can increase or decrease the value sliding the cursor. You can also customize the increment value, if it increments the value 1 by 1, 2, 5, 10... N.

Field Mask Input:

It sets the mask input for the field. There are two types of mask as described in the table below:

Character Description

X	It is overridden by any characters returned by the database. Filled is required and the value will be completed with leading zeros when there are fewer characters than the size of the mask.
Z	It is overridden by any characters returned by the database. Its filling is optional and when there are fewer characters than the mask size, nothing will be done about the characters that are missing. In addition the leading zeros will be suppressed. When used in conjunction with the X necessarily the use of this character is to the left of the mask.
9	It represents any numeric character (from 0-9)
A	It represents an alpha numeric character (A-Z,a-z)
*	It represents any alpha-numeric character (A-Z,a-z,0-9)entered by the user.

Mask Input Examples:

Field	Mask Input	Typed Value	Formatted Value
Phone Number	+99 99 9999 - 9999	123456789012	+12 34 5678 - 9012
Phone Number	(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
Phone Number	(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
Phone Number	(zz) xxxx - xxxx	12345678	() 1234 - 5678
Software Key (Letters only)	AAAA-AAAA-AAAA-AAAA	QWERTYUIASDFGHJK	QWER-TYUI-ASDF-GHJK
Software Key (Letters and numbers)	xxxx-xxxx-xxxx-xxxx	Q1W2E3R4T5Y6U7I8	Q1W2-E3R4-T5Y6-U7I8
License Plate	AAA - 9999	QWE1234	QWE - 1234
Scriptcase Serial Key	A999A999A999- **	D111H111G111DG2P	D111H111G111-DG2P
Multiple masks (Phone Number)	9999-9999;(99)9999-9999;	9999 999 9999	+99 99 9999-9999

Validate with Mask

By enabling this option you will be able to enter data according to the mask that was configured in the option **Field Mask** and Scriptcase will validate it.

Record Variable

Allows you to record a session variable with the value of the field ([global variable] [var_glob]), to be used in other applications.

Example, in the login form the username can be saved in session and displayed in the header of other applications.

Variable Name

In this option you must set the session variable name, enabled in the previous item, which will receive the value of the field.

You need to inform only the variable name, for example: **var_seller**.

The recovery of the value is made as [Global Variable][var_glob]{:target='blank'}.

Field size in Database

This option sets the size of the field relative to the size that is configured in the database. By default this value is already configured automatically when the application is generated.

Hidden Field

This option when enabled will hide the field inside the application at the time of execution.

Label Field

By enabling this option, the field will be changed to only one label where the information will be displayed, so it is not possible to make changes or inserts in the field configured as label.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disable field

Allows you to disable the field, making it impossible for the user to enter a value according to the developer-defined option.

The available options are:

No - initial value of the attribute, this option does not disable the field. **Update mode** - This option disables the field only when editing the records. **Insert mode** - This option disables the field only inserting new records. **Update/Insert mode** - This option disables the field in both editing and inserting new records.

HTML Type

HTML object used to display the field in the application.

Tipo SQL:

Reports the SQL type of the field as it is configured in the database.

Values Format

Use regional settings:

It allows you to apply regional settings to the number fields formatting. When this option is not selected it will be displayed the attributes group, minus sign and negative number format.

Digit grouping:

It allows you to define if the field displays the digit grouping separator.

Maximum Size:

It allows you to define the maximum size that will be used in the field of the application.

Minimum Value:

It allows you to define the minimum value that will be used in the field of the application.

Maximum Value:

It allows you to define the maximum value that will be used in the field of the application.

Grouping:

It allows you to define which character is used to separate thousands. This option is only available when the option to use regional settings is disabled.

Negative sign:

It allows you to define which character will be used for the display of negative numbers. This option is only available when the option to use regional settings is disabled.

Negative number format:

It allows you to define the placement of the negative sign in relation to value. This option is only available when the option to use regional settings is disabled.

Accept:

It allows to define if the field accept only negative values, positive-only or both.

Display Calculator:

This option when enabled will display a calculator to assist the end user to perform calculations.

Use Spin:

This option applies a Spin component to the number field. So the end user can increase or decrease the numbers using it. You will also be able to set a minor or major range for the spin.

Smaller increment for the Spin::

Sets the minimum range of the Spin component.

Greater increment for the Spin:

Sets the maximum range of the Spin.

Lookup Settings

The Lookup is a way used to provide the end user a list of values description/name where the items can be selected and used in the application. For example, for a field sex that in the database is represented with M or F values can be presented as male or female dynamically with the lookup. So you will be able to retrieve these values from a database table or manually, if the reference table does not exist.

Example:

Lookup Methods

There are two lookup methods available:

Manual: To use this method it is necessary to inform the selection conditions manually to the Lookup.

Automatic: To use this method it is necessary to use a lookup query from the database to access the reference table.

Editing-automatic lookup:

Select Command:

It sets the SQL command that will retrieve the value to display inside the Grid field. The command must have the following format

```
SELECT field_to_be_displayed FROM table WHERE key_field = {grid_field}
```

The Grid field must be always referenced between curly braces {}, So at run time, the field braces will be replaced by its value in the table.

Multiple Options:

When the Select command informed return multiple values, the option must be selected.

Delimiter:

It sets the tab of values returned by the Select command, this option should be filled when the “Yes” option is checked in the multiple attribute options.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

Use a specific connection:

This option allows you to select another existing connection in the project, other than the current connection, to select the values for the lookup.

Edit Lookup - Manual:

Lookup used to modify the display of the field with predefined values.

Lookup Types

It sets the operating mode of the lookup can be: single value, multiple values (delimiter), multiple values (position) and multiple values (binary).

Single value: it will be displayed only one value for the field. There is a direct replacement of the value stored in the Bank for a label defined in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value of “M” will be replaced by “Male”.

Multiple Values (Delimiter):

By using this option it will be displayed multiple values for the selected field. The values must be separated by a delimiter to be informed. A replacement of parts from a string stored in the field, separated by a delimiter for values contained in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value S;M will be replaced by Sports and Movies.

Delimiter: Character used to separate the values within the same string.

Multiple Values (Position)

Allows you to recover information stored in a single string of the selected field. In order for this information to be retrieved must be informed, in addition to the label, the starting position and the number of bytes that each information occupies within the string.

As an example we will use a string to store Sex, Marital status and Hobby respectively. Sex occupies one byte, Status one byte and Hobby two bytes .

For this purpose we define the list as:

Label	Value	Start	Size
Male	M	1	1
Female	F	1	1
Married	M	2	1
Single	S	2	1
Study	ST	3	2
Sportes	SP	3	2
Reading	LE	3	2

Example: the string MMST would be presented in the query as: Male Married Study

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value M will be replaced by Male.

Start: : Starting position in the string where the information is recorded. The first position is always 1.

Size : Number of bytes that the information occupies in the string.

Multiple values (binary):

It allows you to retrieve several information stored in decimal form of the selected field.

As examples we will use the following list (although not informed in the interface of inclusion of values in the list, each item has a value assigned automatically according to the order):

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

To display the data, a decomposition of the decimal number stored in the bank is performed. For example, numbers 11 and 12 (written in the database) would be decomposed as follows:

$11 = 1 + 2 + 8 = (\text{Sports} - \text{Culture} - \text{Reading})$

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

$12 = 4 + 8 = (\text{Leisure} - \text{Reading})$

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

Label:

Text that will be displayed in the Grid.

Include Button:

Includes in the list the values populated in the Label and value fields.

Alter Button:

It changes the attributes of the selected item.

Delete Button:

Deletes the selected item.

Clean Button:

It cleans the fields

Save Button:

Allows the user to save the entire list, for later use using the Load Lookup definition option.

Load Lookup definition:

Allows you to load a predefined value list for use as a lookup.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of

Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Control - Decimal Field

General Settings

Decimal field configuration Interface.

Data Type

Define the field type to Decimal. It allows defining the Decimal number format.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Watermark

Create a placeholder to specify a short hint that describes the expected value of an input field

Initial Value (type)

It allows you to define the initial value for the field when in insert mode. The options are:

- **Defined Value:** The field receives the value informed into the input option.

Initial Value Configuration Interface.

- **System Date:** The field receives the current server time.

Amount of characters

Define the number of characters allowed for the field.

Validation Image

Allows displaying an image next to the field when validating it.

Save Variable

It allows saving the value of the field in a session variable to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the session variable that will receive the field value.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Label Field

It sets the field like a Read-Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disabled Field

Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the attributes Grouping, Negative Symbol and negative number format.

Digit grouping

It defines if the field displays the digits separator.

Maximum Size

It defines the max size of the field.

Minimum Value

It defines the min value of the field.

Maximum Value

It defines the max value of the field.

Decimal Precision

It defines the number of decimal places for the field.

Digit Grouping Separator

It defines the character to separate the thousands.

Decimal Separator

It defines the decimal separator.

Negative sign

It defines the character to represent negative numbers.

Negative number format

It defines the position of the Negative sign.

Accept

It determines if the field accepts only negative, positive, or both numbers.

Show a calculator

It displays an icon beside the field to help the user calculating the field value.

Auto-complete with zeros

It automatically informs the decimal places when not specified. If disabled, the user always needs to inform the decimal value.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.

- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Control - HTML Image Field

General Settings

HTML Image field Configuration Interface.

Data Type

Define the type of field. When setting it to HTML Image, it allows to display an image into the field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Image

Set it to display an image. The icon "Select Image" lists all images from Scriptcase and your uploaded images. The "Upload an image" option allows you to send a copy to the Scriptcase server.

Border

Define the width of the Image border in Pixels.

Width

Define the image width size in Pixels.

Height

Define the image height size in Pixels.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.

- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).

Control - Label Field

General Settings

Label field Configuration Interface.

Data Type

Define the type of field. When setting it to label, it displays the value with no input to change it.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Text

You can inform a text to be displayed beside the field.

Reload

It links the informed text to reload the form when clicking on it.

Position

It allows positioning the field in the block.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.

- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard ? icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Control - Card Field

General Settings

Credit Card Number Configuration Interface.

- **Data Type** : Defines the type of field for the application. When it is defined as a Credit Card Number, the field verifies if the value is valid.
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be easier to the user understand if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Watermark** : Creates a placeholder on the field with the text informed.
- **Initial Value (type)** : Set the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Amount of characters** : Defines the amount of characters allowed for the field.
- **Validation Image** : Display an image next to the field when it is being validated.
- **Save Variable** : Saves a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Set the name for the session variable that will receive the field value.
- **Field size in database** : Determines the size in bytes of the fields. It is used to determine the max amount of characters to be typed in.
- **Field Mask** : Defines the display mask for the field. There are three types of masks that can be merged.

Character	Description
9	Represents a numeric character (0-9)
A	Represents an alpha numeric character (A-Z,a-z)
*	Represents any alpha numeric character (A-Z,a-z,0-9) typed by the user.

It is possible to merge two or more masks simultaneously, separated by a semi coma with the smallest mask at start. The replacement occurs when the user is typing when the lowest amount of character exceeds.

Examples of Masks

Field	Mask	Informed Value	Formatted Value
Telephone Number	+99 99 9999 - 9999	123456789012	+12 34 5678 - 9012
Software Key (Only Numbers)	AAAA-AAAA-AAAA-AAAA	QWERTYUIASDFGHJK	QWER-TYUI-ASDF-GHJK
Software Key (Letters an Numbers)	**_--**	Q1W2E3R4T5Y6U7I8	Q1W2-E3R4-T5Y6-U7I8
License Plates	AAA - 9999	QWE1234	QWE - 1234
ScriptCase License	A999A999A999-**	D111H111G111DG2P	D111H111G111-DG2P
Multiple Masks (Telephone)	9999-9999;(99)9999-9999; 9999 999 9999		+99 99 9999-9999

- **Hidden Field** : This option makes the field hidden, but still allows it is value to be processed through JavaScript or PHP.
- **Label Field** : This option make the field behave as a Read Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Display the data type of field in the database.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.

- **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Control - Card Type Field

General Settings

Credit Card field configuration Interface.

Data Type

Define the field type to Credit Card. It sets a combo-box for selecting the credit card type.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Watermark

Create a placeholder to specify a short hint that describes the expected value of an input field

Save Variable

It allows saving the value of the field in a session variable to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the session variable that will receive the field value.

Field size in database

It determines the field size in bytes. It limits the max quantity of the allowed characters.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Label Field

It sets the field like a Read-Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

Disabled Field

Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values Interface.

Credit Card

It allows to define which cards will be listed and their internal value.

Use Title/Deny

It allows informing a new value if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen. It defines the label and value with the Negative Value and the Title.

Negative value

The value of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Title

Label of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Related Field

It allows informing which fields contain the values of Credit Card Number so that it can do the validations correctly.

Reload

It Reloads the form when modifying the value.

Lookups Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.

- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Control - E-mail Field

General Settings

Email field configuration Interface.

- **Data Type** : Defines the type of field for the application. When set to Email, the field applies validations for an email format.
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name is "Client Name".
- **Watermark** : Create a placeholder for the selected field.
- **Initial Value (type)** : Defines the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Amount of characters** : Defines the amount of characters allowed for the field.
- **Validation Image** : Displays an image next to the field when it is being validated.
- **Save Variable** : Saves a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Defines the name for the session variable that will receive the field value.
- **Hidden Field** : This option makes the field hidden, but still allows its value to be processed through Javascript or PHP.
- **Label Field** : This options make the field behave as a Read Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

- **Display Icon** : Displays the Email icon next to the field.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of field in the database.

Values Format

Format of Values Interface.

Credit Card

It allows to define which cards will be listed and their internal value.

Use Title/Deny

It allows informing a new value if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen. It defines the label and value with the Negative Value and the Title.

Negative value

The value of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Title

Label of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Related Field

It allows informing which fields contain the values of Credit Card Number so that it can do the validations correctly.

Reload

It Reloads the form when modifying the value.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard ? icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Control - URL Field

General Settings

URL field configuration Interface.

Data Type

Define the type of field. When setting it to YouTube, it allows displaying an Youtube video on the field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Watermark

Create a placeholder to specify a short hint that describes the expected value of an input field

Initial Value (type)

It allows you to define the initial value for the field when in insert mode. The options are:

- **Defined Value:** The field receives the value informed into the input option.

Initial Value Configuration Interface.

- **System Date:** The field receives the current server time.

Amount of characters

Define the number of characters allowed for the field.

Validation Image

Allows displaying an image next to the field when validating it.

Save Variable

It allows saving the value of the field in a session variable to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the session variable that will receive the field value.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Label Field

It sets the field like a Read-Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

Display Icon

Displays an icon beside the field.

Disabled Field

Defines if the field will be disabled in “Insert Mode”, “Update Mode” or in “Insert and Update Mode”.

Show the URL as a clickable link

It sets the content of the field as a clickable link.

Target handling where the link will open

Target to open the link when clicking on it.

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values Interface.

Credit Card

It allows to define which cards will be listed and their internal value.

Use Title/Deny

It allows informing a new value if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen. It defines the label and value with the Negative Value and the Title.

Negative value

The value of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Title

Label of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Related Field

It allows informing which fields contain the values of Credit Card Number so that it can do the validations correctly.

Reload

It Reloads the form when modifying the value.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced by the curly brackets {}. While running the application, the field within the curly brackets is replaced by its value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input

Object.

- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.

- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Control - HTML Color Field

General Settings

HTML Color field configuration Interface.

- **Data Type** : Select the type of field for the application. When set to HTML Color, you can select a color to be used in the form.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Initial Value (type)** : Set the initial value to the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Amount of characters** : Defines the amount of characters allowed for the field.
- **Validation Image** : Displays an image next to the field when it is being validated.
- **Save Variable** : Save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Defines the name for the session variable that will receive the field value.
- **Hidden Field** : This option makes the field hidden, but still allows its value to be processed through JavaScript or PHP.
- **Label Field** : This options make the field behave as a Read Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of the field in the database.

Values Format

Format of Values Interface.

Credit Card

It allows to define which cards will be listed and their internal value.

Use Title/Deny

It allows informing a new value if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen. It defines the label and value with the Negative Value and the Title.

Negative value

The value of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Title

Label of the new option if the previous options (American Express, Diners, MasterCard, and Visa) wasn't chosen.

Related Field

It allows informing which fields contain the values of Credit Card Number so that it can do the validations correctly.

Reload

It Reloads the form when modifying the value.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.

- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard ? icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Control - HTML Editor Field

General Settings

HTML Editor field configuration Interface.

- **Data Type** : Defines the type of field for the application. When set to HTML Editor, you can inform any type of character and they will be saved in HTML form.
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name is "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Height** : Set the Height in pixels to the HTML Editor field.
- **Hidden Field** : This option makes the field hidden, but still allows its value to be processed through Javascript or PHP.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **SQL Type** : Displays the data type of field in the database.

Toolbar

HTML Editor toolbar settings Interface.

- **Properties**
 - **Position** : Location of the HTML Editor toolbar.
 - **Alignment** : Toolbar button alignment.
 - **Status** : Status Bar Display (Do not Display, Top and Bottom).
 - **Amount** : The Amount of lines of the HTML Editor toolbar.
- **Button Organization** : Positions the toolbar buttons.
- **Preview** : You can visualize the toolbar according to the previous settings.

Database Value

Allows to define a value to be saved to the database.

Database Values configuration Interface.

- **Defined Value** : Allows to specify the fixed value associated to global variables.

Defined Value configuration Interface.

- **Auto Increment (automatic)** : Allows to use the increment generated by the database. Used only when the field of the database is the type AUTO INCREMENT or similar. For the databases that use sequence like Oracle, PostGRES and Firebird, it is necessary to inform the name of the sequence.

Auto Increment configuration Interface.

- **Auto Increment (manual)** : The application generated simulates an auto increment on the field. To include a value to the field it will automatically calculate the next id.
- **Date of Insertion** : When inserting a record, the field will contain the server date as a value.
- **Data of Update** : When updating a record, the value of the field will be the date of the server.
- **User IP** : The field will receive the IP of the machine that the application is be accessed by.
- **Calculated by the database** : The value of the field will be applied by the database. The field will not be used in update processes. For example: it will be updated by a Trigger.
- **Null** : The field will be informed the value null.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).

Control - Localization Field

General Settings

Location field Configuration Interface.

Data Type

Define the type of field. When setting it to Location, you can see a Combobox with the Languages that are part of the Project.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Reload

It links the informed text to reload the form when clicking on it.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Control - Theme Field

General Settings

Theme field configuration Interface.

Data Type

Define the field type to Theme. it shows a combobox with the list of themes set in your project.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Reload

It Reloads the form when modifying the value.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Control - Date Field

General Settings

Date field configuration Interface.

Data Type

Define the type of field. When setting it to Date, you can inform its format into this field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Watermark

Create a placeholder to specify a short hint that describes the expected value of an input field

Initial Value (type)

It allows you to define the initial value for the field when in insert mode. The options are:

- **Defined Value:** The field receives the value informed into the input option.

Initial Value Configuration Interface.

- **System Date:** The field receives the current server Date.

Amount of characters

Define the number of characters allowed for the field.

Validation Image

Allows displaying an image next to the field when validating it.

Save Variable

It allows saving the value of the field in a session variable to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the session variable that will receive the field value.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Label Field

It sets the field like a Read-Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disabled Field

Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the dates of the field. When not enabled, it displays the date separator attribute (Check the Regional Settings).

Date separator

It allows you to inform the separator symbol for the date.

First Day

Defines the first day of the week.

Display

It offers predefined formats for displaying dates.

Internal Format

It allows defining the field format when the SQL type is different from **Date**. You must use the characters **Y**, **M** and **D** that correspond to **Year**, **Month** and **Day**.

Use Combo-box

It allows you to select the date from a combo-box.

Minimum Date

- **Fixed Date**: Inform the minimum date allowed presented in the selected date format.
- **Current Date**: By clicking on the icon next to the text field, ScriptCase offers the following options:
 1. **Actual date**: Set the current date as the minimum allowed date.
 2. **Actual date with increment**: Set the minimum date with the current date more(+) the days, months, or years you want to increment.
 3. **Actual date with decrement**: Set the minimum date with the current date minus(-) the days, months, or years you want to decrement.

Maximum Date

- **Fixed Date**: Inform the maximum date allowed presented in the selected date format.
- **Current Date**: By clicking on the icon next to the text field, ScriptCase offers the following options:
 1. **Actual date**: Set the current date as the maximum allowed date.
 2. **Actual date with increment**: Set the maximum date with the current date more(+) the days, months, or years you want to increment.

3. **Actual date with decrement:** Set the maximum date with the current date minus(-) the days, months, or years you want to decrement.

Display Format

It enables the Date format beside the field when informing the date.

Date display position

Available when activating the **Display Format** flag, defines where the filling mode will be displayed. The options are: **Right**, **B Lower** and **Watermark**.

Display Calendar

It enables a calendar icon beside the field that allows selecting the date from a calendar to fill the input.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.

- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon ? beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a beside the field.

Pop-up

Display a default icon ? beside the field. To display the message just click in the icon that a Pop-up will be

displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Control - Time Field

General Settings

Time field configuration Interface.

Data Type

Define the type of field. When setting it to Time, you can inform a time format into this field.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Watermark

Create a placeholder to specify a short hint that describes the expected value of an input field

Initial Value (type)

It allows you to define the initial value for the field when in insert mode. The options are:

- **Defined Value:** The field receives the value informed into the input option.

Initial Value Configuration Interface.

- **System Date:** The field receives the current server time.

Amount of characters

Define the number of characters allowed for the field.

Validation Image

Allows displaying an image next to the field when validating it.

Save Variable

It allows saving the value of the field in a session variable to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the session variable that will receive the field value.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Label Field

It sets the field like a Read-Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disabled Field

Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Values Format

Format of Values with Regional Settings.

Regional Settings

It allows applying the Regional Settings to format the Time. When not enabled, it displays the Time separator attribute (Check the Regional Settings).

Display

It offers predefined formats for displaying Time.

Internal Format

It allows defining the field format when the SQL type is different from **TIME**. You must use the characters **HH**, **II**, and **SS** that correspond to **Day**, **Hour**, **Minutes** and **Seconds**.

Minimum time

Minimum value accepted by the field.

- **Fixed Time** : Enter the minimum time that scriptcase will criticize in the time type field in the format as presented.
 - **Current Time** : When clicking on the icon next to the box, scriptcase provides the following options:
 - **Current Time with Increment** : The minimum time will be the current time (+) the days or months or years that you increment.
 - **Current Time with Decrement** : The minimum time will be the current time (-) the days or months or years that you want to decrement.

Maximum time

Maximum value accepted by the field.

- **Fixed Time**: Manually enter the maximum time that scriptcase will input in the time type field in the format as it is presented.
 - **Current Time**: When you click the icon next to the box, scriptcase provides the following options:
 - **Current Time with Increment**: The maximum time will be the current time (+) the days or months or years that you increment.
 - **Current Time with Decrement**: The maximum time will be the current time (-) the days or months or years that you want to decrement.

Display Format

It enables the Time format beside the field when informing the time.

Display position

Available when activating the **Display Format** flag, defines where the filling mode will be displayed. The options are: **Right**, **B Lower** and **Watermark**.

Display full name

Displays the full name instead of the mask. Ex: day month year.

Use Time picker

It uses the JQuery plug-in to choose the time.

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.

- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon ? beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a beside the field.

Pop-up

Display a default icon ? beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

- **System Date:** The field receives the current server Date and Time.

Amount of characters

Define the number of characters allowed for the field.

Validation Image

Allows displaying an image next to the field when validating it.

Save Variable

It allows saving the value of the field in a session variable to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the session variable that will receive the field value.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Label Field

It sets the field like a Read-Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

Browser autocomplete

Specifies whether the field will allow the browser's autocomplete feature. By default, autocomplete is enabled for fields.

- When **disabled**, the field will allow the browser's autocomplete.
- When **enabled**, the field's autocomplete will be blocked.

Disabled Field

Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Values Format

Regional settings

Allows you to apply regional date formatting settings to the field. When not selected, the Date Separator and Time Separator attributes will be displayed.

Display

Allows you to select the display format of the date/time field.

Internal Format

Field storage format in the database.

Minimum Date

Minimum value accepted as input for the field.

- **Minimum Date** :
 - **Fixed Date** : Enter the minimum date that scriptcase will criticize in the date type field in the format as presented.
 - **Current Date** : When clicking on the icon next to the box, scriptcase provides the following options:
 - **Simple Current Date** : Will leave the current date as the maximum date, that is, no one born after the current day will enter the form.
 - **Current Date with Increment** : The minimum date will be the current date (+) the days or months or years that you want to increment.
 - **Current Date with Decrement** : The minimum date will be the current date (-) the days or months or years that you want to decrement.

Maximum Date

Maximum value accepted as input for the field.

- **Maximum Date** :
 - **Fixed Date** : Enter the maximum date manually that scriptcase will criticize in the date type field in the format as it is presented.
 - **Current Date** : When clicking the icon next to the box, scriptcase provides the following options:
 - **Simple Current Date** : Will leave the current date as the maximum date, that is, no one born after the current day will enter the form.
 - **Current Date with Increment** : The maximum date will be the current date (+) the days or months or years that you want to increment.
 - **Current Date with Decrement** : The maximum date will be the current date (-) the days or months or years that you want to decrement.
 - **Display Format** : Enables display of the mode

Minimum time

Maximum value accepted by the field.

- **Fixed Time:** Manually enter the maximum time that scriptcase will input in the time type field in the format as it is presented.
 - **Current Time:** When you click the icon next to the box, scriptcase provides the following options:
 - **Current Time with Increment:** The maximum time will be the current time (+) the days or months or years that you increment.
 - **Current Time with Decrement:** The maximum time will be the current time (-) the days or months or years that you want to decrement.

Maximum time

Maximum value accepted by the field.

- **Fixed Time:** Manually enter the maximum time that scriptcase will input in the time type field in the format as it is presented.
 - **Current Time:** When you click the icon next to the box, scriptcase provides the following options:
 - **Current Time with Increment:** The maximum time will be the current time (+) the days or months or years that you increment.
 - **Current Time with Decrement:** The maximum time will be the current time (-) the days or months or years that you want to decrement.

Hour value

Sets the value to be assigned to the time when it is empty and a date is selected in the date picker.

- **Available values are:** Start of day, End of day and Current time.

Apply date limits to the calendar

Apply Minimum and Maximum Date limits when selecting calendar dates, avoiding the selection of dates outside these limits.

Display Format

Display the field format in the data cell.

Date display position

Available when activating the **Display Format** flag, defines where the fill mode will be displayed. The options are: **Right**, **Below** and **Watermark**.

Display full name

Displays the full name instead of the mask. Ex: day month year.

Group Date and Time

Group date and time in the same field.

Display Calendar

Allows you to display a calendar icon next to the field. This allows you to select the month and year, passing the value defined in the calendar to the field.

New Calendar

Show a new calendar with jquery, or the old calendar.

Years Limit

Number of years that will be displayed on the calendar.

View week number

Display week number in application.

Additional months

Display additional months in the calendar.

Available options are: 1, 2 and 3.

Show Combo year and month

Show Combo Year and month in calendar

Lookup Settings

Method used to place a description next to the field.

- **Use lookup to display the field description.** : When enabled, the lookup settings is enabled and opens more settings.
- **SQL Command** : Defines the SQL command that is going to recover the vales from the database. To build a SQL command, it is possible to use the SQL Builder tool. The SQL format needs to have the following format:

```
SELECT Field_displayed FROM table WHERE Key_Field = '{Form_Field}'
```

The Form field needs to be referenced buy the curly brackets {}. While running the application, the field within the curly brackets is replaced by it's value in the table.

- **Font** : Defines the font used to display the lookup.
- **Font Color** : Defines the color in HEX for the lookup display.
- **Font Size** : Defines the font's size in the lookup display.
- **EOF Message** : Defines a message that will be displayed if there is not any results for the record.
- **Use in validation** : When enabled, it will generate an automatic validation based on the lookup, in case there is not any records found, the message will display as a warning (when Updating or Including a record).

- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.

- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Control - Image (File Name) Field

General Settings

Data Type

Define the type of field. When setting it to Image (File Name), all the Images files are stored and loaded directly from the Database.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Image Border

The width of the Image border in Pixels.

Image Height

Image height size in Pixels.

Image Width

Image width size in Pixels.

Maintain Aspect

It maintains the original aspect ratio of the image when resizing it.

Progress bar

It displays a progress bar when sending the files to the server.

Upload area

It displays a drag and drop area to upload the file.

Upload area icon

Font-awesome icon for viewing in the file upload zone.

Clickable upload area

Hides the upload button and turns the upload area responsible for the upload function.

Cloud storage API

Profile with the API information (Dropbox, Google Drive or Amazon S3) used to upload the file to the cloud created in Tools > API

Storage API directory

Directory name for upload to the Cloud Storage API. Eg.: files/docs/{id}. The file will be saved in the root folder if this field is empty.

Storage API cache directory

Local directory for caching files sent to the cloud via the storage API

Keep file after uploading via API

It also saves the file in the default folder for images or documents after uploading to a cloud storage API.

Deletion in the storage API

When deleted in the application, the file will also be removed from the folder in the cloud storage API.

Increment file

It inserts a number increment into the file name if there is already another one with the same name in the upload folder.

Subdirectory for local storage

It sets the Sub-folder name of the stored files. It is relative to the directory of Document upload (see the Settings). It is possible to use global variables or local variables to format the name of the sub-folder.

Create Subfolder

It creates the sub-folder if not already created.

Image Caching

Time in minutes to store the image in the cache.

Hide image name

It displays only the image, without the name.

Files Deletion

It Deletes the files from the directory when deleting a record from the database.

Display link only

It allows showing a link to open the image in another window with the original size. (with no re-dimensioning)

Open in Another Window

Allows to open the image in another window.

File Size

It allows defining the field to store the file size in the database.

Extensions and upload size

This setting defines the extensions allowed for uploading and the maximum size of each one.

This setting is important for the security of your project, as it prevents unwanted files from being uploaded.

Note If no value is informed, all extensions will be allowed. The file size will be limited by your PHP configuration.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

Disabled Field

Defines if the field will be disabled in “Insert Mode”, “Update Mode” or in “Insert and Update Mode”.

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).

- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Control - Document (File Name) Field

General Settings

This option allows to upload multiple files and store them on a table referencing a record from another table.

To use this option you first need to create a virtual field. _

Multi-Upload Configuration.

Amount of columns

The number of columns to display the files in the Field.

Files sorting

It enables the files sorting after the upload.

Position of the delete

Set the position of the checkbox delete files option.

Position on the upload

Set the position of the checkbox delete files option.

Show status

Display the upload status.

Table

Select the table to stores the file information when uploading.

After selecting the table, you can see a field list of the chosen table to associate the parameters for each field when inserting a new record or updating an existing record.

Multi-Upload fields of the table Configuration.

- **File Name** It gets the name of the loaded file.
- **Upload** It gets the binary value of the file.
- **File Size** Field that will storage the file size in the Database.
- **Auto Increment** Use it only when the field in the database is an auto-increment.
- **Manual Increment** The form is responsible for managing the auto-increment, calculating the value of the field before inserting the record.
- **Foreign Key** It associates the file with a value of a field in the current form.
- **Defined** You can specify a constant value or use a global variable. [global_var]
- **Date of Insertion** It gets the data of the server when inserting the record.
- **Datetime of Insertion** It gets the data and time of the server when inserting the record.
- **User IP** It gets the IP of the computer that is accessing the application.
- **Calculated by the Database** The Database calculates the value of the field.
- **Calculated by the Database if empty** If the value is empty in the application, the Database calculates the value of the field.
- **Null** The field will the null value.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.

Control - Select Field

General Settings

Select field configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Select, you can select multiple option from a combo box (Select Field).
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Watermark** : Create a placeholder for the selected field.
- **Initial Value (type)** : Allows you to define the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.
- **Use Select2** : Uses the new component for data selection, allowing searches within the select.
- **Display Select2 search area** : Sets whether to display the search field within Select2.

Initial Value Configuration Interface.

- **Save Variable** : Allows to save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Allows to define the name for the session variable that will receive the field value.
- **Field size in database** : Determines the field size in bytes. It is used to determine the max size of characters that is allowed to type in.
- **Hidden Field** : This option makes the field hidden, but still allows it's value to be processed through Javascript or PHP.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of field in the database.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

• Lookup Methods

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

Selecting the lookup type.

◦ Lookup Method - Automatic

Lookup used to list the values that will be displayed on the Checkbox field. These values will be recovered dynamically using the Select command.

Automatic Lookup Interface.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the key_field will be stored in the table field.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimitation.

- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Height** : Defines the height for the select object.
- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.
- **Link** : Allows to create a link to another form allowing to manipulate the list displayed on the select field. After the manipulation, the select object it updated automatically.

◦ **Lookup Method - Manual**

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

Manual Lookup Interface.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

Setting up Single Value Lookup

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Default** : With this option enabled, the selected item will be inserted to the table when committed.
- **Height** : Defines the height for the select object.

- **Multiple Values (delimiter)**

You can store various values for the select field. The values are separated by the informed delimiter. For example: the combination **Sport, Cinema** and **Tourism** selected in form will be stored like **E;C;T** in case the delimiter is ; (semi coma).

Setting up Multiple Values (delimiter)

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Height** : Defines the height for the select object.

▪ Multiple Values (position)

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Martial Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in the database would be stored the following value **MSRD**.

Setting up Multiple Values (position)

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Negative** : Value to be saved in the table in case there is not any valued selected on the field.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.
- **Height** : Defines the height for the select object.

▪ Multiple Values (binary)

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
---	--------

Attribute Value Lookup Description

2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

Editing Lookup Configuration Multiple Values (Binary)

- **Label** : Text that will be displayed in the item list of the select field.
- **Height** : Defines the height for the select object.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

Displaying the original lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Lookup Method - Actual value

This lookup is used to list all the values in the selected field.

This lookup will apply a “distinct” to your SQL query.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Control - Double Select Field

General Settings

Double Select field configuration Interface.

- **Data Type** : Select the type of field for the application. When set to Double Select you can have multiple options selected.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name is "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Initial Value (type)** : Defines the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Save Variable** : Saves a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Set the name for the session variable that will receive the field value.
- **Field size in database** : Determines the size in bytes of the fields. It is used to set the max amount of characters to be typed in.
- **Hidden Field** : This option makes the field hidden, but still allows its value to be processed through Javascript or PHP.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Displays the data type of field in the database.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or F can be presented like Male or Female or in a dynamic way, getting these values from the database.

Lookup Settings Display for the field.

Automatic Lookup Interface..

- **SQL Select Statement** : Defines the SQL command that will get the values displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the `key_field` will be stored in the table field.

- **Height** : Set the height(lines) of the field interface.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter than (;).
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Selects another specific connection existing in the project. The select command will be done on the second connection.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the

users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Control - CheckBox Field

General Settings

CheckBox field configuration Interface.

- **Data Type** : Select the type of field for the application. When set to CheckBox, you can have multiple options selected.
- **Label** : Set the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name is "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Initial Value (type)** : Defines the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Save Variable** : Saves a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Define the name for the session variable that will receive the field value.
- **Field size in database** : Determines the size in bytes of the fields. It is used to determine the max amount of characters to be typed in.
- **Hidden Field** : This option makes the field hidden, but still allows it's value to be processed through JavaScript or PHP. .
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of field in the database.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or F can be presented like Male or Female or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

• Lookup Methods

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query). *Selecting the lookup type.*

◦ Lookup Method - Automatic

Lookup used to list the values that will be displayed on the CheckBox field. These values will be recovered dynamically using the Select command.

Automatic Lookup Interface.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the `key_field` will be stored in the table field.

- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Reload form when value has changed** : With this option selected, the form will refresh if

there is a change to the selected object in the field.

- **Option check all** : Displays two options on the field to check and uncheck all.

- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Selects another specific connection existing in the project. The select command will be done on the second connection.

◦ **Lookup Method - Manual**

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

Manual Lookup Interface.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).

- **Single Value** :

Setting up Single Value Lookup

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Default** : With this option enabled, the selected item will be inserted to the table when committed.
- **Columns** : Set the amount of columns, for the list of items.

- **Multiple Values (delimiter)**

You can store various values for the checkBox field. The values are separated by the informed delimiter. For example: the combination **Sport, Cinema** and **Tourism** selected in form will be stored like **E;C;T** in case the delimiter is ; (semi coma).

Setting up Multiple Values (delimiter)

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Columns** : Set amount of columns, for the list of items.

- **Multiple Values (position)**

Stores a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Martial Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1

Label	Value	Start	Size
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in the database would be stored the following value **MSRD**.

Setting up Multiple Values (position)

- **Label** : Text that will be displayed in the item list of the checkBox.
 - **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
 - **Negative** : Value to be saved in the table in case there is not any valued selected on the field.
 - **Start** : Starting position of the string that is going to be stored. The first position is always 1.
 - **Size** : Amount of bytes that is going to occupy in the string.
 - **Columns** : Set the amount of columns, for the list of items.
- **Multiple Values (binary)**

Stores a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

Setting up Multiple Values (Binary)

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Columns** : Allows you to inform the amount of columns, for the list of items.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Saves all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Refreshes the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Option check all** : Displays two options on the field to check and uncheck all.

- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

• CSS of the Title

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

• CSS of the Field

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.

- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon ? beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon ? beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard ? icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Control - Radio Field

General Settings

Radio field configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Radio, your allowed to select one of the options listed.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Initial Value (type)** : Allows you to define the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Save Variable** : Allows to save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Allows to define the name for the session variable that will receive the field value.
- **Field size in database** : Determines the size in bytes of the fields. It is used to determine the max amount of characters to be typed in.
- **Hidden Field** : This option makes the field hidden, but still allows it's value to be processed through Javascript or PHP. .
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of field in the database.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

• Lookup Methods

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query). *Selecting the lookup type.*

◦ Lookup Method - Automatic

Lookup used to list the values that will be displayed on the Checkbox field. These values will be recovered dynamically using the Select command.

Automatic Lookup Interface.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the key_field will be stored in the table field.

- **Columns** : Allows you to inform the amount of columns, for the list of items.

- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

◦ Lookup Method - Manual

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

Manual Lookup Interface.

- **Label** : Text that will be displayed in the item list of the radio.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Default** : With this option enabled, the selected item will be inserted to the table when committed.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

Displaying the original lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Ajax Settings

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Control - Profile Field

General Settings

Profile field configuration Interface.

Data Type

Define the type of field. When setting it to Profile, it displays a Combobox with the profiles set up in the project properties.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.

Control - Menu Links Field

General Settings

Menu Links field Configuration Interface.

Data Type

Define the type of field. When setting it to Menu Links, you can show a list of links in the application.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Label below field

Defines the message to be displayed below the field.

Hidden Field

This option hides the field from the application, but its value is still available for JavaScript or PHP processing.

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Values Format

Values Format Interface.

It controls the Insert, Update and Delete of the menu items.

Label

The Label option lets you define the title of a field.

Link

It allows defining to call an external link when clicking on the item.

Icon

It displays an icon beside the link.

Default

Set the current item as default.

Option Buttons

- **Insert:** Insert a new item into the menu.
- **Update:** Update the selected item.
- **Delete:** Delete the selected item.
- **Clear:** Clears the data of the selected item.
- **Clear All:** Removes all items from the menu.

Display Mode

Define how to display the menu items; Select, Radio or Link:

- **Select:**

- **Radio:**

- **Link:**

Hide Label

You can enable or disable the label displaying.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.

- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).

Control - Text Auto-Complete Field

General Settings

Text auto complete field configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Text auto complete, you can inform a value based on the select statement of the lookup settings and it will manipulate an internal Text for the data.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Watermark** : Create a placeholder for the selected field.
- **Initial Value (type)** : Allows you to define the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You'll inform the Defined Value here.
- **Use Select2**: Uses the new component for data selection, allowing searches within the select.
- **Amount of characters for the Select2** : Sets the number of characters to start the search in Select2.
- **Amount of lines for the Select2** : Sets the maximum number of rows to list the search result in Select2.
- **Width for the Select2** : Sets a width for the area for the Select2.

Initial Value Configuration Interface.

- **Amount of characters** : Define the amount of characters allowed for the field.
- **Save Variable** : Allows to save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Allows to define the name for the session variable that will receive the field value.
- **Complete to the Left** : Allows to define the character that will be used to complete the value to the left that the user typed in to the max size of the field defined in the Field size in database option.
- **Field size in database** : Determines the field size in bytes. it is used to determine the max size of characters that is allowed to type in.
- **Hidden Field** : This option makes the field hidden, but still allows its value to be processed through JavaScript or PHP.
- **Label Field** : This options make the field behave as a Read Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

- **Validate on submit** : Validate the field only when the form is submitted.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of field in the database.

Values Format

Format of Values Interface

Case Settings

Allows converting the letters of the field when it loses focus. The options are: **Uppercase**, **Lowercase**, **Capitalize the first word**, **Capitalize all words**.

Minimum Length

Determines the minimum number of characters a user must enter in the field.

Integer values greater than or equal to 0 must be provided.

Maximum Length

Determines the maximum number of characters a user can enter in the field.

Integer values greater than or equal to 0 must be provided.

Allowed Characters

Allows to select a set of characters that can be typed into the field. The options are:

- **All** : Allows any type of character to be typed into the field
- **Selected** : Defines a set of characters allowed. Using the configuration below, will be allowed to type letters, numbers and other characters (defined in the attribute More). The letters a, b and c (defined in the Less Attribute) are not allowed.

Regular expression

Regular expression used to validate field content.

Regular expression modifier

Modifiers used in the field content validation regular expression.

Error message

Message to be displayed if the regular expression is not valid.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field.
- **Rows** : Allows to define the amount of records displayed in the field.
- **Width** : Defines the width the size of capture box (Capture Text).
- **Search options** : Allows to define the search settings of the field(Start equal to, Any part and End equals to).
- **Capture Text** : When not enabled, you will only view the field to inform the data. See an example below. *lookup Settings configuration Interface.*
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

lookup Settings validation configuration Interface.

- **Show label with the description** : Displays a label with the description.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Control - Number Auto-Complete Field

General Settings

Number auto complete field configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Number auto complete, you can inform a value based on the select statement of the lookup settings and it will manipulate an internal number for the data.
- **Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Watermark** : Create a placeholder for the selected field.
- **Initial Value (type)** : Allows you to define the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
 - **System Date** : The field will receive the current server date.

If you select the System Date, then it is not necessary to inform the Initial Value attribute.

- **Initial Value** : You will inform the Defined Value here.

Initial Value Configuration Interface.

- **Amount of characters** : Define the amount of characters allowed for the field.
- **Save Variable** : Allows to save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Allows to define the name for the session variable that will receive the field value.
- **Complete to the Left** : Allows to define the character that will be used to complete the value to the left that the user typed in to the max size of the field defined in the Field size in database option.
- **Field size in database** : Determines the field size in bytes. It is used to determine the max size of characters that is allowed to type in.
- **Hidden Field** : This option makes the field hidden, but still allows its value to be processed through JavaScript or PHP.
- **Label Field** : This options make the field behave as a Read Only field, not allowing modifications to its value while in Insert or Update Mode.

Label Configuration Interface.

- **Validate on submit** : Validate the field only when the form is submitted.
- **Disabled Field** : Defines if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : HTML Object that will be used to display the field in the form.
- **SQL Type** : Informs the data type of field in the database.

Values Format

Format of Values Interface

Case Settings

Allows converting the letters of the field when it loses focus. The options are: **Uppercase, Lowercase, Capitalize the first word, Capitalize all words.**

Minimum Length

Determines the minimum number of characters a user must enter in the field.

Integer values greater than or equal to 0 must be provided.

Maximum Length

Determines the maximum number of characters a user can enter in the field.

Integer values greater than or equal to 0 must be provided.

Allowed Characters

Allows to select a set of characters that can be typed into the field. The options are:

- **All** : Allows any type of character to be typed into the field
- **Selected** : Defines a set of characters allowed. Using the configuration below, will be allowed to type letters, numbers and other characters (defined in the attribute More). The letters a, b and c (defined in the Less Attribute) are not allowed.

Regular expression

Regular expression used to validate field content.

Regular expression modifier

Modifiers used in the field content validation regular expression.

Error message

Message to be displayed if the regular expression is not valid.

Lookup Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field.
- **Rows** : Allows to define the amount of records displayed in the field.
- **Width** : Defines the width the size of capture box (Capture Text).
- **Search options** : Allows to define the search settings of the field(Start equal to, Any part and End equals to).
- **Capture Text** : When not enabled, you will only view the field to inform the data. See an example below. *lookup Settings configuration Interface.*
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

lookup Settings validation configuration Interface.

- **Show label with the description** : Displays a label with the description.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Control - Signature Field

General Settings

Configuration Interface of the Signature Field.

The signature field will help you creating more sophisticated forms and making it possible to store signatures in your database. Inside our development environment we have specific settings that will help you to customize your field, those options are:

- **Data Type** : You can define the type of field for the application. When it is defined as a text, it accepts letters, numbers and special characters.
- **Label** : Lets you define a label to the field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be easier to the user understand if the name is "Client Name".
- **Label below field** : Defines the message to be displayed below the field.
- **Background color** : Defines a color to the field background by using a valid hexadecimal color value or by choosing a color from the color palette.
- **Pen color**: Set a color to the pen by using a valid hexadecimal color value or by choosing a color from the color palette.
- **Width** : Lets you define a width to the field.
- **Height** : Set a height to the field.
- **Subtitle** : Defines the subtitle that will be displayed beside the field.
- **Initial Value** : Lets you define the initial value for the field when in insert mode. The options are:
 - **Defined Value** : The field will receive the value from the text field of the defined value option.
- **Save Variable** : Save a variable in the session with the value of the field, that can be used in other applications. For example, in the login form the user name can be saved in the session so that it can be displayed on the header of other applications.
- **Variable Name** : Set the name for the session variable that will receive the field value.
- **Disabled Field** : Define if the field will be disabled in "Insert Mode", "Update Mode" or in "Insert and Update Mode".
- **HTML Type** : Displays the HTML Object that will be used to display the field in the form.
- **SQL Type** : Displays the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of ScriptCase, there are the same attributes available in Interface.

Display Settings configuration Interface.

- **CSS of the Title**
 - **Font** : Select the font type, that will be applied to the application field title.
 - **Font Size** : Defines the font size, that will be applied to the application field title.
 - **Font Color** : Choose a color to the font by using a valid hexadecimal color value or from the color picker.
 - **Background Color** : You can define the color for the field by using a valid hexadecimal color value or from the color picker.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Set the underline style to the font.
 - **Border style** : Choose a style for the border.
 - **Collapse** : Defines the collapse for the border.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Choose a color for the border, using a color palette to apply to the title.
 - **Horizontal Alignment** : Position the label of the field in the wanted position (left,right,center and justify).
 - **Vertical Alignment** : Position the label of the field in the wanted position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : Defines a width for the title of the field.
 - **Height** : Set a height for the title of the field.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon **?** beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Control - Rating Field

General Settings

This field allows the developer to create a field for rating using stars (or any other image), where the final user can select a rate option.

Attribute descriptions

Data Type

Define the field type to **Rating**.

Label

The Label option lets you define the title of a field. Example: If the database field name is "**Stars**", You can display a different name for the user, like "**Stars**".

Besides use a fixed text, the **Label** attribute allows the use of **Langs** to define the field title, allowing the [internationalization of your application](#).

Label below field

Defines the message to be displayed below the field.

Subtitle

Define the subtitle of the field, below the ratings. **Example:** "Thank you for your feedback!".

As in the **Label**, the **subtitle** attribute also allows the use of **Langs** for the [internationalization of your application](#).

Amount of icons

It defines how many icons it will display in the field. The value set in this attribute must be according to the evaluation rules.

Initial Value (type)

Allow the definition of an initial value for the field when the form application is in insert mode. The only option available in this field is **Defined**. Selecting this option the attribute **Initial Value** will be showed for set the value.

Example: The initial value is 3 when inserting a new record, the rate field will initiate with 3 stars already selected.

The value defined in this attribute will overlap any value defined previously.

Save variable

It allows saving the value of the field in a session variable([Global variable](#)) to use it in other applications. For example, you can save the user name in the login form and display its value on the header of other applications.

Variable Name

It allows setting the name of the **session variable** that will receive the field value.

We must inform only the variable name, - **var_rating**.

We can get the value as a [global variable](#).

HTML Type

HTML Object to display the field in the form.

SQL Type

It informs the data type of field in the database.

Display Settings

The Display Settings allows to define the CSS values individually for each field. For each Display schema of ScriptCase, there are the same attributes available in Interface.

Display Settings configuration Interface.

• CSS of the Title

- **Font** : Select the font type, that will be applied to the application field title.
- **Font Size** : Defines the font size, that will be applied to the application field title.
- **Font Color** : Choose a color to the font by using a valid hexadecimal color value or from the color picker.
- **Background Color** : You can define the color for the field by using a valid hexadecimal color value or from the color picker.
- **Bold** : Applies the bold style to the font.
- **Underline** : Set the underline style to the font.
- **Border style** : Choose a style for the border.
- **Collapse** : Defines the collapse for the border.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Choose a color for the border, using a color palette to apply to the title.
- **Horizontal Alignment** : Position the label of the field in the wanted position (left,right,center and justify).
- **Vertical Alignment** : Position the label of the field in the wanted position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : Defines a width for the title of the field.
- **Height** : Set a height for the title of the field.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon ? beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed

Control - Rating Smile Field

General settings

This field type allows the final user evaluate with an emoji that goes from **Very Bad** to **Excellent**.

Data type

Defines the data type of the field in the application. In this case we should select **Rating Smile**.

Label

Defines the title that will be shown in the field when the application is running. The used terms in the interface are essential to the system has good usability, we should use comum name and terms for the final user, instead of the default values of the system.

For example, for the rating smile field, the client would have a better understanding of the field function when the label is **Product evaluation**.

Besides a fixed text, the **Label** allow to use of lang to define the field title, this way is possible to use the [application internationalization](#).

Label below field

Allows you to define a message that will be displayed under the field, which can serve as a help or caption for example.

Subtitle

Define a subtitle that will be shown beside the field. Ex.: Thank you for the feedback!

Below is one example of an application subtitle:

Values and hints

Allow to the developer to define the values to each emoji taht will be saved at the data base and allow to define a hint (**It is show passing the mouse above the emoji**)

Display format

Allows the developer to define the format that the emojis will be shown.

In case the first option is defined, the emojis will be shown like this:

In case the second option is defined, the emojis will be shown like this:

Icon size

Allows defining the icon size in pixels.

Rating padding

Allows for defining the padding value between the emojis.

Icon colors

Allows the icon colors to be defined in each emoji.

Initial value (type)

Allows defining a default value to the field when the application will be in insert mode. Is possible to choose between two options:

Default value: Selecting this option, the default value will be available, where we should input the field's default value. For example, my default value is **Allan**, inserting a new register, the field **Seller Name** will start with Allan.

Save variable

It allows saving a session variable ([global variable](#)) with the field value, to be used in other applications.

For example, in the login form the username can be saved in session and displayed in the header of other applications.

Variable name

In this one we should define the variable's name in session, available at the last item, which will receive the field value.

We should inform only the variable's name, **var_seller**.

The recovery of the value is done in the form of a [global variable](#).

Disable field

Allow to Disable field, impossible to change the defined value.

Available options are:

No - Default value, this option don't disable the field.

Update mode - This option disable the field only at update. **Insert mode** -This option disable the field only at insert. **Insert/Update mode** -This option disable the field in both insert and update.

HTML type

HTML object used to show the form field.

SQL type

Infomrs the field type at the data base.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).

- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Control - Rating Thumbs Field

General settings

This field type allows the final user to save data with the icons like or dislike.

Data type

Defines the data type of the field in the application. In this case we should select **Rating Thumbs**.

Label

Defines the title that will be shown in the field when the application is running. The used terms in the interface are essential to the system has good usability, we should use comum name and terms for the final user, instead of the default values of the system.

For example, for the rating thumbs field, the client would have a better understanding of the field function when the label is **Product evaluation**.

Besides a fixed text, the **Label** allow to use of lang to define the field title, this way is possible to use the [application internationalization](#).

Label below field

Allows you to define a message that will be displayed under the field, which can serve as a help or caption for example.

Subtitle

Define a subtitle that will be shown beside the field. Ex.: Welcome to help us with your feedback!

Below is one example of an application subtitle:

Values and hints

Allow to the developer to define the values to each icon taht will be saved at the database and allow to define a hint (**It is shown passing the mouse above the icon**)

Display format

Allows the developer to define the format that the emojis will be shown.

In case the first option is defined, the emojis will be shown like this:

In case the second option is defined, the emojis will be shown like this:

Icon size

Allows defining the icon size in pixels.

Rating padding

Allows for defining the padding value between the emojis.

Icon colors

Allows the icon colors to be defined in each emoji.

Initial value (type)

Allows defining a default value to the field when the application will be in insert mode. Is possible to choose between two options:

Default value: Selecting this option, the default value will be available, where we should input the field's default value. For example, my default value is **Allan**, inserting a new register, the field **Seller Name** will start with Allan.

Save variable

It allows saving a session variable ([global variable](#)) with the field value, to be used in other applications.

For example, in the login form the username can be saved in session and displayed in the header of other applications.

Variable name

In this one we should define the variable's name in session, available at the last item, which will receive the field value.

We should inform only the variable's name, **var_seller**.

The recovery of the value is done in the form of a [global variable](#).

Disable field

Allow to Disable field, impossible to change the defined value.

Available options are:

No - Default value, this option don't disable the field.

Update mode - This option disable the field only at update. **Insert mode** -This option disable the field only at insert. **Insert/Update mode** -This option disable the field in both insert and update.

HTML type

HTML object used to show the form field.

SQL type

Infomrs the field type at the data base.

Display Sttings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).

- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon ? beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a beside the field.

Pop-up

Display a default icon **?** beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard **?** icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Control Layout Setting

This module lets you editing display options for the application. You can apply visualization themes, organize blocks, define values, and the display format of the Header and Footer.

Blocks

Blocks are “containers” where you can position the application fieldSlides of Forms, Controls, or Grids.

Scriptcase creates applications with one block by default. You can add more blocks as you wish, to organize it in the best way.

See below, the Columns Organization, and where you can define the position of the next block: beside or below the current one.

Op		Block	Title	Label		Fields		Organization				
Name	Label	Display	Display	Position	Columns	Position	Next	Width	Collapse			
Pag1												
			form_orders	form_orders	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Pag2												
			Block 2	Block 2	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Blocks not shown												

Application Block configuration

On the left side of each block, there are two icons, the first one to edit the information of the block and the second one to delete the block.

Organizing the position of the Blocks

See below how to modify the display order of the Blocks in one Page.

Click and drag the block that you desire to modify to its new position.

Op		Block	Title	Label		Fields		Organization				
Name	Label	Display	Display	Position	Columns	Position	Next	Width	Collapse			
Pag1												
			form_orders	form_orders	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Pag2												
			Block 2	Block 2	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Blocks not shown												

Application Block Display configuration

- See how to remove a block from the display

Click on the block desired and drag it to the item “Blocks not Shown”. This way, you can also drag the block to another page if desired. See the images below.

Block		Title		Label		Fields		Organization				
Op	Name	Label	Display	Display	Position	Columns	Position	Next	Width	Collapse		
Pag1												
			form_orders	form_orders	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Pag2												
			Block 2	Block 2	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Blocks not shown												
			Block 3	Block 3	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼

Application Block Display configuration

Block		Title		Label		Fields		Organization				
Op	Name	Label	Display	Display	Position	Columns	Position	Next	Width	Collapse		
Pag1												
			form_orders	form_orders	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Pag2												
			Block 2	Block 2	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Blocks not shown												
			Block 3	Block 3	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼

Application Block Display configuration

Block

- **Name:** The name that identifier the Block.
- **Label:** Title of the block to display in the application.

Title

- **Display:** It controls the display of the block title.

Label

- **Display:** It controls the display of the field labels of the block.
- **Position:** Options to display label :
 1. **Above:** Display the label above the field.
 2. **Beside:** Display the label beside the field.
 3. **Below:** Display the label below the field.

Fields

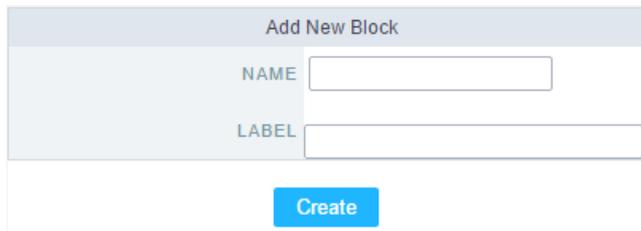

- **Columns:** Amount of columns side by side in the block.
- **Position:** The way to display the fields in the block:
 1. **Below:** Display the fields one below the other respecting the number of columns.
 2. **Beside:** Display the fields one beside the other respecting the number of columns.
 3. **Line:** Display the fields one beside the other with no tabulation.

Organization

- **Next:** The way to display the blocks in the page:
 1. **Below:** Set to show the following block below the current one.
 2. **Beside:** Set to show the following block beside the current one.
 3. **Tab:** Set to show the following block in a different tab then the current one.
- **Width:** Set the block width in pixels or percentages. Use the symbol “%” to indicates the value in percentage.
- **Collapse:** Enables the option to close the block.

Create a New Block

To include new blocks in an Application, click on the button **Create New Block**. Then, enter the name and label of the block in the following interface and finish by click on Create.

The screenshot shows a form titled "Add New Block". It contains two input fields: "NAME" and "LABEL". Below the fields is a blue "Create" button.

Creating application blocks configuration

Name

Name of the Block.

Label

Title of the block to display in the application.

Edit Blocks

To edit a block, click on the icon , that is on the left side of the block. Then you can see the following interface to define the parameters of the blocks. Click on Save to finish.

EDIT BLOCKS	
ATTRIBUTE	VALUE
Name	<input type="text" value="form_orders"/>
Title	<input type="text" value="form_orders"/>
Display Title	<input type="radio"/> Yes <input checked="" type="radio"/> No
Title Font	<input type="text"/> Aa

Block Height	<input type="text" value=""/>
Cell Spacing	<input type="text" value=""/> pixels
Collapse	<input type="text" value="Start open"/>

Application Block editing interface

Name

Name of the block. ##### Title

Block title for display. ##### Display Title

This option, when active, allows displaying the block title. ##### Title Font

Set the font family of the block title. ##### Font Size

Set the font size of the block title. ##### Font Color

Set the font color of the block title. ##### Background Color

Set the Background Color of the block title. ##### Background image

Set a Background image for the block title. ##### Title Height

Height in pixels of the block title line. ##### Horizontal Alignment

Horizontal Alignment of the block title (Left, Center, and Right). ##### Vertical Alignment

Vertical Alignment of the block title (Top, Middle, and Bottom). ##### Display Label

Display the labels of the fields in the block. ##### Columns

Amount of field columns in a block. ##### Columns Width

Set the field column width of the block. ##### Label Color

Color of the field labels. ##### Fields Organization

The way to display the fields in the block. ##### Label Position

Set the position of the field labels of the block.

The options are:

- **Beside** - This option positions the label on the right side of the field.

User

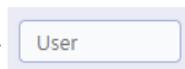

- **Above** - This option places the label above the field.

A light blue rectangular box containing the text "User" positioned above a white rounded rectangular input field.

- **Below** - This option places the label below the field.

A light blue rectangular box containing a white rounded rectangular input field with the text "User" positioned below it.

- **Watermark** - This option positions the label as a watermark.

A light blue rectangular box containing a white rounded rectangular input field with the text "User" faintly visible inside the field as a watermark.

Next Block

Set the position of the following block relating to the current one. ##### Border Color

The border Color for the block. ##### Border Width

The border Width for the block. ##### Block Width

The width for the block. ##### Block Height

The Height for the block. ##### Cell Spacing

The Cell Spacing in the block. ##### Collapse

It enables the option to close the block.

Layout Settings

ScriptCase creates an app by using default values defined per project, but you can change those values for a specific application on this interface.

LAYOUT SETTINGS

Header Template	Flat	Template name used for the application header.
Footer Template	Default	Template name used for the application footer.
Button		Use different buttons than what was defined in the color scheme.
Themes	Sc9_Rhino	Use different themes from the one defined for the color scheme

Header

Navigation: |< < > >| xxyyzz xxxxx yyyyy ▾

Application Layout

Settings

Header Template

Allows choosing the look of the application Header.

Footer Template

Allows choosing the look of the application Footer.

Button

Allows choosing the button theme for the application.

Themes

Choose one of the selected themes in the project properties. It defines the look of the application, like colors, fonts, and others.

Header

Here we can define if we want to display the header or not, the application title, and fill the header variables. The header looks

according to the selected template in the Layout settings interface.

▲ HEADER	
ATTRIBUTE	VALUE
Display Header	<input checked="" type="checkbox"/>
Insertion Title	<input type="text" value="{lang_othr_frmi_tit} - orders"/>
Update Title	<input type="text" value="{lang_othr_frmu_tit} - orders"/>
Header Variables	
SC_HEADER	<input type="text" value="Title"/>
SC_VALUE	<input type="text" value="Date"/> <input type="text"/> ?

Application Header Configuration

Display Header

This option determines if we want to display the header or not.

Title

Allows informing the title of the application.

Header Variables

We must fill the variable fields with one of the types available in the Combobox. Depending on the type, you need to associate content with it. Those are the types:

- **Field:** When you choose the option “**Field**”, it opens a Combobox to choose a field to associate the field value with the header. This option will be enabled in the applications that you can create a fields
- **Title:** It displays the value of “**Application Title**” in the header.
- **Date:** It displays the system’s date in “yyyy/mm/dd” format in the header. There are several display formats available, and you can change it by using the text field beside it. To access existing formats, click on the hint to see an explanation.
- **Image:** It displays a field to inform the name of an existing image in the server. You can select an image by clicking on the icon “**Choose Image**”, and you still can upload new images by using the button “**Upload**”. .
- **Value:** It displays the content of the text input. You can inform static texts and “**Global Variables**”. e.g. “Employee Name: [v_name]”.

Depending on the Application, you may have more than one title option.

Footer

FOOTER	
ATTRIBUTE	VALUE
Display Footer	<input type="checkbox"/>
Footer Variables	
NM_FOOTER_DATA	<input type="text"/>
NM_FOOTER_LOGO	<input type="text"/>
NM_FOOTER_TITLE	<input type="text"/>

Application Footer Settings

This page may change depending on the footer template chosen in the Layout Settings.

Display Footer

This option determines if we want to display the footer or not.

Footer Variables

We must fill the variable fields with one of the types available in the Combobox. Depending on the type, you need to associate content with it. Those are the types:

- **Field:** When you choose the option "**Field**", it opens a Combobox to choose a field to associate the field value with the header. This option will be enabled in the applications that you can create a fields
- **Date:** It displays the system's date in "yyyy/mm/dd" format in the header. There are several display formats available, and you can change it by using the text field beside it. To access existing formats, click on the hint to see an explanation.
- **Image:** It displays a field to inform the name of an existing image in the server. You can select an image by clicking on the icon "**Choose Image**", and you still can upload new images by using the button "**Upload**". 
- **Value:** It displays the content of the text input. You can inform static texts and "**Global Variables**". e.g. "Employee Name: [v_name]".

Control Events Overview

Most Scriptcase applications, with the exception of Tabs and Dashboard applications, have events that can be used to create business rules, validations and changes to the application's CSS, among other things.

When events are executed?

Each event is executed at a certain moment in the application and has an execution order, for this reason, they have different functions within the creation of a business rule and validations.

They can be triggered automatically, as in the case of the **onApplicationInit** and **onScriptInit** events, where they are executed when the application starts. Also, they can be triggered through user interaction, as with the **onNavigate** and **onValidate** events, which are executed when browsing the application or submitting a form, respectively.

For information about the timing of events execution or other information, access the documentation of the desired event.

how they work?

By default, the events already have handle for opening `<?php` and closing `?>` of PHP tags, so they are ready to receive PHP code and macros from Scriptcase.

However, it is possible to use other languages in the event, such as **JQuery**, **JavaScript**, **CSS** and **HTML**. For this, it is necessary to close the PHP tag `?>` of the event, so that the code can be added.

Remembering that it is necessary to reopen the event's PHP tag `<?php`, otherwise the application will not run correctly.

When closing the PHP tag in a Scriptcase event, the executed language is HTML.

Example of using other languages:

onApplicationInit - Control

This event occurs before the application execute the SQL, and execute only once. Is used to do verification of variables, and security verification. Ex: `if ([glo_var_department] != 'financial'){ sc_redir(app_x.php); }`

onScriptInit - Control

These formulas are executed before the application starts. At this moment, the application locals variables are not available.

onLoad - Control

This event its executed before the form is loaded. In this moment all the applications variables are available.

onRefresh - Control

This event occurs when the form application is reloaded, is possible to reload the form based on fields (select , radio, checkbox)

onValidate - Control

This event occurs before the end user (inserts, updates or deletes) a row.

onValidateFailure - Control

This event occurs when submitting the application in OnValidate, there are errors generated by macros `sc_error_exit`, `sc_error_message`, or error detected by Scriptcase (errors related to Database).

onValidateSuccess - Control

This event occurs when submitting the application to onValidate, there is no error generated by the macros `sc_error_exit`, `sc_error_message`, or by error verified by Scriptcase (errors related to Database).

Code Editor

Scriptcase has Events to allow the developers to customize the application code. By using the events, the developers can program custom actions at a specific execution time (e.g. After a record is inserted, when it is loaded, upon submitting a Form, ...) and for a specific application type. In the events area you can use global and local variables, JavaScript, CSS, HTML, PHP codes and also Scriptcase macros.

Scriptcase code editor is used within events and has a series of shortcuts to help in the applications development.

At the top section of the editor, there are some options that allows us to change the editor theme or expand it, for example. These options can also be activated using the hotkeys.

- - Increases the area occupied by your code editor.
- - Expand the sides of the code editor.
- - Activates the search in the code editor.
- - Enables replace in the code editor.
- - Defines the code editor theme.

The hotkeys are available in all browsers compatible with Scriptcase.

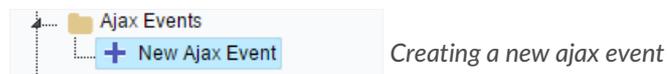

[Click Here](#) to view the Scriptcase hotkeys documentation.

Control Ajax Events

OnClick

The ajax event OnClick is executed when the field that it's based on is clicked.

- Creating a new ajax event

- Selecting a field

Choose a field to create an event To define in which field the event will be add to.

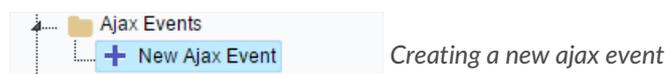

Choose an event that run the ajax Defines which event will be added to the field.

OnChange

The ajax event OnChange is executed when the value of the field that it's based on is modified.

NOTE: The **radio field** is not compatible with this type of event.

Control Buttons Settings

In addition to the applications buttons, you can also create new manual buttons. These buttons will be placed on the application toolbar.

Creating new buttons

Creating a button

To create a new button, click the “new button” and type a name and the button type.

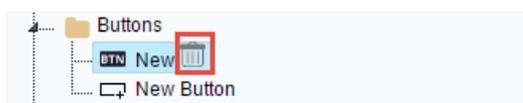

Form button types: (JavaScript, PHP, and Ajax).

 A dialog box titled 'New Button' with a question mark icon. It has a 'Name' text input field. Below it is a 'Type' dropdown menu that is open, showing a list of options: Javascript (selected), PHP, Link, and Ajax.

Form button types

Deleting a button

To delete a button click on the icon next to the name of the button in the application menu (recycle bin).

Deleting a button

JavaScript

Display Mode

You can configure the display mode of the javascript button in Image, Button or Link.

Button

 A configuration panel titled 'Button Settings: JavaScript'. It has a table-like structure with the following fields:

ATTRIBUTE	VALUE
Display Mode	Button ▼
Label	JavaScript
Hint	
Confirmation Message	
Type	JavaScript

Setting up Javascript Button.

Display Mode	You can select the display mode for the javascript button in this option.
Label	Text of the button that will be display in the application while executing.
Hint	Hint message for the button. (Displayed when the mouse hovers the button).
Confirmation Message	Displays a confirmation message when the button is clicked. If not informed this is not informed, no message will appear.
Type	Description of the created button.

Image

Setting up the Link

- Selecting the applications

Link between applications - Application List	
Select the application that will be called:	<input type="text" value="Search..."/>
Application	<input checked="" type="radio"/> All <input type="radio"/> By folder <input type="radio"/> By type
<input type="radio"/> calendar_events <input type="radio"/> chart_customers <input type="radio"/> dashboard <input type="radio"/> form_customers <input type="radio"/> form_employees <input type="radio"/> form_orders <input type="radio"/> form_sec_users <input type="radio"/> grid_categories	
<input type="button" value="« Back"/> <input type="button" value="Next »"/> <input type="button" value="Help"/>	

Choosing the application for the button link.

You should select an application to be called from the button link.

- Link Parameters

Link between applications - Parameters Definition

Select values to pass as parameters

PARAMETERS VALUE

customerid Variable Fixed Empty

« Back Save Help

Choosing the parameters for the button link.

Field Allows you to use an existing field from the current application as a parameter for the link.

Variable Allows you to use a global variable from the current application as a parameter for the link.

Fixed Allows you to inform a fixed value as a parameter for the link.

Empty No value will be passed as a parameter for the link.

- Link Properties (Grid)

Link properties

Link Operation Mode display mode for the application called

Exit URL for the target application Output URL of the application. When not defined, output link (Back button) will be the Grid itself.

Hint of the link Message to be displayed when the mouse is over the field with the link

Form properties

Enable insert button on target application Enables the buttons New and Include within the Form

Enable update button on target application Enables the Update button within the form

Enable delete button on target application Enables the Delete button within the Form

Enable navigation button on target application Enables the navigation buttons (first, previous, next, and last) on the Form.

Enable button to edit a grid record Enables the button for the records edit

Save Help

Configuring the properties for the link button when the destined application is a Grid.

Link Operation Mode How the link will open (Open in the same Window, Open in another Window, Modal).

Exit URL for the target application URL or an application that be redirect to when exiting the Grid application.

Initial Mode Allows you to define the initial mode of the grid application (Search or Grid).

Number of Lines Allows you to define the amount of lines displayed in the Grid.

Number of Columns Allows you to define the amount of columns displayed in the Grid.

Paging Enable the paging in the Grid.

Display Header Enable the Grid Header.

Active Navigation Buttons Enable the navigation button (First, Back, Next and Last) in the Grid.

- Link Properties (Form)

Link properties	
Link Operation Mode	Open in the same Window ▾ display mode for the application called
Exit URL for the target application	Output URL of the application. When not defined, output link (Back button) will be the Grid itself.
Hint of the link	Message to be displayed when the mouse is over the field with the link
Form properties	
<input checked="" type="checkbox"/> Enable insert button on target application	Enables the buttons New and Include within the Form
<input checked="" type="checkbox"/> Enable update button on target application	Enables the Update button within the form
<input checked="" type="checkbox"/> Enable delete button on target application	Enables the Delete button within the Form
<input type="checkbox"/> Enable navigation button on target application	Enables the navigation buttons (first, previous, next, and last) on the Form.
<input checked="" type="checkbox"/> Enable button to edit a grid record	Enables the button for the records edit
<input type="button" value="Save"/> <input type="button" value="Help"/>	

Configuring the properties for the link button when the destined application is a Form.

Link Operation Mode

How the link will open (Open in the same Window, Open in another Window, Modal).

Exit URL for the target application

URL or an application that be redirect to when exiting the Form application.

Enable insert button on target application

Enable the “New” button in the Form Application.

Enable update button on target application

Enable the “Update” button in the Form Application.

Enable delete button on target application

Enable the “Delete” button in the Form Application.

Enable navigation button on target application

Enable the navigation button (First, Back, Next and Last) in the Form.

Enable button to edit a grid record

Enable the buttons that allow you to edit the records of a Grid

Application Settings (Control)

Settings

With this interface, you can set the common attributes of the app.

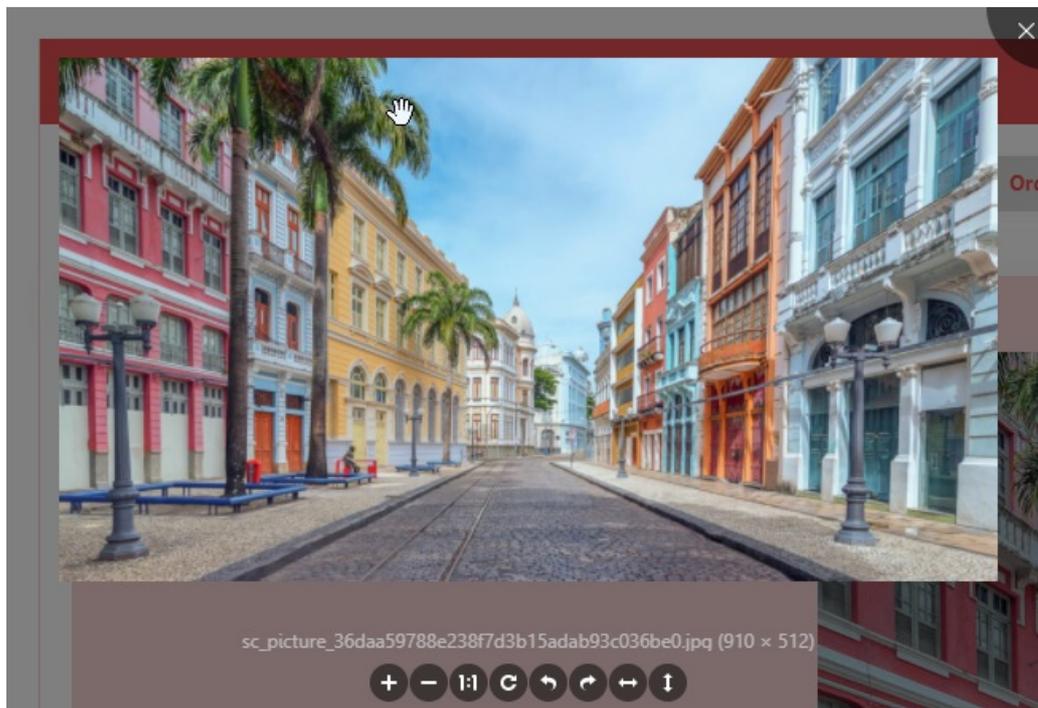

SETTINGS	
ATTRIBUTE	VALUE
Application Code	grid_customers (9.00.0000)
Description	<input type="text"/>
Documents Path	<input type="text" value="C:/Program Files/NetMake/v9/www"/>
Image Directory	<input type="text" value="/scriptcase/file/img"/>
Application images	<input type="button" value="Add"/> <input type="button" value="Delete"/>
Language	<input type="text" value="English (United States)"/>
Share Location Variable	<input checked="" type="checkbox"/>
Charset	<input type="text"/>
Share Theme Variable	<input checked="" type="checkbox"/>
Folder	<input type="text" value="root"/>
Edit by Project	<input checked="" type="checkbox"/>
Timeout	<input type="text" value="0"/>
HelpCase Link	Application <input type="text"/> Search <input type="text"/> Summary <input type="text"/>

Application Settings Interface

• Attributes

- **Application Code** : It is the name that defines an application. An app can be renamed at the [List of Application](#).
- **Description** : This field contains a brief description of the application objectives.
- **Documents Path** : The absolute path to store uploaded documents in the application.
- **Image Directory** : The filesystem directory to store the application images.
- **Application images** : Import images into the application to allows using them in the application.
- **Language** : Set the default language of the application. Display all the application hints and messages in the selected language.
- **Share Location Variable** : Define if the app shares the regional settings with other applications through a session variable.
- **Charset** : Define a specific charset to use in the application.
- **Share Theme Variable** : Define if the app shares the Theme settings with other applications through a session variable.
- **Folder** : Define the project folder that contains the app.

- **Edit by Project** : Define if other project developers can edit the application.
- **Timeout** : Set the session runtime timeout in seconds. If the value is Zero, it assumes the default timeout of the PHP.
- **HelpCase Link** : It allows to associate a [HelpCase](#) file with the application.
- **Image Viewer**: Activates the image viewer features in the running application. By clicking on the image the user can drag, rotate, invert, and enlarge the selected image.

Notification Settings

Notification settings	
ATTRIBUTE	VALUE
Use SweetAlert	<input type="checkbox"/>
Error Position on the field	Down ▼
Show the Error Title in the Application	<input checked="" type="checkbox"/>
Show the Error Title in the Field	<input type="checkbox"/>
Error Title	{lang_errm_errt}
Script Error	<input type="checkbox"/>
SQL Error	<input checked="" type="checkbox"/>
Debug Mode	<input type="checkbox"/>
Ajax Error Output	<input checked="" type="checkbox"/>

- **Use SweetAlert**: Use the SweetAlert to display messages from the application. When this option is active, it will replace the browser's "confirm" and "alert".
- **SweetAlert position using Toast** : The position to display error messages on the application.
- **Error Position on the field** : The position to display error messages when criticizing the field.
- **Show the Error Title in the Application** : Define to display the title line of the error message or not.
- **Show the Error Title in the Field** : Define to display the title line of the error message in the field or not.

- **Script Error** : Allows displaying the line code where there is an error..
- **SQL Error** : Allows displaying the SQL statement if it got an error.
- **Debug Mode** : Runs the application in Debug mode, showing all SQL statements the application is executing.
- **Ajax Error Output** : Enables the Ajax alert for debugging errors.

Navigation

This interface allows defining the navigating behavior of the application

NAVIGATION	
ATTRIBUTE	VALUE
Exit URL	<input type="text"/> 
Close on Exit	<input type="checkbox"/>
Redirect URL	<input type="text"/> 
Redirect Variable	<input type="text"/>

Navigation Interface.

Exit URL

URL to where the user goes when he clicks on the “exit” button.

Close on Exit

Close the browser window when the user clicks on the “exit” button.

Redirect URL

Redirect to another URL in case there aren't any global variables available.

Redirect Variable

Creates a variable with the application name and sends it to the redirected application.

Messages

On this screen, you can redefine the default application messages to the end-user by customizing the validation messages for Insert, Update, and Delete. You can also define messages for SQL errors and the confirmation outputs.

Messages

Messages		
ATTRIBUTE	VALUE	DESCRIPTION
No Records Message	<input type="text"/>	When the application has no records,it will display this customized text.
Primary key violation	<input type="text"/>	Message to display when the primary key constraint is violated
Unique key violation	<input type="text"/>	Message to display when the unique constraint is violated

No Records Message

The message displayed when the application has no records.

Primary key violation

The message displayed when there is a violation in the database's primary key constraint.

Unique key violation

The message displayed when there is a violation in the database's unique constraint.

Insertion Messages

▲ Insertion messages		
ATTRIBUTE	VALUE	DESCRIPTION
Message After Insert		Message to display after inserting a record.
Message to Confirm Insert		Message to display to confirm inserting of a record.

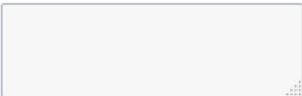

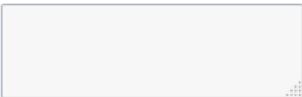

Message After Insert

The message displayed when inserting a new record.

Message to Confirm Insert

The message displayed if the end-user wants to confirm the inserting of a new record.

Update Messages

▲ Update messages		
ATTRIBUTE	VALUE	DESCRIPTION
Message After Update		Message to display after updating a record.
Message to Confirm Update		Message to display on the update confirmation

Message After Update

The message displayed when updating a record.

Message to Confirm Update

The message displayed if the end-user wants to confirm the changes of a record.

Messages of delete

Messages of Delete.		
ATTRIBUTE	VALUE	DESCRIPTION
Message After Delete		Message to display after delete a record.
Message to confirm Delete		Message to display on the delete confirmation

Message After Delete

The message displayed when deleting a record.

Message to confirm Delete

Displays a customized message asking to confirm the record deletion.

If you make no changes, the application will use the default values for the messages. Those values can be configured in [Locales - > Application Language](#).

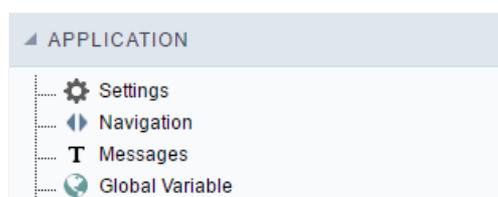

Global variables

This screen shows all global variables used in the application

The global variable is an external parameter required for running the application. The application can include global variables in the WHERE clause, field definitions and names, event programming, and so on.

You can define global variables by using square brackets ([variable]). You can pass the parameters to the application through one of the methods: Session, Post, and Get

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(") instead of the brackets([]) because of the conflict with the of Global Variables syntax{:target="_blank"} Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

Global variables Interface.

Example:

```
Select CustomerID, CustomerName from Customers WHERE CustomerID = '[v_customerid]'
```

We do not recommend using session variables (global variables) with the same name as the table fields.

In this case, the variable **v_customerid** is displaying in the global variables configuration.

VARIABLE SETTINGS	
ATTRIBUTE	VALUE
global	<div> <p>Scope</p> <input type="checkbox"/> SESSION <input checked="" type="checkbox"/> POST <input checked="" type="checkbox"/> GET </div> <div> <p>Settings</p> <input type="checkbox"/> Optional </div> <div> <p>Type</p> <input type="radio"/> Out <input checked="" type="radio"/> In </div>

Global variables configuration Interface.

Attribute

It shows the variable's name in the application.

Value

Defines the behavior of the variables, divided into three blocks, they are:

Scope

Defines how the application receives the variable. A variable defined as the POST method in the app does not receive value if it comes with the GET method. Those are the methods available:

- **Session:** Defines that the variable must be created as a PHP session variable by another application.
- **GET:** Defines that the variable must be passed by the URL, that is, visible by the browser.
- **POST:** Defines that the variable must be passed through the POST method of an HTML form.

Settings

- **Optional:** Check it to don't validate the variable at runtime.

Type (In / Out)

Defines whether the variable comes from another application (In), or it is starting in the current app (Out).

Description

Indicates where the application is using the variable.

Control Links Overview

This feature allows the developer to create links between applications of the same project, expanding the integration of applications. All link options are grouped under the Application Links menu.

Application Links

In the first access to the menu, we can see the list of existing connections in the application.

If the application does not have a configured link, the application list screen will be displayed with the message: **This application does not have any link. Click here to create one now.**

ID

Link identification ID.

Type

The type of link created, some links such as Edit Link allow only one link per application. In this case, the developer will be able to check the connection types that already exist in the application

Target Application

This info show the target application name.

Actions

This column has edit options for the links.

Properties

It allows accessing the binding properties where it is possible to configure the binding behavior.

Link

Displays the links screen, where it is possible to configure the link that was made with the application informed in the target application column. In this option it is possible to change the parameter passed in the connection as well as the target application.

Delete

Permanently deletes the connection in the applications.

Through the option [Restore Applications](#), it is possible to get a previous version of the application, making it possible to recover the link deleted.

Links Type

The Form application has the following links options

The HTML control has only the application binding available in the interface.

- [Application Link](#) - Allows you to link a control with any project application.
- [Button Link](#): It allows creating a link through the buttons created by the developer in the query application, to any application in the project.

Control Applications Link Types x Target Application available to link

Check the links types of the control application and the target applications available for each link types.

Only **Capture link** have some restrictions in the target application use, allowing only to use of Grid application.

	<u>Application Link</u>	<u>Button Link</u>

Application link

Creating an Application Link

This type of link allows the developer to create a link from a grid to a form with the objective of editing the register of a grid's row.

In the link options, we will choose the **Application Link**. When we choose this option, edit a register from a Grid will be possible.

Applications list

After we select this option, will be displayed the applications list to what you want to create the link.

This screen can be viewed from the following ways:

All:

In which is possible to see all the project's applications. **Example:**

By folder:

In which is possible to see the applications according to the folders in which each of them are.

By type:

In which is possible to see the applications grouped by its respective types.

Definition of Parameters

In this setting we are going to define the type of parameter that will be passed to the next application.

We have two options at **Type of Parameters**, they are:

Fixed value:

This option allows the user to define a fixed value that will be used to the call of the next application.

No value:

This option allows to create the link without the need to send any parameter to the next application.

It is also possible to see a refresh button at its right side.

This button should be used when a new parameter is added to the target application, so the new parameter can be loaded in the current application to make the link.

Link properties

In this screen we will set the application display mode that will be called in the link.

There are five display options, they are:

Open in the same window:

When we use this option the target application will be displayed in the same window of the application, and the target application will have a back button so we can return to the previous application.

Open in another window:

When we use this option the target application will be displayed in other browser window, and the target application will have a exit button so we can close this window.

Open in an iframe:

When we use this option the target application will be displayed in the same window of our application, however it will be displayed in a iframe in one of the four options available in the iframe settings.

Open in a parent:

When we use this option the target application will be displayed in the same window of our application, and the target application will have a back button so we can return to the previous application.

Modal:

When we use this option the target application will be displayed in the same window of our application, however it will be displayed in a small window above the current application.

Open in the same window.

When we use this option the target application will be displayed in the same window of the application, and the target application will have a back button so we can return to the previous application.

When we select this option, we can set these following options:

Open in another window

When we use this option the target application will be displayed in another browser window.

When we select this option, we can set the following options:

Modal

When we use this option the target application will be displayed in the same window of the application, however she will be displayed in a small window above the current application.

When we select this option, we can set the following options:

Height:

Allows to set the Modal height.

Width:

Allows to set the Modal width.

Control Button link Settings

Creating a Button Link

Allows the developer to create a link where the call to the other application will be done through a button.

In the type of links options, we will choose the **Button Link**. Choosing this option it will be possible to create a link to any other application.

List of applications

After selecting this option, The list of applications to what you want to create a link will be displayed.

This screen can be viewed in the following ways:

All:

In which is possible to see all the project's applications. **Example:**

By folder:

In which is possible to see the applications according to the folders in which each of them are.

By type:

In which is possible to see the applications grouped by its respective types.

Definition of Parameters

In this setting we are going to define the type of parameter that will be passed to the next application.

We have two options at **Type of Parameters**, they are:

Fixed value:

This option allows the user to define a fixed value that will be used to the call of the next application.

No value:

This option allows to create the link without the need to send any parameter to the next application.

It is also possible to see a refresh button at its right side.

This button should be used when a new parameter is added to the target application, so the new parameter can be loaded in the current application to make the link.

Link properties

In this screen we will set the application display mode that will be called in the link.

There are five display options, they are:

Open in the same window:

When we use this option the target application will be displayed in the same window of the application, and the target application will have a back button so we can return to the previous application.

Open in another window:

When we use this option the target application will be displayed in other browser window, and the target application will have a exit button so we can close this window.

Modal:

When we use this option the target application will be displayed in the same window of our application, however it will be displayed in a small window above the current application.

Open in the same window

When we use this option the target application will be displayed in the same window of the application, and the target application will have a back button so we can return to the previous application.

When we select this option, we can set the following options:

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Open in another window

When we use this option the target application will be displayed in another browser window.

When we select this option, we can set the following options:

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Close the form after an update:

Choosing the option **Yes**, the window will be closed after doing the update of a register.

Close the form after an insert:

Choosing the option **Yes**, the window will be closed after doing the insert of a register.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Open the application in a tab inside the menu:

Choosing the option **Yes**, the application will be open in a **menu tab**, when executed from a menu application, instead of opened in another browser window.

Choosing the option **Yes**, there are also some other settings to be displayed:

Title to the tab:

This option allows the developer to set a title to the tab that will be opened when used in a Menu application.

Hint to the tab:

This option allows the developer to set a message to be displayed when the mouse cursor is over the tab Menu.

Active tab icon:

This option allows the developer to set an icon to be displayed in the tab when used in a menu application.

Modal

When we use this option the target application will be displayed in the same window of the application, however she will be displayed in a small window above the current application.

When we select this option, we can set the following options:

Height:

Allows to set the Modal's height.

Width:

Allows to set the Modal's width.

Exit URL for the target application:

Exit URL to the called form. If any value is defined, the return address (back button) will be the exit URL of the called form.

Close the form after an update:

Choosing the option **Yes**, the window will be closed after doing the update of a register.

Close the form after an insert:

Choosing the option **Yes**, the window will be closed after doing the insert of a register.

Hint for the link:

In this option we will inform a message that will be displayed when the mouse cursor is over the button with the link.

Control Programming

ScriptCase has incorporated the concept of Object Oriented programming, using attributes, resources, methods and libraries. It is possible to create your own business rules in applications, and by using these concepts you can reap huge rewards in terms of better organization and improved development.

Attributes

The attributes are variables that has the global scope declared in the application. An attribute that can be referenced in all the methods and the application's events.

The screenshot shows a web interface titled 'ATTRIBUTES SETTINGS'. It features a table with two columns: 'ATTRIBUTE' and 'VALUE'. Below the table, there is a section labeled 'Attributes' containing an input field for 'Attribute Name'. To the right of the input field are four blue buttons: 'Include', 'Update', 'Delete', and 'Clean'. A vertical scrollbar is visible on the right side of the interface.

Attributes configuration Interface.

Attribute Name : This field allows to inform the attributes name, after typing the name just click on **include**. In case you want to **update** click on the attributes name (located on the buttons' right side), do the necessary modifications and click on update. In case it is necessary to **delete** an attribute, it is necessary to do same process as the update, but when selecting the attribute, it is necessary to click on the delete button. The **clear** button, as the name suggests, it clears the list of all the attributes listed on the right.

Internal libraries

To use the internal libraries just select the correspondent (Project Libraries for example). This process allows the methods existing in the library, to be visible in all the application's Events and Methods.

See how to manage the libraries by [clicking here](#).

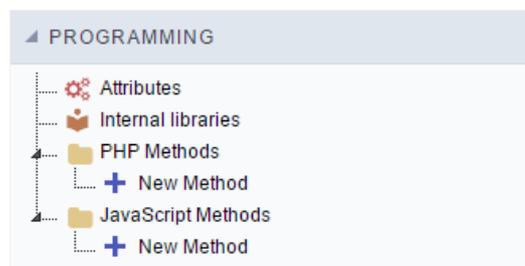

The screenshot displays the 'INTERNAL LIBRARIES - SCRIPTCASE' section with a checkbox and the filename 'sc_ssn.php'. Below it are sections for 'INTERNAL LIBRARIES - PUBLIC', 'INTERNAL LIBRARIES - PROJECT: PROJECT1', and 'INTERNAL LIBRARIES - USER: ADMIN', each with the message 'No library found for this session.'

Internal Libraries management Interface

PHP Methods

Methods are function or procedures declared by the developer, that helps when applying the routines. Using methods in the applications allows to reuse your code throughout the application, optimizing the development experience.

Creating a new method

- Give the method a name and click Create. As in the image below.

PHP methods are incorporated into the same class, so it is not possible to use two functions with the same name even when used in different methods.

A dialog box titled 'New Method - PHP'. It has a text input field for 'Name' containing 'new_method' and a blue 'Create' button below it.

- Methods can receive parameters.

- Add the amount of variables:

A dialog box titled 'Definition of the parameters of the method:'. It shows the method name 'new_method' and a list with one item: '• No defined parameter.'. At the bottom, there is an 'Add' button, a text input field containing '1', the text 'Parameter(s)', and a 'Cancel' button. A 'Save' button is located below the dialog.

- Defining the variables:

A dialog box titled 'Insertion of Parameters'. It contains a table with three columns: 'Name', 'Type', and 'Value Standard'. The 'Type' column has a dropdown menu open, showing 'For Value' (selected) and 'For References'. Below the table are 'Save', 'Back', and 'Cancel' buttons.

Name	Type	Value Standard
	For Value	

- **Name** : Type in the variable's name.
- **Type** : Selecting the type of variables: For Value or For Reference.

- **Value Standard** : The parameter's value used to initialize when calling the method.

References allows to create a second name for a variable that you can use to read and modify the variable's original information.

- Editing a parameter:

- : Checking all the parameters in the parameter list.
- : Uncheck all the parameters in the parameter list.
- : Edit the selected parameter of the list.
- : Deletes the selected variable of the list.

JavaScript Methods

Methods are function or procedures declared by the developer, that helps when applying the routines. Using methods in the applications allows to reuse of the your code throughout the application, optimizing the development experience.

Creating a new method

JavaScript method creation Interface

- Define a name for the method and click on Create. Like the image below.

Include Method.

User HTML

This option is available in the Control application if the item **Set the template HTML manually** template is selected when creating the application.

APPLICATION DATA

TIPS

- scDisplayUserError()
- SC_LIB_SCRIPTCASE
SC_LIB_PUBLIC
SC_LIB_PROJECT
- SC_IMG_URL

scDisplayUserError()

Function to display error messages after the Form submit validation. It receives the error message text as parameter.

Example of use:

```

...
function scDisplayUserError(errorMessage) {
    alert(errorMessage);
}
...

```

When clicking on the **Markups** of the **Check** item, a modal window is displayed with tips for using the same **Markup**.

- The **Markups** are divided in 3 different categories:
 - **TIPS**

TIPS
scDisplayUserError()
SC_LIB_SCRIPTCASE SC_LIB_PUBLIC SC_LIB_PROJECT
SC_IMG_URL
CSS file
Java Script file

These **Markups** are not required, however, they are used to import files from libraries, images and other features.

- **REQUIRED**

REQUIRED
SC_FIELD_CLASS ✓
SC_FORM_ATTR ✓
SC_FORM_HIDDEN ✓
SC_FORM_SUBMIT_CALL SC_FORM_SUBMIT_INFO ✓
SC_JS_LIB ✓
SC_PAGE_CHARSET ✓

These **Markups** are of obligatory use in the item **HTML**. If they are not used, certain internal Scriptcase routines will not be executed.

- **Optional**

OPTIONAL
SC_PAGE_TITLE ✓

Like the category name, these **Markups** are optional, not influencing the correct execution of the application.

Create fields

The use of custom HTML in the Control Application depends on specific markups, so that Scriptcase can include its control and validation routines.

Click in the "Check" button to verify if the HTML has all markups needed.

```

1 <html>
2
3 <head>
4 <!--SC_PAGE_CHARSET-->
5 <!--SC_JS_LIB-->
6 <link rel="stylesheet" type="text/css" href="control_1.css" />
7 <script type="text/javascript" src="control_1.js"></script>
8 <title><!--SC_PAGE_TITLE--></title>
9 </head>
10
11 <body>
12 <form {SC_FORM_ATTR}>
13 <!--SC_FORM_HIDDEN-->
14 <!--SC_FIELD_LABEL_my_field-->
15 <br />
16 <input {SC_FIELD_INFO_my_field} class="{SC_FIELD_CLASS}" type="text" />
17 <br />
18 <input type="button" {SC_FORM_SUBMIT_INFO} />
19 </form>
20 </body>
21
22 </html>

```

In this item, we can insert the desired HTML, remembering to use the required **Markups**.

The **control.js** and **control.css** files refer to the contents of the **JavaScript** and **CSS** items respectively. By default, they are automatically created by the application, by default: **appName.js** and **appName.css**.

Create fields

The use of custom HTML in the Control Application depends on specific markups, so that Scriptcase can include its control and validation routines.

Click in the "Check" button to verify if the HTML has all markups needed.

```

1

```

In this item, we can use our custom CSS to take effect in the **HTML** code used in the previous item.

JavaScript

The use of custom HTML in the Control Application depends on specific markups, so that Scriptcase can include its control and validation routines.

Click in the "Check" button to verify if the HTML has all markups needed.

```

1 function scDisplayUserError(errorMessage) {
2   alert(errorMessage.replace("<br />", "\n"));
3 }

```

In this item, we can use our custom **JavaScript** to take effect in the code **HTML** used in the previous item.

External Libraries

In this option, we can define if we will use the files **. HTML**, **. CSS** and **. JS** from an external library or if we will use the code **HTML**, **CSS** and **JavaScript** of the items of the application itself.

- Do not use external library

The use of custom HTML in the Control Application depends on specific markups, so that Scriptcase can include its control and validation routines.

Click in the "Check" button to verify if the HTML has all markups needed.

You can choose to use an external library from Scriptcase instead of saving the HTML content in the application itself. By doing this, you have the possibility to use multiple CSS and Javascript files, in addition to images.

To create/edit an external libraries you can access the main menu from Scriptcase using the option: Tools > External libraries. Once created and associated with the current project, you can choose the library to use in this application.

Do not use external library

Use external library

This option defines that the **HTML**, **CSS**, and **JavaScript** code to be used, come from the current application's **HTML**, **CSS**, and **JavaScript** items.

Creating a Control Application

New Application

The process of creating an application is quite simple and intuitive.

You only need to select the type of application you want to generate from the list of applications available in Scriptcase, and it will be generated automatically.

Application Data

CONTROL

APPLICATION DATA THEME

Connection * **Name ***

conn_example control

Localization

Inherit project default language

Set the template HTML manually

Connection

Defines the connection used for the creation of the application. The existing connections in the project will be listed.

Name

The name of the application being created. It cannot contain special characters.

Localization

The language of the application to be created. The project's default language is automatically selected.

Set the template HTML manually

This option allows you to fully customize the HTML design of the control application, replacing the default template generated by Scriptcase.

The developer must correctly reference the fields and buttons in the customized HTML using placeholders to ensure proper functionality. Knowledge of HTML and CSS is required to create and adjust the design.

Theme

On this screen, you can select the theme that the application will use. The default project theme, which can be checked and modified in **Project > Properties**, is automatically selected.

The screenshot displays the 'THEME' configuration interface. On the left, a dropdown menu is set to 'Sc9_Rhino'. The main preview area shows a web page layout with the following structure:

- Header**: A dark bar at the top.
- Navigation**: A row of four arrows (left, left, right, right) and two buttons labeled 'Add' and 'Save'.
- Block 1.1**: A section containing a 'Title 1' label and an 'Object text' input field.
- Block 2.1**: A table with three columns and two rows of data.

Title 1	Title 2	Title 3
11111111	22222222	33333333
11111111	22222222	33333333
- Footer**: A row at the bottom with the text 'Footer'.

Control Mobile Optimization

The Mobile settings allows to define the automatic optimization of generated applications to run on mobile devices.

See below the available settings.

Enable mobile optimization

Mobile optimization	
ATTRIBUTE	VALUE
Enable mobile optimization	<input checked="" type="checkbox"/>
Enable scroll up button	<input checked="" type="checkbox"/>
Scroll up button position	Right ▾

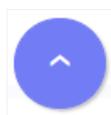

This option changes how the application HTML elements works, adapting them automatically to run on mobile devices.

It enables this option by default when creating a new application.

See some examples of adapted screen:

Enable back to top button

It enables the displaying of the button **back to top button** in the Grid, Filter, Detail and Summary modules.

It enables this option by default when creating a new application.

Back to top button position

Defines the position of the **back to the top** button:

The options are:

- **Right** - Position the button in the bottom right corner;
- **Left** - Position the button in the bottom left corner;

When creating a new application, the button is configured on the right by default.

See below for placement examples.

Button in the bottom right corner

Customerid => AROUT			
	Orderid	Customerid	Employee
...	10.355	AROUT	
...	10.383	AROUT	
[1 a 829 de 829]			

Button in the bottom left corner

Customerid => AROUT			
	Orderid	Customerid	Employee
...	10.355	AROUT	
...	10.383	AROUT	
[1 a 829 de 829]			

Pin the bottom toolbar

Defines the behavior of the lower toolbar when running the application on mobile devices with the **Simplified toolbar** option disabled.

When enabling these options, the lower toolbar will behave similarly to the upper toolbar, remaining fixed on the screen and thus facilitating access to the configured resources.

Example of fixed bottom toolbar

Customerid	Companyname	Contact
ALFKI	04-close-project.md	Exem texto

Go to 1 View 10

If you choose to uncheck this feature, the lower toolbar will be fixed at the end of the application, so access to the configured buttons will only be available when scrolling to the end of the page.

Example of Traditional Toolbar

▲ Contactname => Ann Devon			
	Customerid ↕	Companyname ↕	Contact
...	EASTC	Eastern Connection	Ann D

Go to 1 View 10 ▾ ⏪ ⏩ 1

This setting is available when the **Simplified Toolbar** options is turned off.

onExecute - Grid

OnExecute

This is the only event for the Blank application, and it occurs every time it runs. It is used to create all the HTML, PHP and JS code for the page.

Code Editor

Scriptcase has Events to allow the developers to customize the application code. By using the events, the developers can program custom actions at a specific execution time (e.g. After a record is inserted, when it is loaded, upon submitting a Form, ...) and for a specific application type. In the events area you can use global and local variables, JavaScript, CSS, HTML, PHP codes and also Scriptcase macros.

Scriptcase code editor is used within events and has a series of shortcuts to help in the applications development.

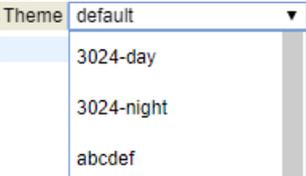

```

▶ onScriptInit
1 if(isset($_GET['lang']) && !empty($_GET['lang'])){
2
3     switch($_GET['lang'])
4     {
5         case 'pt':
6             sc_set_language('pt_br');
7             sc_set_regional('pt_br');
8             break;
9         case 'es':
10            sc_set_language('es');
11            sc_set_regional('es_es');
12            break;
13        default:
14            sc_set_language('en_us');
15            sc_set_regional('en_us');
16        break;
17    }
18 }
19 else
20 {

```

At the top section of the editor, there are some options that allows us to change the editor theme or expand it, for example. These options can also be activated using the hotkeys.

-  - Increases the area occupied by your code editor.
-  - Expand the sides of the code editor.
-  - Activates the search in the code editor.
-  - Enables replace in the code editor.

-  - Defines the code editor theme.

The hotkeys are available in all browsers compatible with Scriptcase.

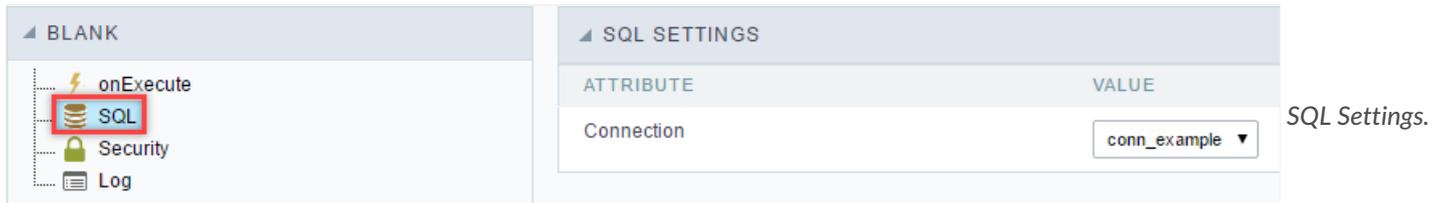

[Click Here](#) to view the Scriptcase hotkeys documentation.

Blank SQL Settings

In blank applications you can use one connection to access the database by default but as in other application types (Forms, Grids and Control) you can run SQL commands using other connections different from the native application connection.

The screenshot displays the 'SQL SETTINGS' configuration interface. On the left, a sidebar shows a tree view with 'SQL' selected and highlighted with a red box. The main panel shows the 'SQL SETTINGS' configuration table with a 'Connection' attribute set to 'conn_example'.

ATTRIBUTE	VALUE
Connection	conn_example ▼

SQL Settings.

- **Connection** : This option allows you to choose one of your project databases connections.

Security

Use security

With this option enabled, when accessing the application, an “unauthorized user” message will be displayed, preventing access to the application.

When enabled, application access is only possible through the macro **sc_apl_status** or through **security module**.

[Click here](#) to access the macro documentation sc_apl_status.

In the development environment, the use of the above options for testing purposes may be suppressed, preventing the password being requested or access being blocked at each execution of the applications. To do this, disable the options “Enable security usage” and “Enable password usage” in the menu **Configuration > My Scriptcase**.

Security exit url

Defines which application the user will be redirected to after the “unauthorized user” warning.

Use password

When enabling the option, you will be asked to define a password for accessing the application.

When running the application using the active password, you will be asked for the password before accessing the application.

The password will be requested regardless of the “use security” setting or the use of the security module.

Request password only once

This option defines the behavior of the use password option.

When this option is enabled, the password will be requested only once per session.

When disabling, the password will be requested every time the application will be accessed.

Allow direct calling by URL

Allows an application to be called by typing the URL directly into browsers.

When disabled, when accessing the application by typing the URL directly, the invalid data error will be displayed. With this configuration, the application can only be accessed through a menu application, for example.

Cookies

HttpOnly

These are cookies that can be set by the server or by javascript but cannot be accessed in any way by javascript.

With the HTTPOnly parameter enabled, it is very difficult to steal a session through XSS because the javascript cannot read the content of these cookies.

A widely exploited attack in XSS is the theft of user session cookies. Theft of cookies is carried out through a javascript command that sends cookies to an external URL where the attacking user has control.

This option is enabled by default in all applications.

Session ID

Enables the session id that will be stored in cookies on the client side. This option embeds the session id directly in the URLs

This option is enabled by default in all applications.

Cookie Secure

With this option enabled, cookies are protected and can only be transmitted via secure communication. Therefore, they cannot be accessed through Javascript.

The HttpOnly option must also be enabled.

Headers

Disable XSS Auditor

XSS is short for Cross-Site Scripting, which is an attack that consists of sending HTML with malicious JavaScript to a website.

It is a security attack that consists of sending HTML with malicious JavaScript to a website. If the website displays this HTML with JavaScript without filtering the malicious JavaScript code, the cookies sent by the website can be stolen and sent to an attacking website, so that it can be used to forge user sessions and access the website's user account without permissions.

Strict-Transport-Security

HSTS forces browsers to use HTTPS in the domain where it is enabled, instead of using HTTP.

When enabled, the default value is "max-age = 31536000".

The HSTS policy is set for one year (31536000 seconds). This period specifies the time the browser will access the server via HTTP

X-Frame-Options

The HTTP X-Frame-Options response header can be used to indicate whether or not the browser should render the page in a `<frame>`, `<iframe>`, `<embed>` " or '". This header provides protection against clickjacking, known as 'click swipe' - this vulnerability can steal relevant information and data from the user.

X-Frame-Options does not allow the rendering of a page in a frame, ensuring that the content of your page is not embedded in other sites

- **SAMEORIGIN:** The SAMEORIGIN directive allows the page to be loaded in a frame from the same source as the page itself. This option must be used so that the application with clickjacking protection can be used in the menu application.
- **DENY:** This directive completely disables page loading in a frame.

If no option is selected, the application can be used on any `<frame>`, `<iframe>`,

or `<object>`, allowing the application to be incorporated into another website.

X-Content-Type-Options

X-Content-Type-Options is used to protect against MIME detection vulnerabilities. With this option enabled, it prevents browsers from interpreting the page content (sniffing) and executing the data as code / tag. These vulnerabilities can occur when uploading a text file with a javascript code and the browser reading the content that is in the file and executing, even though it is just text and not part of the code.

With this enabled, the HTTP X-Content-Type-Options header is defined, by default, as "no detection".

Referrer-Policy

no-referrer.

The Referer header will be omitted completely. No reference information will be sent with requests.

no-referrer-when-downgrade.

This is the default behavior when no policy is specified, or if the value provided is invalid.

origin.

Only send the origin of the document as a reference. For example, a document at `https://example.com/page.html` will send the reference `https://example.com/`.

origin-when-cross-origin.

Sends the origin, path and query string when performing a same-origin request, but only sends the origin of the document in other cases.

same-origin.

The reference will be sent to sources on the same site, but requests between sources will not send reference information.

strict-origin.

Only send the document source as a reference when the security protocol level remains the same (HTTPS → HTTPS), but do not send it to a less secure recipient (HTTPS → HTTP).

strict-origin-when-cross-origin.

Sends the source, path and query string when performing a request from the same source, only sends the source when the security protocol level remains the same during an inter-source request (HTTPS → HTTPS), and sends no header to recipients less secure (HTTPS → HTTP)

unsafe-url.

Sends the source, path and query chain when performing any request, regardless of security.

Feature-Policy

The value of this header is a policy or set of policies that you want the browser to respect for a particular source.

The source whitelist can take on several different values:

- ``*:`` The feature is allowed in top-level navigation contexts and in nested navigation contexts (iframes).
- ``self:`` The feature is allowed in top-level navigation contexts and nested navigation contexts from the same source. It is not allowed in documents of cross origin in nested browsing contexts.
- ``none:`` The feature is not allowed in top-level browsing contexts and is not allowed in nested browsing contexts.
- ``<origin (s)>:`` specific sources for which to enable the policy (for example `https://example.com`).

Example 1 - Using only one directive Let's say you want to prevent all content from using the geolocation API on your site. You can do this by submitting a restricted 'none' whitelist to the geolocation resource:

Feature-Policy: ``geolocation 'none'``

Example 2 - Using more than one directive Functionalities within a policy are separated by semicolons.

Feature-Policy: `unsized-media 'none'; geolocation 'self' https://example.com; camera *;``

Directives

accelerometer

Controls whether the current document is allowed to collect information about the acceleration of the device

via the Accelerometer interface.

ambient-light-sensor

Controls whether the current document is allowed to collect information about the amount of light in the environment around the device through the AmbientLightSensor interface.

autoplay

Controls whether the current document is allowed to play the requested media automatically via the HTMLMediaElement interface. When this policy is disabled and there is no user action, the Promise returned by HTMLMediaElement.play () will reject it with a DOMException. The autoplay attribute on <audio> " and " elements will be ignored.

battery

Controls whether the use of the Battery Status API is allowed. When this policy is disabled, the Promise returned by Navigator.getBattery () will reject it with a NotAllowedError DOMException.

camera

Controls whether the current document is allowed to use inputs from video devices. When this policy is disabled, the Promise returned by getUserMedia () will reject it with a NotAllowedError DOMException.

display-capture

Controls whether or not the current document is allowed to use the getDisplayMedia () method to capture screen content. When this policy is disabled, the Promise returned by getDisplayMedia () will reject it with a NotAllowedError if permission is not obtained to capture the contents of the screen.

document-domain

Control whether the current document is allowed to place document.domain. When this policy is disabled, attempts to place document.domain will fail and cause a SecurityError DOMException to be thrown.

encrypted-media

Controls whether the current document is allowed to use the Encrypted Media Extensions (EME) API. When this policy is disabled, the Promise returned by Navigator.requestMediaKeySystemAccess () will reject it with a DOMException.

execution-while-not-rendered

Controls whether tasks should be performed in frames while they are not rendered (e.g. whether a frame is hidden or display: none).

execution-while-out-of-viewport

Controls whether tasks should be performed in frames while they are outside the visible viewing window.

fullscreen

Controls whether the current document is allowed to use Element.requestFullscreen (). When this policy is disabled, the returned Promise rejects it with a TypeError DOMException.

geolocation

Controls whether the current document is allowed to use the Geolocation interface. When the policy is disabled, calls to getCurrentPosition () and watchPosition () will cause function callbacks to be invoked with a PositionError of PERMISSION_DENIED.

gyroscope

Controls whether the current document is allowed to collect information about the orientation of the device through the Gyroscope interface.

layout-animations

Controls whether the current document is allowed to show layout animations.

legacy-image-formats

Controls whether the current document is allowed to show images in legacy formats.

magnetometer

Controls whether the current document is allowed to collect information about the orientation of the device through the Magnetometer interface.

microphone

Controls whether the current document is allowed to use inputs from audio devices. When this policy is disabled, the Promise returned by `MediaDevices.getUserMedia ()` will reject it with a `NotAllowedError`.

midi

Controls whether the current document is allowed to use the Web MIDI API. When this policy is disabled, the Promise returned by `Navigator.requestMIDIAccess ()` will reject it with a `DOMException`.

navigation-override

Controls the availability of mechanisms that enable the author of the page to take control over the behavior of spatial navigation, or to cancel completely.

oversized-images

Controls whether the current document is allowed to download and display large images.

payment

Controls whether the current document allows the use of the Payment Request API. When this policy is disabled, the `PaymentRequest ()` constructor will throw a `SecurityError DOMException`.

picture-in-picture

Controls whether the current document allows a video to be allowed to play in Picture-in-Picture mode via the corresponding API.

publickey-credentials-get

Controls whether the current document is allowed to use the Web Authentication API to retrieve already stored public key credentials, i.e. via `navigator.credentials.get ({publicKey: ..., ...})`.

sync-xhr

Controls whether the current document is allowed to make synchronous XMLHttpRequest requests.

usb

Controls whether the current document is allowed to use the WebUSB API.

vr

Controls whether the current document is allowed to use the WebVR API. When this policy is disabled, the Promise returned by `Navigator.getVRDisplays ()` will reject it with a `DOMException`. Keep in mind that the WebVR standard is in the process of being replaced by WebXR.

wake-lock

Controls whether the current document is allowed to use the Wake Lock API to indicate that the device should not go into a power saving mode.

screen-wake-lock

Controls whether the current document is allowed to use the Screen Wake Lock API to indicate whether or not the device should darken the screen.

xr-spatial-tracking

Controls whether or not the current document is allowed to use the WebXR Device API to interact with the WebXR session.

Content-Security-Policy

Content-Security-Policy is the name of an HTTP response header that modern browsers use to increase the security of the document (or web page).

The Content-Security-Policy header allows you to restrict resources such as JavaScript, CSS or just about anything the browser loads.

Directives**default-src**

The default-src directive defines the standard policy for fetching features such as JavaScript, Images, CSS, Fonts, AJAX requests, Frames, HTML5 Media. Not all directives go back to default-src. Refer to the Source List Reference for possible values.

DEFAULT-SRC Policy Example `default-src 'self' cdn.example.com;`

script-src

Defines valid JavaScript sources.

SCRIPT-SRC Policy Example `script-src 'self' js.example.com;`

style-src

Defines valid fonts for style sheets or CSS.

EXAMPLE__STYLE-SRC POLICY `style-src 'self' css.example.com;`

img-src

Defines valid image sources.

Example of IMG-SRC Policy `img-src 'self' img.example.com;`

connect-src

Applies to XMLHttpRequest (AJAX), WebSocket, fetch (), `<a ping>` or EventSource. If not allowed, the browser emulates a 400 HTTP status code. `__Connect-SRC Policy Example__ connect-src 'self';``

font-src

Defines valid fonts for font resources (loaded via @ font-face).

FONT-SRC Policy Example `font-src font.example.com;``

object-src

Defines valid plug-in sources, for example `<object>` or `<applet>`.

Example OBJECT-SRC Policy `object-src 'self';`

media-src

Defines valid audio and video sources, for example `<audio>`, HTML5, `<video>` elements.

Example of MEDIA-SRC Policy `media-src media.example.com;`

frame-src

Defines valid fonts for loading frames. In CSP, Level 2 `frame-src` has been deprecated in favor of the `child-src` directive. CSP Level 3, has not been replaced with `frame-src` and will continue to postpone `child-src` if not present.

Example FRAME-SRC `frame-src 'self';`

sandbox

Enables a sandbox for the requested resource similar to the `iframe` `sandbox` attribute. The sandbox applies a policy of the same origin, avoids pop-ups, plug-ins and blocks the execution of scripts. You can keep the `sandbox` value empty to keep all restrictions in place, or add values: `allow-forms allow-same-origin allow-scripts allow-popups allow-modals allow-orientation-lock allow-pointer-lock allow-presentation allow-popups-to-escape-sandbox allow-top-navigation`

Example of SANDBOX policy `sandbox allow-forms allow-scripts;`

report-uri

Instructs the browser to POST policy crash reports to this URI. You can also use `Content-Security-Policy-Report-Only` as the HTTP header name to instruct the browser to send reports only (does not block anything). This directive was discontinued at CSP Level 3 in favor of the `report-to` directive.

Example REPORT-URI `report-uri / some-report-uri;`

child-src

Defines valid fonts for web workers and nested browsing contexts loaded using elements such as `<frame>` and `<iframe>`.

Example of FILHO-SRC Policy `child-src 'self'`

form-action

Defines valid fonts that can be used as an `<form>` HTML action.

Example action policy example `form-action 'self';`

frame-ancestors

Defines valid fonts for embedding the resource using `<frame>`, `<iframe>`, `<object>`, `<embed>`, `<applet>`. Setting this directive to `'none'` should be roughly equivalent to `X-Frame-Options: DENY FRAME-ANCESTORS`.
EXAMPLE POLICY `frame-ancestors 'none';`

plugin-types

Defines valid MIME types for plug-ins called via `<object>` and `<embed>`. To load one, `<applet>` you must specify `application / x-java-applet`.

PLUG-IN TYPES Policy Example ``plugin-types application / pdf;``

base-uri

Defines a set of allowed URLs that can be used in the attribute of an HTML basetag.

URI-BASE Policy Example ``` base-uri 'self'; ```

report-to

Defines a report group name defined by an HTTP Response Report-Header. See the reporting API for more information.

Example Report for Policy `report-to groupName;`

worker-src

Restricts URLs that can be loaded as Worker, SharedWorker or ServiceWorker.

WORKER-SRC Policy Example `worker-src 'none';``

manifest-src

Restricts URLs where application manifests can be loaded.

Example of MANIFEST-SRC Policy `manifest-src 'none';``

prefetch-src

Defines valid sources for pre-fetching and pre-rendering of requests, for example, through the linktag with `rel = "prefetch"` or `rel = "prerender"`:

`__ PREFETCH-SRC Policy Example__ prefetch-src 'none'``

navigate-to

Restricts the URLs to which the document can navigate by any means. For example, when a link is clicked, a form is submitted or `window.location` is called. If `form-action` is present, this directive will be ignored for submitting forms. Implementation status

Navigation Policy Example ``navigate-to example.com``

Blank Log

This interface allows you to define a Log schema to the app. The Log scheme tracks what the end-users are doing in the app. Those are the events it can tracks: Access, Insert, Update, and delete.

To learn how to create a Log schema [see here](#).

LOG	
ATTRIBUTE	VALUE
Schema	log ▾ ☰
Events	<div style="display: flex; align-items: center; gap: 10px;"><div style="border: 1px solid #ccc; width: 100px; height: 40px; position: relative;"><div style="position: absolute; top: -10px; right: 0;">▲</div><div style="position: absolute; bottom: -10px; right: 0;">▼</div></div><div style="text-align: center;"><div style="background-color: #007bff; color: white; padding: 5px 10px; border-radius: 3px;">Add >></div><div style="background-color: #007bff; color: white; padding: 5px 10px; border-radius: 3px; margin-top: 5px;">Remove <<</div></div><div style="border: 1px solid #ccc; width: 100px; height: 40px; position: relative;"><div style="position: absolute; top: -10px; right: 0;">▲</div><div style="position: absolute; bottom: -10px; right: 0;">▼</div></div></div>

Application Log configuration

Schema Select an existing log schema for the application.

Events You can select just specific events to save in the log.

Application Settings (Blank Application)

Settings

Settings	
ATTRIBUTE	VALUE
Application Code	blank (9.08.0011)
Application title	<input type="text" value="{lang_othr_blank_title}"/>
Friendly URL	<input type="text"/>
Description	<input type="text"/>
Application images	
Language	<input type="text" value="Portuguese (Brazil)"/>
Use Shared Localization Variable	<input checked="" type="checkbox"/>
Charset	<input type="text"/>
Share Theme Variable	<input checked="" type="checkbox"/>
Folder	<input type="text" value="root"/>
Edit by Project	<input checked="" type="checkbox"/>
Timeout	<input type="text"/>

Application Code

Informes the current name of the application and the version in which it was created

Application Code	menu (9.06.0014)
------------------	------------------

Application title

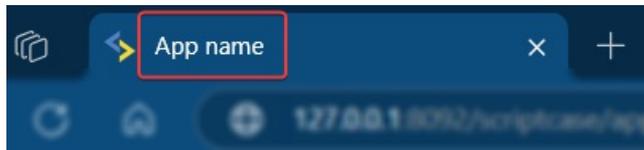

Application Title

Application Title	<input type="text" value="{lang_app_name}"/>
-------------------	--

Defines the application title, which can be set dynamically using langs or with a fixed text.

In this option it is also possible to use langs, for a system with multiple languages. [Click here](#) and see how to configure the langs

Example of the application title

Friendly URL

Friendly URL

This attribute defines the application's friendly URL.

Friendly URL	<input type="text" value="order-clients"/>
--------------	--

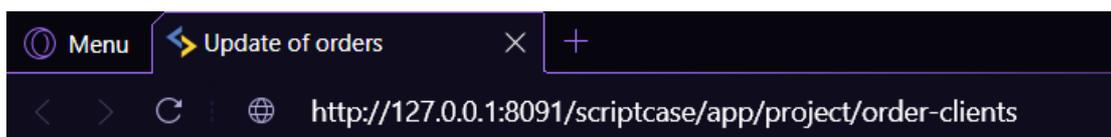

Alphanumeric characters and some special characters are allowed, such as: **hyphen** (-), **underscore** (_), **comma** (,), and **dot** (.).

The use of accents or spaces is not allowed.

Some recommendations for definition are:

- Use keywords for identification.
- Use hyphens to separate words.
- Use only lowercase letters.
- Avoid using dates.

Example of an application using a Friendly URL

The friendly URL can also be defined in the application list on the project's initial screen.

See the example below

APPLICATION	FRIENDLY URL	DESCRIPTION	CREATOR
grid_dbo_vwTarrafa	vwTask		

Description

Displays the description of the application.

You can edit or add a description also in the [Project Explorer](#) interface.

Application images

It stores the images that will be used in the application through codes in the events, causing these images to be sent along with the application at the time of publication.

Only images used in codes, such as creating a dynamic menu with icons or creating a bill of exchange using a blank, need to be added.

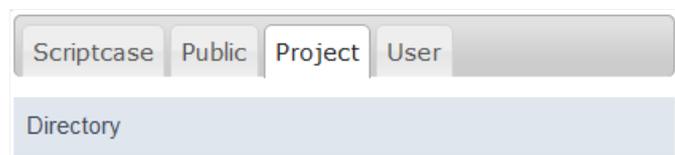

Images added in HTML Image fields or in the application header, for example, are already sent with the applications.

The added images will be stored in this directory: `../_lib/img/`

How to use the images

When inserting the image in the image manager, its name is changed according to the **scope** (public, project or user) and the **storage directory** (background, button, icon, menu or general) following the following pattern.

Scope: It refers to the level of access to the file within Scriptcase, in the development environment.

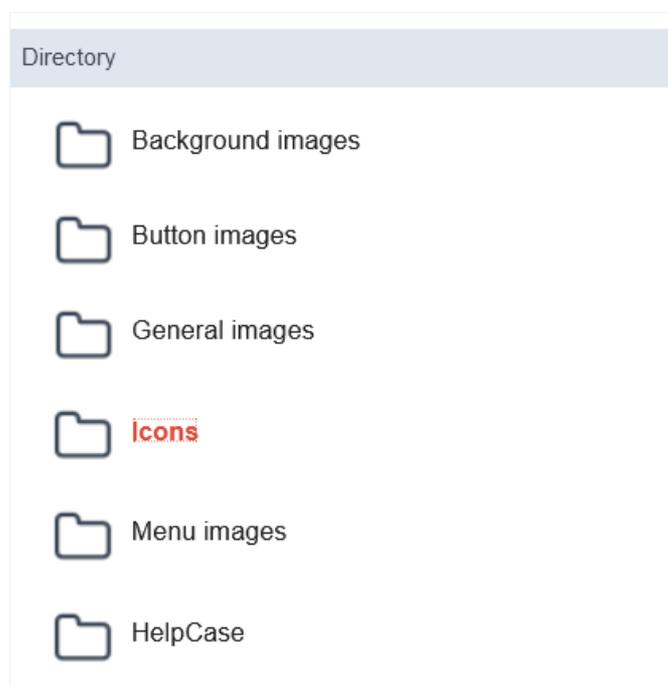

- Scriptcase__ - Contains preexisting images in the tool, where it is not possible to upload new images.
- Public__ - Images accessible for all projects.
- Project__ - Images accessible only in the project in which it was inserted.
- User__ - Images accessible only to the user who uploaded the image.

Each scope adds a prefix to the image name.

- Public - **sys__NM__**
- Project - **grp__NM__**
- User - **usr__NM__**

Storage Directory: Directory where the image will be added. Each directory adds one more prefix to the image name.

- background images - **bg__NM__**
- button images - **btn__NM__**
- general images - **img__NM__**
- icons - **ico__NM__**
- menu images - **menu_img__NM__**

This way, an image called `_001.jpg`, added in the public scope and in the icon directory will be named **sys__NM__ico__NM__001.jpg**

Language

Defines a specific language for the application, overriding the default language defined in the project. If no language is selected, the application will inherit the project's default language.

The languages listed in the option are defined in the project properties

Use Shared Localization Variable

Defines if the language of the applications will be stored

Charset

Defines an application-specific charset.

If no value is selected, the application inherits the project's default charset.

Ideally, this charset option, within the application's settings, does not have a defined value. Different usage of your base charset can cause problems saving information in your tables.

Share Theme Variable

When active, this option allows the theme stored in the session to be used by the application.

For example, by selecting theme x at login, all applications in the project will use the selected theme.

If the option is unchecked, the application remains with its original theme.

Folder

Folder where the application is stored in [Project Explorer](#).

Editing by Project

By disabling this option, only the user who created the application will have access to its settings.

No other project users will be able to access the application.

In the image below, the menu application has the edit by project option disabled.

<input checked="" type="checkbox"/>	 menu	Click here to edit	Main menu	admin	08/09/21 16:27	updated	Run
<input type="checkbox"/>	 treemenu	Click here to edit	Click here to edit	admin		outdated	Run Edit Copy Rename

Timeout

Set the session runtime timeout in seconds. If the value is Zero, it assumes the default timeout of the PHP.

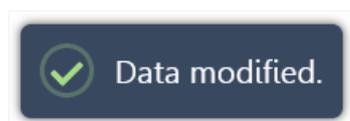

Notifications Settings

Notification settings	
ATTRIBUTE	VALUE
Use SweetAlert	<input checked="" type="checkbox"/>
SweetAlert position using Toast	Top right ▾
Script Error	<input type="checkbox"/>
SQL Error	<input type="checkbox"/>
Debug Mode	<input type="checkbox"/>

Use SweetAlert

Activate SweetAlert in the application, replacing the “confirm” and “alert” of the browser.

Confirm Example with SweetAlert Enabled

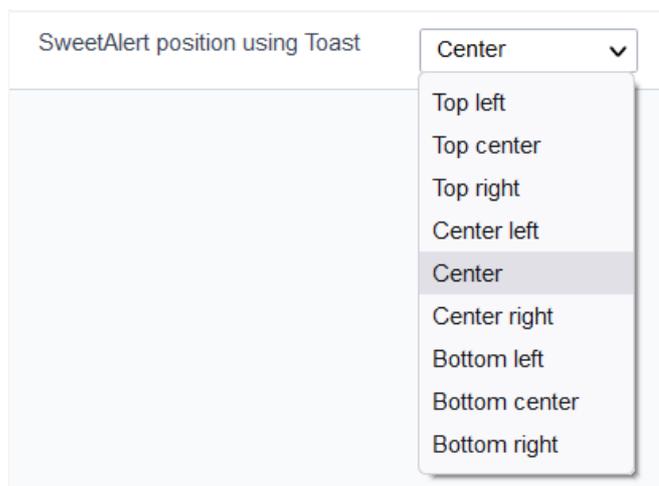

Confirm Example with SweetAlert Disabled

SweetAlert position using Toast

Sets the display position of the message window using toast.

Script Error

Allows displaying the line code where there is an error.

SQL Error

Allows displaying the SQL statement if it got an error

Debug Mode

Runs the application in Debug mode, showing all SQL statements the application is executing.

Global Variables

This screen shows all global variables used in the application

The global variable is an external parameter required for running the application. The application can include global variables in the WHERE clause, field definitions and names, event programming, and so on.

You can define global variables by using square brackets ([variable]). You can pass the parameters to the application through one of the methods: Session, Post, and Get

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(") instead of the brackets([]) because of the conflict with the of Global Variables syntax{:target="_blank"} Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

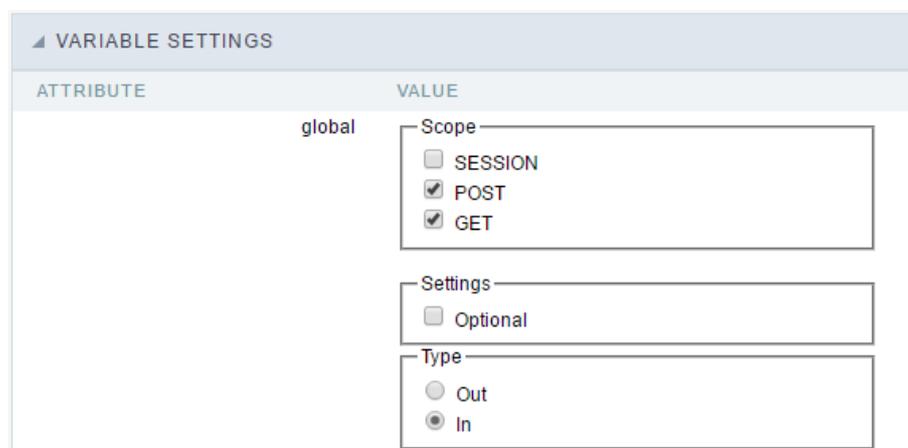

Global variables Interface.

Example:

```
Select CustomerID, CustomerName from Customers WHERE CustomerID = '[v_customerid]'
```

We do not recommend using session variables (global variables) with the same name as the table fields.

In this case, the variable **v_customerid** is displaying in the global variables configuration.

Global variables configuration Interface.

Attribute

It shows the variable's name in the application.

Value

Defines the behavior of the variables, divided into three blocks, they are:

Scope

Defines how the application receives the variable. A variable defined as the POST method in the app does not receive value if it comes with the GET method. Those are the methods available:

- **Session:** Defines that the variable must be created as a PHP session variable by another application.
- **GET:** Defines that the variable must be passed by the URL, that is, visible by the browser.
- **POST:** Defines that the variable must be passed through the POST method of an HTML form.

Settings

- **Optional:** Check it to don't validate the variable at runtime.

Type (In / Out)

Defines whether the variable comes from another application (In), or it is starting in the current app (Out).

Description

Indicates where the application is using the variable.

Blank Programming

ScriptCase has incorporated the concept of Object Oriented programming, using attributes, resources, methods and libraries. It is possible to create your own business rules in applications, and by using these concepts you can reap huge rewards in terms of better organization and improved development.

Attributes

The attributes are variables that has the global scope declared in the application. An attribute that can be referenced in all the methods and the application's events.

The screenshot displays the 'ATTRIBUTES SETTINGS' interface. It features a table with two columns: 'ATTRIBUTE' and 'VALUE'. Below the table, there is a text input field labeled 'Attribute Name'. To the right of the input field, there are four blue buttons: 'Include', 'Update', 'Delete', and 'Clean'. A vertical scrollbar is also visible on the right side of the interface.

Attributes configuration Interface.

Attribute Name : This field allows to inform the attributes name, after typing the name just click on **include**. In case you want to **update** click on the attributes name (located on the buttons' right side), do the necessary modifications and click on update. In case it is necessary to **delete** an attribute, it is necessary to do same process as the update, but when selecting the attribute, it is necessary to click on the delete button. The **clear** button, as the name suggests, it clears the list of all the attributes listed on the right.

Internal libraries

To use the internal libraries just select the correspondent (Project Libraries for example). This process allows the methods existing in the library, to be visible in all the application's Events and Methods.

See how to manage the libraries by [clicking here](#).

The screenshot shows the 'INTERNAL LIBRARIES - SCRIPTCASE' management interface. It lists four categories of internal libraries: 'INTERNAL LIBRARIES - SCRIPTCASE', 'INTERNAL LIBRARIES - PUBLIC', 'INTERNAL LIBRARIES - PROJECT: PROJECT1', and 'INTERNAL LIBRARIES - USER: ADMIN'. Each category has a checkbox and the text 'No library found for this session.'

Internal Libraries management Interface

PHP Methods

Methods are function or procedures declared by the developer, that helps when applying the routines. Using methods in the applications allows to reuse your code throughout the application, optimizing the development experience.

Creating a new method

- Give the method a name and click Create. As in the image below.

PHP methods are incorporated into the same class, so it is not possible to use two functions with the same name even when used in different methods.

A dialog box titled 'New Method - PHP'. It has a text input field for 'Name' containing 'new_method' and a blue 'Create' button below it.

- Methods can receive parameters.

- Add the amount of variables:

A dialog box titled 'Definition of the parameters of the method:'. It shows the method name 'new_method' and a list with one item: '• No defined parameter.'. At the bottom, there is an 'Add' button, a text input field containing '1', the label 'Parameter(s)', a 'Cancel' button, and a 'Save' button.

- Defining the variables:

A dialog box titled 'Insertion of Parameters'. It contains a table with three columns: 'Name', 'Type', and 'Value Standard'. The 'Type' column has a dropdown menu open, showing 'For Value' (selected) and 'For References'. Below the table are 'Save', 'Back', and 'Cancel' buttons.

Name	Type	Value Standard
	For Value	

- **Name** : Type in the variable's name.
- **Type** : Selecting the type of variables: For Value or For Reference.

- **Value Standard** : The parameter's value used to initialize when calling the method.

References allows to create a second name for a variable that you can use to read and modify the variable's original information.

- Editing a parameter:

Definition of the parameters of the method:

new_method

Parameters
\$test = test

Add 1 Parameter(s) Cancel

Save

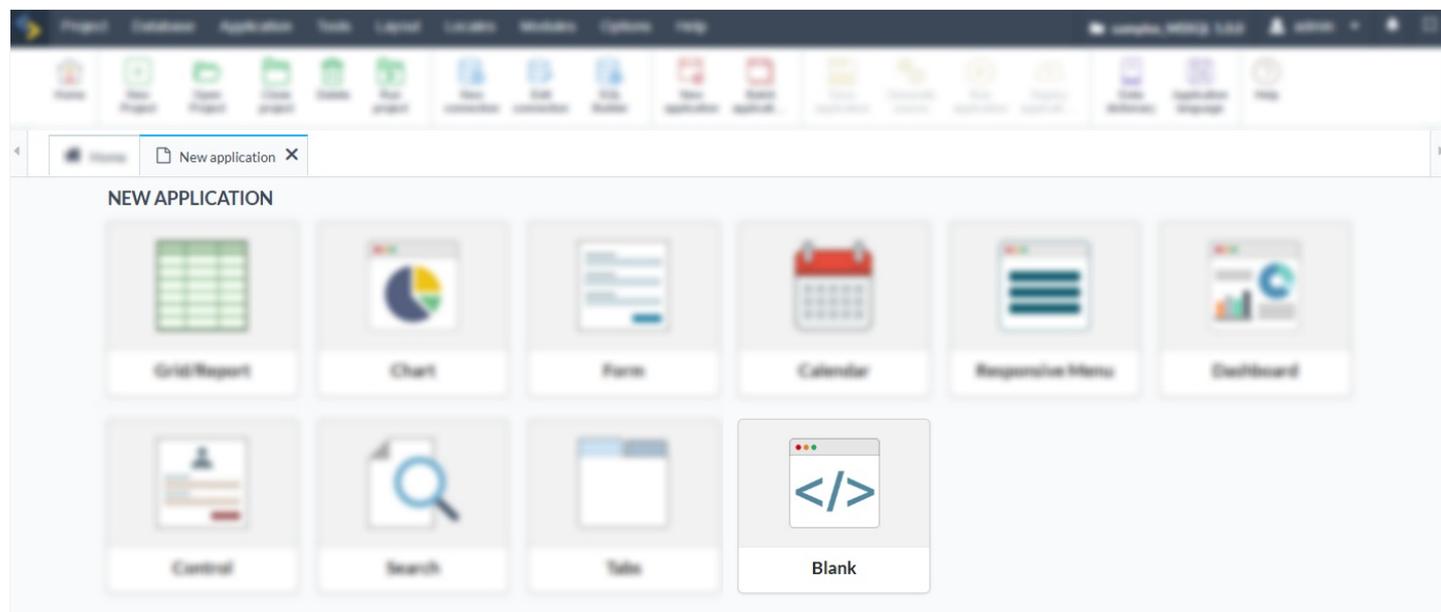

- : Checking all the parameters in the parameter list.
- : Uncheck all the parameters in the parameter list.
- : Edit the selected parameter of the list.
- : Deletes the selected variable of the list.

Creating a Blank Application

New Application

The process of creating an application is quite simple and intuitive.

You only need to select the type of application you want to generate from the list of applications available in Scriptcase, and it will be generated automatically.

Application Data

A screenshot of the 'BLANK' application configuration form. The form has a title bar with a code editor icon and the text 'BLANK'. Below the title bar, there are two tabs: 'APPLICATION DATA' (selected) and 'THEME'. Under the 'APPLICATION DATA' tab, there are three fields: 'Connection *' with a dropdown menu showing 'conn_example', 'Name *' with a text input field containing 'blank', and 'Localization' with a dropdown menu showing 'Inherit project default language' and a small edit icon to its right.

Connection

Defines the connection used for the creation of the application. The existing connections in the project will be listed.

Name

The name of the application being created. It cannot contain special characters.

Localization

The language of the application to be created. The project's default language is automatically selected.

Theme

On this screen, you can select the theme that the application will use. The default project theme, which can be checked and modified in **Project > Properties**, is automatically selected.

APPLICATION DATA RELATIONSHIP EDIT FIELDS **THEME**

Menu Settings

Desktop

The menu settings allow to define the attributes of the application display, according to the following:

Menu Settings ?		
ATTRIBUTE	VALUE	DESCRIPTION
Horizontal Alignment of the Menu	Left ▾	Horizontal alignment mode of the menu.
Vertical Alignment of the items	Top ▾	Vertical alignment mode of the menu items.
Horizontal Alignment of the Items	Left ▾	Horizontal alignment mode of the menu items.
Toolbar Horizontal Alignment	Left ▾	Alignment Mode of the toolbar items
Friendly URL	<input type="text"/>	Friendly URL
Menu Width	<input type="text" value="100%"/>	Table size width in pixels or percentage where the menu will be placed.
Menu Height	<input type="text"/>	Table size height in pixels or percentage where the menu will be placed.
Iframe Width	<input type="text" value="100%"/>	Iframe width in pixels or percentage where the application will be loaded.
Iframe Height	<input type="text" value="100%"/>	Iframe height in pixels or percentage where the application will be loaded.
Hide menu items.	<input type="checkbox"/>	When security is being used, rather than disable the menu item, it hides the item. The item must have link to be able to be hidden.
Hide the menu's toolbar	<input type="checkbox"/>	When used with the security, instead of calling the toolbar item it will hide the item.
Use theme background	<input checked="" type="checkbox"/>	If set to Yes, will use the background theme of the menu, if set to No, will be used to set the background theme of the project.
Scroll bar	<input type="checkbox"/>	Allow scroll bar.
Select Language	<input type="checkbox"/>	Select the language on the bar menu.
Select Theme	<input type="checkbox"/>	Select theme on the top menu.
Alignment of Theme and Language	Right ▾	Horizontal alignment of theme and language on the menu.
Always show the items	<input checked="" type="checkbox"/>	Show items even if the applications do not exist or if they were not generated.
Hide menu	<input type="checkbox"/>	Enables the option to hide the menu
Use expand/collapse	<input type="checkbox"/>	Enables an option that allows user to expand the application area, hiding menu items and header.

Menu configuration Interface.

- **Horizontal Alignment of the Menu:** Defines the horizontal alignment of the menu (Left, Center, Right).
- **Vertical Alignment of the items:** Defines the vertical alignment of the menu items (Top, Center, Bottom).
- **Horizontal Alignment of the Items:** Defines the horizontal alignment of the menu items (Left, Center, Right).
- **Toolbar Horizontal Alignment:** Defines the horizontal alignment of the toolbar items (Left, Center, Right).
- **Friendly URL:** Allows defining a name for the URL that's going to be called by the application. The characters allowed in the URL are(a-z, A-Z, 0-9). You still can inform the Friendly URL on the project home, where there is a list of applications with

the “Friendly URL” column.

- **Menu Width:** Define the width of the menu in pixels or percentages.
- **Menu Height:** Define the height of the menu in pixels or percentages.
- **Iframe Width:** Define the width of the Iframe (Where the applications will open in) in pixels or percentages.
- **Iframe Height:** Define the height of the Iframe (Where the applications will open in) in pixels or percentages.
- **Hide Menu Items:** This attribute defines whether the menu item will be displayed or not. When enabled, items are hidden if they do not have a link, the application has active security (without user access), or the item is disabled using the `sc_menu_disable` macro. When disabled, the items will always be displayed.
- **Hide the menu's toolbar:** When enabled and used with the security module, it'll hide the toolbar that the user doesn't have permission to access, instead of only disabling them.
- **Use theme background:** If enabled, it'll use the background theme of the menu. Else it'll use the background defined in the project.
- **Scroll bar:** Enables the scroll bar in the Iframe.
- **Select Language:** Allows to select the language in the menu bar.
- **Select Theme:** Allows to select the theme in the menu bar.
- **Alignment of Theme and Language:** Defines the horizontal alignment of the language and theme comboboxes.
- **Always show the items:** Displays the application items, even though they don't exist, or haven't been generated yet.
- **Hide menu:** Enables the option to hide the menu.

Navigation

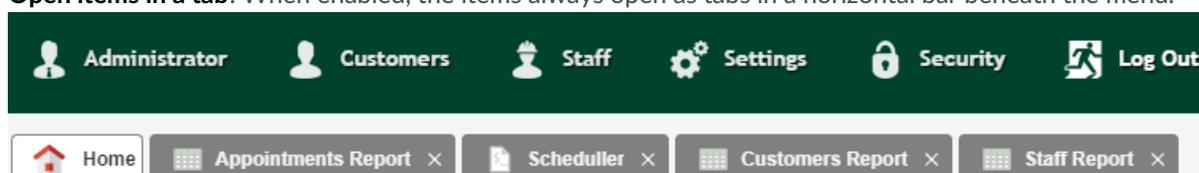

The menu navigation settings allow to define the attributes of the tabs and the navigation path, according to the following:

Navigation		
ATTRIBUTE	VALUE	DESCRIPTION
Open itens in a tab	<input checked="" type="checkbox"/>	Open the menu itens in a different tab above the application
Tab context menu	<input checked="" type="checkbox"/>	Creates a context menu to manage the menu tabs
Menu tabs navigation	<input checked="" type="checkbox"/>	Activates the tab navigation when many tabs are opened at the same time.
Minimum tab width	<input type="text"/>	Minimum tab width to standardize the sizes of all the tabs
Maximum tab width	<input type="text"/>	Maximum width of the tab, if the width exceed this the text will be hidden
Use default icons in the tab	<input checked="" type="checkbox"/>	Uses the standard icons when the menu tab has no icon
Use default icons in the item	<input type="checkbox"/>	Uses the standard icons when the menu item has no icon
Show navigation breadcrumb	<input type="checkbox"/>	Show the navigation breadcrumb each time an opened application calls another application.
Default Application	<input type="text" value="Blank"/>	Menu initial application.

Menu Navigation

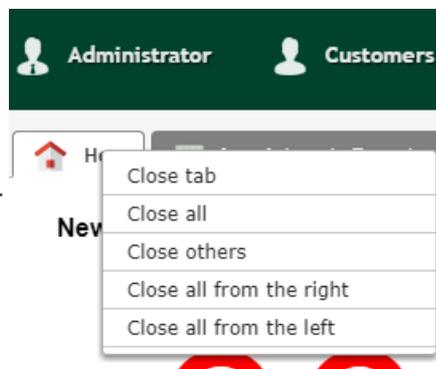

configurations Interface.

- **Open items in a tab:** When enabled, the items always open as tabs in a horizontal bar beneath the menu.

Navigating

through Applications with tabs.

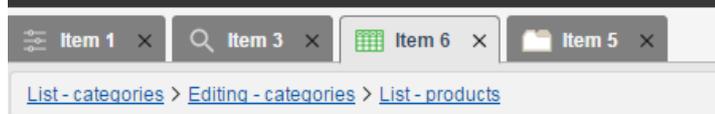

Application with a

- **Context menu of the Tabs:** Allows you to manage the open tabs.

context menu.

- **Minimum tab-width:** Allows to inform the min-width of all the tabs.
- **Maximum tab-width:** Allows to inform the max-width of all the tabs.
- **Show navigation breadcrumb:** Displays the path containing the application in the tab.

Navigation path Display in the Application.

- **Use default icons in the item:** When enabled, this option displays the standard icons for each item.
- **Use default icons in the tab:** When enabled, this option displays the standard icons for each tab.
- **Default Application:** Select a default application initiate when the menu opens.
- **Show the initial app as a tab:** Allows to open the default application in a tab.

Mobile

desktop

mobile

Menu Settings ?

ATTRIBUTE	VALUE	DESCRIPTION
Menu mobile	Normal ▾	Define if the menu will be in the navigation mode or normal menu
Hide menu	<input checked="" type="checkbox"/>	Enables the option to hide the menu in mobile views
Menu's initial mode	Open ▾	Informs the menu initial mode, if it is not set as visible
Float menu	<input type="checkbox"/>	Configures if the menu floats or occupies a physical space in the mobile view
Hide menu by clicking an item	<input checked="" type="checkbox"/>	Option to hide the menu after clicking an item, in case it is not set as visible

Mobile menu configuration

Interface.

- **Hide menu:** Enables the option to hide the menu when viewing from a mobile device.
- **Menu's initial mode:** Inform the starter mode of the menu. Otherwise, it'll always be visible.
- **Hide menu by clicking on an item:** When enabled, it hides the menu when clicking on an item.
- **Float Menu:** Hides the icon to open the menu or always displays it.

Menu items

Menu items settings

In this screen the user menu structure, indicating which applications will be called. Presents the following attributes, which should be completed by the user:

On mobile devices, if the menu item has sub-items and link, the link will be scored to display the sub-items.

interface.

- **Label** : Title for the application within the menu. Type a fixed title or use the Scriptcase language system to create lang variable for these names, according to the languages used in the project.
- **Link** : Here you have to enter the application name that will be linked to the menu item. You can also click the search button and select from the application list. This link can also be an external URL.
- **Hint** : Descriptive text that helps the user to identify the application. It is an optional field.
- **Icon** : Image that will be displayed as an icon in the menu item. The user can click the search button to select the image from the Scriptcase Image Manage. It is an optional field.
- **Active tab icon** : Image that will be displayed as an icon in the menu item when active. The user can click the search button to select the image from the Scriptcase Image Manage. It is an optional field. If you leave it blank Scriptcase adds a default image.
- **Inactive tab icon** : Image that will be displayed as an icon in the menu item when inactive. The user can click the search button to select the image from the Scriptcase Image Manage. It is an optional field. If you leave it blank Scriptcase adds a default image.
- **Target** : This option sets how the application will be displayed, it can be targeted as: Same window, Another window or leave (it will log the user out from the system).

Resources for menu items creation

- **Insert item** : This option add items to the menu.
- **Insert Sub-Item** : This option add sub-items to the menu, you might select the main item before to add the sub-items within the selected main item. You can also manage the sub-item position using the arrows.
- **Remove** : This option deletes the item/sub-item, you can select the items before and then remove.
- **Import applications** : You can use this option to call an application to attach to the item. It will open the project application list.
- **Move up** : This option allows you to move up a menu item or sub-item.
- **Move down** : This option allows you to move down a menu item or sub-item.
- **Move left** : This option allows you to move a menu item or sub-item to the left. You can use it to organize the menu hierarchy.
- **Move right** : This option allows you to move a menu item or sub-item to the right. You can use it to organize the menu hierarchy.

Importing the Applications

Importing applications is easy and fast. You can select to import one or more applications from a list. Then you need to organize the menu levels as you wish, by using the positioning buttons.

Application	Directory	Dt. Creating	Description
<input type="radio"/> calendar01	root/Calendar	14/07/10 17:15	Calendar Application *
<input type="radio"/> calendar02	root/Calendar	19/07/10 18:43	
<input type="radio"/> calendar03	root/Calendar	29/10/10 17:32	Calendar per user
<input type="radio"/> calendar_color_event	root/Calendar	25/07/14 00:11	Calendar Application with print button and event color per day *
<input type="radio"/> chart01	root/Grid_Applications/Charts	25/01/13 10:02	Bar HTML 5 Chart *

Applications list to

Import.

The link property receives the application name, as the image below.

The screenshot shows the 'Menu Settings' interface. On the left is a tree view of menu items. The 'Properties' panel for the selected item shows the following fields:

- ID (item_185)
- Label:
- Link: (highlighted with a red box)
- Hint:
- Icon:
- Active tab icon:
- Inactive tab icon:
- Target:

The 'Theme' panel shows a list of themes under the 'ScriptCase' category, with 'Horizontal and vertical' selected. The 'Menu orientation' panel shows 'Horizontal' selected.

Application Import Interface.

Menu Toolbar

This article describes the menu application toolbar and provides information on how to add new items and how to configure them.

Toolbar buttons

Resources for creating menu items Below are the options for adding items to the toolbar. Added items are displayed in the list of items.

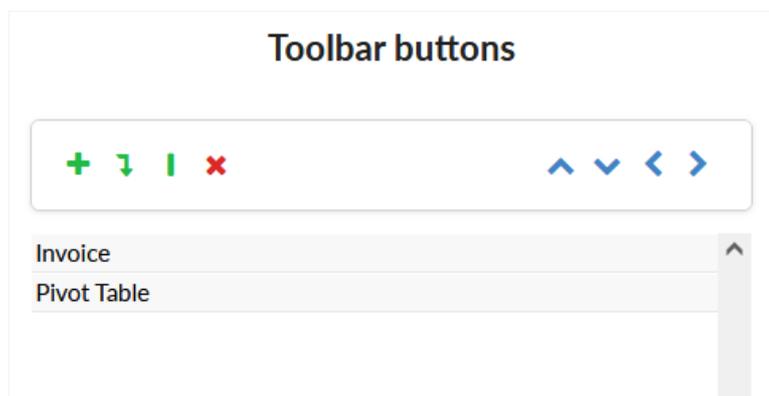

Table with the description of each of the options for creating and ordering the toolbar items.

Title	Icon	Description
Insert item		Add a new item to the menu toolbar.
Insert subitem		Add a sub-item to the menu toolbar. For this, some item must be previously selected. Otherwise an item will be added.
Add Separator		Adds an item separator to the toolbar.
Remove		Remove the selected item from the toolbar
Move up		The move up button changes the order of the selected item, moving it up.
Move down		The move down button changes the order of the selected item, moving it down.
Move left		The move left button changes the position of an item, moving it to the left. In this way, an item added as a sub-item can be turned into an item.
Move right		The move left button changes the position of an item, moving it to the right. In this way, an item can be turned into a sub-item. This button is only active if the selected item is positioned below another item. In the toolbar it is only possible to create one level of items.

Button Properties

Properties are available by selecting one of the previously added toolbar buttons.

Dropdown

Defines the display format of subitems

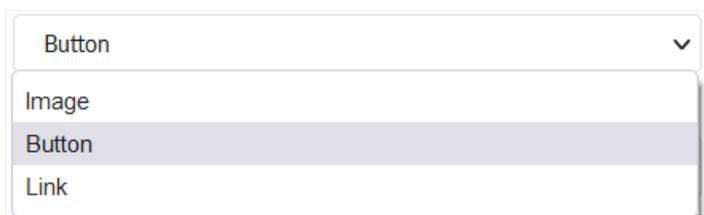

Dropdown - The subitems displayed in the list.

Side by side - Subitems will be displayed side by side in the toolbar.

Type

Defines the type of button that will be displayed.

The available options are:

Image

When selecting this option only the image will be displayed, without any CSS application to the button.

Below is an example of a button configured as an image

Button

Below is an example of a standard button

Link

In this option, only the button's label will be displayed in the form of a link, without any application of css to the button.

Below is an example of a button configured as a link

[Dashboard](#) [Report](#) [Invoice](#)

Link

Allows selecting the application through his name or by a link.

Label

Defines the title that will be shown on the button when the application is run.

In addition to a fixed text, the **Label** attribute allows the use of langs to define the button's title, making it possible to use your application in a multi-language project.

Using a fixed text

Pivot Table

Using a lang

{lang_menu_paymants}

[Click here for more details on Application Language](#)

Hint

Displays a message in the hover of the button.

For the feature to work, just add a text or language in the **Hint** attribute, as in the example below.

Using a fixed text

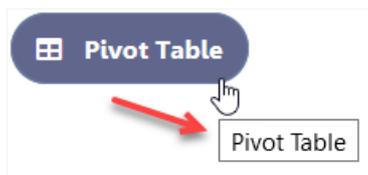

Pivot Table

Using a lang

{lang_menu_paymants}

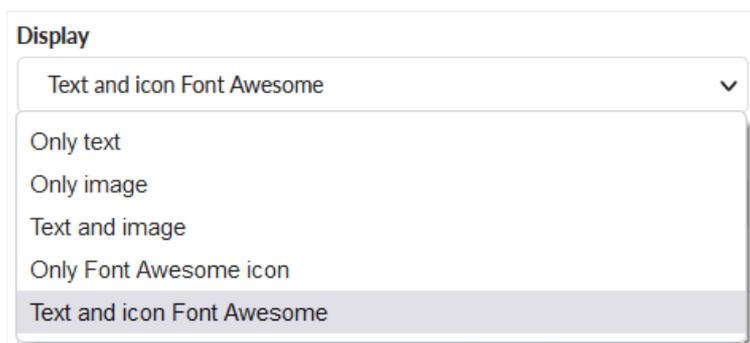

[Click here for more details on Application Language](#)

See below the behavior of each of them:

Display

Defines the way the button will be displayed on the toolbar. The options are **Only text**, **Only image**, **Text and image**, **Only Font Awesome icon** and **Text and icon Font Awesome**

See below the behavior of each of them:

Only text

Displays only the text entered in the **Label** attribute.

Only image

Displays only the image informed in the **Icon** attribute.

Text and image

Displays the text and image informed in the attributes **Label** and **Icon**, respectively.

Only Font Awesome icon

Display Font Awesome icon informed in the attribute **Icon**.

Text and icon Font Awesome

Displays Font Awesome texts and icons, informed in the attributes **Label** and **Icon**, respectively.

Icon

Defines the icon or image that is shown on the button.

This attribute works in two ways, to select a image or Font Awesome icon, it will depend on the option selected in the **Display** attribute.

When selected Only image or Text and image

If on the attribute Display was selected, Only image or Text and image, you need select a image.

See how add a image

The screenshot shows the 'Toolbar Settings' dialog box. On the left, the 'Toolbar buttons' panel lists several options: '{lang_menu_paymants}', 'Invoice', 'Payment Report', and 'Pivot Table'. 'Pivot Table' is selected and highlighted in blue. On the right, the 'Properties' panel displays various configuration options for the selected button:

- Id:** btn_5
- Dropdown:** Dropdown
- Type:** Button
- Link:** (empty field)
- Label:** Pivot Table
- Hint:** {lang_menu_pivot_table}
- Display:** Text and image
- Icon:** (empty field with an image icon)
- Icon position:** Icon on the left
- Target:** This Window
- CSS Style:** default

At the bottom of the dialog, there is a code snippet: `ascrip: nm_window_image_new('ico','form_edit','field_icon_on','nmUpdateltem');`

When selected Only Font Awesome Icon or Text and icon Font Awesome

If on the attribute Display was selected, Only Font Awesome Icon or Text and icon Font Awesome, you need select a Font

Awesome Icon for the icon attribute.

See how add a Font Awesome Icon

![how add a Font Awesome Icon][gif_selecting_a_font_awesome_icon_attribute]

.png [gif_selecting_a_font_awesome_icon_attribute]:

../../assets/images/docs/app/menu/toolbar/selecting_a_font_awesome_icon_attribute.gif .png

Icon Position

Defines the position of the Text or Image (Text to the right, Image to the right).

Target

Allows defining how to display the applications: In the same window or in a new one.

Icon Color

Defines the Font Awesome icon color. If no value is informed, the icon will receive the default color of the button theme.

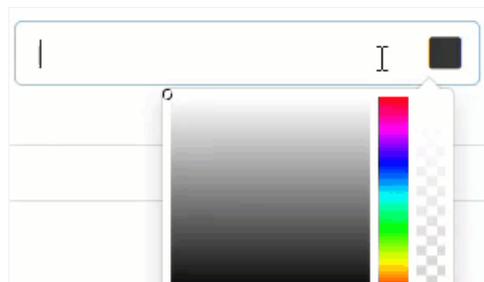

The icon Color option is available whenever any Font Awesome option to set in the Display attribute.

You can set the icon color in the following ways.

Informing a HEX code

Selecting a color

When selecting a color, the HEX value will be inserted into the field automatically.

Informing the color name

When informing the color name, the HEX value will be inserted in the field automatically.

Informing a RGB code

Informing a HSL code

.png gif_informing_name: ../../../../assets/images/docs/app/menu/toolbar/informing_name.gif

Hover Icon Color

Defines the Font Awesome icon color when hover in the button. If no value is informed, the icon will receive the default color of the button theme.

The Hover Icon Color option is available whenever any Font Awesome option to set in the Display attribute.

You can set the icon color in the following ways.

Informing a HEX code

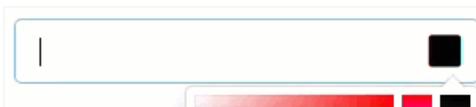

Selecting a color

When selecting a color, the HEX value will be inserted into the field automatically.

Informing the color name

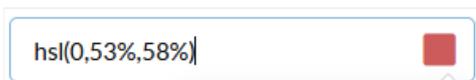

When informing the color name, the HEX value will be inserted in the field automatically.

Informing a RGB code

Informing a HSL code

.png gif_informing_name: ../../../../assets/images/docs/app/menu/toolbar/informing_name.gif

Disabled Icon Color

Defines the Font Awesome icon color when the button is disabled. If no value is informed, the icon will receive the default color of the button theme.

The Disabled Icon Color option is available whenever any Font Awesome option to set in the Display attribute.

You can set the icon color in the following ways.

Informing a HEX code

Selecting a color

When selecting a color, the HEX value will be inserted into the field automatically.

Informing the color name

When informing the color name, the HEX value will be inserted in the field automatically.

Informing a RGB code

Informing a HSL code

CSS Style

Define the style of the buttons

Security

Use security

With this option enabled, when accessing the application, an “unauthorized user” message will be displayed, preventing access to the application.

When enabled, application access is only possible through the macro **sc_apl_status** or through **security module**.

[Click here](#) to access the macro documentation sc_apl_status.

In the development environment, the use of the above options for testing purposes may be suppressed, preventing the password being requested or access being blocked at each execution of the applications. To do this, disable the options “Enable security usage” and “Enable password usage” in the menu **Configuration > My Scriptcase**.

Security exit url

Defines which application the user will be redirected to after the “unauthorized user” warning.

Use password

When enabling the option, you will be asked to define a password for accessing the application.

When running the application using the active password, you will be asked for the password before accessing the application.

The password will be requested regardless of the “use security” setting or the use of the security module.

Request password only once

This option defines the behavior of the use password option.

When this option is enabled, the password will be requested only once per session.

When disabling, the password will be requested every time the application will be accessed.

Allow direct calling by URL

Allows an application to be called by typing the URL directly into browsers.

When disabled, when accessing the application by typing the URL directly, the invalid data error will be displayed. With this configuration, the application can only be accessed through a menu application, for example.

Cookies

HttpOnly

These are cookies that can be set by the server or by javascript but cannot be accessed in any way by javascript.

With the HTTPOnly parameter enabled, it is very difficult to steal a session through XSS because the javascript cannot read the content of these cookies.

A widely exploited attack in XSS is the theft of user session cookies. Theft of cookies is carried out through a javascript command that sends cookies to an external URL where the attacking user has control.

This option is enabled by default in all applications.

Session ID

Enables the session id that will be stored in cookies on the client side. This option embeds the session id directly in the URLs

This option is enabled by default in all applications.

Cookie Secure

With this option enabled, cookies are protected and can only be transmitted via secure communication. Therefore, they cannot be accessed through Javascript.

The HttpOnly option must also be enabled.

Headers

Disable XSS Auditor

XSS is short for Cross-Site Scripting, which is an attack that consists of sending HTML with malicious JavaScript to a website.

It is a security attack that consists of sending HTML with malicious JavaScript to a website. If the website displays this HTML with JavaScript without filtering the malicious JavaScript code, the cookies sent by the website can be stolen and sent to an attacking website, so that it can be used to forge user sessions and access the website's user account without permissions.

Strict-Transport-Security

HSTS forces browsers to use HTTPS in the domain where it is enabled, instead of using HTTP.

When enabled, the default value is "max-age = 31536000".

The HSTS policy is set for one year (31536000 seconds). This period specifies the time the browser will access the server via HTTP

X-Frame-Options

The HTTP X-Frame-Options response header can be used to indicate whether or not the browser should render the page in a `<frame>`, `<iframe>`, `<embed>` " or '". This header provides protection against clickjacking, known as 'click swipe' - this vulnerability can steal relevant information and data from the user.

X-Frame-Options does not allow the rendering of a page in a frame, ensuring that the content of your page is not embedded in other sites

- **SAMEORIGIN:** The SAMEORIGIN directive allows the page to be loaded in a frame from the same source as the page itself. This option must be used so that the application with clickjacking protection can be used in the menu application.
- **DENY:** This directive completely disables page loading in a frame.

If no option is selected, the application can be used on any `<frame>`, `<iframe>`,

or `<object>`, allowing the application to be incorporated into another website.

X-Content-Type-Options

X-Content-Type-Options is used to protect against MIME detection vulnerabilities. With this option enabled, it prevents browsers from interpreting the page content (sniffing) and executing the data as code / tag. These vulnerabilities can occur when uploading a text file with a javascript code and the browser reading the content that is in the file and executing, even though it is just text and not part of the code.

With this enabled, the HTTP X-Content-Type-Options header is defined, by default, as "no detection".

Referrer-Policy

no-referrer.

The Referer header will be omitted completely. No reference information will be sent with requests.

no-referrer-when-downgrade.

This is the default behavior when no policy is specified, or if the value provided is invalid.

origin.

Only send the origin of the document as a reference. For example, a document at `https://example.com/page.html` will send the reference `https://example.com/`.

origin-when-cross-origin.

Sends the origin, path and query string when performing a same-origin request, but only sends the origin of the document in other cases.

same-origin.

The reference will be sent to sources on the same site, but requests between sources will not send reference information.

strict-origin.

Only send the document source as a reference when the security protocol level remains the same (HTTPS → HTTPS), but do not send it to a less secure recipient (HTTPS → HTTP).

strict-origin-when-cross-origin.

Sends the source, path and query string when performing a request from the same source, only sends the source when the security protocol level remains the same during an inter-source request (HTTPS → HTTPS), and sends no header to recipients less secure (HTTPS → HTTP)

unsafe-url.

Sends the source, path and query chain when performing any request, regardless of security.

Feature-Policy

The value of this header is a policy or set of policies that you want the browser to respect for a particular source.

The source whitelist can take on several different values:

- `*:` The feature is allowed in top-level navigation contexts and in nested navigation contexts (iframes).
- `self:` The feature is allowed in top-level navigation contexts and nested navigation contexts from the same source. It is not allowed in documents of cross origin in nested browsing contexts.
- `none:` The feature is not allowed in top-level browsing contexts and is not allowed in nested browsing contexts.
- `<origin (s)>:` specific sources for which to enable the policy (for example `https://example.com`).

Example 1 - Using only one directive Let's say you want to prevent all content from using the geolocation API on your site. You can do this by submitting a restricted 'none' whitelist to the geolocation resource:

Feature-Policy: `geolocation none`

Example 2 - Using more than one directive Functionalities within a policy are separated by semicolons.

Feature-Policy: `unsized-media none; geolocation self https://example.com; camera *;`

Directives

accelerometer

Controls whether the current document is allowed to collect information about the acceleration of the device

via the Accelerometer interface.

ambient-light-sensor

Controls whether the current document is allowed to collect information about the amount of light in the environment around the device through the AmbientLightSensor interface.

autoplay

Controls whether the current document is allowed to play the requested media automatically via the HTMLMediaElement interface. When this policy is disabled and there is no user action, the Promise returned by HTMLMediaElement.play () will reject it with a DOMException. The autoplay attribute on <audio> " and " elements will be ignored.

battery

Controls whether the use of the Battery Status API is allowed. When this policy is disabled, the Promise returned by Navigator.getBattery () will reject it with a NotAllowedError DOMException.

camera

Controls whether the current document is allowed to use inputs from video devices. When this policy is disabled, the Promise returned by getUserMedia () will reject it with a NotAllowedError DOMException.

display-capture

Controls whether or not the current document is allowed to use the getDisplayMedia () method to capture screen content. When this policy is disabled, the Promise returned by getDisplayMedia () will reject it with a NotAllowedError if permission is not obtained to capture the contents of the screen.

document-domain

Control whether the current document is allowed to place document.domain. When this policy is disabled, attempts to place document.domain will fail and cause a SecurityError DOMException to be thrown.

encrypted-media

Controls whether the current document is allowed to use the Encrypted Media Extensions (EME) API. When this policy is disabled, the Promise returned by Navigator.requestMediaKeySystemAccess () will reject it with a DOMException.

execution-while-not-rendered

Controls whether tasks should be performed in frames while they are not rendered (e.g. whether a frame is hidden or display: none).

execution-while-out-of-viewport

Controls whether tasks should be performed in frames while they are outside the visible viewing window.

fullscreen

Controls whether the current document is allowed to use Element.requestFullscreen (). When this policy is disabled, the returned Promise rejects it with a TypeError DOMException.

geolocation

Controls whether the current document is allowed to use the Geolocation interface. When the policy is disabled, calls to getCurrentPosition () and watchPosition () will cause function callbacks to be invoked with a PositionError of PERMISSION_DENIED.

gyroscope

Controls whether the current document is allowed to collect information about the orientation of the device through the Gyroscope interface.

layout-animations

Controls whether the current document is allowed to show layout animations.

legacy-image-formats

Controls whether the current document is allowed to show images in legacy formats.

magnetometer

Controls whether the current document is allowed to collect information about the orientation of the device through the Magnetometer interface.

microphone

Controls whether the current document is allowed to use inputs from audio devices. When this policy is disabled, the Promise returned by `MediaDevices.getUserMedia ()` will reject it with a `NotAllowedError`.

midi

Controls whether the current document is allowed to use the Web MIDI API. When this policy is disabled, the Promise returned by `Navigator.requestMIDIAccess ()` will reject it with a `DOMException`.

navigation-override

Controls the availability of mechanisms that enable the author of the page to take control over the behavior of spatial navigation, or to cancel completely.

oversized-images

Controls whether the current document is allowed to download and display large images.

payment

Controls whether the current document allows the use of the Payment Request API. When this policy is disabled, the `PaymentRequest ()` constructor will throw a `SecurityError DOMException`.

picture-in-picture

Controls whether the current document allows a video to be allowed to play in Picture-in-Picture mode via the corresponding API.

publickey-credentials-get

Controls whether the current document is allowed to use the Web Authentication API to retrieve already stored public key credentials, i.e. via `navigator.credentials.get ({publicKey: ..., ...})`.

sync-xhr

Controls whether the current document is allowed to make synchronous XMLHttpRequest requests.

usb

Controls whether the current document is allowed to use the WebUSB API.

vr

Controls whether the current document is allowed to use the WebVR API. When this policy is disabled, the Promise returned by `Navigator.getVRDisplays ()` will reject it with a `DOMException`. Keep in mind that the WebVR standard is in the process of being replaced by WebXR.

wake-lock

Controls whether the current document is allowed to use the Wake Lock API to indicate that the device should not go into a power saving mode.

screen-wake-lock

Controls whether the current document is allowed to use the Screen Wake Lock API to indicate whether or not the device should darken the screen.

xr-spatial-tracking

Controls whether or not the current document is allowed to use the WebXR Device API to interact with the WebXR session.

Content-Security-Policy

Content-Security-Policy is the name of an HTTP response header that modern browsers use to increase the security of the document (or web page).

The Content-Security-Policy header allows you to restrict resources such as JavaScript, CSS or just about anything the browser loads.

Directives**default-src**

The default-src directive defines the standard policy for fetching features such as JavaScript, Images, CSS, Fonts, AJAX requests, Frames, HTML5 Media. Not all directives go back to default-src. Refer to the Source List Reference for possible values.

DEFAULT-SRC Policy Example `default-src 'self' cdn.example.com;`

script-src

Defines valid JavaScript sources.

SCRIPT-SRC Policy Example `script-src 'self' js.example.com;`

style-src

Defines valid fonts for style sheets or CSS.

EXAMPLE__STYLE-SRC POLICY `style-src 'self' css.example.com;`

img-src

Defines valid image sources.

Example of IMG-SRC Policy `img-src 'self' img.example.com;`

connect-src

Applies to XMLHttpRequest (AJAX), WebSocket, fetch (), `<a ping>` or EventSource. If not allowed, the browser emulates a 400 HTTP status code. `__Connect-SRC Policy Example__ connect-src 'self';``

font-src

Defines valid fonts for font resources (loaded via @ font-face).

FONT-SRC Policy Example `font-src font.example.com;``

object-src

Defines valid plug-in sources, for example `<object>` or `<applet>`.

Example OBJECT-SRC Policy `object-src 'self';`

media-src

Defines valid audio and video sources, for example `<audio>`, HTML5, `<video>` elements.

Example of MEDIA-SRC Policy `media-src media.example.com;`

frame-src

Defines valid fonts for loading frames. In CSP, Level 2 `frame-src` has been deprecated in favor of the `child-src` directive. CSP Level 3, has not been replaced with `frame-src` and will continue to postpone `child-src` if not present.

Example FRAME-SRC `frame-src 'self';`

sandbox

Enables a sandbox for the requested resource similar to the `iframe` `sandbox` attribute. The sandbox applies a policy of the same origin, avoids pop-ups, plug-ins and blocks the execution of scripts. You can keep the `sandbox` value empty to keep all restrictions in place, or add values: `allow-forms` `allow-same-origin` `allow-scripts` `allow-popups` `allow-modals` `allow-orientation-lock` `allow-pointer-lock` `allow-presentation` `allow-popups-to-escape-sandbox` `allow-top-navigation`

Example of SANDBOX policy `sandbox allow-forms allow-scripts;`

report-uri

Instructs the browser to POST policy crash reports to this URI. You can also use `Content-Security-Policy-Report-Only` as the HTTP header name to instruct the browser to send reports only (does not block anything). This directive was discontinued at CSP Level 3 in favor of the `report-to` directive.

Example REPORT-URI `report-uri / some-report-uri;`

child-src

Defines valid fonts for web workers and nested browsing contexts loaded using elements such as `<frame>` and `<iframe>`.

Example of CHILD-SRC Policy `child-src 'self'`

form-action

Defines valid fonts that can be used as an `<form>` HTML action.

Example action policy example `form-action 'self';`

frame-ancestors

Defines valid fonts for embedding the resource using `<frame>` `<iframe>` `<object>` `<embed>` `<applet>`. Setting this directive to `'none'` should be roughly equivalent to `X-Frame-Options: DENY FRAME-ANCESTORS`.
EXAMPLE POLICY `frame-ancestors 'none';`

plugin-types

Defines valid MIME types for plug-ins called via `<object>` and `<embed>`. To load one, `<applet>` you must specify `application / x-java-applet`.

PLUG-IN TYPES Policy Example ``plugin-types application / pdf;``

base-uri

Defines a set of allowed URLs that can be used in the attribute of an HTML basetag.

URI-BASE Policy Example ``` base-uri 'self'; ```

report-to

Defines a report group name defined by an HTTP Response Report-Header. See the reporting API for more information.

Example Report for Policy `report-to groupName;`

worker-src

Restricts URLs that can be loaded as Worker, SharedWorker or ServiceWorker.

WORKER-SRC Policy Example `worker-src 'none';``

manifest-src

Restricts URLs where application manifests can be loaded.

Example of MANIFEST-SRC Policy `manifest-src 'none';``

prefetch-src

Defines valid sources for pre-fetching and pre-rendering of requests, for example, through the linktag with `rel = "prefetch"` or `rel = "prerender"`:

`__ PREFETCH-SRC Policy Example__ prefetch-src 'none'``

navigate-to

Restricts the URLs to which the document can navigate by any means. For example, when a link is clicked, a form is submitted or `window.location` is called. If `form-action` is present, this directive will be ignored for submitting forms. Implementation status

Navigation Policy Example ``navigate-to example.com``

Menu Log Configuration

This interface allows you to define a Log schema to the app. The Log scheme tracks what the end-users are doing in the app. Those are the events it can tracks: Access, Insert, Update, and delete.

To learn how to create a Log schema [see here](#).

LOG	
ATTRIBUTE	VALUE
Schema	log <input type="button" value="⋮"/>
Events	<div style="display: flex; align-items: center; gap: 10px;"><div style="border: 1px solid #ccc; width: 100px; height: 40px; position: relative;"><div style="position: absolute; top: -10px; right: -10px;">▲</div><div style="position: absolute; bottom: -10px; right: -10px;">▼</div></div><div style="text-align: center;"><input type="button" value="Add >>"/> <input type="button" value="Remove <<"/></div><div style="border: 1px solid #ccc; width: 100px; height: 40px; position: relative;"><div style="position: absolute; top: -10px; right: -10px;">▲</div><div style="position: absolute; bottom: -10px; right: -10px;">▼</div></div></div>

Application Log configuration

Schema Select an existing log schema for the application.

Events You can select just specific events to save in the log.

Menu Events Overview

Most Scriptcase applications, with the exception of Tabs and Dashboard applications, have events that can be used to create business rules, validations and changes to the application's CSS, among other things.

When events are executed?

Each event is executed at a certain moment in the application and has an execution order, for this reason, they have different functions within the creation of a business rule and validations.

They can be triggered automatically, as in the case of the **onApplicationInit** and **onScriptInit** events, where they are executed when the application starts. Also, they can be triggered through user interaction, as with the **onNavigate** and **onValidate** events, which are executed when browsing the application or submitting a form, respectively.

For information about the timing of events execution or other information, access the documentation of the desired event.

how they work?

By default, the events already have handle for opening `<?php` and closing `?>` of PHP tags, so they are ready to receive PHP code and macros from Scriptcase.

However, it is possible to use other languages in the event, such as **JQuery**, **JavaScript**, **CSS** and **HTML**. For this, it is necessary to close the PHP tag `?>` of the event, so that the code can be added.

Remembering that it is necessary to reopen the event's PHP tag `<?php`, otherwise the application will not run correctly.

When closing the PHP tag in a Scriptcase event, the executed language is HTML.

Example of using other languages:

onApplicationInit - Menu

This event occurred before the application execute the SQL, and execute only once. Is used to do verification of variables, and security verification.

onExecute - Menu

This event works only in the "menu" applications and are executed when an application is called through a link of the menu. Normally are used to the decision taking before the application execution named `sc_script_name`.

onLoad - Menu

This event occurs when loading a horizontal / vertical menu. In this event we can run some security policy, for example if there is an attempt to access the menu directly, without first going through a login form, we can test a session variable defined in the login form, redirect the flow to the initial application. if(!isset([var_id_user]) or empty([var_id_user])) { sc_redirect("login.php"); }

Code Editor

Scriptcase has Events to allow the developers to customize the application code. By using the events, the developers can program custom actions at a specific execution time (e.g. After a record is inserted, when it is loaded, upon submitting a Form, ...) and for a specific application type. In the events area you can use global and local variables, JavaScript, CSS, HTML, PHP codes and also Scriptcase macros.

Scriptcase code editor is used within events and has a series of shortcuts to help in the applications development.

At the top section of the editor, there are some options that allows us to change the editor theme or expand it, for example. These options can also be activated using the hotkeys.

- - Increases the area occupied by your code editor.
- - Expand the sides of the code editor.
- - Activates the search in the code editor.
- - Enables replace in the code editor.
- - Defines the code editor theme.

The hotkeys are available in all browsers compatible with Scriptcase.

[Click Here](#) to view the Scriptcase hotkeys documentation.

Menu Layout Setting

This module lets you editing display options for the application. You can apply visualization themes, organize blocks, define values, and the display format of the Header and Footer.

Layout Settings

ScriptCase creates an app by using default values defined per project, but you can change those values for a specific application on this interface.

▲ LAYOUT SETTINGS

Header Template	<input type="text" value="Flat"/>	Template name used for the application header.
Footer Template	<input type="text" value="Default"/>	Template name used for the application footer.
Button	<input type="text"/>	Use different buttons than what was defined in the color scheme.
Themes	<input type="text" value="Sc9_Rhino"/>	Use different themes from the one defined for the color scheme

Choose one of the selected themes in the project properties. It defines the look of the application, like colors, fonts, and others.

Header

Here we can define if we want to display the header or not, the application title, and fill the header variables. The header looks according to the selected template in the Layout settings interface.

▲ HEADER	
ATTRIBUTE	VALUE
Display Header	<input checked="" type="checkbox"/>
Insertion Title	<input type="text" value="{lang_othr_frmi_tit} - orders"/>
Update Title	<input type="text" value="{lang_othr_frmu_tit} - orders"/>
Header Variables	
SC_HEADER	<input type="text" value="Title"/>
SC_VALUE	<input type="text" value="Date"/> ?

Application Header Configuration

Display Header

This option determines if we want to display the header or not.

Title

Allows informing the title of the application.

Header Variables

We must fill the variable fields with one of the types available in the Combobox. Depending on the type, you need to associate content with it. Those are the types:

- **Field:** When you choose the option “**Field**”, it opens a Combobox to choose a field to associate the field value with the header. This option will be enabled in the applications that you can create a fields
- **Title:** It displays the value of “**Application Title**” in the header.
- **Date:** It displays the system’s date in “yyyy/mm/dd” format in the header. There are several display formats available, and you can change it by using the text field beside it. To access existing formats, click on the hint to see an explanation.
- **Image:** It displays a field to inform the name of an existing image in the server. You can select an image by clicking on the icon “**Choose Image**”, and you still can upload new images by using the button “**Upload**”. 
- **Value:** It displays the content of the text input. You can inform static texts and “**Global Variables**”. e.g. “Employee Name: [v_name]”.

Depending on the Application, you may have more than one title option.

Footer

FOOTER	
ATTRIBUTE	VALUE
Display Footer	<input type="checkbox"/>
Footer Variables	
NM_FOOTER_DATA	<input type="text"/>
NM_FOOTER_LOGO	<input type="text"/>
NM_FOOTER_TITLE	<input type="text"/>

Application Footer Settings

This page may change depending on the footer template chosen in the Layout Settings.

Display Footer

This option determines if we want to display the footer or not.

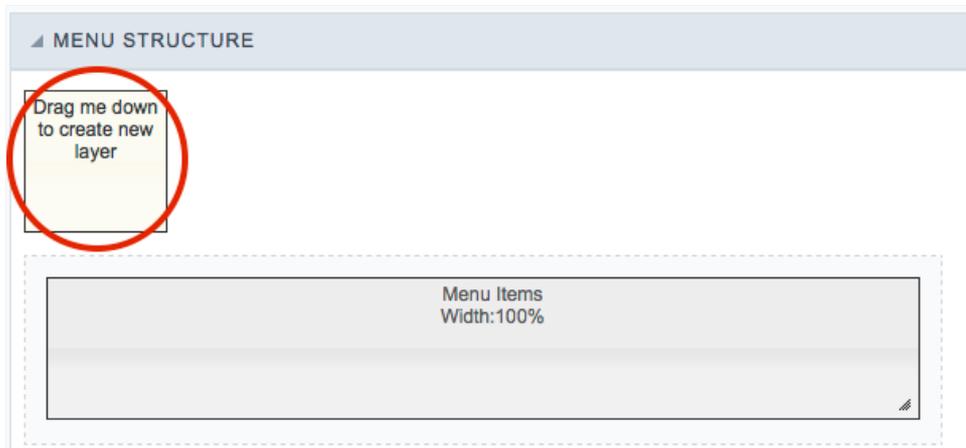

Footer Variables

We must fill the variable fields with one of the types available in the Combobox. Depending on the type, you need to associate content with it. Those are the types:

- **Field:** When you choose the option “**Field**”, it opens a Combobox to choose a field to associate the field value with the header. This option will be enabled in the applications that you can create a fields
- **Date:** It displays the system’s date in “yyyy/mm/dd” format in the header. There are several display formats available, and you can change it by using the text field beside it. To access existing formats, click on the hint to see an explanation.
- **Image:** It displays a field to inform the name of an existing image in the server. You can select an image by clicking on the icon “**Choose Image**”, and you still can upload new images by using the button “**Upload**”. 
- **Value:** It displays the content of the text input. You can inform static texts and “**Global Variables**”. e.g. “Employee Name: [v_name]”.

Menu Structure

Using this option you can change the entire menu structure.

Drag me down to create new layer

Menu Items
Width: 100%

Using this option, you can change the entire menu structure. Drag the selected option to the “Menu Items” area to create a new “Layer” where you can add the contents. You can increase or decrease the layer width and also change its positioning within the “Menu items” area.

After adding the layer and customize its size, you can click on the “pencil” icon to edit the layer options or click on the “trash” icon to delete it.

Layer editing

Name

Use this option to set a name for the layer.

Width

It changes the layer size by using percentages or pixels. You need to change the “Menu Width” option within the Menu “Settings”. This value is in percentage as default.

Display

This option sets whether to display the layer or not.

Alignment

Using this option, you can change the alignment of all layer contents in the Left, Right, or Center.

Type

Using this option, you can select the data type of each row of the layer.

***Title**: It displays the application title, according to the value set on “Application Title” within the menu “Header & Footer”.

***Date**: It displays a date using your preferred date format. Example: d-m-Y

***Image**: Add an image to the menu. Use the link to access the Image Manager from Scriptcase to choose an image or upload a new one.

***Value**: It displays the content of the text input. You can inform static texts and “**Global Variables**” such as the logged user, for example: [usr_login].

***Library**: Select an External Library from Scriptcase. You can import or create new libraries using the option “Tools » External Libraries” from the Scriptcase main menu.

***Method**: Select an application method to apply to the layer. Create new methods by using the option “PHP Programming” within the menu “Programming.”

Font

Select one of the available font families from the list. Change the font size and set the text as bold and/or italic.

Background color

Change the background color of each row of the layer content.

Font color

Change the color for the text in the layer.

Delete

It allows deleting the layer line.

Add

It allows adding another line to the layer.

Close

It closes the edit screen of the layer.

Save

Save all changes for the layer.

HelpCase Link	WebHelp ▾

Application Code

Informs the current name of the application and the version in which it was created

Application Code	menu (9.06.0014)
------------------	------------------

Language

Defines a specific language for the application, overriding the default language defined in the project. If no language is selected, the application will inherit the project's default language.

The languages listed in the option are defined in the project properties

Editing by Project

By disabling this option, only the user who created the application will have access to its settings.

No other project users will be able to access the application.

In the image below, the menu application has the edit by project option disabled.

<input checked="" type="checkbox"/>	 menu	Click here to edit	Main menu	admin	08/09/21 16:27	updated	Run
<input type="checkbox"/>	 treemenu	Click here to edit	Click here to edit	admin		outdated	Run Edit Copy Rename

Session Location

Defines if the language of the applications will be stored

Charset

Defines an application-specific charset.

If no value is selected, the application inherits the project's default charset.

Ideally, this charset option, within the application's settings, does not have a defined value. Different usage of your base charset can cause problems saving information in your tables.

Schemes in Session

When active, this option allows the theme stored in the session to be used by the application.

For example, by selecting theme x at login, all applications in the project will use the selected theme.

If the option is unchecked, the application remains with its original theme.

Folder

Folder where the application is stored in [Project Explorer](#).

Description

Displays the description of the application.

You can edit or add a description also in the [Project Explorer](#) interface.

Extra Application Icons

It stores the images that will be used in the application through codes in the events, causing these images to be sent along with the application at the time of publication.

Only images used in codes, such as creating a dynamic menu with icons or creating a bill of exchange using a blank, need to be added.

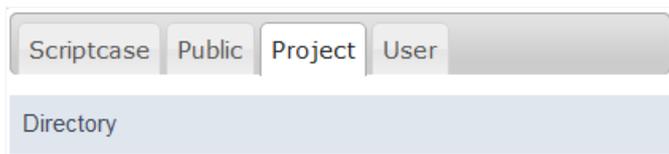

Images added in HTML Image fields or in the application header, for example, are already sent with the applications.

The added images will be stored in this directory: `../_lib/img/`

How to use the images

When inserting the image in the image manager, its name is changed according to the **scope** (public, project or user) and the **storage directory** (background, button, icon, menu or general) following the following pattern.

Scope: It refers to the level of access to the file within Scriptcase, in the development environment.

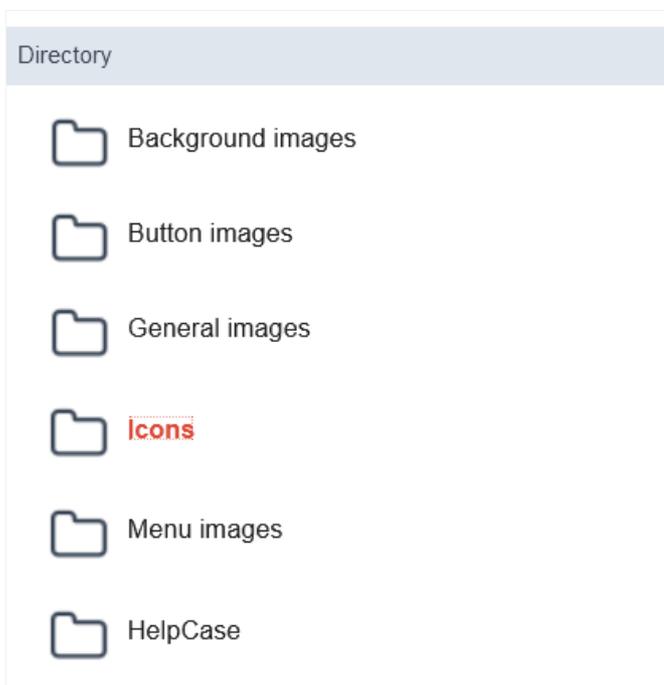

- Scriptcase__ - Contains preexisting images in the tool, where it is not possible to upload new images.
- Public__ - Images accessible for all projects.
- Project__ - Images accessible only in the project in which it was inserted.
- User__ - Images accessible only to the user who uploaded the image.

Each scope adds a prefix to the image name.

- Public - **sys__NM__**
- Project - **grp__NM__**
- User - **usr__NM__**

Storage Directory: Directory where the image will be added. Each directory adds one more prefix to the image name.

- background images - **bg__NM__**
- button images - **btn__NM__**
- general images - **img__NM__**
- icons - **ico__NM__**
- menu images - **menu_img__NM__**

This way, an image called `_001.jpg`, added in the public scope and in the icon directory will be named **sys__NM__ico__NM__001.jpg**

HelpCase Link

Associates HelpCase files to your application.

This configuration can be done expressly in the HelpCase settings, where it is possible to change this option for all project applications. [See how by clicking here.](#)

The HelpCase button must be selected in the toolbar to be able to access the selected page.

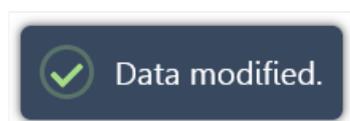

Notifications Settings

Notification settings	
ATTRIBUTE	VALUE
Use SweetAlert	<input checked="" type="checkbox"/>
SweetAlert position using Toast	Top right <input type="button" value="v"/>

Use SweetAlert

Activate SweetAlert in the application, replacing the “confirm” and “alert” of the browser.

Confirm Example with SweetAlert Enabled

Confirm Example with SweetAlert Disabled

SweetAlert position using Toast

Sets the display position of the message window using toast.

SweetAlert position using Toast	Center <input type="button" value="v"/>
	<ul style="list-style-type: none"> Top left Top center Top right Center left <li style="background-color: #f0f0f0;">Center Center right Bottom left Bottom center Bottom right

Convert menu type

Convert Menu to Tree Menu
Would you like to convert your Menu application to Tree Menu ?
<input type="button" value="Convert"/>

Scriptcase makes available two types of menu application, they are: Tree Menu and Menu(Horizontal).

This tool allows the conversion of an application from **Menu** to **Menu Tree** or from **Menu Tree** to **Menu**, keeping header and item settings as well as event codes.

The menu conversion only changes its format, keeping all the settings of the original application.

Menu Programming

ScriptCase has incorporated the concept of Object Oriented programming, using attributes, resources, methods and libraries. It is possible to create your own business rules in applications, and by using these concepts you can reap huge rewards in terms of better organization and improved development.

Attributes

The attributes are variables that has the global scope declared in the application. An attribute that can be referenced in all the methods and the application's events.

The screenshot shows a web interface titled 'ATTRIBUTES SETTINGS'. It features a table with two columns: 'ATTRIBUTE' and 'VALUE'. Below the table, there is a section labeled 'Attributes'. This section contains an input field labeled 'Attribute Name', four blue buttons labeled 'Include', 'Update', 'Delete', and 'Clean', and a vertical scrollbar on the right side.

Attributes configuration Interface.

Attribute Name : This field allows to inform the attributes name, after typing the name just click on **include**. In case you want to **update** click on the attributes name (located on the buttons' right side), do the necessary modifications and click on update. In case it is necessary to **delete** an attribute, it is necessary to do same process as the update, but when selecting the attribute, it is necessary to click on the delete button. The **clear** button, as the name suggests, it clears the list of all the attributes listed on the right.

Internal libraries

To use the internal libraries just select the correspondent (Project Libraries for example). This process allows the methods existing in the library, to be visible in all the application's Events and Methods.

See how to manage the libraries by [clicking here](#).

The screenshot shows a web interface titled 'INTERNAL LIBRARIES - SCRIPTCASE'. It displays a list of internal libraries for different sessions: 'INTERNAL LIBRARIES - PUBLIC', 'INTERNAL LIBRARIES - PROJECT: PROJECT1', and 'INTERNAL LIBRARIES - USER: ADMIN'. Each session shows 'No library found for this session.'

Internal Libraries management Interface

PHP Methods

Methods are function or procedures declared by the developer, that helps when applying the routines. Using methods in the applications allows to reuse your code throughout the application, optimizing the development experience.

Creating a new method

- Give the method a name and click Create. As in the image below.

PHP methods are incorporated into the same class, so it is not possible to use two functions with the same name even when used in different methods.

A dialog box titled 'New Method - PHP'. It has a text input field for 'Name' containing 'new_method' and a blue 'Create' button below it.

- Methods can receive parameters.

- Add the amount of variables:

A dialog box titled 'Definition of the parameters of the method:'. It shows the method name 'new_method' and a list with one item: '• No defined parameter.'. At the bottom, there is an 'Add' button, a text input field containing '1', the label 'Parameter(s)', a 'Cancel' button, and a 'Save' button.

- Defining the variables:

A dialog box titled 'Insertion of Parameters'. It has a table with three columns: 'Name', 'Type', and 'Value Standard'. The 'Type' column has a dropdown menu open, showing 'For Value' (selected) and 'For References'. Below the table are 'Save', 'Back', and 'Cancel' buttons.

Name	Type	Value Standard
	For Value	

- **Name** : Type in the variable's name.
- **Type** : Selecting the type of variables: For Value or For Reference.

- **Value Standard** : The parameter's value used to initialize when calling the method.

References allows to create a second name for a variable that you can use to read and modify the variable's original information.

- Editing a parameter:

Definition of the parameters of the method:

new_method

Parameters
\$test = test

✓ ✎ ✕

Add 1 Parameter(s) Cancel

Save

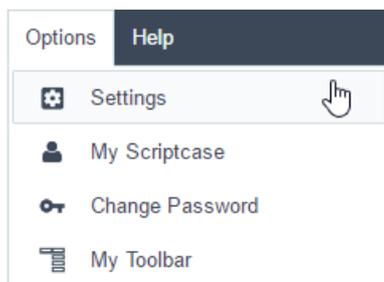

- : Checking all the parameters in the parameter list.
- : Uncheck all the parameters in the parameter list.
- ✎ : Edit the selected parameter of the list.
- ✕ : Deletes the selected variable of the list.

Creating a Menu Application

New Application

With the implementation of the responsive menu, the old menu application was removed from the interface. However, it is still possible to use it, keeping in mind that it does not include some features developed exclusively for the responsive menu.

To enable this functionality, the Scriptcase administrator must access the menu Options > Settings and open the System Settings page.

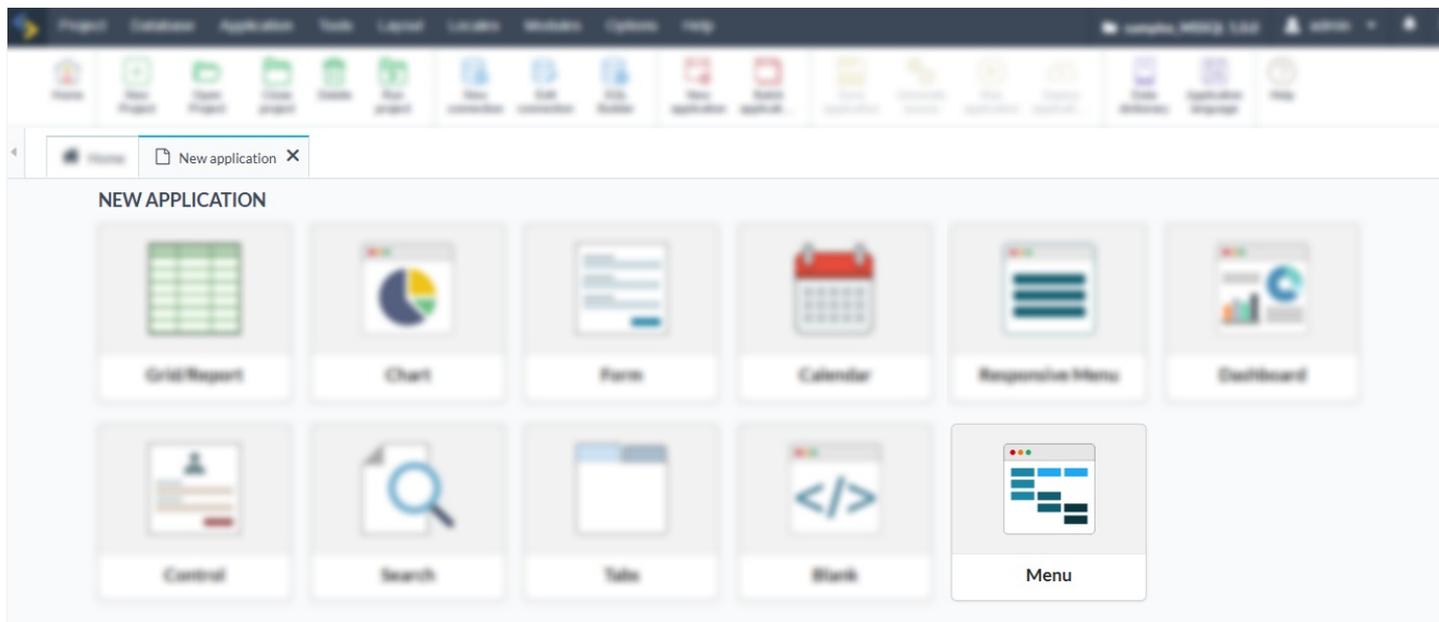

At the bottom of the page, after the foreign key configuration section, you can enable the old menu application to display it as an option when creating new applications.

Mostrar una opción en el asistente de despliegue para almacenar variables de sesión PHP en la base de datos	<input type="radio"/> Sí <input checked="" type="radio"/> No
Pase el ID de la sesión de PHP en la url	<input type="radio"/> Sí <input checked="" type="radio"/> No
Optimización de clave externa	<input checked="" type="radio"/> Sí <input type="radio"/> No
Mostrar aplicación de Menú antigua	<input checked="" type="radio"/> Sí <input type="radio"/> No
Mostrar la aplicación Informe PDF	<input type="radio"/> Sí <input checked="" type="radio"/> No
Timezone	<input type="text" value=""/>

[Actualizar](#)

Once enabled, the application will appear on the new application creation screen, as shown in the image below.

Application Data

 A screenshot of the 'MENU' application configuration dialog. The dialog has a title bar with 'MENU' and a small icon. Below the title bar are two tabs: 'APPLICATION DATA' and 'THEME'. The 'APPLICATION DATA' tab is active. It contains the following fields:

- Name ***: A text input field containing the text 'menu'.
- Localization**: A dropdown menu with the text 'Inherit project default language' and a small edit icon to its right.
- Create Tree Menu**: A checkbox that is currently unchecked.

Name

The name of the application being created. It cannot contain special characters.

Localization

The language of the application to be created. The project's default language is automatically selected.

Create Tree Menu

Allows you to create a menu application in a tree format, where the elements are organized hierarchically with expandable options.

Theme

On this screen, you can select the theme that the application will use. The default project theme, which can be checked and modified in **Project > Properties**, is automatically selected.

Menu SQL Settings

SQL Settings	
ATTRIBUTE	VALUE
Connection	<input type="text"/>

The Connection field defines the connection that will be used by the application. In Menu type application, it is not mandatory to select a connection.

By default, the connection field has no value after creating a menu type application.

In menu applications, it is only necessary to select a connection to use some code in the events, for example, to create a dynamic menu.

Menu Mobile Optimization

The Mobile settings allows to define the automatic optimization of generated applications to run on mobile devices.

See below the available settings.

Mobile optimization

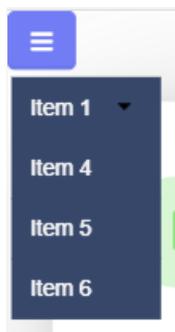

Mobile optimization	
ATTRIBUTE	VALUE
Menu format	Horizontal ▾
Menu mobile	Normal ▾
Hide menu	<input checked="" type="checkbox"/>
Menu's initial mode	Hide ▾
Float menu	<input checked="" type="checkbox"/>
Hide menu by clicking an item	<input checked="" type="checkbox"/>
Hide menu icon	<input checked="" type="checkbox"/>

Menu Format

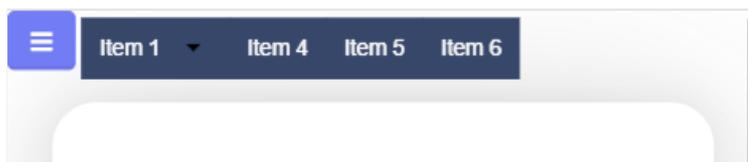

Sets the menu items orientation when the **Menu mobile** option is set to **normal** value

The menu can be displayed vertically or horizontally. See the examples below.

Vertical menu example

Horizontal menu example

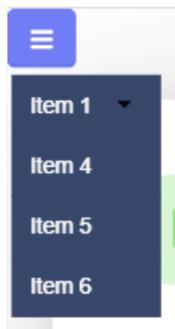

Mobile Menu

Sets the menu display format in two ways: **normal** and **navigation**

Normal

Sets the menu display format in two ways: **normal** and **navigation**

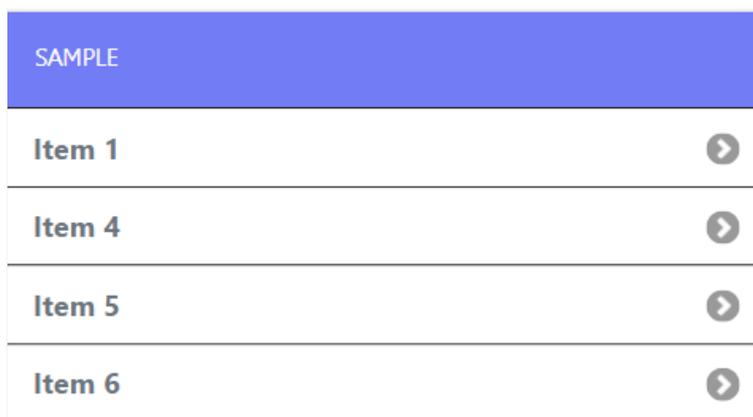

Sample normal menu

Navigation

This type of menu expands and takes up the entire screen, so that navigation is limited to only the options of the selected item.

Sample Navigation Menu

hide the menu

Defines whether the menu can be collapsed or will remain fixed on the screen.

When **enabled**, this feature allows the end user to hide the menu. If the developer chooses to **disable this option**, the menu items will continue to be displayed on the screen.

The behavior of the hide menu option is defined in the detailed options below and are enabled only when activating the hide menu feature.

Initial state of the menu

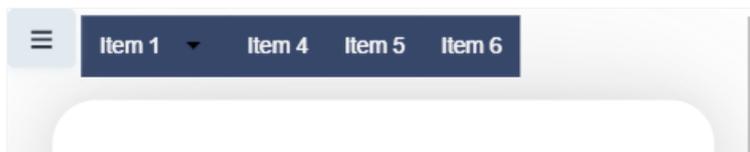

Only available when the **Hide menu** option is enabled. This setting defines the initial state of the menu.

The options are **Open** and **Hide**.

Open

This value displays the menu items on the initial access to the application, without the need to click on the button to expand the menu.

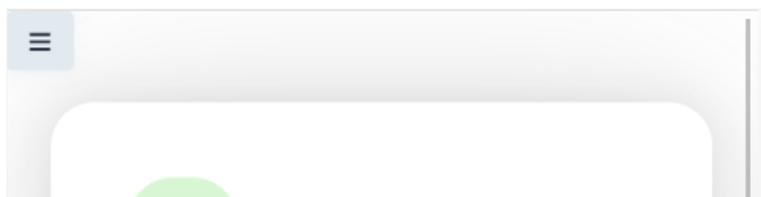

Example of open starting menu

Hide

In this option the menu items will not be displayed in the initial load of the application, it is necessary to create the button to expand the menu to perform the navigation.

Example of menu starting closed

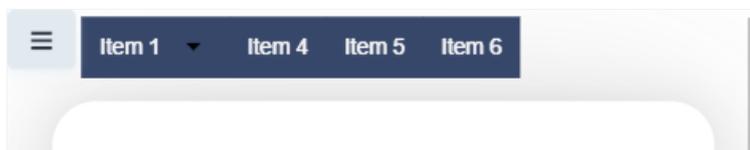

float menu

Defines how the items are opened in relation to the application.

When enabled, items will be displayed floating, overlaying the application without changing its display.

When disabled, items will be opened together with the application, occupying space and moving it away during the period it is open.

Example with option enabled

Example with the option disabled

Hide menu when clicking an item

This feature allows menu items to be collapsed when clicking on one of the items to open an application.

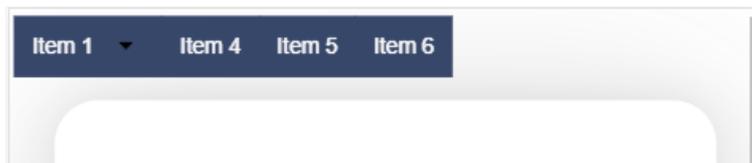

Hide menu icon

Defines whether the Hide Menu button will always be visible.

This option is only available if the **Hide menu when clicking an item** is enabled.

Enabled

In this case, the hide menu button will also be hidden when clicked, returned to display as soon as an item is clicked to open an application.

Disabled

In this case, the hide menu button will always be visible, even when items are being displayed.

Tree Menu Settings

Desktop

The menu settings allow to define the attributes of the application display, according to the following:

Menu Settings ?		
ATTRIBUTE	VALUE	DESCRIPTION
Horizontal Alignment of the Menu	<input type="text" value="Left"/>	Horizontal alignment mode of the menu.
Vertical Alignment of the items	<input type="text" value="Top"/>	Vertical alignment mode of the menu items.
Horizontal Alignment of the Items	<input type="text" value="Left"/>	Horizontal alignment mode of the menu items.
Toolbar Horizontal Alignment	<input type="text" value="Left"/>	Alignment Mode of the toolbar items
Friendly URL	<input type="text"/>	Friendly URL
Menu Width	<input type="text" value="100%"/>	Table size width in pixels or percentage where the menu will be placed.
Menu Height	<input type="text"/>	Table size height in pixels or percentage where the menu will be placed.
Iframe Width	<input type="text" value="100%"/>	Iframe width in pixels or percentage where the application will be loaded.
Iframe Height	<input type="text" value="100%"/>	Iframe height in pixels or percentage where the application will be loaded.
Hide menu items.	<input type="checkbox"/>	When security is being used, rather than disable the menu item, it hides the item. The item must have link to be able to be hidden.
Hide the menu's toolbar	<input type="checkbox"/>	When used with the security, instead of calling the toolbar item it will hide the item.
Use theme background	<input checked="" type="checkbox"/>	If set to Yes, will use the background theme of the menu, if set to No, will be used to set the background theme of the project.
Scroll bar	<input type="checkbox"/>	Allow scroll bar.
Select Language	<input type="checkbox"/>	Select the language on the bar menu.
Select Theme	<input type="checkbox"/>	Select theme on the top menu.
Alignment of Theme and Language	<input type="text" value="Right"/>	Horizontal alignment of theme and language on the menu.
Always show the items	<input checked="" type="checkbox"/>	Show items even if the applications do not exist or if they were not generated.
Hide menu	<input type="checkbox"/>	Enables the option to hide the menu
Use expand/collapse	<input type="checkbox"/>	Enables an option that allows user to expand the application area, hiding menu items and header.

Menu configuration Interface.

- **Horizontal Alignment of the Menu:** Defines the horizontal alignment of the menu (Left, Center, Right).
- **Vertical Alignment of the items:** Defines the vertical alignment of the menu items (Top, Center, Bottom).
- **Horizontal Alignment of the Items:** Defines the horizontal alignment of the menu items (Left, Center, Right).
- **Toolbar Horizontal Alignment:** Defines the horizontal alignment of the toolbar items (Left, Center, Right).
- **Friendly URL:** Allows defining a name for the URL that's going to be called by the application. The characters allowed in the URL are(a-z, A-Z, 0-9). You still can inform the Friendly URL on the project home, where there is a list of applications with

the “Friendly URL” column.

- **Menu Width:** Define the width of the menu in pixels or percentages.
- **Menu Height:** Define the height of the menu in pixels or percentages.
- **Iframe Width:** Define the width of the Iframe (Where the applications will open in) in pixels or percentages.
- **Iframe Height:** Define the height of the Iframe (Where the applications will open in) in pixels or percentages.
- **Hide Menu Items:** This attribute defines whether the menu item will be displayed or not. When enabled, items are hidden if they do not have a link, the application has active security (without user access), or the item is disabled using the `sc_menu_disable` macro. When disabled, the items will always be displayed.
- **Hide the menu's toolbar:** When enabled and used with the security module, it'll hide the toolbar that the user doesn't have permission to access, instead of only disabling them.
- **Use theme background:** If enabled, it'll use the background theme of the menu. Else it'll use the background defined in the project.
- **Scroll bar:** Enables the scroll bar in the Iframe.
- **Select Language:** Allows to select the language in the menu bar.
- **Select Theme:** Allows to select the theme in the menu bar.
- **Alignment of Theme and Language:** Defines the horizontal alignment of the language and theme comboboxes.
- **Always show the items:** Displays the application items, even though they don't exist, or haven't been generated yet.
- **Hide menu:** Enables the option to hide the menu.

Navigation

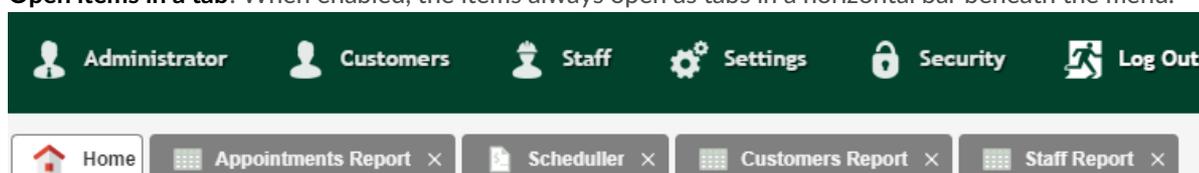

The menu navigation settings allow to define the attributes of the tabs and the navigation path, according to the following:

Navigation		
ATTRIBUTE	VALUE	DESCRIPTION
Open itens in a tab	<input checked="" type="checkbox"/>	Open the menu itens in a different tab above the application
Tab context menu	<input checked="" type="checkbox"/>	Creates a context menu to manage the menu tabs
Menu tabs navigation	<input checked="" type="checkbox"/>	Activates the tab navigation when many tabs are opened at the same time.
Minimum tab width	<input type="text"/>	Minimum tab width to standardize the sizes of all the tabs
Maximum tab width	<input type="text"/>	Maximum width of the tab, if the width exceed this the text will be hidden
Use default icons in the tab	<input checked="" type="checkbox"/>	Uses the standard icons when the menu tab has no icon
Use default icons in the item	<input type="checkbox"/>	Uses the standard icons when the menu item has no icon
Show navigation breadcrumb	<input type="checkbox"/>	Show the navigation breadcrumb each time an opened application calls another application.
Default Application	<input type="text" value="Blank"/>	Menu initial application.

Menu Navigation

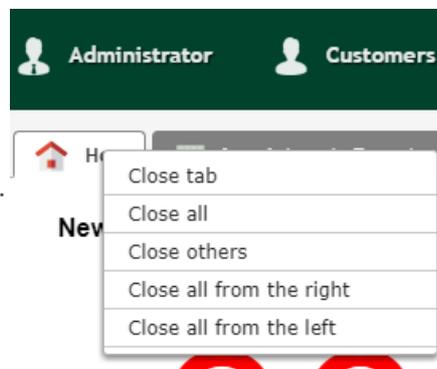

configurations Interface.

- **Open items in a tab:** When enabled, the items always open as tabs in a horizontal bar beneath the menu.

Navigating

through Applications with tabs.

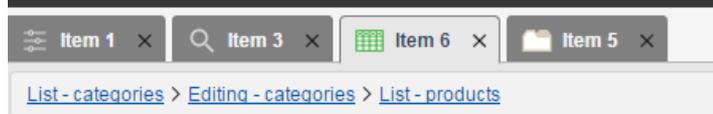

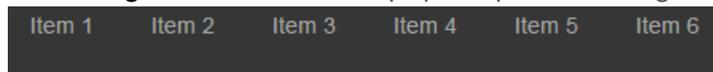

Application with a

- **Context menu of the Tabs:** Allows you to manage the open tabs.

context menu.

- **Minimum tab-width:** Allows to inform the min-width of all the tabs.
- **Maximum tab-width:** Allows to inform the max-width of all the tabs.
- **Show navigation breadcrumb:** Displays the path containing the application in the tab.

Navigation path Display in the Application.

- **Use default icons in the item:** When enabled, this option displays the standard icons for each item.
- **Use default icons in the tab:** When enabled, this option displays the standard icons for each tab.
- **Default Application:** Select a default application initiate when the menu opens.
- **Show the initial app as a tab:** Allows to open the default application in a tab.

Mobile

Menu Items

Menu items settings

In this Screen the user have the settings to configure all the menu structure, below you will see how to use each setting.

Insert Item

With this button, the user can add a new item to the menu structure. Every time the user clicks in the button will generate a new item with the id.

Ex: Item 1

Insert Subitem

With this button, the user can add a new subitem in the menu structure. Every time the user clicks in the button will generate a new subitem but differently from the Insert item, when pressed will generate a subitem inside a subitem, so, to have all the items inside the same, the user must select the first item(The father item).

Remove Item

With this button, the user can delete an item or subitem by selecting it on the checkbox.

Import Applications

With this button, the user can select the applications want to use as menu items, this way the user doesn't need to create an item and then link the application to it.

Move Up

With this button, the user can move the position of the item up.

Move Down

With this button, the user can move the position of the item up.

Move Left

With this button, the user can move the position of the item left, this will make the item to be add as a subitem or not.

Move Right

With this button, the user can move the position of the item right, this will make the item to be add as a subitem or not.

Properties

In this settings, the user can configure how the item will look in the Menu.

Properties

ID: (item_1)

<p>Text</p> <input style="width: 90%;" type="text" value="Item 1"/>	<p>Hint</p> <input style="width: 90%;" type="text"/>
<p>Link</p> <input style="width: 95%;" type="text"/>	
<p>Icon position</p> <input style="width: 90%;" type="text" value="Icon on the left"/>	<p>Display</p> <input style="width: 90%;" type="text" value="Text and image"/>
<p>Icon</p> <input style="width: 90%;" type="text"/>	<p>Target</p> <input style="width: 90%;" type="text" value="This window"/>
<p>Active tab icon</p> <input style="width: 90%;" type="text"/>	<p>Inactive tab icon</p> <input style="width: 90%;" type="text"/>

ID

This option shows the actual item that is being edited.

Text

In this option the user configure the text that will be shown in the menu item.

Hint

In this option the user can configure a help text when the mouse is over the item.

Link

In this option the user configure the application that will be open when the link is clicked.

Display

In this option the user can configure how the item will be displayed. There are two options:

- Text and Image - Show the item with an imagem and a text side by side.

- Text and icon Font Awesome - Show the item with an icon from the Font Awesome library and a text side by side.

Icon

If in the display option is selected Text and Image here the user will select the image to be along with the text. If in the display option is selected Text and icon Font Awesome here the user will select the icon to be along with the text.

Active tab icon

This option allows the user to select the icon or image (same condition to the Icon settings from above) to be shown when the item is activated.

Inactive Tab icon

This option allows the user to select the icon or image (same condition to the Icon settings from above) to be shown when the item is deactivated.

Target

This option allows to select what will happens when the user clicks on the item. There are three options:

- This Window - Will open the application in the same window.
- New Window - Will open a new window for the application be displayed.
- Leave - Will exit the application, most used with the login application to return to the login.

Security

Use security

With this option enabled, when accessing the application, an “unauthorized user” message will be displayed, preventing access to the application.

When enabled, application access is only possible through the macro **sc_apl_status** or through **security module**.

[Click here](#) to access the macro documentation sc_apl_status.

In the development environment, the use of the above options for testing purposes may be suppressed, preventing the password being requested or access being blocked at each execution of the applications. To do this, disable the options “Enable security usage” and “Enable password usage” in the menu **Configuration > My Scriptcase**.

Security exit url

Defines which application the user will be redirected to after the “unauthorized user” warning.

Use password

When enabling the option, you will be asked to define a password for accessing the application.

When running the application using the active password, you will be asked for the password before accessing the application.

The password will be requested regardless of the “use security” setting or the use of the security module.

Request password only once

This option defines the behavior of the use password option.

When this option is enabled, the password will be requested only once per session.

When disabling, the password will be requested every time the application will be accessed.

Allow direct calling by URL

Allows an application to be called by typing the URL directly into browsers.

When disabled, when accessing the application by typing the URL directly, the invalid data error will be displayed. With this configuration, the application can only be accessed through a menu application, for example.

Cookies

HttpOnly

These are cookies that can be set by the server or by javascript but cannot be accessed in any way by javascript.

With the HTTPOnly parameter enabled, it is very difficult to steal a session through XSS because the javascript cannot read the content of these cookies.

A widely exploited attack in XSS is the theft of user session cookies. Theft of cookies is carried out through a javascript command that sends cookies to an external URL where the attacking user has control.

This option is enabled by default in all applications.

Session ID

Enables the session id that will be stored in cookies on the client side. This option embeds the session id directly in the URLs

This option is enabled by default in all applications.

Cookie Secure

With this option enabled, cookies are protected and can only be transmitted via secure communication. Therefore, they cannot be accessed through Javascript.

The HttpOnly option must also be enabled.

Headers

Disable XSS Auditor

XSS is short for Cross-Site Scripting, which is an attack that consists of sending HTML with malicious JavaScript to a website.

It is a security attack that consists of sending HTML with malicious JavaScript to a website. If the website displays this HTML with JavaScript without filtering the malicious JavaScript code, the cookies sent by the website can be stolen and sent to an attacking website, so that it can be used to forge user sessions and access the website's user account without permissions.

Strict-Transport-Security

HSTS forces browsers to use HTTPS in the domain where it is enabled, instead of using HTTP.

When enabled, the default value is "max-age = 31536000".

The HSTS policy is set for one year (31536000 seconds). This period specifies the time the browser will access the server via HTTP

X-Frame-Options

The HTTP X-Frame-Options response header can be used to indicate whether or not the browser should render the page in a `<frame>`, `<iframe>`, `<embed>` " or '". This header provides protection against clickjacking, known as 'click swipe' - this vulnerability can steal relevant information and data from the user.

X-Frame-Options does not allow the rendering of a page in a frame, ensuring that the content of your page is not embedded in other sites

- **SAMEORIGIN:** The SAMEORIGIN directive allows the page to be loaded in a frame from the same source as the page itself. This option must be used so that the application with clickjacking protection can be used in the menu application.
- **DENY:** This directive completely disables page loading in a frame.

If no option is selected, the application can be used on any `<frame>`, `<iframe>`,

or `<object>`, allowing the application to be incorporated into another website.

X-Content-Type-Options

X-Content-Type-Options is used to protect against MIME detection vulnerabilities. With this option enabled, it prevents browsers from interpreting the page content (sniffing) and executing the data as code / tag. These vulnerabilities can occur when uploading a text file with a javascript code and the browser reading the content that is in the file and executing, even though it is just text and not part of the code.

With this enabled, the HTTP X-Content-Type-Options header is defined, by default, as "no detection".

Referrer-Policy

no-referrer.

The Referer header will be omitted completely. No reference information will be sent with requests.

no-referrer-when-downgrade.

This is the default behavior when no policy is specified, or if the value provided is invalid.

origin.

Only send the origin of the document as a reference. For example, a document at `https://example.com/page.html` will send the reference `https://example.com/`.

origin-when-cross-origin.

Sends the origin, path and query string when performing a same-origin request, but only sends the origin of the document in other cases.

same-origin.

The reference will be sent to sources on the same site, but requests between sources will not send reference information.

strict-origin.

Only send the document source as a reference when the security protocol level remains the same (HTTPS → HTTPS), but do not send it to a less secure recipient (HTTPS → HTTP).

strict-origin-when-cross-origin.

Sends the source, path and query string when performing a request from the same source, only sends the source when the security protocol level remains the same during an inter-source request (HTTPS → HTTPS), and sends no header to recipients less secure (HTTPS → HTTP)

unsafe-url.

Sends the source, path and query chain when performing any request, regardless of security.

Feature-Policy

The value of this header is a policy or set of policies that you want the browser to respect for a particular source.

The source whitelist can take on several different values:

- ``*:`` The feature is allowed in top-level navigation contexts and in nested navigation contexts (iframes).
- ``self:`` The feature is allowed in top-level navigation contexts and nested navigation contexts from the same source. It is not allowed in documents of cross origin in nested browsing contexts.
- ``none:`` The feature is not allowed in top-level browsing contexts and is not allowed in nested browsing contexts.
- ``<origin (s)>:`` specific sources for which to enable the policy (for example `https://example.com`).

Example 1 - Using only one directive Let's say you want to prevent all content from using the geolocation API on your site. You can do this by submitting a restricted 'none' whitelist to the geolocation resource:

Feature-Policy: ``geolocation 'none``

Example 2 - Using more than one directive Functionalities within a policy are separated by semicolons.

Feature-Policy: `unsized-media 'none'; geolocation 'self' https://example.com; camera *;``

Directives

accelerometer

Controls whether the current document is allowed to collect information about the acceleration of the device

via the Accelerometer interface.

ambient-light-sensor

Controls whether the current document is allowed to collect information about the amount of light in the environment around the device through the AmbientLightSensor interface.

autoplay

Controls whether the current document is allowed to play the requested media automatically via the HTMLMediaElement interface. When this policy is disabled and there is no user action, the Promise returned by HTMLMediaElement.play () will reject it with a DOMException. The autoplay attribute on <audio> " and " elements will be ignored.

battery

Controls whether the use of the Battery Status API is allowed. When this policy is disabled, the Promise returned by Navigator.getBattery () will reject it with a NotAllowedError DOMException.

camera

Controls whether the current document is allowed to use inputs from video devices. When this policy is disabled, the Promise returned by getUserMedia () will reject it with a NotAllowedError DOMException.

display-capture

Controls whether or not the current document is allowed to use the getDisplayMedia () method to capture screen content. When this policy is disabled, the Promise returned by getDisplayMedia () will reject it with a NotAllowedError if permission is not obtained to capture the contents of the screen.

document-domain

Control whether the current document is allowed to place document.domain. When this policy is disabled, attempts to place document.domain will fail and cause a SecurityError DOMException to be thrown.

encrypted-media

Controls whether the current document is allowed to use the Encrypted Media Extensions (EME) API. When this policy is disabled, the Promise returned by Navigator.requestMediaKeySystemAccess () will reject it with a DOMException.

execution-while-not-rendered

Controls whether tasks should be performed in frames while they are not rendered (e.g. whether a frame is hidden or display: none).

execution-while-out-of-viewport

Controls whether tasks should be performed in frames while they are outside the visible viewing window.

fullscreen

Controls whether the current document is allowed to use Element.requestFullscreen (). When this policy is disabled, the returned Promise rejects it with a TypeError DOMException.

geolocation

Controls whether the current document is allowed to use the Geolocation interface. When the policy is disabled, calls to getCurrentPosition () and watchPosition () will cause function callbacks to be invoked with a PositionError of PERMISSION_DENIED.

gyroscope

Controls whether the current document is allowed to collect information about the orientation of the device through the Gyroscope interface.

layout-animations

Controls whether the current document is allowed to show layout animations.

legacy-image-formats

Controls whether the current document is allowed to show images in legacy formats.

magnetometer

Controls whether the current document is allowed to collect information about the orientation of the device through the Magnetometer interface.

microphone

Controls whether the current document is allowed to use inputs from audio devices. When this policy is disabled, the Promise returned by `MediaDevices.getUserMedia ()` will reject it with a `NotAllowedError`.

midi

Controls whether the current document is allowed to use the Web MIDI API. When this policy is disabled, the Promise returned by `Navigator.requestMIDIAccess ()` will reject it with a `DOMException`.

navigation-override

Controls the availability of mechanisms that enable the author of the page to take control over the behavior of spatial navigation, or to cancel completely.

oversized-images

Controls whether the current document is allowed to download and display large images.

payment

Controls whether the current document allows the use of the Payment Request API. When this policy is disabled, the `PaymentRequest ()` constructor will throw a `SecurityError DOMException`.

picture-in-picture

Controls whether the current document allows a video to be allowed to play in Picture-in-Picture mode via the corresponding API.

publickey-credentials-get

Controls whether the current document is allowed to use the Web Authentication API to retrieve already stored public key credentials, i.e. via `navigator.credentials.get ({publicKey: ..., ...})`.

sync-xhr

Controls whether the current document is allowed to make synchronous XMLHttpRequest requests.

usb

Controls whether the current document is allowed to use the WebUSB API.

vr

Controls whether the current document is allowed to use the WebVR API. When this policy is disabled, the Promise returned by `Navigator.getVRDisplays ()` will reject it with a `DOMException`. Keep in mind that the WebVR standard is in the process of being replaced by WebXR.

wake-lock

Controls whether the current document is allowed to use the Wake Lock API to indicate that the device should not go into a power saving mode.

screen-wake-lock

Controls whether the current document is allowed to use the Screen Wake Lock API to indicate whether or not the device should darken the screen.

xr-spatial-tracking

Controls whether or not the current document is allowed to use the WebXR Device API to interact with the WebXR session.

Content-Security-Policy

Content-Security-Policy is the name of an HTTP response header that modern browsers use to increase the security of the document (or web page).

The Content-Security-Policy header allows you to restrict resources such as JavaScript, CSS or just about anything the browser loads.

Directives**default-src**

The default-src directive defines the standard policy for fetching features such as JavaScript, Images, CSS, Fonts, AJAX requests, Frames, HTML5 Media. Not all directives go back to default-src. Refer to the Source List Reference for possible values.

DEFAULT-SRC Policy Example `default-src 'self' cdn.example.com;`

script-src

Defines valid JavaScript sources.

SCRIPT-SRC Policy Example `script-src 'self' js.example.com;`

style-src

Defines valid fonts for style sheets or CSS.

EXAMPLE__STYLE-SRC POLICY `style-src 'self' css.example.com;`

img-src

Defines valid image sources.

Example of IMG-SRC Policy `img-src 'self' img.example.com;`

connect-src

Applies to XMLHttpRequest (AJAX), WebSocket, fetch (), `<a ping>` or EventSource. If not allowed, the browser emulates a 400 HTTP status code. `__Connect-SRC Policy Example__ connect-src 'self';``

font-src

Defines valid fonts for font resources (loaded via @ font-face).

FONT-SRC Policy Example `font-src font.example.com;``

object-src

Defines valid plug-in sources, for example `<object>` or `<applet>`.

Example OBJECT-SRC Policy `object-src 'self';`

media-src

Defines valid audio and video sources, for example `<audio>`, HTML5, `<video>` elements.

Example of MEDIA-SRC Policy `media-src media.example.com;`

frame-src

Defines valid fonts for loading frames. In CSP, Level 2 `frame-src` has been deprecated in favor of the `child-src` directive. CSP Level 3, has not been replaced with `frame-src` and will continue to postpone `child-src` if not present.

Example FRAME-SRC `frame-src 'self';`

sandbox

Enables a sandbox for the requested resource similar to the `iframe` `sandbox` attribute. The sandbox applies a policy of the same origin, avoids pop-ups, plug-ins and blocks the execution of scripts. You can keep the `sandbox` value empty to keep all restrictions in place, or add values: `allow-forms allow-same-origin allow-scripts allow-popups allow-modals allow-orientation-lock allow-pointer-lock allow-presentation allow-popups-to-escape-sandbox allow-top-navigation`

Example of SANDBOX policy `sandbox allow-forms allow-scripts;`

report-uri

Instructs the browser to POST policy crash reports to this URI. You can also use `Content-Security-Policy-Report-Only` as the HTTP header name to instruct the browser to send reports only (does not block anything). This directive was discontinued at CSP Level 3 in favor of the `report-to` directive.

Example REPORT-URI `report-uri / some-report-uri;`

child-src

Defines valid fonts for web workers and nested browsing contexts loaded using elements such as `<frame>` and `<iframe>`.

Example of FILHO-SRC Policy `child-src 'self'`

form-action

Defines valid fonts that can be used as an `<form>` HTML action.

Example action policy example `form-action 'self';`

frame-ancestors

Defines valid fonts for embedding the resource using `<frame>` `<iframe>` `<object>` `<embed>` `<applet>`. Setting this directive to `'none'` should be roughly equivalent to `X-Frame-Options: DENY FRAME-ANCESTORS` `EXAMPLE POLICY frame-ancestors 'none';`

plugin-types

Defines valid MIME types for plug-ins called via `<object>` and `<embed>`. To load one, `<applet>` you must specify `application / x-java-applet`.

PLUG-IN TYPES Policy Example ``plugin-types application / pdf;``

base-uri

Defines a set of allowed URLs that can be used in the attribute of an HTML basetag.

URI-BASE Policy Example ``` base-uri 'self'; ```

report-to

Defines a report group name defined by an HTTP Response Report-Header. See the reporting API for more information.

Example Report for Policy `report-to groupName;`

worker-src

Restricts URLs that can be loaded as Worker, SharedWorker or ServiceWorker.

WORKER-SRC Policy Example `worker-src 'none';``

manifest-src

Restricts URLs where application manifests can be loaded.

Example of MANIFEST-SRC Policy `manifest-src 'none';``

prefetch-src

Defines valid sources for pre-fetching and pre-rendering of requests, for example, through the linktag with rel = "prefetch" or rel = "prerender":

`__ PREFETCH-SRC Policy Example__ prefetch-src 'none'``

navigate-to

Restricts the URLs to which the document can navigate by any means. For example, when a link is clicked, a form is submitted or window.location is called. If form-action is present, this directive will be ignored for submitting forms. Implementation status

Navigation Policy Example ``navigate-to example.com``

Tree Menu Log Configuration

This interface allows you to define a Log schema to the app. The Log schema tracks what the end-users are doing in the app. Those are the events it can tracks: Access, Insert, Update, and delete.

To learn how to create a Log schema [see here](#).

LOG	
ATTRIBUTE	VALUE
Schema	log <input type="button" value="⋮"/>
Events	<input type="text"/> <input type="button" value="Add >>"/> <input type="text" value="Access"/> <input type="button" value="Remove <<"/>

Application Log configuration

Schema Select an existing log schema for the application.

Events You can select just specific events to save in the log.

Tree Menu Events Overview

Most Scriptcase applications, with the exception of Tabs and Dashboard applications, have events that can be used to create business rules, validations and changes to the application's CSS, among other things.

When events are executed?

Each event is executed at a certain moment in the application and has an execution order, for this reason, they have different functions within the creation of a business rule and validations.

They can be triggered automatically, as in the case of the **onApplicationInit** and **onScriptInit** events, where they are executed when the application starts. Also, they can be triggered through user interaction, as with the **onNavigate** and **onValidate** events, which are executed when browsing the application or submitting a form, respectively.

For information about the timing of events execution or other information, access the documentation of the desired event.

how they work?

By default, the events already have handle for opening `<?php` and closing `?>` of PHP tags, so they are ready to receive PHP code and macros from Scriptcase.

However, it is possible to use other languages in the event, such as **JQuery**, **JavaScript**, **CSS** and **HTML**. For this, it is necessary to close the PHP tag `?>` of the event, so that the code can be added.

Remembering that it is necessary to reopen the event's PHP tag `<?php`, otherwise the application will not run correctly.

When closing the PHP tag in a Scriptcase event, the executed language is HTML.

Example of using other languages:

onApplicationInit - Tree Menu

This event occurred before the application execute the SQL, and execute only once. Is used to do verification of variables, and security verification.

onExecute - Tree Menu

This event works only in the "menu" applications and are executed when an application is called through a link of the menu. Normally are used to the decision taking before the application execution named `sc_script_name`.

onLoad - Tree Menu

This event occurs when loading a horizontal / vertical menu. In this case, we can execute some security policy, for example, if you try to access the menu directly, without first going through a login form, we can test a session variable defined in the login form, redirect the flow to the initial application. if(!isset([var_id_user]) or empty([var_id_user])) { sc_redirect("login.php"); }

Code Editor

Scriptcase has Events to allow the developers to customize the application code. By using the events, the developers can program custom actions at a specific execution time (e.g. After a record is inserted, when it is loaded, upon submitting a Form, ...) and for a specific application type. In the events area you can use global and local variables, JavaScript, CSS, HTML, PHP codes and also Scriptcase macros.

Scriptcase code editor is used within events and has a series of shortcuts to help in the applications development.

At the top section of the editor, there are some options that allows us to change the editor theme or expand it, for example. These options can also be activated using the hotkeys.

- - Increases the area occupied by your code editor.
- - Expand the sides of the code editor.
- - Activates the search in the code editor.
- - Enables replace in the code editor.
- - Defines the code editor theme.

The hotkeys are available in all browsers compatible with Scriptcase.

[Click Here](#) to view the Scriptcase hotkeys documentation.

Tree Menu Layout Setting

This module lets you editing display options for the application. You can apply visualization themes, organize blocks, define values, and the display format of the Header and Footer.

Layout Settings

ScriptCase creates an app by using default values defined per project, but you can change those values for a specific application on this interface.

▲ LAYOUT SETTINGS

Header Template	<input type="text" value="Flat"/>	Template name used for the application header.
Footer Template	<input type="text" value="Default"/>	Template name used for the application footer.
Button	<input type="text"/>	Use different buttons than what was defined in the color scheme.
Themes	<input type="text" value="Sc9_Rhino"/>	Use different themes from the one defined for the color scheme

Application Layout

Settings

Header Template

Allows choosing the look of the application Header.

Footer Template

Allows choosing the look of the application Footer.

Button

Allows choosing the button theme for the application.

Themes

Choose one of the selected themes in the project properties. It defines the look of the application, like colors, fonts, and others.

Header

Here we can define if we want to display the header or not, the application title, and fill the header variables. The header looks according to the selected template in the Layout settings interface.

▲ HEADER	
ATTRIBUTE	VALUE
Display Header	<input checked="" type="checkbox"/>
Insertion Title	<input type="text" value="{lang_othr_frmi_tit} - orders"/>
Update Title	<input type="text" value="{lang_othr_frmu_tit} - orders"/>
Header Variables	
SC_HEADER	<input type="text" value="Title"/>
SC_VALUE	<input type="text" value="Date"/> ?

Application Header Configuration

Display Header

This option determines if we want to display the header or not.

Title

Allows informing the title of the application.

Header Variables

We must fill the variable fields with one of the types available in the Combobox. Depending on the type, you need to associate content with it. Those are the types:

- **Field:** When you choose the option “**Field**”, it opens a Combobox to choose a field to associate the field value with the header. This option will be enabled in the applications that you can create a fields
- **Title:** It displays the value of “**Application Title**” in the header.
- **Date:** It displays the system’s date in “yyyy/mm/dd” format in the header. There are several display formats available, and you can change it by using the text field beside it. To access existing formats, click on the hint to see an explanation.
- **Image:** It displays a field to inform the name of an existing image in the server. You can select an image by clicking on the icon “**Choose Image**”, and you still can upload new images by using the button “**Upload**”. 
- **Value:** It displays the content of the text input. You can inform static texts and “**Global Variables**”. e.g. “Employee Name: [v_name]”.

Depending on the Application, you may have more than one title option.

Footer

FOOTER	
ATTRIBUTE	VALUE
Display Footer	<input type="checkbox"/>
Footer Variables	
NM_FOOTER_DATA	<input type="text"/>
NM_FOOTER_LOGO	<input type="text"/>
NM_FOOTER_TITLE	<input type="text"/>

Application Footer Settings

This page may change depending on the footer template chosen in the Layout Settings.

Display Footer

This option determines if we want to display the footer or not.

Footer Variables

We must fill the variable fields with one of the types available in the Combobox. Depending on the type, you need to associate content with it. Those are the types:

- **Field:** When you choose the option "**Field**", it opens a Combobox to choose a field to associate the field value with the header. This option will be enabled in the applications that you can create a fields
- **Date:** It displays the system's date in "yyyy/mm/dd" format in the header. There are several display formats available, and you can change it by using the text field beside it. To access existing formats, click on the hint to see an explanation.
- **Image:** It displays a field to inform the name of an existing image in the server. You can select an image by clicking on the icon "**Choose Image**", and you still can upload new images by using the button "**Upload**". 
- **Value:** It displays the content of the text input. You can inform static texts and "**Global Variables**". e.g. "Employee Name: [v_name]".

HelpCase Link	WebHelp ▾

Application Code

Informs the current name of the application and the version in which it was created

Application Code	menu (9.06.0014)
------------------	------------------

Language

Defines a specific language for the application, overriding the default language defined in the project. If no language is selected, the application will inherit the project's default language.

The languages listed in the option are defined in the project properties

Editing by Project

By disabling this option, only the user who created the application will have access to its settings.

No other project users will be able to access the application.

In the image below, the menu application has the edit by project option disabled.

<input checked="" type="checkbox"/>	 menu	Click here to edit	Main menu	admin	08/09/21 16:27	updated	Run
<input type="checkbox"/>	 treemenu	Click here to edit	Click here to edit	admin		outdated	Run Edit Copy Rename

Session Location

Defines if the language of the applications will be stored

Charset

Defines an application-specific charset.

If no value is selected, the application inherits the project's default charset.

Ideally, this charset option, within the application's settings, does not have a defined value. Different usage of your base charset can cause problems saving information in your tables.

Schemes in Session

When active, this option allows the theme stored in the session to be used by the application.

For example, by selecting theme x at login, all applications in the project will use the selected theme.

If the option is unchecked, the application remains with its original theme.

Folder

Folder where the application is stored in [Project Explorer](#).

Description

Displays the description of the application.

You can edit or add a description also in the [Project Explorer](#) interface.

Extra Application Icons

It stores the images that will be used in the application through codes in the events, causing these images to be sent along with the application at the time of publication.

Only images used in codes, such as creating a dynamic menu with icons or creating a bill of exchange using a blank, need to be added.

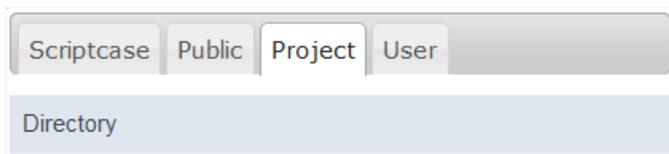

Images added in HTML Image fields or in the application header, for example, are already sent with the applications.

The added images will be stored in this directory: `../_lib/img/`

How to use the images

When inserting the image in the image manager, its name is changed according to the **scope** (public, project or user) and the **storage directory** (background, button, icon, menu or general) following the following pattern.

Scope: It refers to the level of access to the file within Scriptcase, in the development environment.

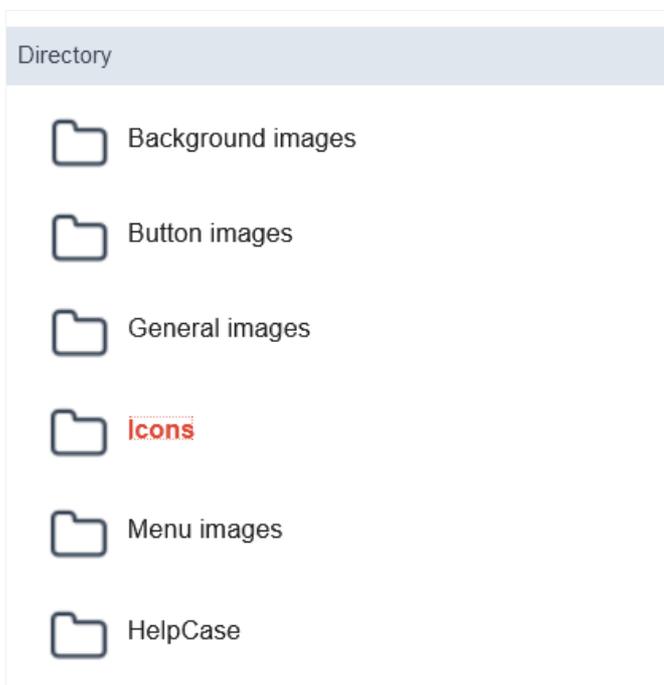

- Scriptcase__ - Contains preexisting images in the tool, where it is not possible to upload new images.
- Public__ - Images accessible for all projects.
- Project__ - Images accessible only in the project in which it was inserted.
- User__ - Images accessible only to the user who uploaded the image.

Each scope adds a prefix to the image name.

- Public - **sys__NM__**
- Project - **grp__NM__**
- User - **usr__NM__**

Storage Directory: Directory where the image will be added. Each directory adds one more prefix to the image name.

- background images - **bg__NM__**
- button images - **btn__NM__**
- general images - **img__NM__**
- icons - **ico__NM__**
- menu images - **menu_img__NM__**

This way, an image called `_001.jpg`, added in the public scope and in the icon directory will be named **sys__NM__ico__NM__001.jpg**

HelpCase Link

Associates HelpCase files to your application.

This configuration can be done expressly in the HelpCase settings, where it is possible to change this option for all project applications. [See how by clicking here.](#)

The HelpCase button must be selected in the toolbar to be able to access the selected page.

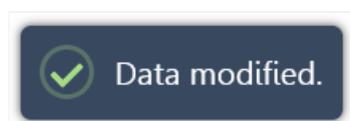

Notifications Settings

Notification settings	
ATTRIBUTE	VALUE
Use SweetAlert	<input checked="" type="checkbox"/>
SweetAlert position using Toast	Top right <input type="button" value="v"/>

Use SweetAlert

Activate SweetAlert in the application, replacing the “confirm” and “alert” of the browser.

Confirm Example with SweetAlert Enabled

Confirm Example with SweetAlert Disabled

SweetAlert position using Toast

Sets the display position of the message window using toast.

SweetAlert position using Toast	Center <input type="button" value="v"/>
	<ul style="list-style-type: none"> Top left Top center Top right Center left <li style="background-color: #f0f0f0;">Center Center right Bottom left Bottom center Bottom right

Convert menu type

Convert Menu to Tree Menu
Would you like to convert your Menu application to Tree Menu ?
<input type="button" value="Convert"/>

Scriptcase makes available two types of menu application, they are: Tree Menu and Menu(Horizontal).

This tool allows the conversion of an application from **Menu** to **Menu Tree** or from **Menu Tree** to **Menu**, keeping header and item settings as well as event codes.

The menu conversion only changes its format, keeping all the settings of the original application.

Tree Menu Programming

ScriptCase has incorporated the concept of Object Oriented programming, using attributes, resources, methods and libraries. It is possible to create your own business rules in applications, and by using these concepts you can reap huge rewards in terms of better organization and improved development.

Attributes

The attributes are variables that has the global scope declared in the application. An attribute that can be referenced in all the methods and the application's events.

The screenshot shows a web interface titled 'ATTRIBUTES SETTINGS'. It features a table with two columns: 'ATTRIBUTE' and 'VALUE'. Below the table, there is a section labeled 'Attributes' containing an input field for 'Attribute Name'. To the right of the input field are four blue buttons: 'Include', 'Update', 'Delete', and 'Clean'. A vertical scrollbar is visible on the right side of the interface.

Attributes configuration Interface.

Attribute Name : This field allows to inform the attributes name, after typing the name just click on **include**. In case you want to **update** click on the attributes name (located on the buttons' right side), do the necessary modifications and click on update. In case it is necessary to **delete** an attribute, it is necessary to do same process as the update, but when selecting the attribute, it is necessary to click on the delete button. The **clear** button, as the name suggests, it clears the list of all the attributes listed on the right.

Internal libraries

To use the internal libraries just select the correspondent (Project Libraries for example). This process allows the methods existing in the library, to be visible in all the application's Events and Methods.

See how to manage the libraries by [clicking here](#).

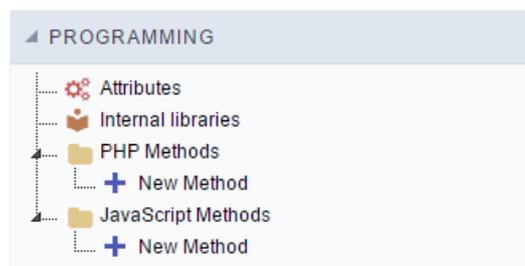

The screenshot shows a web interface titled 'INTERNAL LIBRARIES - SCRIPTCASE'. It displays a tree view with four categories: 'INTERNAL LIBRARIES - SCRIPTCASE', 'INTERNAL LIBRARIES - PUBLIC', 'INTERNAL LIBRARIES - PROJECT: PROJECT1', and 'INTERNAL LIBRARIES - USER: ADMIN'. Each category has a checkbox and a message 'No library found for this session.'

Internal Libraries management Interface

PHP Methods

Methods are function or procedures declared by the developer, that helps when applying the routines. Using methods in the applications allows to reuse your code throughout the application, optimizing the development experience.

Creating a new method

- Give the method a name and click Create. As in the image below.

PHP methods are incorporated into the same class, so it is not possible to use two functions with the same name even when used in different methods.

A dialog box titled 'New Method - PHP'. It has a text input field for 'Name' containing 'new_method' and a blue 'Create' button below it.

- Methods can receive parameters.

- Add the amount of variables:

A dialog box titled 'Definition of the parameters of the method:'. It shows the method name 'new_method' and a list with one item: '• No defined parameter.'. At the bottom, there is an 'Add' button, a text input field containing '1', the text 'Parameter(s)', a 'Cancel' button, and a 'Save' button.

- Defining the variables:

A dialog box titled 'Insertion of Parameters'. It contains a table with three columns: 'Name', 'Type', and 'Value Standard'. The 'Type' column has a dropdown menu open, showing 'For Value' (selected) and 'For References'. Below the table are 'Save', 'Back', and 'Cancel' buttons.

Name	Type	Value Standard
	For Value	

- **Name** : Type in the variable's name.
- **Type** : Selecting the type of variables: For Value or For Reference.

- **Value Standard** : The parameter's value used to initialize when calling the method.

References allows to create a second name for a variable that you can use to read and modify the variable's original information.

- Editing a parameter:

Definition of the parameters of the method:

new_method

Parameters
\$test = test

Add 1 Parameter(s) Cancel

Save

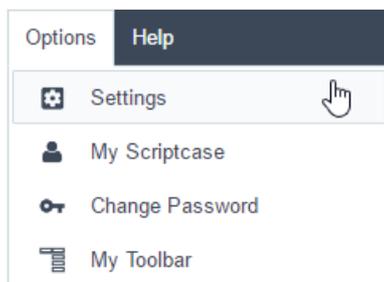

- : Checking all the parameters in the parameter list.
- : Uncheck all the parameters in the parameter list.
-  : Edit the selected parameter of the list.
-  : Deletes the selected variable of the list.

Creating a Tree Menu Application

New Application

With the implementation of the responsive menu, the old menu application was removed from the interface. However, it is still possible to use it, keeping in mind that it does not include some features developed exclusively for the responsive menu.

To enable this functionality, the Scriptcase administrator must access the Options > Settings menu and open the System Settings page.

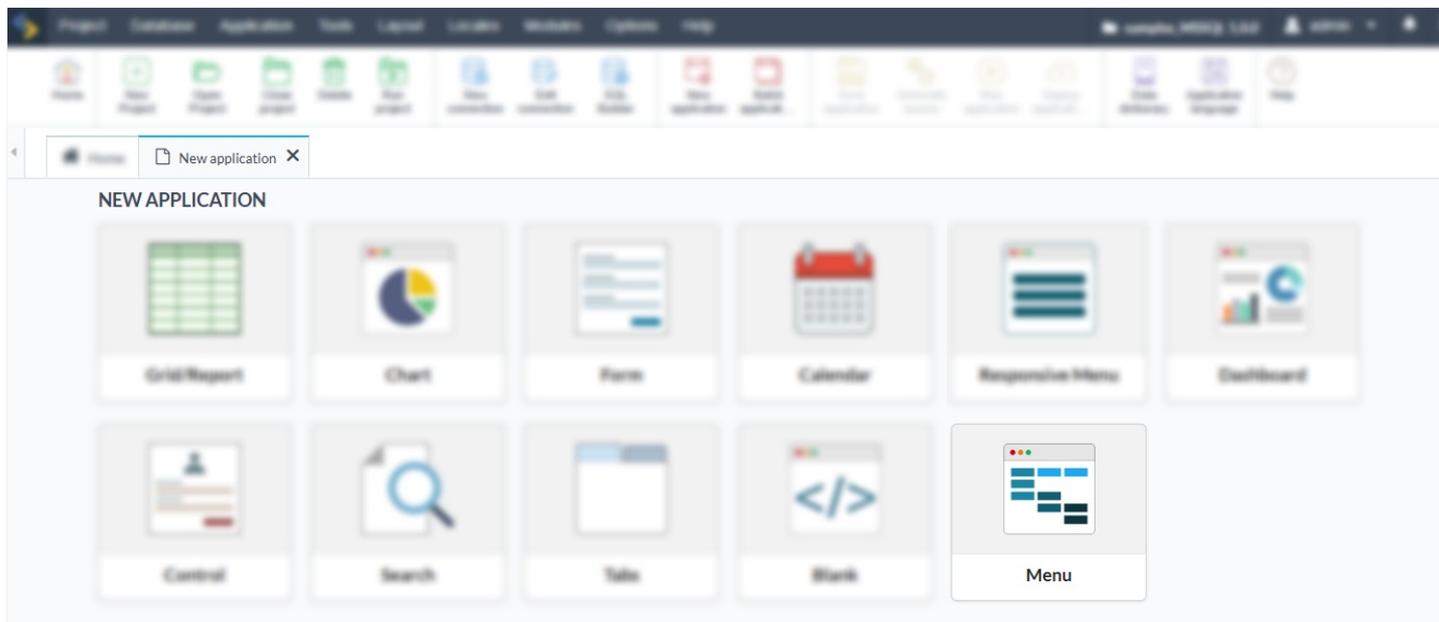

At the bottom of the page, after the foreign key configuration section, you can enable the old menu application to display it as an option when creating new applications.

Mostrar una opción en el asistente de despliegue para almacenar variables de sesión PHP en la base de datos	<input type="radio"/> Sí <input checked="" type="radio"/> No
Pase el ID de la sesión de PHP en la url	<input type="radio"/> Sí <input checked="" type="radio"/> No
Optimización de clave externa	<input checked="" type="radio"/> Sí <input type="radio"/> No
Mostrar aplicación de Menú antigua	<input checked="" type="radio"/> Sí <input type="radio"/> No
Mostrar la aplicación Informe PDF	<input type="radio"/> Sí <input checked="" type="radio"/> No
Tiempozone	<input type="text"/>

[Actualizar](#)

Once enabled, the application will appear on the new application creation screen, as shown in the image below.

Application Data

To create a menu in tree format, simply check the “Create Tree Menu” option when setting up the new menu application. This will automatically enable the hierarchical structure with expandable options.

M

Tree Menu Mobile Optimization

The Mobile settings allows to define the automatic optimization of generated applications to run on mobile devices.

See below the available settings.

Mobile optimization

Mobile optimization	
ATTRIBUTE	VALUE
Menu format	Horizontal ▾
Menu mobile	Normal ▾
Hide menu	<input checked="" type="checkbox"/>
Menu's initial mode	Hide ▾
Float menu	<input checked="" type="checkbox"/>
Hide menu by clicking an item	<input checked="" type="checkbox"/>
Hide menu icon	<input checked="" type="checkbox"/>

Menu Format

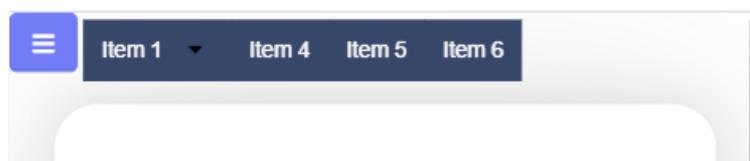

Sets the menu items orientation when the **Menu mobile** option is set to **normal** value

The menu can be displayed vertically or horizontally. See the examples below.

Vertical menu example

Horizontal menu example

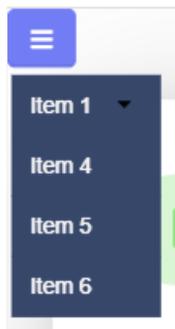

Mobile Menu

Sets the menu display format in two ways: **normal** and **navigation**

Normal

Sets the menu display format in two ways: **normal** and **navigation**

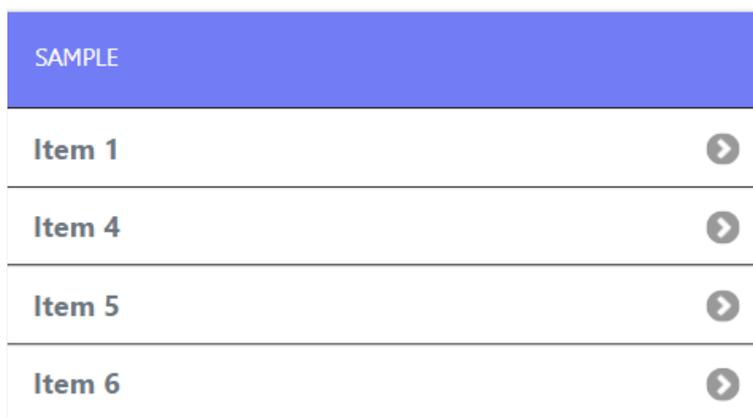

Sample normal menu

Navigation

This type of menu expands and takes up the entire screen, so that navigation is limited to only the options of the selected item.

Sample Navigation Menu

hide the menu

Defines whether the menu can be collapsed or will remain fixed on the screen.

When **enabled**, this feature allows the end user to hide the menu. If the developer chooses to **disable this option**, the menu items will continue to be displayed on the screen.

The behavior of the hide menu option is defined in the detailed options below and are enabled only when activating the hide menu feature.

Initial state of the menu

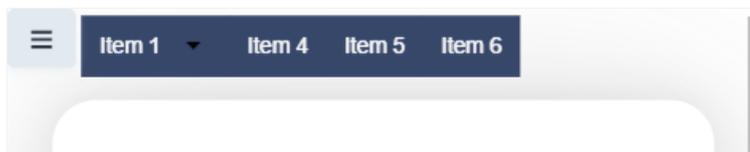

Only available when the **Hide menu** option is enabled. This setting defines the initial state of the menu.

The options are **Open** and **Hide**.

Open

This value displays the menu items on the initial access to the application, without the need to click on the button to expand the menu.

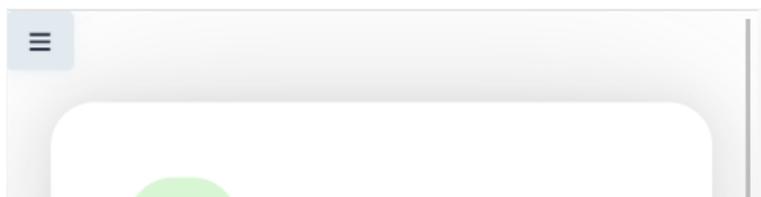

Example of open starting menu

Hide

In this option the menu items will not be displayed in the initial load of the application, it is necessary to create the button to expand the menu to perform the navigation.

Example of menu starting closed

float menu

Defines how the items are opened in relation to the application.

When enabled, items will be displayed floating, overlaying the application without changing its display.

When disabled, items will be opened together with the application, occupying space and moving it away during the period it is open.

Example with option enabled

Example with the option disabled

Hide menu when clicking an item

This feature allows menu items to be collapsed when clicking on one of the items to open an application.

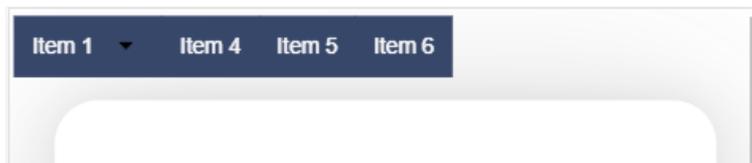

Hide menu icon

Defines whether the Hide Menu button will always be visible.

This option is only available if the **Hide menu when clicking an item** is enabled.

Enabled

In this case, the hide menu button will also be hidden when clicked, returned to display as soon as an item is clicked to open an application.

Disabled

In this case, the hide menu button will always be visible, even when items are being displayed.

Search Application Settings

Through these attributes you can define some general search settings such as alignment, width, search conditions, etc.

Search Settings ?		
ATTRIBUTE	VALUE	DESCRIPTION
Search Criteria	<input type="text" value="AND"/>	Condition for searches with more than one field.
Display Condition	<input type="checkbox"/>	Display the search criteria.
Horizontal Alignment	<input type="text" value="Center"/>	Defines the horizontal alignment of the application.
Friendly URL	<input type="text"/>	Friendly URL
Margins	<input type="text"/> Up <input type="text"/> Down <input type="text"/> Right <input type="text"/> Left	Set the margin.
Keep Values	<input checked="" type="checkbox"/>	Maintain the last search values when accessing the search page again.
Keep columns and sorting	<input checked="" type="checkbox"/>	Keeps last columns and order selection
Table Width	<input type="text" value="0"/>	Width value for the application table.
Table Width Unit	<input type="text" value="Automatic"/>	Measure unit for the width.
Use Iframe	<input type="checkbox"/>	Use iframes to display the Search and the Grid on the same page.
Show Results	<input type="checkbox"/>	Display the search results on the same page when loading the application for the first time using iframes.
Iframe Height	<input type="text" value="1500"/>	Iframe height in pixels where the grid will be displayed.
Case Sensitive	<input checked="" type="checkbox"/>	Use case sensitive.
Use auto-complete in the fields.	<input type="text" value="Defined in the field"/>	Field turns auto-complete automatically based on the existing values in the database.

Search settings interface.

- **Search Criteria** : Using this option you can select the SQL command as “AND” or “OR” to set the search criteria to be used;
- **Display Condition** : If you choose “Yes”, it will be displayed all records when the search fields are blank. If the option set is “No”, no record will be displayed;
- **Horizontal Alignment**: It allows to define the horizontal alignment of the application (Centered, Left, Right).
- **Vertical Alignment**: Allows you to define the initial vertical alignment of the application (Above, Centered and Below).
- **Friendly URL** : This field allows you to change the URL that will be called by the application. Allowed characters are the same available on URLs: a-z, A-Z, 0-9, -_. This option can also be changed on the home screen, at the “Friendly URL” column at the applications list;
- **Margins** : Allows you to set the Search application positioning (margins).
- **Keep Values** : When this option is activated the last searched values are going to be maintained and displayed when the system user returns to the search application screen.
- **Keep columns and sorting** : This option determines if each search should preserve the selected values to the Grid fields columns and sorting, i.e. to each search, these values return to original condition.
- **Table Width** : This option sets the search application HTML width value, it can be in pixels or percent. You need to set the unit within the option “Table Width Unit”.
- **Table Width Unit** : Using this option you can set the Search application width unit;
- **Use Iframe** : When this option is enabled the Search screen and the search results are going to be displayed in the same browser window, using two FRAMES, one above the other. The Search application and the Grid with the results are going to be part of the same page.
- **Show Results** : This option is associated with the “Use Iframe”. When enabled it will initially displays the Search application along with the Grid inside the iframe positioned below the search screen, when disabled initially displays only

the Search screen.

- **Iframe Height** : This option is also associated with the “Use Iframe”. It sets the height, in pixels, of the iframe where the recovered data will be displayed by the search.
- **Case Sensitive** : This option enables the Case Sensitive option.
- **Use auto-complete in the fields** : Using this option you can enable the auto-complete option automatically based on the existing values in the database tables. You can also define this option one by one using the “defined in the field”

Advanced search

Select fields

Adding and Removing Application Fields

The fields must be configured using the selection buttons, located between the columns.

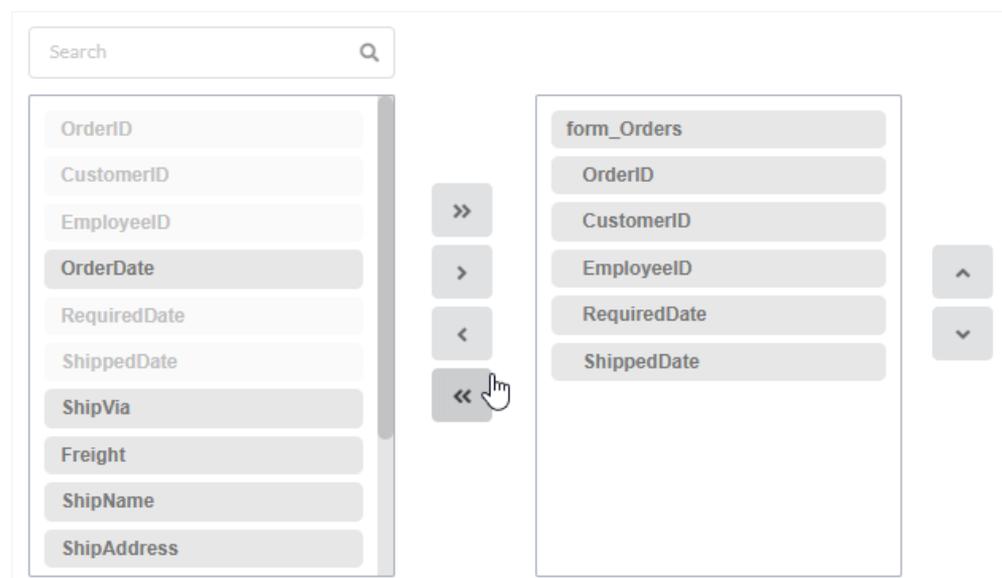

- **>>** - Move all fields to the right.
- **>** - Moves only selected fields to the right
- **<** - Moves only the selected fields to the left.
- **<<** - Move all fields to the left.

In the left column, there are the application fields that are not in use in the filter, while the right column shows all the selected fields and the order in which they will be displayed.

To add fields to the filter, select the fields you want in the filter and click the **>** button.

To select fields in sequence, simply click on a field and drag. Pressing control (Ctrl) allows you to select multiple alternate fields.

Search and positioning

Field display order

The fields will be displayed in the application respecting the order defined in the right column.

The display order must be defined using the sort buttons **^** and **v** which will move the selected fields in the column.

Remembering that the fields must be positioned inside a block (**customers**) which must be inside a page (**Pag1**).

Check below the use of the buttons to order the fields

The screenshot shows a field selection interface. At the top left is a search bar with the text 'Search' and a magnifying glass icon. Below it is a list of fields: OrderID, CustomerID, EmployeeID, OrderDate, RequiredDate, ShippedDate, ShipVia, Freight, ShipName, and ShipAddress. To the right of this list are four arrow buttons: >>, >, <, and <<. In the center is a box labeled 'form_Orders' containing a list of selected fields: OrderID, CustomerID, EmployeeID, RequiredDate, and ShippedDate. To the right of this box are two arrow buttons: ^ and v. A mouse cursor is visible over the 'form_Orders' box.

Save and Restore

Below the columns are two buttons:

- **Save** which records the current placement of fields in columns.
- **Restore** which reorganizes the fields returning to the last position saved.

Restoring the positioning of the fields to the last saved definition.

This screenshot is identical to the one above, showing the field selection interface for 'form_Orders'. However, at the bottom of the interface, there are two buttons: 'Restore' and 'Save'. The 'Save' button is highlighted in blue, while the 'Restore' button is in a light gray color. A mouse cursor is visible over the 'form_Orders' box.

Required

This interface has the options for you to select and set the Search application required fields.

REQUIRED FIELDS

Select required fields.

- customerid
- companyname
- contactname
- contacttitle
- birthdate
- country
- regionid

Required fields interface.

Within the generated application will be displayed a marker(*) next to the field and an error message will also pops up if there's no value assigned to the mandatory fields. You will be able to set some options for the market using the options below.

DISPLAY

ATTRIBUTE	VALUE
Markers positioning	Right
Display message	<input type="checkbox"/>

Marker placement configuration interface.

- **Marker position** : Marker's position relative to the field (options are right, left or Do not display).
- **Display message** : Displays whether or not the validation error message.

Search Criteria

With this interface, you can configure the conditions available for each field of the Search form.

SEARCH CRITERIA

ATTRIBUTE	VALUE	DESCRIPTION
Check the field that is part of the search and select in the right combo-box an option to enable or disable a search option.		
customerid	*Contains	
companyname	*Not Contains	
contactname	*Equal to	
contacttitle	*Empty	
birthdate	.Different	
country	.Beginning with	
regionid	.Greater than	
stateid	.Greater equal	
city	.Less than	
address	.Less equal	
postalcode	.Between two values	
phone	.In	

On/Off

All

None

Search configuration Interface.

We can see the fields list on the left combo. On the right, the list of options for filtering the selected field. To select an option, click on one of them (Equal to, Beginning with, Contains, etc.) and then the button On/Off. The arrows, on the right, allows altering the order of the fields.

For the Date type fields, you can define special conditions for the search, accessing the field configurations, and editing the Special Conditions Settings.

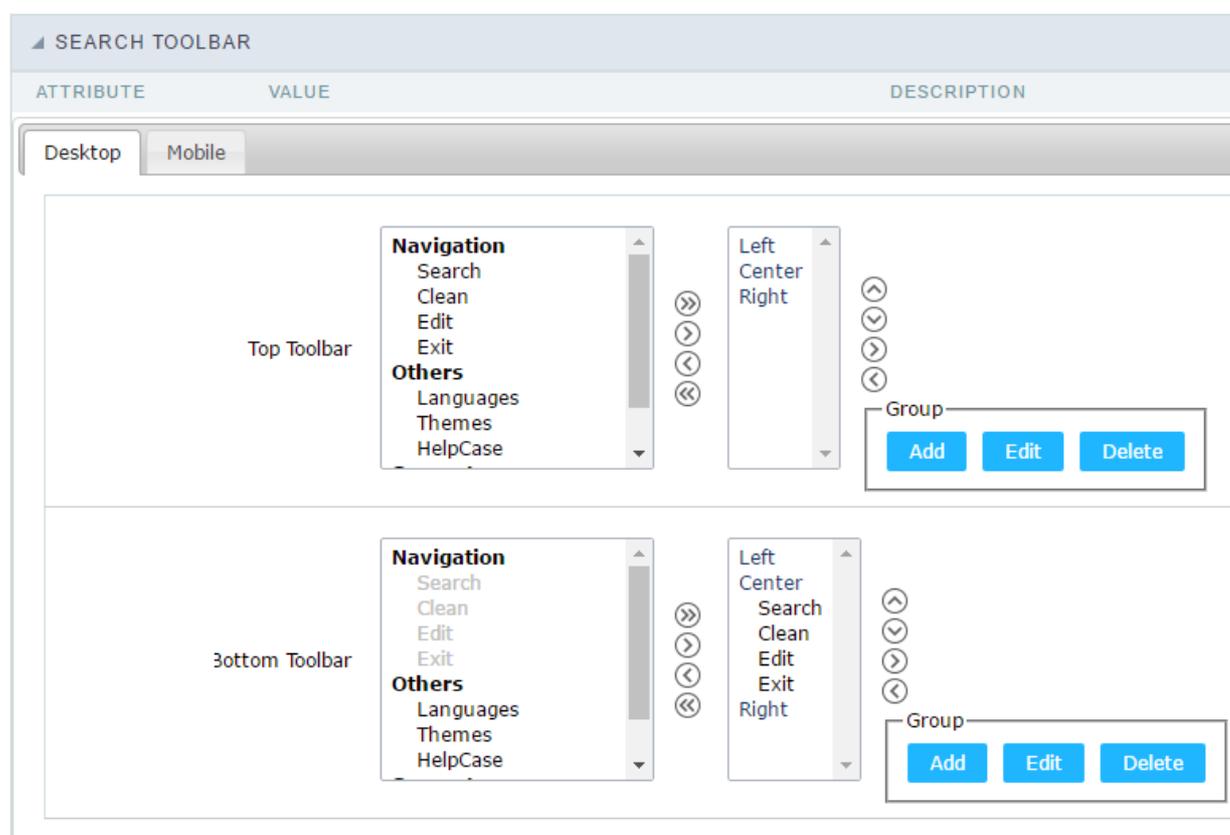

Below the list are the buttons to enable the selected options:

- **On/Off:** Enables or disables the field or the option chosen.
- **All:** Marks all fields or options.
- **None:** Unmarks all the fields or options.

Toolbar

Search Toolbar

The Search toolbar is divided in two parts: Top and Bottom, in a way that is possible to define the buttons that will be displayed in both bars. The selection of buttons in the top and bottom toolbar works independently, allowing the buttons to be displayed in both bars at the same time.

Navigation:

Groups the options relative to the navigation buttons that can be displayed in the application.

- **Search:** Execute the search.
- **Clean:** Clean the all the search fields.
- **Edit:** Enable the **Save Tag** option.
- **Exit:** Exit the application.

Others:

Groups a diversity of options relative to the application.

- **Languages:** Displays a combobox with the names available, defined in the project properties.
- **Themes:** Displays a combobox with the themes available, defined in the project properties.

- **HelpCase:** Displays a button to redirect to the help page.

Separator

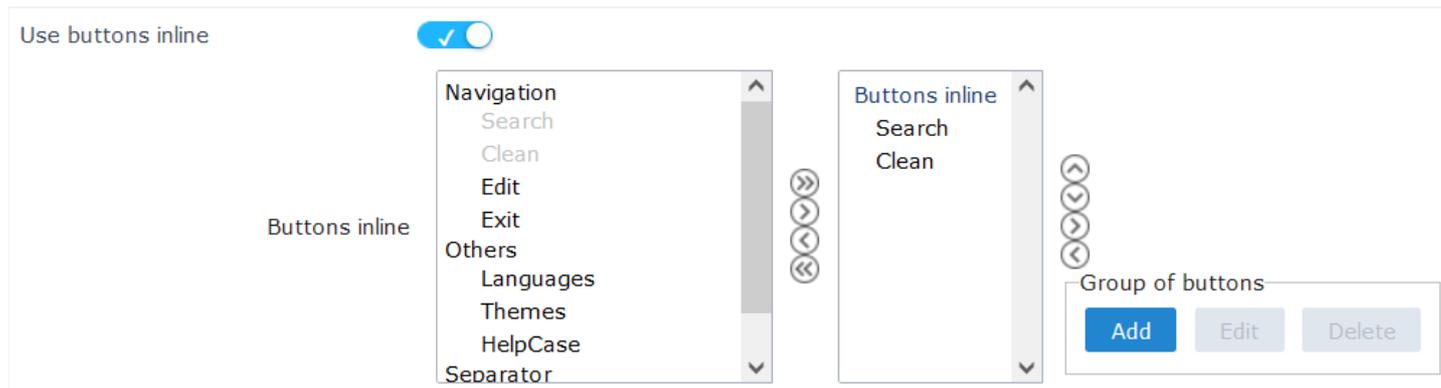

- -----: Displays a line separating the buttons, when used the Group Buttons.

Use in-line buttons:

Allows the alignment of the filter buttons next to the fields.

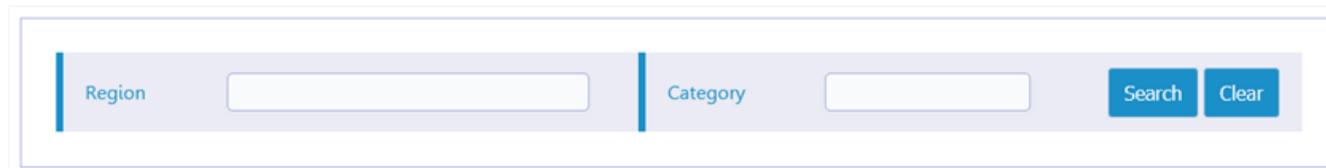

Inline buttons: Allows you to select which buttons will be displayed next to the field, and you can sort them according to your wishes. This option is available by enabling **Use buttons inline** in the button settings.

When activating the **Inline Buttons** option, the screen to configure the buttons will be displayed.

The buttons available in this in-line button option are the same as those shown in the standard toolbar described above.

This is the result when using a radio button on the line

Button Settings

BUTTON SETTINGS

Search Tags.

Save Tag Interface.

Layout Settings

This module lets you editing display options for the application. You can apply visualization themes, organize blocks, define values, and the display format of the Header and Footer.

Blocks

Blocks are “containers” where you can position the application fieldSlides of Forms, Controls, or Grids.

Scriptcase creates applications with one block by default. You can add more blocks as you wish, to organize it in the best way.

See below, the Columns Organization, and where you can define the position of the next block: beside or below the current one.

Block		Title	Label			Fields		Organization		
Op	Name	Label	Display	Display	Position	Columns	Position	Next	Width	Collapse
Pag1										
	form_orders	form_orders	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Pag2										
	Block 2	Block 2	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Blocks not shown										

Application Block configuration

On the left side of each block, there are two icons, the first one to edit the information of the block and the second one to delete the block.

Organizing the position of the Blocks

See below how to modify the display order of the Blocks in one Page.

Click and drag the block that you desire to modify to its new position.

Block		Title	Label			Fields		Organization		
Op	Name	Label	Display	Display	Position	Columns	Position	Next	Width	Collapse
Pag1										
	form_orders	form_orders	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Pag2										
	Block 2	Block 2	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Blocks not shown										

Application Block Display configuration

- See how to remove a block from the display

Click on the block desired and drag it to the item “Blocks not Shown”. This way, you can also drag the block to another page if desired. See the images below.

Block		Title	Label			Fields		Organization		
Op	Name	Label	Display	Display	Position	Columns	Position	Next	Width	Collapse
Pag1										
	form_orders	form_orders	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Pag2										
	Block 2	Block 2	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼
Blocks not shown										
	Block 3	Block 3	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼

Application Block Display configuration

			Block 3	Block 3	<input type="checkbox"/>	<input checked="" type="checkbox"/>	Beside ▼	1	Beside ▼	Below ▼	100%	Start open ▼

Application Block Display configuration

Block

- **Name:** The name that identifier the Block.
- **Label:** Title of the block to display in the application.

Title

- **Display:** It controls the display of the block title.

Label

- **Display:** It controls the display of the field labels of the block.
- **Position:** Options to display label :
 1. **Above:** Display the label above the field.
 2. **Beside:** Display the label beside the field.
 3. **Below:** Display the label below the field.

Fields

- **Columns:** Amount of columns side by side in the block.
- **Position:** The way to display the fields in the block:
 1. **Below:** Display the fields one below the other respecting the number of columns.
 2. **Beside:** Display the fields one beside the other respecting the number of columns.
 3. **Line:** Display the fields one beside the other with no tabulation.

Organization

- **Next:** The way to display the blocks in the page:
 1. **Below:** Set to show the following block below the current one.
 2. **Beside:** Set to show the following block beside the current one.
 3. **Tabs:** Set to show the following block in a different tab then the current one.
- **Width:** Set the block width in pixels or percentages. Use the symbol "%" to indicates the value in percentage.
- **Collapse:** Enables the option to close the block.

Create a New Block

To include new blocks in an Application, click on the button [Create New Block](#). Then, enter the name and label of the block in the following interface and finish by click on Create.

Add New Block	
NAME	<input type="text"/>

Display Footer

This option determines if we want to display the footer or not.

Footer Variables

We must fill the variable fields with one of the types available in the Combobox. Depending on the type, you need to associate content with it. Those are the types:

- **Field:** When you choose the option "**Field**", it opens a Combobox to choose a field to associate the field value with the header. This option will be enabled in the applications that you can create a fields
- **Date:** It displays the system's date in "yyyy/mm/dd" format in the header. There are several display formats available, and you can change it by using the text field beside it. To access existing formats, click on the hint to see an explanation.
- **Image:** It displays a field to inform the name of an existing image in the server. You can select an image by clicking on the icon "**Choose Image**", and you still can upload new images by using the button "**Upload**". 
- **Value:** It displays the content of the text input. You can inform static texts and "**Global Variables**". e.g. "Employee Name: [v_name]".

Search Application SQL Settings

SQL Settings

This interface allows configuring the related database settings, such as the SQL statement, the used database connection, case sensitive, and others.

ATTRIBUTE	VALUE	DESCRIPTION
SQL Select Statement	<pre>SELECT customerid, companyname, contactname, contacttitle, birthdate, country, regionid, stateid, city,</pre>	
Limit	<input type="text"/>	It sets the number of records to be retrieved from the SQL statement.
SQL Preparation	<input type="text"/>	
Connection	<input type="text" value="conn_example"/>	Connection name to access the database.
Use Customized Message	<input type="checkbox"/>	Use a customized error message when the application has no records.
No Records Message	<input type="text"/>	When the application has no records, it will display this customized text.
Font	<input type="text" value="Aa"/>	Font face of the error message.
Font Size	<input type="text" value="12"/>	Font size of the error message.
Font Color	<input type="text" value="#000000"/>	Font color of the error message.
Variable for Table	<input type="text"/>	Variable name used for replacing the table name. Please indicate the name of the table that will be replaced by the variable value.
Fields Variables	<div style="border: 1px solid black; padding: 5px;"> <p>Variable</p> <input type="text"/> <p>customerid</p> </div>	Variables for substitution of the field names on the application. For each dynamically determined field, inform the name of the variable and the field that will be substituted.
Case Sensitive	<input checked="" type="checkbox"/>	Use case sensitive.

Grid

SQL configuration

SQL Select Statement

It allows you to define the primary SQL of the application. You can edit this SQL to add or delete fields.

Limit

Lets you limit the display in the number of records retrieved by SQL query.

SQL Preparation

You can enter SQL commands or procedure names to execute them before the primary SQL of the application.

Connection

It allows defining the database connection of the application. You can change the connection to another one that has the same table.

Use Customized Message

Lets you define to display the “no records” message or not.

No Records Message

Lets you set the message when the application has no records.

Font

This option is available when using the “Use Customized Message” option. It lets you set the font for the message.

Font Size

This option is available when using the “Use Customized Message” option. It lets you to set the font size.

Font Color

This option is available when using the “Use Customized Message” option. It lets you to set the font color.

Variable for Table

It allows to use a variable to change a part of the string containing the table name.

Fill the first input with the name of the variable (replace to). The second input you should fill with the part of the name of the table you want to replace (replace from).

Fields Variables

It allows to use a variable to change a part of the string containing the field name.

Fill the first input with the name of the variable (replace to). The second input you should fill with the part of the name of the field you want to replace (replace from).

Case sensitive

It defines if the database connection uses case sensitive or not.

Security

Use security

With this option enabled, when accessing the application, an “unauthorized user” message will be displayed, preventing access to the application.

When enabled, application access is only possible through the macro **sc_apl_status** or through **security module**.

[Click here](#) to access the macro documentation sc_apl_status.

In the development environment, the use of the above options for testing purposes may be suppressed, preventing the password being requested or access being blocked at each execution of the applications. To do this, disable the options “Enable security usage” and “Enable password usage” in the menu **Configuration > My Scriptcase**.

Security exit url

Defines which application the user will be redirected to after the “unauthorized user” warning.

Use password

When enabling the option, you will be asked to define a password for accessing the application.

When running the application using the active password, you will be asked for the password before accessing the application.

The password will be requested regardless of the “use security” setting or the use of the security module.

Request password only once

This option defines the behavior of the use password option.

When this option is enabled, the password will be requested only once per session.

When disabling, the password will be requested every time the application will be accessed.

Allow direct calling by URL

Allows an application to be called by typing the URL directly into browsers.

When disabled, when accessing the application by typing the URL directly, the invalid data error will be displayed. With this configuration, the application can only be accessed through a menu application, for example.

Cookies

HttpOnly

These are cookies that can be set by the server or by javascript but cannot be accessed in any way by javascript.

With the HTTPOnly parameter enabled, it is very difficult to steal a session through XSS because the javascript cannot read the content of these cookies.

A widely exploited attack in XSS is the theft of user session cookies. Theft of cookies is carried out through a javascript command that sends cookies to an external URL where the attacking user has control.

This option is enabled by default in all applications.

Session ID

Enables the session id that will be stored in cookies on the client side. This option embeds the session id directly in the URLs

This option is enabled by default in all applications.

Cookie Secure

With this option enabled, cookies are protected and can only be transmitted via secure communication. Therefore, they cannot be accessed through Javascript.

The HttpOnly option must also be enabled.

Headers

Disable XSS Auditor

XSS is short for Cross-Site Scripting, which is an attack that consists of sending HTML with malicious JavaScript to a website.

It is a security attack that consists of sending HTML with malicious JavaScript to a website. If the website displays this HTML with JavaScript without filtering the malicious JavaScript code, the cookies sent by the website can be stolen and sent to an attacking website, so that it can be used to forge user sessions and access the website's user account without permissions.

Strict-Transport-Security

HSTS forces browsers to use HTTPS in the domain where it is enabled, instead of using HTTP.

When enabled, the default value is "max-age = 31536000".

The HSTS policy is set for one year (31536000 seconds). This period specifies the time the browser will access the server via HTTP

X-Frame-Options

The HTTP X-Frame-Options response header can be used to indicate whether or not the browser should render the page in a `<frame>`, `<iframe>`, `<embed>` " or '". This header provides protection against clickjacking, known as 'click swipe' - this vulnerability can steal relevant information and data from the user.

X-Frame-Options does not allow the rendering of a page in a frame, ensuring that the content of your page is not embedded in other sites

- **SAMEORIGIN:** The SAMEORIGIN directive allows the page to be loaded in a frame from the same source as the page itself. This option must be used so that the application with clickjacking protection can be used in the menu application.
- **DENY:** This directive completely disables page loading in a frame.

If no option is selected, the application can be used on any `<frame>`, `<iframe>`,

or `<object>`, allowing the application to be incorporated into another website.

X-Content-Type-Options

X-Content-Type-Options is used to protect against MIME detection vulnerabilities. With this option enabled, it prevents browsers from interpreting the page content (sniffing) and executing the data as code / tag. These vulnerabilities can occur when uploading a text file with a javascript code and the browser reading the content that is in the file and executing, even though it is just text and not part of the code.

With this enabled, the HTTP X-Content-Type-Options header is defined, by default, as "no detection".

Referrer-Policy

no-referrer.

The Referer header will be omitted completely. No reference information will be sent with requests.

no-referrer-when-downgrade.

This is the default behavior when no policy is specified, or if the value provided is invalid.

origin.

Only send the origin of the document as a reference. For example, a document at `https://example.com/page.html` will send the reference `https://example.com/`.

origin-when-cross-origin.

Sends the origin, path and query string when performing a same-origin request, but only sends the origin of the document in other cases.

same-origin.

The reference will be sent to sources on the same site, but requests between sources will not send reference information.

strict-origin.

Only send the document source as a reference when the security protocol level remains the same (HTTPS → HTTPS), but do not send it to a less secure recipient (HTTPS → HTTP).

strict-origin-when-cross-origin.

Sends the source, path and query string when performing a request from the same source, only sends the source when the security protocol level remains the same during an inter-source request (HTTPS → HTTPS), and sends no header to recipients less secure (HTTPS → HTTP)

unsafe-url.

Sends the source, path and query chain when performing any request, regardless of security.

Feature-Policy

The value of this header is a policy or set of policies that you want the browser to respect for a particular source.

The source whitelist can take on several different values:

- ``*:`` The feature is allowed in top-level navigation contexts and in nested navigation contexts (iframes).
- ``self:`` The feature is allowed in top-level navigation contexts and nested navigation contexts from the same source. It is not allowed in documents of cross origin in nested browsing contexts.
- ``none:`` The feature is not allowed in top-level browsing contexts and is not allowed in nested browsing contexts.
- ``<origin (s)>:`` specific sources for which to enable the policy (for example `https://example.com`).

Example 1 - Using only one directive Let's say you want to prevent all content from using the geolocation API on your site. You can do this by submitting a restricted 'none' whitelist to the geolocation resource:

Feature-Policy: ``geolocation 'none'``

Example 2 - Using more than one directive Functionalities within a policy are separated by semicolons.

Feature-Policy: `unsized-media 'none'; geolocation 'self' https://example.com; camera *;``

Directives

accelerometer

Controls whether the current document is allowed to collect information about the acceleration of the device

via the Accelerometer interface.

ambient-light-sensor

Controls whether the current document is allowed to collect information about the amount of light in the environment around the device through the AmbientLightSensor interface.

autoplay

Controls whether the current document is allowed to play the requested media automatically via the HTMLMediaElement interface. When this policy is disabled and there is no user action, the Promise returned by HTMLMediaElement.play () will reject it with a DOMException. The autoplay attribute on <audio> " and " elements will be ignored.

battery

Controls whether the use of the Battery Status API is allowed. When this policy is disabled, the Promise returned by Navigator.getBattery () will reject it with a NotAllowedError DOMException.

camera

Controls whether the current document is allowed to use inputs from video devices. When this policy is disabled, the Promise returned by getUserMedia () will reject it with a NotAllowedError DOMException.

display-capture

Controls whether or not the current document is allowed to use the getDisplayMedia () method to capture screen content. When this policy is disabled, the Promise returned by getDisplayMedia () will reject it with a NotAllowedError if permission is not obtained to capture the contents of the screen.

document-domain

Control whether the current document is allowed to place document.domain. When this policy is disabled, attempts to place document.domain will fail and cause a SecurityError DOMException to be thrown.

encrypted-media

Controls whether the current document is allowed to use the Encrypted Media Extensions (EME) API. When this policy is disabled, the Promise returned by Navigator.requestMediaKeySystemAccess () will reject it with a DOMException.

execution-while-not-rendered

Controls whether tasks should be performed in frames while they are not rendered (e.g. whether a frame is hidden or display: none).

execution-while-out-of-viewport

Controls whether tasks should be performed in frames while they are outside the visible viewing window.

fullscreen

Controls whether the current document is allowed to use Element.requestFullscreen (). When this policy is disabled, the returned Promise rejects it with a TypeError DOMException.

geolocation

Controls whether the current document is allowed to use the Geolocation interface. When the policy is disabled, calls to getCurrentPosition () and watchPosition () will cause function callbacks to be invoked with a PositionError of PERMISSION_DENIED.

gyroscope

Controls whether the current document is allowed to collect information about the orientation of the device through the Gyroscope interface.

layout-animations

Controls whether the current document is allowed to show layout animations.

legacy-image-formats

Controls whether the current document is allowed to show images in legacy formats.

magnetometer

Controls whether the current document is allowed to collect information about the orientation of the device through the Magnetometer interface.

microphone

Controls whether the current document is allowed to use inputs from audio devices. When this policy is disabled, the Promise returned by `MediaDevices.getUserMedia ()` will reject it with a `NotAllowedError`.

midi

Controls whether the current document is allowed to use the Web MIDI API. When this policy is disabled, the Promise returned by `Navigator.requestMIDIAccess ()` will reject it with a `DOMException`.

navigation-override

Controls the availability of mechanisms that enable the author of the page to take control over the behavior of spatial navigation, or to cancel completely.

oversized-images

Controls whether the current document is allowed to download and display large images.

payment

Controls whether the current document allows the use of the Payment Request API. When this policy is disabled, the `PaymentRequest ()` constructor will throw a `SecurityError DOMException`.

picture-in-picture

Controls whether the current document allows a video to be allowed to play in Picture-in-Picture mode via the corresponding API.

publickey-credentials-get

Controls whether the current document is allowed to use the Web Authentication API to retrieve already stored public key credentials, i.e. via `navigator.credentials.get ({publicKey: ..., ...})`.

sync-xhr

Controls whether the current document is allowed to make synchronous XMLHttpRequest requests.

usb

Controls whether the current document is allowed to use the WebUSB API.

vr

Controls whether the current document is allowed to use the WebVR API. When this policy is disabled, the Promise returned by `Navigator.getVRDisplays ()` will reject it with a `DOMException`. Keep in mind that the WebVR standard is in the process of being replaced by WebXR.

wake-lock

Controls whether the current document is allowed to use the Wake Lock API to indicate that the device should not go into a power saving mode.

screen-wake-lock

Controls whether the current document is allowed to use the Screen Wake Lock API to indicate whether or not the device should darken the screen.

xr-spatial-tracking

Controls whether or not the current document is allowed to use the WebXR Device API to interact with the WebXR session.

Content-Security-Policy

Content-Security-Policy is the name of an HTTP response header that modern browsers use to increase the security of the document (or web page).

The Content-Security-Policy header allows you to restrict resources such as JavaScript, CSS or just about anything the browser loads.

Directives**default-src**

The default-src directive defines the standard policy for fetching features such as JavaScript, Images, CSS, Fonts, AJAX requests, Frames, HTML5 Media. Not all directives go back to default-src. Refer to the Source List Reference for possible values.

DEFAULT-SRC Policy Example `default-src 'self' cdn.example.com;`

script-src

Defines valid JavaScript sources.

SCRIPT-SRC Policy Example `script-src 'self' js.example.com;`

style-src

Defines valid fonts for style sheets or CSS.

EXAMPLE__ STYLE-SRC POLICY `style-src 'self' css.example.com;`

img-src

Defines valid image sources.

Example of IMG-SRC Policy `img-src 'self' img.example.com;`

connect-src

Applies to XMLHttpRequest (AJAX), WebSocket, fetch (), `<a ping>` or EventSource. If not allowed, the browser emulates a 400 HTTP status code. **__Connect-SRC Policy Example__** `connect-src 'self';``

font-src

Defines valid fonts for font resources (loaded via @ font-face).

FONT-SRC Policy Example `font-src font.example.com;``

object-src

Defines valid plug-in sources, for example `<object>` or `<applet>`.

Example OBJECT-SRC Policy `object-src 'self';`

media-src

Defines valid audio and video sources, for example `<audio>`, HTML5, `<video>` elements.

Example of MEDIA-SRC Policy `media-src media.example.com;`

frame-src

Defines valid fonts for loading frames. In CSP, Level 2 `frame-src` has been deprecated in favor of the `child-src` directive. CSP Level 3, has not been replaced with `frame-src` and will continue to postpone `child-src` if not present.

Example FRAME-SRC `frame-src 'self';`

sandbox

Enables a sandbox for the requested resource similar to the `iframe` `sandbox` attribute. The sandbox applies a policy of the same origin, avoids pop-ups, plug-ins and blocks the execution of scripts. You can keep the `sandbox` value empty to keep all restrictions in place, or add values: `allow-forms` `allow-same-origin` `allow-scripts` `allow-popups` `allow-modals` `allow-orientation-lock` `allow-pointer-lock` `allow-presentation` `allow-popups-to-escape-sandbox` `allow-top-navigation`

Example of SANDBOX policy `sandbox allow-forms allow-scripts;`

report-uri

Instructs the browser to POST policy crash reports to this URI. You can also use `Content-Security-Policy-Report-Only` as the HTTP header name to instruct the browser to send reports only (does not block anything). This directive was discontinued at CSP Level 3 in favor of the `report-to` directive.

Example REPORT-URI `report-uri / some-report-uri;`

child-src

Defines valid fonts for web workers and nested browsing contexts loaded using elements such as `<frame>` and `<iframe>`.

Example of CHILD-SRC Policy `child-src 'self'`

form-action

Defines valid fonts that can be used as an `<form>` HTML action.

Example action policy example `form-action 'self';`

frame-ancestors

Defines valid fonts for embedding the resource using `<frame>` `<iframe>` `<object>` `<embed>` `<applet>`. Setting this directive to `'none'` should be roughly equivalent to `X-Frame-Options: DENY FRAME-ANCESTORS`.
EXAMPLE POLICY `frame-ancestors 'none';`

plugin-types

Defines valid MIME types for plug-ins called via `<object>` and `<embed>`. To load one, `<applet>` you must specify `application / x-java-applet`.

PLUG-IN TYPES Policy Example ``plugin-types application / pdf;``

base-uri

Defines a set of allowed URLs that can be used in the attribute of an HTML basetag.

URI-BASE Policy Example ``` base-uri 'self'; ```

report-to

Defines a report group name defined by an HTTP Response Report-Header. See the reporting API for more information.

Example Report for Policy `report-to groupName;`

worker-src

Restricts URLs that can be loaded as Worker, SharedWorker or ServiceWorker.

WORKER-SRC Policy Example `worker-src 'none';``

manifest-src

Restricts URLs where application manifests can be loaded.

Example of MANIFEST-SRC Policy `manifest-src 'none';``

prefetch-src

Defines valid sources for pre-fetching and pre-rendering of requests, for example, through the linktag with rel = "prefetch" or rel = "prerender":

`__ PREFETCH-SRC Policy Example__ prefetch-src 'none'``

navigate-to

Restricts the URLs to which the document can navigate by any means. For example, when a link is clicked, a form is submitted or window.location is called. If form-action is present, this directive will be ignored for submitting forms. Implementation status

Navigation Policy Example ``navigate-to example.com``

Captcha

Captcha

Use Captcha

Defines if the application uses Captcha.

Number of Characters

Amount of characters in the Captcha image.

Character List

List of characters used in the Captcha.

Label

The message displayed for the Captcha.

Error message

Captcha error message.

Height

Height of the Captha image. (in pixels)

Width

Width of the Captha image. (in pixels)

Font Size

Font Size of the Captha image. (in pixels)

Reload

Display the refresh button in the Captcha.

Select one layout

It offers layouts for display the Captcha.

Recaptcha

ReCAPTCHA is an API provided by Google for forms. It adds security, preventing automatic submission of forms through robots.

reCAPTCHA sample:

1. First, we must request an API Key to activate reCAPTCHA into a Scriptcase application by following the steps below:

To get a **Site key** and **Secret Key** go to the link: <https://www.google.com/recaptcha/admin#list>.

See the image:

Label

It is a project identifier to create the reCAPTCHA keys.

Choose the type of reCaptcha

We must choose the option **reCAPTCHA V2**.

Domains

We can insert multiple domains (one per line) to limit the API uses.

1. Then, we need to accept the Terms of Service (“Accept the reCAPTCHA Terms of Service”).
2. When clicking on **Register**, the page refreshes and shows the integration of reCAPTCHA information. There we can get the **Site Key** and **Secret Key**:

1. Now, we can set the Scriptcase application security:

Site Key

Key generated by Google after reCAPTCHA project creation.

Secret Key

Key generated by Google after reCAPTCHA project creation.

Theme

Defines the reCAPTCHA color. There are two options:

- **Light** :
- **Dark** :

Type

The type of reCAPTCHA. There are two options:

- **Audio**:
- **Image**:

Size

The size of reCAPTCHA. There are two options:

- **Normal** :
- **Compact**:

Position

Here we can define the reCAPTCHA component alignment:

- **Left**: Position the reCAPTCHA component at the left.
- **Center**: Position the reCAPTCHA component at the center.
- **Right** : Position the reCAPTCHA component at the right.

Search Application Log

This interface allows you to define a Log schema to the app. The Log schema tracks what the end-users are doing in the app. Those are the events it can tracks: Access, Insert, Update, and delete.

To learn how to create a Log schema [see here](#).

LOG	
ATTRIBUTE	VALUE
Schema	log  
Events	<div style="display: flex; align-items: center; gap: 10px;"><div style="border: 1px solid #ccc; width: 100px; height: 40px; position: relative;"><div style="position: absolute; top: -10px; left: 5px;">▲</div><div style="position: absolute; bottom: -10px; left: 5px;">▼</div></div><div style="text-align: center;"><div style="background-color: #007bff; color: white; padding: 5px 10px; border-radius: 3px;">Add >></div><div style="background-color: #007bff; color: white; padding: 5px 10px; border-radius: 3px; margin-top: 5px;">Remove <<</div></div><div style="border: 1px solid #ccc; width: 100px; height: 40px; position: relative;"><div style="position: absolute; top: -10px; left: 5px;">▲</div><div style="position: absolute; bottom: -10px; left: 5px;">▼</div></div></div>

Application Log configuration

Schema Select an existing log schema for the application.

Events You can select just specific events to save in the log.

Search - Fields Overview

The applications can have two types of fields.

Table Fields

Columns of the table connected to the application and their data types.

Example:

In a table with the following structure:

```
CREATE TABLE `orders` (
  `orderid` int(11) NOT NULL,
  `customerid` varchar(5) NULL DEFAULT NULL,
  `employeeid` int(11) NULL DEFAULT NULL,
  `orderdate` date NULL DEFAULT NULL,
  `requireddate` date NULL DEFAULT NULL,
  PRIMARY KEY (`orderid`) USING BTREE
);
```

These are the listed fields on left menu **Fields**:

Virtual Fields

Fields created inside application to assist in the development process.

How to create a virtual field

1. Inside an application, access the left menu **Fields** and click on **New Field** option.
2. Choose how many fields do you want to create:

1. Create the fields and define type, name and label for each one:

- **Type**: Data type of the field.
- **Name**: Internal name of the field. Used to identify the field on events and Scriptcase interface.
- **Label**: Title of the field displayed on the application.

Scriptcase **doesn't insert** virtual fields on the table after its creation.

Types of fields by applications

Application Table Fields Virtual Fields

Grid	<input type="text"/>	<input type="text"/>
Procedure	<input type="text"/>	<input type="text"/>
Chart	<input type="text"/>	<input type="text"/>
Form	<input type="text"/>	<input type="text"/>
Control	<input type="text"/>	<input type="text"/>
Calendar	<input type="text"/>	<input type="text"/>
Search	<input type="text"/>	<input type="text"/>
PDF Report	<input type="text"/>	<input type="text"/>

The applications **Menu**, **Tree Menu**, **Dashboard** and **Blank** were not listed because they haven't manage fields.

Search - Text Field

General Settings

This type of field allows the developer to create quickly inputs to insert and update data, where the final user can inform its data to be allocated in its database.

Type of Data

Defines the type of the field in the application. In this case we should select **Text**.

Search Label

Defines the title that will be displayed in the field when the application is executed. The terminology used in the interface is fundamental to the system have a good usability, who should use names and familiar terms to the final user of the application, instead of using terms from the system.

For example, this text field that has the name **sellername_**, **the client would have a much better understanding of the functionality of the field when we define the label as Seller name**.

Not only a fixed text, the **Label** attribute allows the use of langs to define the field's title, making it possible to use your application in a multi language project.

Watermark

Informing a text to the **Watermark** it will be displayed in the input a text as an example that can be informed in the field. The result after set will be this:

Amount of Characters

Allows to set the width of the text field's input that varies with the amount of characters informed. Although, if the amount of characters typed are greater than the setting, the text will be pushed to the left, to keep the maximum amount of characters as defined.

Maximum Size:

Allows the user to determinate the maximum size used in the application field.

SQL Type

Informs the type of the field in the database.

Field Behavior

Use autocomplete:

Field automatically turns into autocomplete according to existing values in the database.

Use Select2

Uses the new component for data selection, allowing searches within the select comboBox.

Width for the Select2

Sets a width for the area in the Select2.

Amount of characters

Sets the amount of characters to start the search.

Amount of rows

Sets the maximum number of rows to list the search result.

Width:

Defines a width in pixels for a result box.

Search options:

Defines the validation that will be made to fetch the search result.

Start equals to: Will return the records with the same start value as in the database.

Any part: Will return the records when exist the character in any part of the record.

End equals to: Will return the records with the same final value as in the database.

Position between values:

Defines the position that objects will be displayed.

Text Between Values

Text that will appear when using a filter condition between two values.

OnChange Submit:

Submit search on this field changing.

Show Condition:

To show or not the search condition. It only works if the search has at least one condition.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).

- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Search - Integer Field

On this page, you can configure settings related to your field of type Number. Since the use of specific symbols display until the mode in which they are displayed. And thus, boost your application.

Data type:

It sets the application field type. When the field is set as Number, it is permissible to define formatting rules of integers.

Watermark

Informing a text for the **watermark** it will be displayed on the input text with an example of what can be reported in the field. The result after that will be configured:

Use slider:

It displays a slider component in the field. So you can increase or decrease the value sliding the cursor. You can also customize the increment value, if it increments the value 1 by 1, 2, 5, 10... N.

Amount of characters

It allows you to set the width of the input text field according to the amount of characters. However, if the quantity entered is greater than the set for the characters, the text will be pushed to the left, in order to ensure the maximum amount of characters set in the option of **Values formatting**.

Tipo SQL:

Reports the SQL type of the field as it is configured in the database.

Use autocomplete:

The field turns into autocomplete automatically according to the values in the database.

Amount of characters:

Sets the amount of characters to start the search.

Number of rows:

It sets the maximum number of rows to list the search result.

Width:

it sets the width in pixels for the results.

Search options:

It sets the validation that will be made to get the search result.

Position between values:

It sets the position that objects will be displayed.

Text between values:

Text that will appear between the values.

Submit in Onchange:

Allows you to submit the filter when there are changes in the field.

Display Condition:

Allows you to display or not the condition of the filter, it will only work if the filter has at least an option.

Use regional settings:

It allows you to apply regional settings to the number fields formatting. When this option is not selected it will be displayed the attributes group, minus sign and negative number format.

Grouping:

It allows you to define which character is used to separate thousands. This option is only available when the option to use regional settings is disabled.

Accept:

It allows to define if the field accept only negative values, positive-only or both.

Lookup Settings

The Lookup is a way used to provide the end user a list of values description/name where the items can be selected and used in the application. For example, for a field sex that in the database is represented with M or F values can be presented as male or female dynamically with the lookup. So you will be able to retrieve these values from a database table or manually, if the reference table does not exist.

Example:

Lookup Methods

There are two lookup methods available:

Manual: To use this method it is necessary to inform the selection conditions manually to the Lookup.

Automatic: To use this method it is necessary to use a lookup query from the database to access the reference table.

Editing-automatic lookup:

Select Command:

It sets the SQL command that will retrieve the value to display inside the Grid field. The command must have the following format

```
SELECT field_to_be_displayed FROM table WHERE key_field = {grid_field}
```

The Grid field must be always referenced between curly braces {}, So at run time, the field braces will be replaced by its value in the table.

Multiple Options:

When the Select command informed return multiple values, the option must be selected.

Delimiter:

It sets the tab of values returned by the Select command, this option should be filled when the "Yes" option is checked in the multiple attribute options.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

Use a specific connection:

This option allows you to select another existing connection in the project, other than the current connection, to select the values for the lookup.

Edit Lookup - Manual:

Lookup used to modify the display of the field with predefined values.

Lookup Types

It sets the operating mode of the lookup can be: single value, multiple values (delimiter), multiple values (position) and multiple values (binary).

Single value: it will be displayed only one value for the field. There is a direct replacement of the value stored in the Bank for a label defined in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value of "M" will be replaced by "Male".

Multiple Values (Delimiter):

By using this option it will be displayed multiple values for the selected field. The values must be separated by a delimiter to be informed. A replacement of parts from a string stored in the field, separated by a delimiter for values contained in a list.

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value S;M will be replaced by Sports and Movies.

Delimiter: Character used to separate the values within the same string.

Multiple Values (Position)

Allows you to recover information stored in a single string of the selected field. In order for this information

to be retrieved must be informed, in addition to the label, the starting position and the number of bytes that each information occupies within the string.

As an example we will use a string to store Sex, Marital status and Hobby respectively. Sex occupies one byte, Status one byte and Hobby two bytes .

For this purpose we define the list as:

Label	Value	Start	Size
Male	M	1	1
Female	F	1	1
Married	M	2	1
Single	S	2	1
Study	ST	3	2
Sportes	SP	3	2
Reading	LE	3	2

Example: the string MMST would be presented in the query as: Male Married Study

Label: Text that will be displayed in the Grid.

Value: Attribute that matches the value stored in the table. For example, the value M will be replaced by Male.

Start: : Starting position in the string where the information is recorded. The first position is always 1.

Size : Number of bytes that the information occupies in the string.

Multiple values (binary):

It allows you to retrieve several information stored in decimal form of the selected field.

As examples we will use the following list (although not informed in the interface of inclusion of values in the list, each item has a value assigned automatically according to the order):

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

To display the data, a decomposition of the decimal number stored in the bank is performed. For example, numbers 11 and 12 (written in the database) would be decomposed as follows:

$$11 = 1 + 2 + 8 = (\text{Sports} - \text{Culture} - \text{Reading})$$

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

$$12 = 4 + 8 = (\text{Leisure} - \text{Reading})$$

Assigned value Description in Lookup

1	Sports
2	Culture
4	Leisure
8	Reading
16	Music

Label:

Text that will be displayed in the Grid.

Include Button:

Includes in the list the values populated in the Label and value fields.

Alter Button:

It changes the attributes of the selected item.

Delete Button:

Deletes the selected item.

Clean Button:

It cleans the fields

Save Button:

Allows the user to save the entire list, for later use using the Load Lookup definition option.

Load Lookup definition:

Allows you to load a predefined value list for use as a lookup.

Use the lookup in:

Grid: It applies the lookup in all Grid modules (HTML, PDF, XML, CSV, and RTF).

Summary: It applies the lookup only to the Summary (HTML and PDF).

Both This is equivalent to check Grid and Summary options.

Default Value:

Defines a default value, used in cases where the stored value does not match any value from the list.

Display original value and lookup:

When selected **No**, is only displayed the value returned by the Select command. Otherwise, it returns the original value of the field and the value that is returned by the Select command separated by character set in separated by.

Separated By:

Sets the character(s) that will be used to separate the original value of the field and the value that is returned by the Select command. This option should be filled when is checked **Yes** in the Show original value and lookup.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.

- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon ? beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon `?` beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard `?` icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Search - Decimal Field

General Settings

Decimal field Configuration Interface.

Data Type

Define the field type to Decimal. It allows defining the Decimal number format.

Label

The Label option lets you define the title of a field. Example: If the database field name is "cmp_name_client", You can display a different name for the user, like "Client Name".

Accumulated

It defines the field to accumulate values of another field. This option is only available for virtual fields.

Accumulator field

It is available when the option "Accumulated" is enabled. This configuration defines which field will accumulate the values. The field should be Integer, Currency, or Decimal.

Grid Mask

It defines a mask for the field value. There is two types of masks:

Character	Description
X	It sets the placeholder to any character for replacing. If the entered number of characters is less than the mask size, It completes the field value with zeros (Filling full-size field entry is required).
Z	It sets the placeholder to any character for replacing, but it suppresses zeros at field left (Complete field filling is optional). Use it on the left when combined with the X mask.

Mask Examples

Mask	Field Value	Formatted Value
(xx) xxxx - xxxx	1234567890	(12) 3456 - 7890
(xx) xxxx - xxxx	12345678	(00) 1234 - 5678
(zz) xxxx - xxxx	1234567890	(12) 3456 - 7890
(zz) xxxx - xxxx	12345678	() 1234 - 5678
(zz) xxxx - xxxx	0012345678	() 1234 - 5678

Do Not Repeat Value

Do not repeat the value of the field if it is the same as the previous record.

SQL Type

It informs the data type of field in the database.

Field Behavior

Use autocomplete:

Field automatically turns into autocomplete according to existing values in the database.

Use Select2

Uses the new component for data selection, allowing searches within the select comboBox.

Width for the Select2

Sets a width for the area in the Select2.

Amount of characters

Sets the amount of characters to start the search.

Amount of rows

Sets the maximum number of rows to list the search result.

Width:

Defines a width in pixels for a result box.

Search options:

Defines the validation that will be made to fetch the search result.

Start equals to: Will return the records with the same start value as in the database.

Any part: Will return the records when exist the character in any part of the record.

End equals to: Will return the records with the same final value as in the database.

Position between values:

Defines the position that objects will be displayed.

Text Between Values

Text that will appear when using a filter condition between two values.

OnChange Submit:

Submit search on this field changing.

Show Condition:

To show or not the search condition. It only works if the search has at least one condition.

Values format

Decimal Field Format of Values with Regional Settings.

- **Regional Settings** : Allows to apply the Regional Settings to format the number of the field. When not enabled, the attributes Digit Grouping Separator, Decimal Separator, Negative sign and Negative number format.
- **Decimal Precision** : Defines the amount of decimal places for the field.
- **Digit grouping** : Defines if the field will display the digits separator.
- **Decimal Separator** : Defines the decimal separator.
- **Accept** : Determines if the field, will accept only negative, positive or both numbers.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.

- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Search - Currency Field

General Settings

Currency field Configuration Interface.

- **Data Type** : Define the type of field for the application. When set to Currency, you can currency values to the field.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

Currency Field Behavior Interface of the Search Configuration.

- **Use auto-complete** : The field behaves as an auto-complete according to the values existing in the database.
- **Amount of characters** : Sets the amount of characters to start the search.
- **Amount of rows** : Sets the maximum number of rows to list the search result.
- **Width** : Sets the width in pixels for the result box.
- **Search options** : Defines the validation that will be made to fetch the search result.
- **Position between values** : This option sets the position that objects will be displayed.
- **Text between values** : Text that will appear between values.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Values format

Currency Field Format of Values with Regional Settings.

- **Regional Settings** : Allows to apply the Regional Settings to format the number of the field. When not enabled, the attributes Digit Grouping Separator, Decimal Separator.
- **Decimal Precision** : Defines the amount of decimal places for the field.
- **Digit grouping** : Defines if the field will display the digits separator.
- **Decimal Separator** : Defines the decimal separator.
- **Accept** : Determines if the field, will accept only negative, positive or both numbers.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).

- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Search - Date Field

General Settings

- **Data Type** : Define the type of field for the application. When set to Date, you can inform a date.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Watermark**: Displays a watermark in the field input.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the datatype of field in the database.

Values format

- **Regional Settings** : Allows to apply the Regional Settings to format the dates of the field. When not enabled, it will be displayed the date separator attribute.
- **Date separator** : Allows you to inform the separator symbol for the date.
- **Display** : Select the format of the day for display.
- **Internal Format** : Allows to define the format the field when the SQL type is different from **Date**. You need to use the characters **A**, **M** and **D** that correspond to **Year**, **Month** and **Day**.
- **Use Combo-box** : Allows you to select the date using a combo-box.
 - **Year as Combo** : Allows to use the year combo to select the date.
 - **Initial Year** : First year displayed in the combo.
 - **Actual Year +** : Display the current plus the amount of years informed.
- **Month in full textual** : Displays the Month format in Full.
- **Display Calendar** : Enables the a calendar icon beside the field, this allows to select the date from a calendar with the format already setup.
 - **New Calendar** : Defines if the JQuery calendar (New Calendar) is going to be displayed or the old format.
 - **Years Limit** : Amount of years displayed in the calendar.
 - **View week number** : Displays the number of the week in the application.
 - **Additional months** : Displays the additional months of the calendar.
 - **Show Combo year and month** : Displays the year and month of the calendar in the combo box.

Field Behavior

- **Position between values** : This option sets the position that objects will be displayed.
- **Text between values** : Text that will appear between values.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Special Conditions

- **All Period** : Searches for all periods of dates.
- **Today** : Searches in today's date.
- **Yesterday** : Searches in yesterday's date.
- **Last 7 days** : Searches the last 7 days. Ex: ((01/01/2017 01/07/2017)).
- **This month** : Searches the dates from the first day of the current month.
- **Last month** : Searches the dates from the first day of lasts month.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of

Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

Allow the developer to set up instructions and hints about the field's use, allowing the developer to help the users about the system usage.

Description of the settings attributes.

Help Description

In this area, you can set up a text that will be shown in the application according to the type of help selected below.

Help Type

Hint

Display a default icon  beside the field. When the mouse is above the icon a help text will be displayed.

Text

Display a text inside of a `` beside the field.

Pop-up

Display a default icon  beside the field. To display the message just click in the icon that a Pop-up will be displayed with the help text.

The icon displayed when selecting the types **Hint** or **Pop-up** vary according to the theme that is being used in the application. This icon can be modified in the CSS Buttons.

Tippy

Displays a standard  icon next to the field. When you hover the mouse over the icon, the message will be displayed in a more user-friendly way.

Help type settings (Tippy)

- **Help Description** : Defines where the field's help button will be displayed
- **Help button position** : Defines the display position of the Tippy hint in relation to the field's help icon
- **Time to open hin Tippy** : Defines the time in milliseconds for the Tippy hint to be displayed after the mouse passes over the help icon.
- **Time to close hin Tippy** : Sets the time in milliseconds for the Tippy hint to be hidden after the mouse leaves the help icon.
- **Tippy hint width** : Sets the width of the Tippy hint in pixels.

Help button position (except Tippy)

Allow to set up where the help button will be displayed in the field, there are two options:

Beside: The help icon will be displayed beside the field.

Column: The help icon will be displayed beside the label of the field.

Search - Time Field

General Settings

![Time field Configuration Interface.][filtro_cons_hora] *Time field Configuration Interface.*

- **Data Type** : Define the type of field for the application. When set to Time, you can inform a time to this field.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Values format

![Time Field Format of Values with Regional Settings.][filtro_cons_hora_filtro] *Time Field Format of Values with Regional Settings.*

- **Regional Settings** : Allows to apply the Regional Settings to format the dates of the field. When not enabled, it will be displayed the date separator and time separator attributes.
- **Time separator** : Allows you to inform the separator symbol for the time.
- **Display** : Select the format of the time for display.
- **Internal Format** : Allows to define the format the field when the SQL type is different from **TIME**. You need to use the characters **HH**, **II**, and **SS** that correspond to **Day**, **Hour**, **Minutes** and **Seconds**.

Field Behavior

![Time Field Behavior Interface of the Search Configuration.][filtro_cons_hora_format] *Time Field Behavior Interface of the Search Configuration.*

- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.

- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Search - Datetime Field

General Settings

![[Datetime field Configuration Interface.]][[filtro_cons_data_hora] *Datetime field Configuration Interface.*

- **Data Type** : Define the type of field for the application. When set to Datetime, you can inform a date and time to this field.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Values format

![[Datetime Field Format of Values with Regional Settings.]][[filtro_cons_data_hora_format] *Datetime Field Format of Values with Regional Settings.*

- **Regional Settings** : Allows to apply the Regional Settings to format the dates of the field. When not enabled, it will be displayed the date separator and time separator attributes.
- **Date separator** : Allows you to inform the separator symbol for the date.
- **Time separator** : Allows you to inform the separator symbol for the time.
- **Display** : Select the format of the day/time for display.
- **Internal Format** : Allows to define the format the field when the SQL type is different from **DATETIME**. You need to use the characters **A, M, D, HH, II, and SS** that correspond to **Year, Month, Day, Hour, Minutes** and **Seconds**.
- **Use Combo-box** : Allows you to select the date using a combo-box.
 - **Year as Combo** : Allows to use the year combo to select the date.
 - **Initial Year** : First year displayed in the combo.
 - **Actual Year +** : Display the current plus the amount of years informed.
- **Month in full textual** : Displays the Month format in Full.
- **Display Calendar** : Enables the a calendar icon beside the field, this allows to select the date from a calendar with the format already setup.
 - **New Calendar** : Defines if the JQuery calendar (New Calendar) is going to be displayed or the old format.
 - **Years Limit** : Amount of years displayed in the calendar.
 - **View week number** : Displays the number of the week in the application.
 - **Additional months** : Displays the additional months of the calendar.
 - **Show Combo year and month** : Displays the year and month of the calendar in the combo box.

Field Behavior

![[Date Field Behavior Interface of the Search Configuration.]][[filtro_cons_data_hora_format] *Date Field Behavior Interface of the Search Configuration.*

- **Position between values** : This option sets the position that objects will be displayed.
- **Text between values** : Text that will appear between values.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Special Conditions

![[Datetime Field Special Conditions.]][[filtro_cons_data_cond] *Datetime Field Special Conditions.*

- **All Period** : Searches for all periods of dates.
- **Today** : Searches in todays date.
- **Yesterday** : Searches in yesterdays date.
- **Last 7 days** : Searches the last 7 days. Ex: ((01/01/2017 01/07/2017)).
- **This month** : Searches the dates from the first day of the current month.
- **Last month** : Searches the dates from the first day of lasts month.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**

- **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Search - Select Field

General Settings

![Select field Configuration Interface.][filtro_cons_select] *Select field Configuration Interface.*

- **Data Type** : Define the type of field for the application. When set to Select, you can select multiple option from a combo box (Select Field).
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

![Select Field Behavior Interface of the Search Configuration.][filtro_cons_cpf_filtro] *Select Field Behavior Interface of the Search Configuration.*

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Search Lookup

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query).

Selecting the lookup type.

- **Lookup Method - Automatic**

Lookup used to list the values that will be displayed on the Checkbox field. These values will be recovered dynamically using the Select command.

Automatic Lookup Interface.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the key_field will be stored in the table field.

- **Multiple Values** : When enabled, allows to select more than one item from the list, separated by a delimitation.

- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Height** : Defines the height for the select object.
- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to

a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.
- **Link** : Allows to create a link to another form allowing to manipulate the list displayed on the select field. After the manipulation, the select object it updated automatically.

◦ **Lookup Method - Manual**

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

Manual Lookup Interface.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).
- **Single Value** :

Setting up Single Value Lookup

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Default** : With this option enabled, the selected item will be inserted to the table when committed.
- **Height** : Defines the height for the select object.

- **Multiple Values (delimiter)**

You can store various values for the select field. The values are separated by the informed delimiter. For example: the combination **Sport, Cinema** and **Tourism** selected in form will be stored like **E;C;T** in case the delimiter is ; (semi coma).

Setting up Multiple Values (delimiter)

- **Label** : Text that will be displayed in the item list of the select field.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Height** : Defines the height for the select object.

- **Multiple Values (position)**

Allows to store a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of

bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Marital Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man**, **Single** and **Read**, in the database would be stored the following value **MSRD**.

Setting up Multiple Values (position)

- **Label** : Text that will be displayed in the item list of the select field.
 - **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
 - **Negative** : Value to be saved in the table in case there is not any valued selected on the field.
 - **Start** : Starting position of the string that is going to be stored. The first position is always 1.
 - **Size** : Amount of bytes that is going to occupy in the string.
 - **Height** : Defines the height for the select object.
- **Multiple Values (binary)**

Allows to store a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute	Value	Lookup	Description
1		Sports	
2		Culture	
4		Pleasure	
8		Reading	
16		Music	

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute	Value	Lookup	Description
1		Sports	
2		Culture	
4		Pleasure	
8		Reading	
16		Music	

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute	Value	Lookup	Description
-----------	-------	--------	-------------

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

Editing Lookup Configuration Multiple Values (Binary)

- **Label** : Text that will be displayed in the item list of the select field.
- **Height** : Defines the height for the select object.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on Load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

Displaying the original lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Lookup Method - Actual value

This lookup is used to list all the values in the selected field.

This lookup will apply a “distinct” to your SQL query.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.

- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Search - Double Select Field

General Settings

![[Double Select field Configuration Interface.]][[filtro_cons_duplo_select] *Double Select field Configuration Interface.*

- **Data Type** : Define the type of field for the application. When set to Double Select, your allowed to have multiple options selected.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

![[Double Select Field Behavior Interface of the Search Configuration.]][[filtro_cons_cpf_filtro] *Double Select Field Behavior Interface of the Search Configuration.*

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Search Lookup

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or F can be presented like Male or Female or in a dynamic way, getting these values from the database.

Lookup Settings Display for the field.

Automatic Lookup Interface..

- **SQL Select Statement** : Defines the SQL command that will get the values displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the `key_field` will be stored in the table field.

- **Height** : Set the height(lines) of the field interface.
- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter than (;).
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.
- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Selects another specific connection existing in the project. The select command will be done on the second connection.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**

- **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Search - Checkbox Field

General Settings

![Check box field Configuration Interface.][filtro_cons_checkbox] *Check box field Configuration Interface.*

- **Data Type** : Define the type of field for the application. When set to Check box, your allowed to have multiple options selected.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

![Check box Field Behavior Interface of the Search Configuration.][filtro_cons_cpf_filtro] *Check box Field Behavior Interface of the Search Configuration.*

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Search Lookup

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or F can be presented like Male or Female or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query). *Selecting the lookup type.*

- **Lookup Method - Automatic**

Lookup used to list the values that will be displayed on the CheckBox field. These values will be recovered dynamically using the Select command.

Automatic Lookup Interface.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the key_field will be stored in the table field.

- **Delimiter** : Defines the character used to separate the values selected in the form. Only inform a value to this field if you need to separate the selected options with a different delimiter then (;).
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Option check all** : Displays two options on the field to check and uncheck all.

- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Selects another specific connection existing in the project. The select command will be done on the second connection.

◦ **Lookup Method - Manual**

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

Manual Lookup Interface.

- **Lookup Type** : Define the functionality of the lookup, being: Single Value, Multiple Values (delimiter), Multiple Values (position) and Multiple Values (binary).

- **Single Value** :

Setting up Single Value Lookup

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Default** : With this option enabled, the selected item will be inserted to the table when committed.
- **Columns** : Set the amount of columns, for the list of items.

- **Multiple Values (delimiter)**

You can store various values for the checkBox field. The values are separated by the informed delimiter. For example: the combination **Sport, Cinema** and **Tourism** selected in form will be stored like **E;C;T** in case the delimiter is ; (semi coma).

Setting up Multiple Values (delimiter)

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Delimiter** Characters used to separate Multiple Values in the table field. If not informed, the default delimiter is a semi coma (;).
- **Columns** : Set amount of columns, for the list of items.

- **Multiple Values (position)**

Stores a diversity of information selected on the field in only one string. For this information to be added, you need to inform the label, initial position and the number of bytes that each information occupies on a string.

For this example, Gender, Marital status and Hobby were used. Gender uses one byte as does the Martial Status, the Hobby will use two bytes.

The example below:

Label	Value	Start	Size
Man	M	1	1
Women	W	1	1
Divorced	D	2	1
Single	S	2	1
Study	SD	3	2
Sports	SP	3	2
Read	RD	3	2

Example: Of you choose **Man, Single** and **Read**, in the database would be stored the

following value **MSRD**.

Setting up Multiple Values (position)

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Negative** : Value to be saved in the table in case there is not any valued selected on the field.
- **Start** : Starting position of the string that is going to be stored. The first position is always 1.
- **Size** : Amount of bytes that is going to occupy in the string.
- **Columns** : Set the amount of columns, for the list of items.

▪ **Multiple Values (binary)**

Stores a diversity of information selected on the field in only one value.

In this example uses the following list (although it is not informed when inserting values to the list, each item has a value applied automatically according to the order):

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

To store the data, it is done an internal sum of the decimal number. See the examples below.

Example 1: If the options **Sports** and **Culture** were selected, the number stored in the table would be **3**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 2 (Culture) = **3**

Example 2: If the options **Sports**, **Pleasure** and **Reading** were selected, the number stored in the table would be **13**.

Attribute Value Lookup Description

1	Sports
2	Culture
4	Pleasure
8	Reading
16	Music

1 (Sports) + 4 (Pleasure) + 8 (Reading) = **13**

Setting up Multiple Values (Binary)

- **Label** : Text that will be displayed in the item list of the checkBox.
- **Columns** : Allows you to inform the amount of columns, for the list of items.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Saves all the items of the list, to use on other fields, just click on Load lookup definition.

- **Load lookup definitions** : Refreshes the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Option check all** : Displays two options on the field to check and uncheck all.

- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

• CSS of the Title

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

• CSS of the Field

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

• CSS of the Input Object

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio,

Select, Text, etc

- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Search - Radio Field

General Settings

![[Radio field Configuration Interface.]][[filtro_cons_radio]] *Radio field Configuration Interface.*

- **Data Type** : Define the type of field for the application. When set to Radio, your allowed to select one of the options listed.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

![[Radio Field Behavior Interface of the Search Configuration.]][[filtro_cons_cpf_filtro]] *Radio Field Behavior Interface of the Search Configuration.*

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Search Lookup

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

- **Lookup Methods**

You will have available two types of lookup methods: Manual (informing manually the conditions of the select) or Automatic (using a database query). *Selecting the lookup type.*

- **Lookup Method - Automatic**

Lookup used to list the values that will be displayed on the Checkbox field. These values will be recovered dynamically using the Select command.

Automatic Lookup Interface.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field. The command needs to have the following structure:

```
SELECT key_field , display_field FROM table
```

The value of the `key_field` will be stored in the table field.

- **Columns** : Allows you to inform the amount of columns, for the list of items.

- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.

- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

◦ **Lookup Method - Manual**

This method is used so that the developer can create manually the list of values that will be saved to the generated application. This method is mostly used when the database does not have a table that contains this information.

Manual Lookup Interface.

- **Label** : Text that will be displayed in the item list of the radio.
- **Value** : Attribute that corresponds to the value that is stored in the table field. For example, the value M will be included into the table when the user will view in the list **Man**.
- **Default** : With this option enabled, the selected item will be inserted to the table when committed.
- **Insert Button** : Adds to the list the values informed on the fields Label and Value.
- **Update Button** : Modifies the attributes of the selected item.
- **Remove Button** : Remove the selected item from the list.
- **Clear Button** : Clear the Fields.
- **Save Button** : Allows the user to save all the items of the list, to use on other fields, just click on load lookup definition.
- **Load lookup definitions** : Allows to refresh the list of values predefined when using the lookup. It will be listed the existing definitions in ScriptCase and the ones saved by the user.
- **Use title** : Allows to display a line of a title on the select object (Title Attribute) associated to a value informed manually (Title internal value).

- **Title internal value** : Value Saved to the field when the line of the title is selected in the object.
- **Title** : Text displayed on the title of the Select object.
- **Reload form when value has changed** : With this option selected, the form will refresh if there is a change to the selected object in the field.
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

Displaying the original lookup.

- **Separated by** : Defines which character will be used to separate the values of the field with the value returned from the lookup. It is only necessary to inform this value of the option Display original and lookup value is enabled.

Ajax Processing

Ajax Processing configuration Interface.

Allows to define the field that will be reloaded when selecting a value that has the (onChange) trigger.

For example: a field of the type select with a **list of states**, and another select field with a **list of cities**. When selecting a state, the cities list is reloaded.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

-
- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
 - **Help Type**
 - **Pop-up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

 Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Search - Text Auto-Complete Field

General Settings

![Text Auto-Complete field Configuration Interface.][filtro_cons_texto_auto] *Text Auto-Complete field Configuration Interface.*

- **Data Type** : Define the type of field for the application. When set to Text auto complete, you can inform a value based on the select statement of the lookup settings and it will manipulate an internal Text for the data.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as `cmp_name_client`, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

![Text Auto-Complete Field Behavior Interface of the Search Configuration.][filtro_cons_texto_filtro] *Text Auto-Complete Field Behavior Interface of the Search Configuration.*

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **Case Settings** : Allows to convert the letters of the field when losing the focus. The options are:
 - **Upper Case** : All in Upper Case.
 - **Lower Case** : All in Lower Case.
 - **Capitalize first word** : Capitalizes the first letter of the word.
 - **Capitalize all words** : Capitalizes the first letter of all the words.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Search Settings

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field.
- **Rows** : Allows to define the amount of records displayed in the field.
- **Width** : Defines the width the size of capture box (Capture Text).
- **Search options** : Allows to define the search settings of the field(Start equal to, Any part and End equals to).
- **Capture Text** : When not enabled, you will only view the field to inform the data. See an example below. *lookup Settings configuration Interface.*
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

lookup Settings validation configuration Interface.

- **Show label with the description** : Displays a label with the description.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**

- **Font** : Allows to choose the font type, that will be applied to the application field title.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the title of the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
- **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the title of the field.
- **Height** : To define a height for the title of the field.

- **CSS of the Field**

- **Font** : Allows to choose the font type, that will be applied to the application field.
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the field.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
- **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the field.
- **Height** : To define a height for the field.

- **CSS of the Input Object**

- **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
- **Font Size** : Allows to choose the the font size, that will be applied to the application field.
- **Font Color** :Allows to choose a color for the font from the color pallet.
- **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
- **Bold** : Applies the bold style to the font.
- **Underline** : Applies the underline style to the font.
- **Border Size** : Applies the border size to the Input Object.
- **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
- **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
- **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
- **Width** : To define a width for the Input Object.
- **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps the end user to understand better how the system works.

-
- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
 - **Help Type**
 - **Pop-up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

 Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Search - Number Auto-Complete Field

General Settings

![[Number Auto-Complete Field Behavior Interface of the Search Configuration.]]filtro_cons_número_auto] *Number Auto-Complete Field Behavior Interface of the Search Configuration.*

- **Data Type** : Define the type of field for the application. When set to Number auto complete, you can inform a value based on the select statement of the lookup settings and it will manipulate an internal number for the data.
- **Search Label** : Defines the title of a field in the application. For example: if the field is defined in the database as cmp_name_client, it will be more clear for the comprehension of the user if the name would be "Client Name".
- **Use same label used on the Grid** : When this option is enabled, it allows to field to use the same title defined in the grid, in this case the Search Label is not used.
- **Amount of characters** : Define the amount of characters allowed for the field.
- **Maximum Size** : Defines the size of the field.
- **SQL Type** : Informs the data type of field in the database.

Field Behavior

![[Number Auto-Complete Field Behavior Interface of the Search Configuration.]]filtro_cons_decimal_filtro] *Number Auto-Complete Field Behavior Interface of the Search Configuration.*

- **Use autocomplete** : The field behaves as an autocomplete according to the values existing in the database.
- **Position between values** : This option sets the position that objects will be displayed.
- **Text between values** : Text that will appear between values.
- **OnChange Submit** : When enabled, it submits the search when there is modifications to the field.
- **Show Condition** : When enabled, it displays the condition of the search in the Grid, it will only work if there is at least one option selected.

Values format

![[Number Auto-Complete Field Format of Values with Regional Settings.]]filtro_cons_decimal_format] *Number Auto-Complete Field Format of Values with Regional Settings.*

- **Regional Settings** : Allows to apply the Regional Settings to format the number of the field. When not enabled, the attributes Digit Grouping Separator, Decimal Separator, Negative sign and Negative number format.
- **Decimal Precision** : Defines the amount of decimal places for the field.
- **Digit grouping** : Defines if the field will display the digits separator.
- **Decimal Separator** : Defines the decimal separator.
- **Accept** : Determines if the field, will accept only negative, positive or both numbers.

Search Lookup

A method used to offer the user a list of values that can be selected in the form applications. For example, the gender field in the Database with the values M or W can be presented like Man or Women or in a dynamic way, having these values recovered from the database.

Lookup Settings Display for the field.

- **SQL Select Statement** : Define the SQL command that will recover the values that will be displayed on the form field.
- **Rows** : Allows to define the amount of records displayed in the field.
- **Width** : Defines the width the size of capture box (Capture Text).
- **Search options** : Allows to define the search settings of the field(Start equal to, Any part and End equals to).
- **Capture Text** : When not enabled, you will only view the field to inform the data. See an example below. *lookup Settings configuration Interface.*
- **Display original and lookup value** : Displays the value of the field and the value returned from the lookup.

lookup Settings validation configuration Interface.

- **Show label with the description** : Displays a label with the description.
- **Choose connection** : Allows you to select another specific connection existing in the project. The select command will be done on the second connection.

Display Settings

The Display Settings allows to define the CSS for the fields individually. For each Display Settings of Scriptcase, exists the same attributes available for this interface.

- **CSS of the Title**
 - **Font** : Allows to choose the font type, that will be applied to the application field title.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field title.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the title of the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the title.
 - **Horizontal Alignment** : Allows to position the label of the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the label of the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the title of the field.
 - **Height** : To define a height for the title of the field.
- **CSS of the Field**
 - **Font** : Allows to choose the font type, that will be applied to the application field.
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the field, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the field.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the field.
 - **Horizontal Alignment** : Allows to position the field in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the field in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the field.
 - **Height** : To define a height for the field.
- **CSS of the Input Object**
 - **Font** : Allows to choose the font type, that will be applied to the Input Object. For example: Radio, Select, Text, etc
 - **Font Size** : Allows to choose the the font size, that will be applied to the application field.
 - **Font Color** :Allows to choose a color for the font from the color pallet.
 - **Background Color** : Allows to define the color for the Input Object, the color can be selected from the color pallet.
 - **Bold** : Applies the bold style to the font.
 - **Underline** : Applies the underline style to the font.
 - **Border Size** : Applies the border size to the Input Object.
 - **Border Color** : Allows to choose a color for the border, using a color pallet to apply to the Input Object.
 - **Horizontal Alignment** : Allows to position the Input Object in the desired position (left,right,center and justify).
 - **Vertical Alignment** : Allows to position the Input Object in the desired position (baseline, sub, super, top, text-top, middle, bottom, text-bottom).
 - **Width** : To define a width for the Input Object.
 - **Height** : To define a height for the Input Object.

Help Settings

This feature allows that the instructions are documented to be used for the generated application, this helps

the end user to understand better how the system works.

- **Help Description** : Allows to inform a text that will present to the user when he positions the mouse over the field.
- **Help Type**
 - **Pop-Up** : Selecting the pop-up type, it will display an icon beside the field that when clicked, you will view a pop-up with help description.

Help type - Pop-up configuration Interface.

- **Hint** : Passing the cursor over the field, you will view a hint with the help description.

Help type - Hint configuration Interface.

- **Text** : It will display the help description beside the field.

Help type - Text configuration Interface.

Search Application Events Overview

Most Scriptcase applications, with the exception of Tabs and Dashboard applications, have events that can be used to create business rules, validations and changes to the application's CSS, among other things.

When events are executed?

Each event is executed at a certain moment in the application and has an execution order, for this reason, they have different functions within the creation of a business rule and validations.

They can be triggered automatically, as in the case of the **onApplicationInit** and **onScriptInit** events, where they are executed when the application starts. Also, they can be triggered through user interaction, as with the **onNavigate** and **onValidate** events, which are executed when browsing the application or submitting a form, respectively.

For information about the timing of events execution or other information, access the documentation of the desired event.

how they work?

By default, the events already have handle for opening `<?php` and closing `?>` of PHP tags, so they are ready to receive PHP code and macros from Scriptcase.

However, it is possible to use other languages in the event, such as **JQuery**, **JavaScript**, **CSS** and **HTML**. For this, it is necessary to close the PHP tag `?>` of the event, so that the code can be added.

Remembering that it is necessary to reopen the event's PHP tag `<?php`, otherwise the application will not run correctly.

When closing the PHP tag in a Scriptcase event, the executed language is HTML.

Example of using other languages:

onApplicationInit - Search

This event occurs just once before it display the search form. It can be used to set some default values to the fields. For example: {company} = [glo_company]; Date fields are used differently, They use a suffix "day" for day, "month" for month and/or "year" for year. For example, The {Birth} field will be: {Birth_day}=date("d"); {Birth_month}=date("m"); {Birth_year}=date("Y");

onScriptInit - Search

This event occurs when the application is loaded, or reloaded. It occurs before the application runs the SQL statement, so using this event it is possible to modify the grid SQL statement dynamically, based on any logical condition. Macros frequently called on this event: `sc_select_field`, `sc_select_order`, `sc_select_where(add)`, etc.

onRefresh - Search

This event occurs when the form application is reloaded, is possible to reload the form based on fields (select , radio, checkbox)

onSave - Search

This event occurs always that some search setting is saved in the filter application.

Code Editor

Scriptcase has Events to allow the developers to customize the application code. By using the events, the developers can program custom actions at a specific execution time (e.g. After a record is inserted, when it is loaded, upon submitting a Form, ...) and for a specific application type. In the events area you can use global and local variables, JavaScript, CSS, HTML, PHP codes and also Scriptcase macros.

Scriptcase code editor is used within events and has a series of shortcuts to help in the applications development.

At the top section of the editor, there are some options that allows us to change the editor theme or expand it, for example. These options can also be activated using the hotkeys.

- - Increases the area occupied by your code editor.
- - Expand the sides of the code editor.
- - Activates the search in the code editor.
- - Enables replace in the code editor.
- - Defines the code editor theme.

The hotkeys are available in all browsers compatible with Scriptcase.

[Click Here](#) to view the Scriptcase hotkeys documentation.

Application Settings (Search Application)

Settings

With this interface, you can set the common attributes of the app.

Settings ?		
ATTRIBUTE	VALUE	DESCRIPTION
Application Code	search_products (9.00.0036)	Application code for ScriptCase internal use.
Description	<input type="text"/>	Application description.
Language	English (United States) ▾	Language of the generated application.
Share Location Variable	<input checked="" type="checkbox"/>	If you choose the option YES this application will inherit the locale (Language and Regional Settings) from a global variable, otherwise this application will always load its default locale.
Charset	<input type="text"/>	Application specific charset.
Share Theme Variable	<input checked="" type="checkbox"/>	If you choose the option YES this application will inherit the theme from a global variable, otherwise this application will always load its default schema.
Folder	root ▾	Folder that will store the application on the working project.
Edit by Project	<input checked="" type="checkbox"/>	Allow other users of the same project to edit the application.
Timeout	<input type="text" value="0"/>	Script execution timeout in seconds. Zero uses the PHP default timeout.
HelpCase Link	<input type="text"/>	Associate a HelpCase manual to your application.
Use Enter to	<input type="text"/>	Use the "Enter" key to move from the current field to the next field.

Application Settings Interface

- **Attributes**

- **Application Code** : It is the name that defines an application. An app can be renamed at the [List of Application](#).
- **Description** : This field contains a brief description of the application objectives.
- **Language** : Set the default language of the application. Display all the application hints and messages in the selected language.
- **Share Location Variable** : Define if the app shares the regional settings with other applications through a session variable.
- **Charset** : Define a specific charset to use in the application.
- **Share Theme Variable** : Define if the app shares the Theme settings with other applications through a session variable.
- **Folder** : Define the project folder that contains the app.
- **Edit by Project** : Define if other project developers can edit the application.
- **Timeout** : Set the session runtime timeout in seconds. If the value is Zero, it assumes the default timeout of the PHP.
- **HelpCase Link** : It allows to associate a [HelpCase](#) file with the application.
- **Use Enter to** : Allows selecting the action of the Enter key (submit or tabulate the Form).

Error Settings

It groups the notification options of the app.

Error Settings		
ATTRIBUTE	VALUE	DESCRIPTION
Show the Error Title in the Application	<input checked="" type="checkbox"/>	Show the title line of the error message in the application.
Show the Error Title in the Field	<input type="checkbox"/>	Show the title line of the error message in the field.
Error Title	<input type="text" value="{lang_errm_errt}"/>	Title message of the error
Script Error	<input type="checkbox"/>	Display information about the script and line where the error occurred.
SQL Error	<input checked="" type="checkbox"/>	Display the SQL Select Statement that originated the error.
Debug Mode	<input type="checkbox"/>	Run Application on debug mode, showing SQL commands.

Error Settings Interface.

• Attributes

- **Use SweetAlert:** Use the SweetAlert to display messages from the application. When this option is active, it will replace the browser's "confirm" and "alert".
- **SweetAlert position using Toast :** The position to display error messages on the application.
- **Show the Error Title in the Application :** Define to display the title line of the error message or not.
- **Show the Error Title in the Field :** Define to display the title line of the error message in the field or not.
- **Script Error :** Allows displaying the line code where there is an error..
- **SQL Error :** Allows displaying the SQL statement if it got an error.
- **Debug Mode :** Runs the application in Debug mode, showing all SQL statements the application is executing.

Navigation

This interface allows defining the navigating behavior of the application

NAVIGATION	
ATTRIBUTE	VALUE
Exit URL	<input type="text"/> 
Close on Exit	<input type="checkbox"/>
Redirect URL	<input type="text"/> 
Redirect Variable	<input type="text"/>

Navigation Interface.

Exit URL

URL to where the user goes when he clicks on the "exit" button.

Close on Exit

Close the browser window when the user clicks on the "exit" button.

Redirect URL

Redirect to another URL in case there aren't any global variables available.

Redirect Variable

Creates a variable with the application name and sends it to the redirected application.

Global Variables

This screen shows all global variables used in the application

The global variable is an external parameter required for running the application. The application can include global variables in the WHERE clause, field definitions and names, event programming, and so on.

You can define global variables by using square brackets ([variable]). You can pass the parameters to the application through one of the methods: Session, Post, and Get

IMPORTANT: if you need to use [Database Identifiers](#) in your tables, we recommend using the double quotation marks(") instead of the brackets([]) because of the conflict with the of Global Variables syntax{:target="_blank"} Scriptcase. **Using the brackets as database identifiers may lead to problems in the Scriptcase applications.**

Global variables Interface.

Example:

```
Select CustomerID, CustomerName from Customers WHERE CustomerID = '[v_customerid]'
```

We do not recommend using session variables (global variables) with the same name as the table fields.

In this case, the variable **v_customerid** is displaying in the global variables configuration.

 A screenshot of the 'VARIABLE SETTINGS' configuration interface. It shows a table with two columns: 'ATTRIBUTE' and 'VALUE'. The 'ATTRIBUTE' column contains the text 'global'. The 'VALUE' column contains three sections: 'Scope' with radio buttons for 'SESSION' (unchecked), 'POST' (checked), and 'GET' (checked); 'Settings' with a radio button for 'Optional' (unchecked); and 'Type' with radio buttons for 'Out' (unchecked) and 'In' (checked).

Global variables configuration Interface.

Attribute

It shows the variable's name in the application.

Value

Defines the behavior of the variables, divided into three blocks, they are:

Scope

Defines how the application receives the variable. A variable defined as the POST method in the app does not receive value if it comes with the GET method. Those are the methods available:

- **Session:** Defines that the variable must be created as a PHP session variable by another application.
